Claim.—1. In a device of the character described, a door-section hinged at the lower end of the car-door opening, so as to perform the function of a door and of a loading or unloading platform or shoveling-board, brackets secured to the car, and consisting of lower upright portions, and upper portions extending substantially parallel with the car-lines of the car, and an upper section provided with arms fitting and adapted to be adjusted between said brackets and the car-frame, substantially as described.

2. In a device of the character described, a door-section hinged at the lower end of the car-door opening, so as to perform the function of a door and of a loading or unloading platform or shoveling-board, brackets secured to the car, and consisting of lower upright portions, and upper portions extending substantially parallel with the car-lines of the car, an upper section provided with arms fitting and adapted to be adjusted between said brackets and the car-frame, and a gravity-dog to engage said section when the latter is supported by the upper portions of the brackets, substantially as described.

3. In a device of the character described, a door-section hinged to the lower end of the car-door opening, so as to perform the function of a door and of a loading or unloading platform or shoveling-board, brackets secured to the car, and consisting of lower upright portions and upper portions extending substantially parallel with the car-lines of the car, embodying inwardly-projecting loops at or near the junction-point of the upper and lower portions of the brackets, and an upper section, provided with angle-arms adapted to fit between the brackets and the car-frame, and adapted to be supported in said loops, substantially as described.

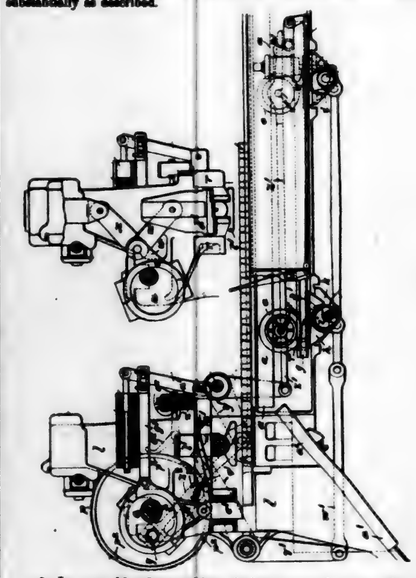
4. In a device of the character described, a door-section having its lower edge hinged at the bottom of the door-opening and adapted to swing outward, and provided with inwardly-projecting flanges at its sides, and angle-plates secured to the sides of the door-casing to provide space wherein said flanges fit when the door-section is closed, substantially as described.

5. In a device of the character described, a door-section having its lower edge hinged at the bottom of the door-opening and adapted to swing outward, and provided with inwardly-projecting flanges at its sides, angle-plates secured to the side of the door-casing to provide space wherein said flanges fit when the door-section is closed, and means for securing said section in its closed position, substantially as described.

6. In a device of the character described, a door-section having its lower edge hinged at the bottom of the door-opening and adapted to swing outward, and provided with inwardly-projecting flanges at its sides, angle-plates secured to the side of the door-casing to provide space wherein said flanges fit when the door-section is closed, a tubular rib secured to the outer side of the door and provided with an inverted-U-shaped slot, a bolt fitting in the tubular rib to engage a cavity in the door-casing, and provided with an arm adapted to depend through one arm of the other of said U-shaped slot, and thereby hold the bolt in its locked or unlocked position, substantially as described.

708,801. MACHINERY FOR BREAKING PIG-IRON. HARRY BENTLEY, Whitehaven, England. Filed May 1, 1902. Serial No. 105,457. (No model.)

Claim.—1. A machine for breaking pig-iron comprising in combination with the framing and driving-gear, a main or eccentric shaft, a movable table for supporting and feeding forward the bed of pigs, a crank, levers and rods for traversing the said table, eccentrics and sheaves for raising said table, mechanism for actuating these, a toothed wedge-block for clamping the pigs, an eccentric rod and lever for actuating said block, toothed pawls for locking the wedge-block, a lever and cam for releasing the pawls from the wedge-block, toggle-levers and an eccentric for actuating the pig-breaking ram, and an eccentric for actuating the sow-breaker, substantially as described.



2. In a machine for breaking pig-iron, means for supporting and traversing the bed of pigs under the gripping and breaking devices, said means comprising a stationary framing for supporting the bed of pigs during the breaking operation, a table or trolley for raising and feeding forward the bed of pigs, connections from a crank on the main shaft of the machine to traverse the table, rails on which the table travels and eccentric-blocks connected to said rails and fitted with sheaves for raising and lowering the rails and table to permit of the bed of pigs being fed forward and of the table being returned under said bed, substantially as described.

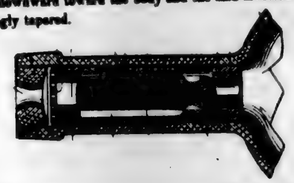
3. In a machine for breaking pig-iron, means for locking the clamping-block during the breaking operation comprising a wedge-block, a lever operated from the main shaft and connected to said wedge-block, teeth upon said wedge-block, toothed pawls adapted to engage these teeth, and a lever connected to said pawls and actuated from the main shaft of the machine substantially as described.

4. In a machine for breaking pig-iron means for locking the clamping-block during the clamping operation said means comprising in conjunction with a toothed wedge-block, a series of spring-actuated pawls arranged side by side and each consisting of a plate having one of its edges formed with teeth of similar pitch to the teeth on the wedge-block, the teeth on each plate being so spaced from its forward side in relation to the adjacent plates that a pawl action is obtained equal to that obtainable by a tooth-pitch of a fraction of that of the wedge-block, said pawls being raised simultaneously from engagement with the wedge-block by levers actuated from the main shaft substantially as described.

708,802. NON-REFILLABLE BOTTLE. JOHN J. BENTZ, Brooklyn, N. Y. Filed Mar. 27, 1902. Serial No. 100,347. (No model.)

Claim.—1. A non-refillable bottle, comprising the combination with the bottle-neck, of a centrally-orificed plug secured in the lower portion thereof, a flexible tube held in the orifice of the plug, a plunger-valve working with the tube, an inverted cup inclosing the plunger-valve and perforated to permit the passage of the liquid therethrough, said plunger-valve having a longitudinal passage for the liquid, and an orificed end plug secured in the outer portion of the neck of the bottle.

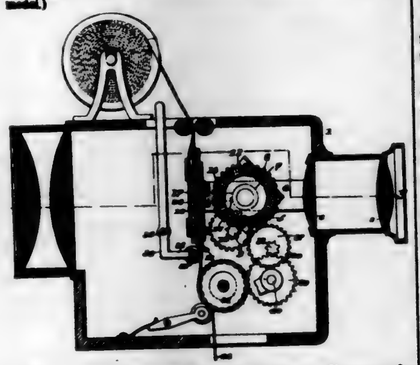
2. A non-refillable bottle, comprising the combination with the bottle-neck, of a centrally-orificed plug secured in the lower portion thereof, a flexible tube held in the orifice of the plug, a plunger-valve working with the tube, an inverted cup inclosing the plunger-valve and perforated to permit the passage of the liquid therethrough, said plunger-valve having a longitudinal passage for the liquid, and an orificed end plug secured in the outer portion of the neck of the bottle, the neck of the bottle being tapered downward toward the body and the said inverted cup being correspondingly tapered.



3. A non-refillable bottle, comprising the combination with the neck of a bottle, of a plug secured in the lower portion thereof and having a central orifice, a yielding tube fitted in said orifice and forming a valve-seat, an inverted cup having perforations in its upper portion, said cup being secured in the neck of the bottle above the said plug, a plunger-valve mounted in the cup and having a longitudinal passage for the liquid, and a glass or like plug secured permanently in the outer portion of the neck and having a central orifice for the passage of the liquid.

4. A non-refillable bottle, comprising the combination with the bottle-neck, of an orificed plug secured in the lower portion thereof, means held by the plug and constituting a valve-seat, a plunger-valve working with the said means constituting the valve-seat, and an inverted cup inclosing the plunger-valve and perforated to permit the passage of the liquid therethrough, said plunger-valve having a longitudinal passage for the liquid.

708,803. APPARATUS FOR ANIMATED PICTURES. JOSEPH RAINES, Philadelphia, Pa. Filed Oct. 24, 1900. Serial No. 34,169. (No model.)



Claim.—1. In an apparatus for animated pictures, a film, means for moving the same, a revolvable solid body of transparent material, mounted to present flat and angular faces and disposed in the optical axis, and means for revolving said body at different speeds as the film is moved so that the pictures are properly presented.

2. In an apparatus for animated pictures, a film, means for moving the same, a solid body of transparent material, in the optical axis mounted to present flat and angular faces, and means for revolving said body as the film moves, so that a flat surface of said body is presented when a complete picture is in position in the optical axis and when a portion of one picture and the portion of another picture on the film is in the optical axis, the angle of said body is presented in order to project both portions of said pictures.

3. In an apparatus for animated pictures, means for moving the film, a revolvable transparent body constructed to present flat and angular faces, and an apertured slide and means operating synchronously with the film to slightly raise and lower the slide as the film moves so as to properly frame the pictures on the film.

4. In an apparatus for animated pictures, means for moving the film, a revolvable transparent body constructed to present flat and angular faces, an apertured slide, and means for moving said slide in conjunction with the movement of said film.

5. In an apparatus for animated pictures, the combination of a rotatable transparent body in the optical axis for properly projecting the pictures of an apertured slide, and connections whereby said body and slide can be simultaneously actuated.

6. In an apparatus for animated pictures, means for moving the film, a transparent body, means for turning the same, and means for retarding and accelerating its revolutions with respect to the moving film.

7. In an apparatus for animated pictures, means for moving the film, and a lever having one end located against said film and projecting in order to be operated by hand and so arranged that the same can be operated to press against the film and thus draw down the picture to the proper point, and operated in the other direction to remove the pressure from the film.

8. In an apparatus for animated pictures, means for moving the film, a body of transparent material having flat faces, eccentric gears for rotating said body to present a flat surface thereof when a complete picture is in position in the optical axis and to present an angle of said body when portions of two adjacent pictures on the film are in the optical axis.

9. In an apparatus for animated pictures, means for moving the film, a revolvable transparent body adapted to present alternate flat and angular faces in the optical center, and means adapted to move in conformity with the movement of said body and film in order to properly frame the picture at the optical axis.

10. In an apparatus for animated pictures, means for removing the film, a body of transparent material having flat faces mounted in the optical axis and means for imparting variable rotary motion to said body, whereby the pictures will be properly presented.

11. In an apparatus for animated pictures, in combination with means for moving the film, a body composed of transparent material having flat faces of equal length whereby proper portions of the adjacent picture will be reflected, and means for reflecting said body as the film moves so as to properly project the pictures.

12. In an apparatus for moving pictures, means for presenting the film in a curved contour in cross-section at the optical axis.

13. In an apparatus for animated pictures, means for moving the film, and means situated below the optical axis which is adapted to be operated to press against the film and thus draw down the pictures to the proper point in the optical axis and is adapted to be operated in the other direction to remove the pressure from the film, so that the slack of the film will be taken up before that portion of the film which is in the optical axis, is moved.

14. In a moving-picture apparatus, the combination with mechanism for continuously moving a picture film, or surface, and an optical system for compensating for such movement by projecting the images of the picture to the same point, of a device having one or more apertures of dimensions to expose a single picture and movable in unison with the film so as to expose the picture to the optical system singly and during a portion of its travel through the field.

15. In a moving-picture apparatus, the combination with mechanism for continuously moving a picture-film, and an optical system for deflecting the rays of light from successive pictures to a fixed point, of a device movable in unison with the film for exposing the picture to the optical system singly and during a portion of its travel through the field.

16. In a movable-picture apparatus, the combination with mechanism for continuously moving a picture-film, and an optical system for deflecting the rays of light from successive pictures to a fixed point, of a contact having one or more apertures which follow the movements of the pictures through a portion of their travel so as to expose the pictures to the optical system in succession.

17. In a moving-picture apparatus, the combination with mechanism for continuously moving a picture-film, and an optical system for deflecting the rays of light from successive pictures to a fixed point, means intermediate the picture-film and the optical system and having a slot which affords an aperture of sufficient width to expose a single picture and of such form as to follow the movements of the picture through a portion of its travel.

18. In an apparatus for moving pictures, means for presenting the film in curved contour at the optical axis, in a plane at a right angle to the line of movement of said film.

708,804. BREECH-LOADING FIREARM. JOSEPH BENOITE, St. Constant, Canada. Filed July 31, 1901. Serial No. 70,236. (No model.)

Claim.—1. A breech mechanism for firearms comprising a sliding breech-plate covering the upper side of the receiver-chamber, a breech-block depending from said plate, a firing-pin resiliently mounted in said breech-block and projected through the front end thereof, a firing-bolt slidable in a recess in the receiver and having a head to engage said firing-pin and to be engaged by said breech-block when the latter is retracted, a spur engaging said firing-bolt when retracted, a spring to project said firing-bolt forwardly when released, and a transverse latch-bolt 71 projected into a slot in the breech-plate to lock it in advanced position.

2. A breech mechanism for firearms comprising a breech-plate adapted to reciprocate on the upper side of the receiver and to cover the receiver-chamber, a breech-block depending from the lower side of said breech-plate and to close the end of the barrel, a firing-pin resiliently mounted in said breech-block, a firing-bolt having a tang 16 sliding in a longitudinal recess in the receiver-chamber, and a head to strike said firing-pin and to be engaged by the rear face of said breech-block to retract the bolt when the breech-plate is retracted, a transverse pin passing through a slot in said tang to limit the movement of said firing-bolt, a guide-stem 20 mounted on the head of said firing-bolt parallel with and above the tang thereof and guided in a longitudinal recess in the rear end of the receiver-chamber, a coiled spring mounted on said guide-stem, a vertically-reciprocating sear having a nose to engage over the front end of said firing-bolt when retracted, a trigger-lever having a finger-piece and an arm engaging said sear to move it vertically, and means for locking said breech-plate in forward position.

3. A breech mechanism for firearms comprising a breech-plate to reciprocate on the upper side of the receiver and to cover the receiver-chamber, a breech-block depending from the lower side of said breech-plate to close the end of the barrel, a firing-pin resiliently mounted in said breech-block, a firing-bolt having a tang 16 sliding in a longitudinal recess in the receiver-chamber and a head to strike said firing-pin and engaged by the rear face of said breech-block to retract the bolt when the breech-plate is retracted, a transverse pin passing through a slot in said tang to limit the movement of said firing-bolt, a guide-stem 20 mounted on the head of said firing-bolt parallel with and above the tang thereof and guided in a longitudinal recess in the rear end of the receiver-chamber, a coiled spring mounted on said guide-stem, a vertically-reciprocating sear having a nose to engage over the front end of said firing-bolt when retracted, a trigger-lever having a finger-piece and an arm engaging said sear to move it vertically, means for locking said breech-plate in forward position, an extractor-bolt reciprocably mounted below the barrel and in advance of the firing-bolt, a spring pressing against the forward end of said extractor to project the same rearwardly, and means for releasing said extractor-bolt when the breech-plate is withdrawn.

708,805. **BUNG.** HENRY C. BLANEY, Philadelphia, Pa. Filed Apr. 29, 1902. Serial No. 105,136. (No model.)

Claim.—1. In a bung, a body portion having a passage therethrough, a valve adapted to cover said passage and rotatably mounted to one side thereof, means upon the rotary shaft of said valve for operating the same, and a packing seated and held within a recess in said body portion and surrounding the said passage at its inner end.

2. In a bung, a body portion having a passage therethrough, a valve adapted to cover said passage and rotatably mounted to one side thereof, means upon the rotary shaft of said valve for operating the same, a packing seated and held within a recess in said body portion and surrounding the said passage at its inner end, and means for supporting and tightening said valve against the under side of said packing.

3. In a bung, a body portion having a passage therethrough, a valve adapted to cover said passage and rotatably mounted to one side thereof, means upon the rotary shaft of said valve for operating the same, a packing seated and held within a recess in said body portion and surrounding the said passage at its inner end, and means for supporting and tightening said valve against the under side of said packing and means for forming a tight joint about said shaft.

4. In a bung, a body portion having a passage therethrough, a valve adapted to cover said passage and rotatably mounted to one side thereof, means upon the rotary shaft of said valve for operating the same, and a packing seated and held within a recess in said body portion and surrounding the said passage at its inner end, the said body portion being formed with a cam-guide at its inner end to support the free edge of the valve and tighten said valve against the packing.

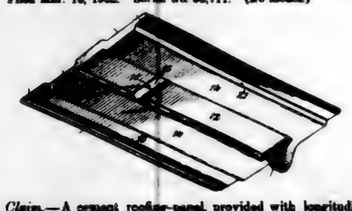
708,806. **LUBRICATOR FOR CAR-TRUCKS.** JOHN A. BRADFORD Victor, Colo. Filed Oct. 24, 1901. Serial No. 79,183. (No model.)

Claim.—1. A car-truck provided with wheels each of which is provided with an independent hollow axle, a receptacle connecting and furnishing communication between the inner ends of the axles, and a receptacle on the outer end of each axle, whereby lubricant supplied to any one of the receptacles will be distributed to all the others, substantially as described.

2. A car-truck provided with wheels each of which is provided with an independent hollow axle, lubricant-receptacles mounted on and surrounding the outer end of each axle, and an independent lubricant-receptacle between said wheels which furnishes communication between the inner ends of the axles, substantially as described.

3. A car-truck comprising wheels each having an independent hollow axle, side frames provided with lubricant-receptacles supported on the outer ends of said axles, means connecting said side frames, short frames secured to said means and carrying lubricant-receptacles which extend from the inner ends of the axles on one side of the frame to the inner ends of the axles on the opposite side, substantially as described.

708,807. **CEMENT ROOFING.** HOLDEN BROCK, St. Paul, Minn. Filed Mar. 15, 1902. Serial No. 98,711. (No model.)



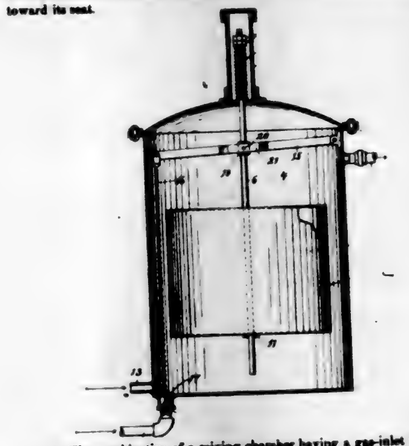
Claim.—A cement roofing-panel, provided with longitudinal gutters in its exposed surface, one at each side of the center and corresponding offsets in its back or under surface, together with a central longitudinal channel between the offsets, an apertured lug at one end of the channel, and an apertured rib crossing the channel at its opposite end, the said panel being also provided at its under or back surface with a longitudinal toothed recess at one side edge and a longitudinal plain recess at its opposite side edge, transversely inclined, the front exposed surface of the panel at one longitudinal edge being beyond the plane of the bottom of the gutters and the corresponding exposed surface of the opposite side edge of the panel being in the same plane with the bottom of the gutters and provided with longitudinal teeth, substantially as described.

708,808. **GAS AND AIR MIXER.** STEPHAN BROICHHAUS, Milwaukee, Wis., assignor to the Perfect Gas Machine Company, Milwaukee, Wis., a Corporation of Wisconsin. Filed Dec. 30, 1901. Serial No. 87,734. (No model.)

Claim.—1. The combination of a mixing-chamber having a gas-inlet port, a mixed air and gas eduction port, and an air-inlet port, the latter adapted to deliver air to said mixing-chamber, a float within the chamber, means for suspending the float, a pivoted lever within the mixing-chamber, a connection between the float and the lever, whereby said lever is turned on its fulcrum when the float is moved, a valve for controlling the air-inlet port, and a connection between the valve and the lever, whereby the movement of the lever causes the valve to be moved away from or toward its seat.

2. The combination of a mixing-chamber having a gas-inlet port, a mixed air and gas eduction port, and an air-inlet port, the latter adapted to deliver air to said mixing-chamber, a float within the chamber, elastic means for suspending the float, a pivoted lever within the chamber, a connection between the lever and the float, whereby said lever is turned on its fulcrum when the float is moved, a valve for controlling the air-inlet port, and a connection between the valve and the lever, whereby the movement of the lever causes the valve to be moved away from or toward its seat.

3. The combination of a mixing-chamber having a gas-inlet port, a mixed air and gas eduction port, and an air-inlet port, the latter adapted to deliver air to said mixing-chamber, a float within the chamber, an adjustable means for suspending the float, a pivoted lever within the chamber, a connection between the lever and the float, whereby said lever is turned on its fulcrum when the float is moved, a valve for controlling the air-inlet port, and a connection between the valve and the lever, whereby the movement of the lever causes the valve to be moved away from or toward its seat.



4. The combination of a mixing-chamber having a gas-inlet port, a mixed air and gas eduction port, and an air-inlet port, the latter adapted to deliver air to said mixing-chamber, a float within the chamber, means for suspending the float, a rod extending from the float, a pivoted lever within the chamber and adapted to be actuated by the rod, when the float is moved, a valve for controlling the air-inlet port, and a connection between the valve and the lever whereby the movement of the lever causes the valve to be moved away from or toward its seat.

5. The combination of a mixing-chamber having a gas-inlet port, a mixed air and gas eduction port, and an air-inlet port, the latter adapted to deliver air to said mixing-chamber, a float within the chamber, means for suspending said float, a rod extending from the float, a pivoted lever within the chamber and having a pivotal connection with the rod, whereby said lever is actuated when the float is moved, a valve for controlling the air-inlet port, and a connection between the valve and the lever, whereby the movement of the lever causes the valve to be moved away from or toward its seat.

6. The combination of a mixing-chamber having a gas-inlet port, a mixed air and gas eduction port, and an air-inlet port, the latter adapted to deliver air to said mixing-chamber, a float within the chamber, a rod extending from the float, a pivoted lever within the chamber and adapted to be actuated by the rod when the float is moved, a valve for controlling the air-inlet port, a connection between the valve and the lever, whereby the movement of the lever causes the valve to be moved away from or toward its seat, and a coiled spring surrounding the rod and confined between a fixed part and an enlargement on the rod, said spring adapted to yieldingly suspend the float.

7. The combination of a mixing-chamber having a gas-inlet port, a mixed air and gas eduction port, and an air-inlet port, the latter adapted to deliver air to said mixing-chamber, a float within the chamber, a rod extending from the float, a coiled spring surrounding the rod and confined between a fixed part and an enlargement on the rod, said spring adapted to suspend the float, a valve for controlling the air-inlet port, and means adapted as the float rises or falls for causing the valve to be moved away from or toward its seat.

8. The combination of a mixing-chamber having a gas-inlet port, a mixed air and gas eduction port, and an air-inlet port, the latter adapted to deliver air to said mixing-chamber, a float within the chamber, a rod extending from the float, a coiled spring surrounding the rod and confined between a fixed part and an enlargement on the rod, said spring adapted to suspend the float, a valve for controlling the air-inlet port, means for regulating the tension of the spring, and means adapted as the float rises or falls for causing the valve to be moved away from or toward its seat.

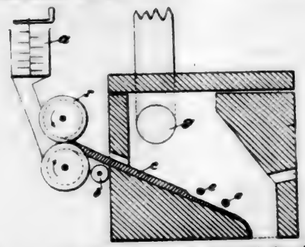
9. The combination of a mixing-chamber having a gas-inlet port, a mixed air and gas eduction port, and an air-inlet port, the latter adapted to deliver air to said mixing-chamber, a tube extending from the end of the mixing-chamber, a float within the chamber, a rod extending from the float and through the end of the mixing-chamber and into the tube, a coiled spring within the tube and surrounding the rod and confined between a fixed part, and an enlargement on the rod, said spring adapted to suspend the float, a valve for controlling the air-inlet port, and means adapted as the float rises or falls for causing the valve to be moved away from or toward its seat.

10. The combination of a mixing-chamber having a gas-inlet port, a mixed air and gas eduction port, and an air-inlet port, the latter adapted to deliver air to said mixing-chamber, a float within the chamber, means for suspending the float, a valve for controlling the air-inlet port, means adapted as the float rises or falls for causing the valve to be moved away from or toward its seat, and means for guiding the float in its movement.

11. The combination of a mixing-chamber having a gas-inlet port, a mixed air and gas eduction port, and an air-inlet port, the latter adapted to deliver air to said mixing-chamber, a float within the chamber, means for suspending the float, a valve for controlling the air-inlet port, means adapted as the float rises or falls for causing the valve to be moved away from or toward its seat, a rod extending from the float, and a device which the rod engages, said device adapted for guiding the float in its movement.

12. The combination of a mixing-chamber having a gas-inlet port, a mixed air and gas eduction port, and an air-inlet port, the latter adapted to deliver air to said mixing-chamber, a float within the chamber, means for suspending the float, a valve for controlling the air-inlet port, means adapted as the float rises or falls for causing the valve to be moved away from or toward its seat, a rod extending from the float, and a guide-bar having an opening through which the rod passes, whereby the float is guided in its movement.

708,809. **MANUFACTURE OF GLASS BY MEANS OF ELECTRICITY.** JOSEF BRONN, Cologne, Germany, assignor to Gesellschaft zur Verwertung der Patente für Glasverfeugung auf Electrischem Wege Becker & Co., M. B. H., Cologne, Germany. Filed Sept. 21, 1901. Serial No. 76,087. (No specimens.)



Claim.—1. The process herein described of producing glass by electricity, which consists in mixing the raw materials together with water and a suitable binding agent, conducting the mixture in plastic form between compressing-rolls and thence, in a continuous moving strip in close proximity to electrodes by which it is subjected to melting heat from an electric arc, as explained.

2. A process for producing glass by means of electricity consisting in compressing the raw material, to which a suitable binding agent such as water, water-glass, hydraulic plaster or lime is added, into solid pieces and in then subjecting these pieces to the action of the electric current and melting the same, substantially as and for the purpose set forth.

3. A process for producing glass by means of electricity consisting in compressing the raw material to which a suitable binding agent such as water, water-glass, hydraulic plaster or lime is added into a continuous rod and in then subjecting this rod to the action of the electric current, and melting the same, substantially as and for the purpose set forth.

4. A process for producing glass by means of electricity consisting in compressing the raw material, to which a suitable binding agent such as water water-glass, hydraulic plaster or lime is added into a solid form, then drying the same and finally melting it by means of the electric current, substantially as and for the purpose set forth.

5. A process for producing glass by means of electricity consisting in compressing the raw material, to which a suitable binding agent such as water, water-glass, hydraulic plaster or lime is added into a solid form, conducting said form over a heated surface, drying the same and in then melting said form by means of the electric current, substantially as and for the purpose set forth.

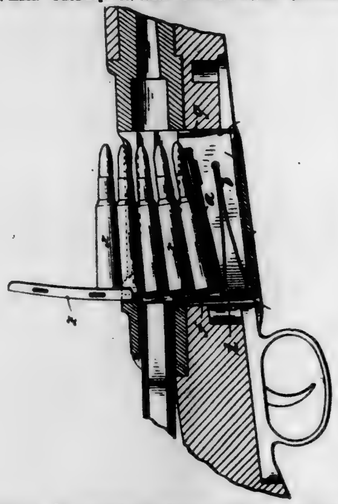
708,810. **MANIFOLD-COPY BOOK.** JAMES C. BROWNING, Saltpoint, N. Y. Filed Mar. 28, 1902. Serial No. 100,490. (No model.)

Claim.—1. A manifold-copying book provided with a pad one side of the book being provided transversely at the free ends of the leaves of

the pad with a plaited or folded carbon-holder provided at its free edge with a flange or strip and spring-connected hooks engaging the ends of said flange or strip and adapted to hold a carbon-sheet, substantially as shown and described.

2. A manifold-copying book comprising a pad and the usual back or cover, one side of the back or cover being provided at the end thereof adjacent to the free ends of the leaves of the pad with a transversely-plaited holder which is connected therewith at one edge, and the other or free edge of which is provided with a transverse member, and means for connecting a writing-sheet or plate and a carbon-sheet with said member, substantially as shown and described.

708,811. MAGAZINE FOR FIREARMS. LOUIS F. REED, Springfield, Mass. Filed Sept. 18, 1901. Serial No. 75,507. (No model.)



Claim.—1. In a magazine for firearms of the character described, the magazine-case having the loosely-mounted and spring-supported follower therein and having its rear end wall provided at a distance below its top, and somewhat above its bottom with a forwardly-protruding shoulder, against which the rear end portion of the follower in its descending movement may contact, for the purpose set forth.

2. In a magazine for firearms, of the character described, the magazine-case having the loosely-mounted and spring-supported follower therein, and having its rear end wall provided with a forwardly-protruding shoulder or ledge, at a distance above the bottom of the magazine-chamber, and said rear wall at all points below said ledge being as forwardly prominent as the ledge.

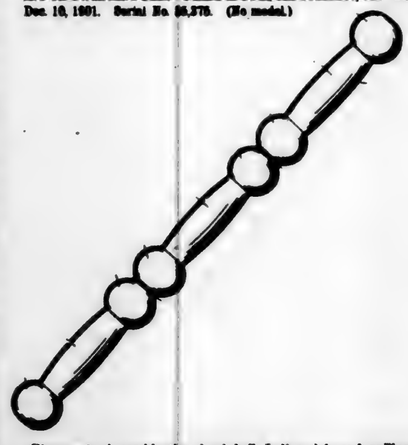
3. In a magazine of the character described, the magazine-case having the loosely-mounted and spring-supported follower therein, the rear end of which is adjacent the rear wall of the case, and said rear wall being provided, above its bottom, with a forwardly-protruding shoulder; said rear wall below said shoulder being as forwardly prominent as the shoulder, and the lower portion of the forward wall of the chamber being forwardly recessed for the purposes set forth.

708,812. PLOW. HENRY BRYAN, Modesto, Cal. Filed Jan. 28, 1902. Serial No. 91,504. (No model.)

Claim.—1. The combination, with a gang-plow frame having front transporting-wheel, of a rear transporting-wheel, a crank-arm carrying said wheel and journaled on the frame, whereby it is adapted to swing in a vertical plane, a hand-lever fulcrumed on a fixed support in front of the wheel, an adjusting-rod pivotally connected with said lever in rear of its fulcrum and also with the free end of the aforesaid crank-arm, a straight bar fixed in vertical position on the frame, in rear of the wheel, a sleeve adapted to slide on said bar and also on the said lever, and a spring-lock connected with the lever and sleeve, for securing the latter firmly in any adjustment, in the manner shown and described.

2. The combination, with a gang-plow frame, having front transporting-wheel and a rear extension formed as a handle, of the rear transporting-wheel, a crank-arm upon which the same is journaled, the said arm being journaled in slotted bearings on the under side of the frame extension, a clamp-collar and screw applied to the journal of the arm in the slot of said bearings, a hand-lever fulcrumed at a point in advance of the bearings and extending rearward over the handle of the frame, whereby both are adapted to be conveniently seized and manipulated, a rod connecting the wheel crank-arm with the lever at a point in rear of its fulcrum, a straight rod fixed vertically on the frame in rear of the wheel-bearings, and the sleeve adapted to slide on said bar and the lever, and means for locking them together at any point to which the lever may be adjusted, as shown and described.

708,813. COMBINED DUMB-BELL, INDIAN CLUB, AND PULLING OR SWINGING BAR. FRANK R. DOTY, San Francisco, Cal. Filed Dec. 10, 1901. Serial No. 85,575. (No model.)



Claim.—1. A combination dumb-bell, Indian club, and pulling or swinging bar, comprising a bar having formed thereon a central hand-grip and two terminal hand-grips and having also formed thereon terminal knobs on the outside of the terminal hand-grips, and bands separating the terminal hand-grips from the central hand-grip, said knobs and bands being all immovably secured on the bar at equal intervals of substantially a hand's breadth and each such interval of the bar being free or unobstructed throughout its entire length, to afford a hand-grip over the whole of said interval, substantially as described.

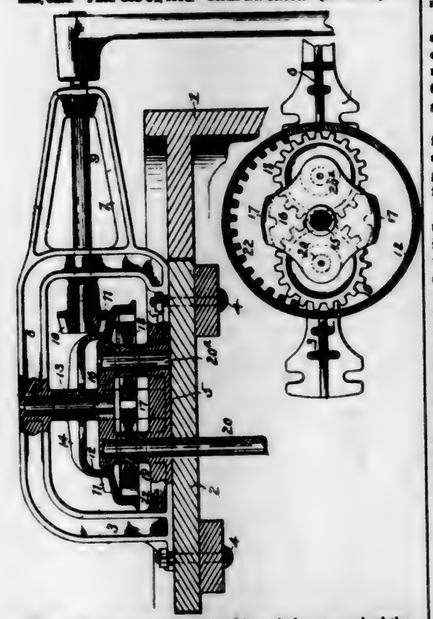
2. A combination dumb-bell, Indian club, and pulling or swinging bar, comprising a bar having formed thereon a central hand-grip and two terminal hand-grips, said central hand-grip being separated from the terminal hand-grips by pairs of bands, the bands of each pair being rigidly secured to each other, but separated by a groove suitable for receiving a cord or small rope, substantially as described.

708,814. WIRE-GRIP. JOSEPH D. CAMPBELL, Delaware, and ROBERT C. KYLE, Columbus, Ohio. Filed Jan. 27, 1902. Serial No. 91,230. (No model.)

Claim.—1. In a wire-grip, the combination with the section 1 having its inner end portion bent outward at an angle therewith and having its forward end portion formed with an upper side notch or recess, of a separately-formed section 2 the body of which is adapted to pass loosely through an opening in said outwardly-bent portion of the section 1, said section 2 having an enlarged head portion 7 and an upper side notch or recess 8 adjacent thereto, substantially as specified.

2. In a wire-grip, the combination with the section 1 comprising a bar having an outwardly-inclined inner end portion 1ª and having an upper side flaring recess or notch 3 in its outer end portion and an opening in its outwardly-bent end portion, of a section 2 comprising a curved bar adapted to pass loosely through the opening at the inner end of the bar 1, said section 2 having an enlarged head portion 7 and upper side notch or recess 8, substantially as specified.

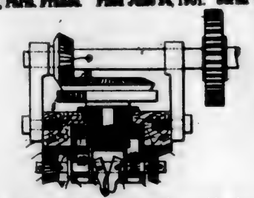
708,815. GEARING. JOHN R. CARTER, Augusta, Ky., and JOSEPH R. HAMFELD, Cincinnati, Ohio, assignors to Ernst H. Hunnefeld, Cincinnati, Ohio. Filed Oct. 31, 1901. Serial No. 80,690. (No model.)



Claim.—1. The combination of a driven shaft, a gear-wheel thereon, another gear-wheel meshing with said first-mentioned gear-wheel, a hollow wheel or ring surrounding said gears and having an internal notched gear alternately engaging said first-mentioned gears, and a rack or series of gear-teeth around its outer face to which motion is transmitted.

2. The combination with a receptacle, a frame thereon, and a dasher-rod or shaft projecting up into said frame and entering said receptacle, of a gear-wheel secured on said dasher-rod, another gear-wheel meshing with said first-mentioned gear-wheel, a hollow wheel or ring supported on a bearing in said frame and inclosing said gear-wheels, an internal notched gear in said wheel or ring adapted to alternately engage said gear-wheels, an external rack or gear on said wheel or ring, a drive-shaft, and a gear thereon meshing with said rack or gear.

708,816. KNOTTING DEVICE FOR HARVESTING-MACHINES. ANDRÉ CASTELLIN, Paris, France, assignor to Société Anonyme d'Etudes et d'Exploitation des Brevets A. Castellin pour Machines Agricoles Automobiles, Paris, France. Filed June 24, 1901. Serial No. 65,866. (No model.)



Claim.—1. In a binding apparatus, the combination of a rotary cup, a shaft supported by said cup, a plurality of fingers carried by said shaft for independent oscillation, means for rotating the cup and shaft respectively and means for effecting a movement of each of the fingers, independent of those applied to the cup and shaft.

2. In a binding apparatus, the combination of a cup, a shaft supported by said cup, means for rotating the cup, driven devices carried by said shaft, means for independently actuating said driven devices, a plurality of fingers shiftably carried by said shaft, and means for effecting motion of the fingers independent of those applied to the shaft and cup respectively:

3. In a binding apparatus, the combination of a cup, a shaft supported by said cup, means for rotating the cup, driven devices carried by said shaft, means for independently actuating said driven devices, a plurality of fingers shiftably carried by said shaft, and fixed projections arranged in the paths of said fingers and serving to shift the same.

4. In a binding apparatus, the combination of a rotary cup, a shaft supported by said cup, a plurality of fingers carried by said shaft for independent oscillation, means for rotating the cup and shaft respectively, means for effecting a movement of each of the fingers, independent of those applied to the cup and shaft, and means upon the cup for holding the cord for a predetermined period.

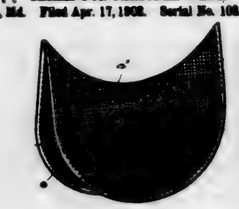
5. In a binding apparatus, a cup, a shaft carried by the cup, means for rotating said cup, gears carried by said shaft, fixed racks for engaging said gears as the cup is rotated, for rotating said shaft, a plurality of fingers shiftably carried by said shaft, and means for effecting motion of the fingers independent of those applied to the cup and shaft, respectively.

6. In a binding apparatus for harvesters, a cup, a knife mounted upon said cup, a toothed sector connected with the knife, teeth mounted independently of the sector for engaging the same to put the knife in its working position means normally acting upon the knife in opposition to said teeth, and means for rotating said cup.

7. In a binding apparatus for harvesters, a cup, means for rotating the same, a shaft carried by said cup, independent devices for effecting the rotation of said shaft during a certain period of the rotation of said cup, means for preventing rotation of said shaft during the remainder of the rotation of the cup, a plurality of fingers carried by said shaft, and means for effecting the motion of said fingers independent of those applied to the cup and shaft, respectively.

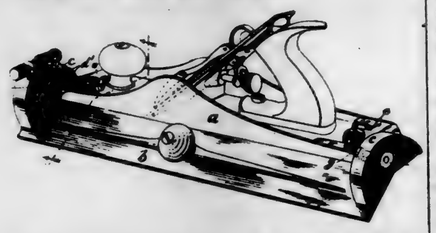
8. In a binding apparatus for harvesters, a shaft, a plurality of fingers having holes to receive said shaft, the walls of the holes being inwardly curved and said fingers having external incurved faces, pivots passing through the fingers and shafts respectively, and fixed projections for engaging said external incurved faces.

708,817. SHIELD FOR PERSONAL WEAR. LILLIE H. CATHER, Baltimore, Md. Filed Apr. 17, 1902. Serial No. 103,261. (No model.)



Claim.—As a new article of manufacture, a shield for personal wear, comprising three superposed plies, namely, a ply of waterproof material, a ply of open-mesh fabric, and an intermediate ply of coarse-mesh fabric of sufficiently cellular nature to hold in its interstices a quantity of toilet powder and all three plies bound around their marginal edges, as and for the purpose set forth.

708,818. **PLANE.** LUCAS C. CLARK, Southington, Conn. Filed July 11, 1901. Serial No. 67,267. (No model.)

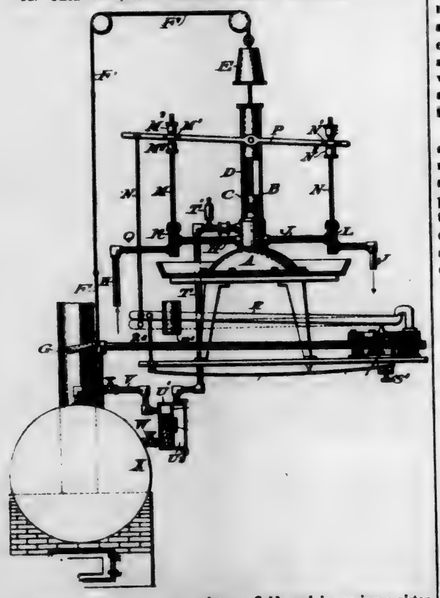


Claim.—1. In combination, the plane, the adjustable leaf, the rim-sectors attached to the leaf, and the disk-sections within the rims of the rim-sectors, and attached medinely to the plane, all substantially as described and for the purposes set forth.

2. In combination, the plane, the adjustable leaf, the rim-sectors attached to the leaf, the disk-sections within the rims of the rim-sectors, and the planes attached to the disk-sections and adapted for attachment to and detachment from the plane, all substantially as described and for the purposes set forth.

3. In combination, the plane, the adjustable leaf, a rim-sector attached to the leaf, the worm borne by the rim-sector and the disk-section attached to the plane and peripherally worm-toothed, all substantially as described and for the purposes set forth.

708,819. **DAMPER-REGULATOR.** SAMUEL COATS, Bridgeport Pa. Filed Nov. 9, 1901. Serial No. 81,718. (No model.)



Claim.—1. In a damper-regulator, a fluid-receiving casing, a piston therein, a connection for said piston with a damper of a furnace or heating device, supply and discharge pipes connected to said casing, valves on said pipes, a pressure-motor, a horizontally-disposed swinging beam, connections for opposite portions of said beam directly, with the stems of said valves, and a connection for said motor with said beam.

2. A fluid-receiving casing, a piston therein, a connection for said piston with a damper of a furnace or heating device, fluid supply and discharge pipes connected with said casing, a valve on said pipes, and a pressure-motor in combination with a swinging beam, and a connection for said diaphragm with said beam, the stems of said valves passing loosely through and being attached to opposite portions of said beam.

3. In a damper-regulator, a fluid-receiving casing, a piston therein, supply and discharge pipes connected with said casing, and valves on said pipes in combination with a swinging beam through which loosely pass and to opposite portions of which the stems of said valves are attached, and means for operating said beam by the changes in the pressure of steam of a boiler whose furnace or heating device is provided with a damper, with which said piston is connected.

4. In a damper-regulator, a fluid-receiver, supply and discharge pipes connected with said receiver, valves in said pipes, a swinging beam for operating said valves, and means for clamping the stems of said valves upon opposite sides of said beam, the latter having elongated slots which the adjacent portions of said stems freely occupy.

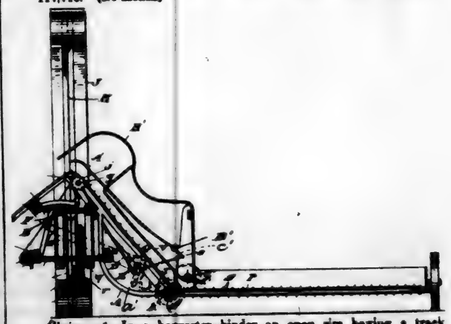
5. In a damper-regulator, a fluid-receiving casing, a piston therein, supply and discharge pipes connected with said casing, and valves on said pipes and having stems in combination with a swinging beam to opposite portions of which the stems of said valves are attached and means for operating said beam by the changes in the pressure of steam of a boiler whose furnace or heating device is provided with a damper with which said piston is connected, in combination with a pipe connected with said casing, and a low-water-actuated device adapted to be connected with said boiler and with said pipe.

6. In a damper-regulator, a fluid-receiving casing, supply and discharge pipes connected with said casing, valves on said pipes and consisting of rods of substantially the same diameter throughout and having ends shaped to coact with valve-seats in valve-casings in said supply and discharge pipes, a pivoted swinging beam for reversely operating said valves and means for operating said beam by changes in the pressure of steam, in combination with means for connecting the stems of said valves with said beam consisting of elongated slots in the latter opposite sides of the pivot, jaws clamping said stems above and below said beam, and collars on said jaws for tightening the same, said stems passing freely through said jaws, collars and slots.

7. In a damper-regulator, a fluid-receiving casing, water supply and discharge pipes connected therewith, a piston in said casing having connection with a damper, a swinging beam mounted between its ends on said casing, a pressure-motor, valve-stems passed loosely through and connected with said beam upon opposite sides of its pivot with ends adapted to seats in the supply and discharge pipes, a lever connected with the motor and extending substantially parallel with the said beam, and a connection between one end of the lever and the adjacent end of the beam.

8. In a damper-regulator, a fluid-receiving casing, water supply and discharge pipes connected therewith, a piston in said casing having connection for a damper, a swinging beam pivoted between its ends, valve-stems passed loosely through and connected with said beam near its opposite ends, a pressure-motor, a lever connected with the motor and extending substantially parallel with the beam, a connection between one end of the said lever and the adjacent end of the beam, a spring secured at one end, a link connecting the other end to said lever and a weight on said lever.

708,820. **HARVESTER-BINDER.** JOHN A. COWAN, Calgary Canada. Filed Oct. 10, 1900. Renewed July 30, 1902. Serial No. 117,710. (No model.)



Claim.—1. In a harvester-binder an open rim having a track formed on its inner periphery in combination with a truck running on the said track; and a harvester-frame journaled at one end of the frame of the said truck and adjustably supported upon it at the other end, substantially as and for the purpose specified.

2. In a harvester-binder an open rim having a track formed on its periphery, in combination with a truck having three wheels running on the track; a sprocket-wheel connected with the main wheel of the truck; a harvester-frame journaled at one end of the frame of the said truck and adjustably supported upon it at the other end; a cross-shaft journaled on the said harvester-frame; a sprocket-wheel on the shaft connected by a sprocket-chain with the sprocket-wheel on the main wheel of the truck; a shaft longitudinally journaled on the harvester-frame and geared to the aforesaid shaft; and a crank-disk on the forward end of the longitudinal shaft, substantially as and for the purpose specified.

3. In a harvester-binder, an open rim having a track formed on its inner periphery, in combination with a truck having three wheels running on the track; a sprocket-wheel connected with the main wheel of the truck; a harvester-frame supported on the said truck being journaled at one end and adjustably supported at the other; a cross-shaft journaled on the said harvester-frame; a sprocket-wheel on the shaft connected by a sprocket-chain with the sprocket-wheel on the main wheel of the truck; a shaft longitudinally journaled on the harvester-frame and geared to the aforesaid shaft; a crank-disk on the forward end of the longitudinal shaft; conveying and elevating chains upon the harvester carried by sprocket-wheels upon suitable shafts; and a sprocket-wheel and chain connection between the aforesaid longitudinal shaft and one of the latter, substantially as and for the purpose specified.

4. In a harvester-binder, and in combination with the elevator and needle thereof, a series of rods passing through holes at or near the apex between the elevator and binder-deck and extending above said apex, and means for automatically extending the said rods simultaneously with the motion of the needle, substantially as and for the purpose specified.

5. In a harvester-binder, and in combination with the elevator and needle thereof, a series of rods passing through holes at or near the apex between the elevator and binder-deck, and means for automatically extending the said rods simultaneously with the motion of the needle; an apron supported above the elevator and having its upper end turned outwardly and slotted; fingers connected to a suitably-journaled shaft and extending through the said slots normally close to the elevator, and means for swinging the said fingers backward simultaneously with the movement of the aforesaid rods, substantially as and for the purpose specified.

6. In a harvester-binder, and in combination with the elevator and needle thereof, a series of rods movably mounted to engage through holes at or near the apex between the elevator and binder-deck, and means for automatically extending the said rods simultaneously with the motion of the needle; a vertically-divided apron supported above the elevator and having its upper end turned outwardly and slotted; fingers connected to a suitably-journaled shaft and extending through the said slots normally close to the elevator, and means for swinging the said fingers backward simultaneously with the movement of the aforesaid rods, substantially as and for the purpose specified.

7. In a harvester-binder, an elevator provided with elevating-chains running over sprocket-wheels upon suitably-journaled shafts; means for driving the said shafts; a vertically-divided slotted spring-apron supported close to the said elevator; a shaft journaled above the bottom of the apron; a series of disks connected to the said shaft and provided with fingers which fingers only are adapted to extend through slots in the apron; and a gear connection between the said shaft and an elevator-chain-driving shaft substantially as and for the purpose specified.

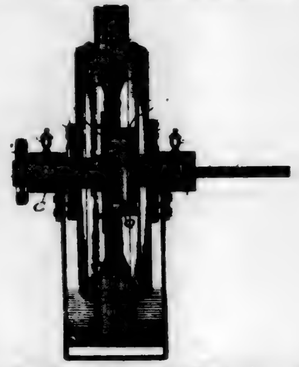
8. In a harvester-binder, a combined rim having a track formed on its inner periphery, combined with a truck running on said track, and a harvester-frame hinged at one end of the truck-frame and adjustably supported upon it at the other, and means for tilting the truck-frame, substantially as and for the purpose specified.

9. In a harvester-binder, the combination with the elevator and needle thereof, of a series of rods movable through holes at or near the apex between the elevator and binder-deck, means for automatically extending said rods simultaneously with the motion of the needle, a slotted apron, fingers extended through the slots of the apron and means for simultaneously actuating said fingers and rods, substantially as and for the purpose specified.

10. In a harvester-binder, the combination with the elevator and needle thereof, of a series of rods movable through holes at or near the apex between the elevator and binder-deck, means for automatically simultaneously actuating the needle and rods, and fingers extended above said apex, and means for moving said fingers simultaneously with the movement of said rods, substantially as and for the purpose specified.

708,821. **BOTTLE-WASHING MACHINE.** WILLIAM J. CUSHMAN, Philadelphia, Pa. Filed Mar. 1, 1902. Serial No. 96,945. (No model.)

Claim.—1. In a bottle-washing machine, brushes adapted to receive and hold the bottles, means for rotating said brushes and with them the bottles, and means for revolving said bottles with respect to said brushes.



2. In a bottle-washing machine, bottle-holders, brushes on said holders adapted to contact with the interior and exterior of the bottles, means for revolving the same, means for rotating said bottles with respect to said bottle-holders and brushes, and means for imparting a reciprocating motion to said bottles with respect to said bottle-holders and brushes.

3. In a bottle-washing machine, bottle-holders, brushes on said holders adapted to contact with the interior and exterior of the bottles, means for revolving the same, means for rotating said bottles with respect to said bottle-holders and brushes, and means for conducting cleansing material to the interior of said bottle-holders and for automatically closing the supply thereof.

4. In a bottle-washing machine, bottle-holders, brushes on said holders adapted to contact with the interior and exterior of the bottles, means for revolving the bottles with respect to said bottle-holders and brushes, and a valve mechanism for automatically controlling the supply of cleansing material to said bottles and bottle-holders.

5. In a bottle-washing machine, bottle-holders, means for revolving the same, means for rotating said bottles with respect to said bottle-holders, means for imparting a reciprocating motion to said bottles with respect to said bottle-holders, and a valve mechanism for automatically supplying cleansing material to the interior of said bottles.

6. In a bottle-washing machine, a tank, brushes suitably supported therein and adapted to receive a bottle, means for revolving said brushes with respect to said tank, and disks suitably supported and adapted to contact with said bottle for rotating the same with respect to said brushes.

7. In a bottle-washing machine, a tank, brushes suitably supported therein and adapted to receive a bottle, means for revolving said brushes with respect to said tank, and a track provided with means for imparting a reciprocating motion to the bottle with respect to said brushes.

8. In a bottle-washing machine, a tank, brushes suitably supported therein, means for revolving the same with respect to said tank, bottles adapted to be held adjacent said brushes, and disks suitably supported and adapted to contact with the bottle and means for imparting motion to said disks whereby said bottles are rotated with respect to said brushes.

9. In a bottle-washing machine, a tank, brushes suitably supported therein and adapted to receive bottles, means for revolving said brushes with respect to said tank, and a block having suitable passages therein which are adapted to register with the communications to the interior of the bottles, whereby cleansing material is conducted thereinto.

10. In a bottle-washing machine, a tank, a plate suitably supported therein, means for revolving said plate, brushes connected with said plate, one of which is adapted to enter the bottle, ports in said plate communicating with the interior of said bottle and a block having a passage therein which is so situated as to register with said ports or passages in said plate, in order to conduct cleansing material to the interior of the bottle at a suitable time.

11. In a bottle-washing machine, a tank, a plate secured therein, means for revolving said plate, brushes connected with said plate, one of which is adapted to be inserted in a bottle, ports in said plate, disks suitably supported and adapted to contact with the sides of the bottle, means for rotating said disks independent of said plate, a block having a port therein adapted to register with the ports or passages in said plate and means for conducting cleansing material into said port, whereby cleansing material is supplied to the interior of the bottle at the proper time.

12. In a bottle-washing machine, bottle-holders adapted to receive the bottles, means for rotating the said holders and with them the bottles,

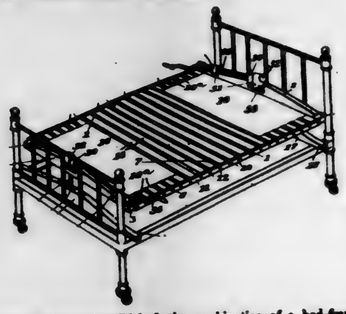
means for revolving said bottles with respect to said bottle-holders, and means for conducting cleansing material to the interior of the bottles when in position.

13. In a bottle-washing machine, brushes adapted to receive and to hold the bottle and adapted to contact with the interior and exterior of the bottles when in position, means for rotating said bottles with respect to said brushes, means for imparting a reciprocating motion to said bottles with respect to said brushes, and means for conducting cleansing material to the interior of said bottle.

14. In a bottle-washing machine, a tank adapted to receive cleansing material, brushes suitably supported and adapted to receive a bottle and to rotate in said tank, whereby the bottles are carried through the cleansing material, and means for revolving said bottles with respect to said brushes, whereby the bottles are thoroughly cleansed.

15. In a bottle-washing machine, a tank adapted to receive cleansing material, brushes suitably supported and adapted to contact with the interior and exterior of said bottles, means for rotating said brushes and bottles with respect to said tank, whereby the said bottles pass through the cleansing material, means for revolving said bottles with respect to said brushes, and means for introducing suitable cleansing material into said bottles whereby the exterior and interior of said bottles are thoroughly cleansed.

708,822. **INVALID-BED.** ELLA B. DOERR, Cincinnati, Ohio, assignor of one-half to Frank W. Handley, Cincinnati, Ohio. Filed Aug. 16, 1901. Serial No. 72,256. (No model.)



Claim.—1. In an invalid-bed, the combination of a bed-frame, a horizontally-extended cross-bar extended transversely beneath each end of said bed-frame and means interposed between the bed-frame and said cross-bars for raising and lowering the bed-frame relatively to said cross-bars, each cross-bar having at its central part pivotal connection with the raising and lowering means and being adapted for pivotal movement in a horizontal plane independently of the other cross-bar, substantially as set forth.

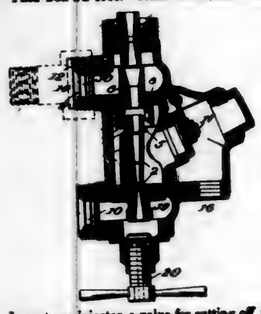
2. In an invalid-bed, the combination of a bed-frame, horizontally-extended supports, independent of each other and arranged beneath opposite ends of the bed-frame and raising and lowering means interposed between the ends of the bed-frame and said supports and comprising rotative parts extended between the bed-frame and said supports and upon which the said supports are centrally pivoted and are adapted for turning or pivotal movement in a horizontal plane, substantially as set forth.

3. In an invalid-bed, the combination of a bed-frame, independent horizontally-extended cross-bars arranged beneath opposite ends of the bed-frame and means for raising and lowering the bed-frame relatively to said cross-bars and comprising collared screws extended between the bed-frame and said cross-bars and upon which the cross-bars are centrally pivoted and are adapted for turning or pivotal movement independent of each other and devices for operating said screws, substantially as set forth.

4. In an invalid-bed, the combination of a bed-frame, horizontally-extended supports, independent of each other and arranged beneath opposite ends of the bed-frame and provided at their central portions with nuts, screws having their upper ends collared at the ends of the bed-frame and having their lower ends engaged with the nuts carried by the respective supports, the said supports being arranged for pivotal or turning movement in horizontal planes upon said screws and means carried by the bed-frame for rotating said screws to raise and lower the bed-frame upon said supports, substantially as set forth.

5. In an invalid-bed, the combination of a bed-frame formed of side rails and end pieces arranged for detachable connection with the side rails at the corners of the bed-frame, horizontally-extended supports independent of each other and extended beneath each end of said bed-frame and means interposed between the said supports and the end pieces of the bed-frame for raising and lowering the bed-frame upon said supports, each of said supports having at its central part pivotal connection with the raising and lowering means being adapted for pivotal or turning movement in a horizontal plane and independently of the other support, substantially as set forth.

708,823. **STEAM-INJECTOR.** JOHN DESMOND, Cincinnati, Ohio, assignor to the William Powell Company, Cincinnati, Ohio, a Corporation of Ohio. Filed Dec. 24, 1901. Serial No. 87,091. (Model.)



Claim.—1. In a steam-injector, a valve for cutting off the overflow at the mouth of the combining-tube, and the combining-tube having a spill-outlet set at such angle relatively to the valve that the latter will be seated by the force of the water discharged through such opening, as set forth.

2. In a steam-injector, a cup-shaped valve for cutting off the overflow at the mouth of the combining-tube, and the combining-tube having a spill-outlet so arranged that the discharge therethrough will be directed into the cupped side of the valve for effecting the seating thereof by the force of the water discharged through such opening, substantially as set forth.

3. In a steam-injector, a valve for cutting off the overflow at the mouth of the combining-tube formed with a face set at an angle, and the combining-tube having a spill-outlet opening for directing the overflow passing therethrough against such face of the valve, as and for the purpose stated.

4. In a steam-injector, a valve for cutting off the overflow at the mouth of the combining-tube formed with two faces set at an angle, the combining-tube having a spill-outlet opening for directing the overflow passing therethrough against one of said faces, and the water-lifting tube having a seat against which the other face of the valve is designed to be seated, as and for the purpose stated.

5. The combination with the combining-tube having a spill-opening set at an angle, of a valve for cutting off the overflow at the mouth of such combining-tube, said valve having a face set at an angle and against which the discharge through said spill-opening is designed to strike, as and for the purpose stated.

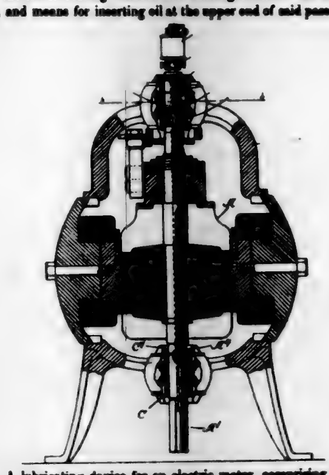
6. The combination with the combining-tube having a spill-opening set at an angle, of a valve having a central ring dilatable on the combining-tube, and a flange at an oblique angle to such ring against one side of which the discharge through said spill-opening is designed to strike, and the water-lifting tube having a seat for such valve, substantially as set forth.

7. The combination with the casing and the couplings, the former being composed of inferior material, and the latter having nipples or tailpieces, of the bushings forming seats for such nipples formed of yielding non-corrosive metal of a superior grade to that composing the casing, as set forth.

8. The combination with the casing having socketed openings, and the couplings designed to be secured thereto having nipples or tailpieces, such casing being composed of inferior material, such as cast-iron, of the bushings having annular portions fitted in the sockets of the several openings and having flared portions against which the nipples are designed to bear, such bushings being formed of yielding non-corrosive metal of a grade different from that composing the casing, as set forth.

708,824. **LUBRICATING DEVICE.** FREDERICK B. DUNBAR, Madison, Wis., assignor to Northern Electrical Manufacturing Company, Madison, Wis., a Corporation of Wisconsin. Filed Jan. 19, 1901. Serial No. 43,849. (No model.)

Claim.—1. The combination with suitable bearings of a rotating vertical shaft, having a passage-way extending part way therethrough, one or more lateral passage-ways extending from said passage-way to the upper bearing-face of the shaft, an escape at or near the bottom of said passage-way, by means of which the oil is conducted to the lower bearing-face of the shaft, the parts arranged so that the upper and lower bearings are both oiled from the same passage-way, the oil being supplied to the lower bearing without first making contact with the upper bearing, and means for inserting oil at the upper end of said passage-way.

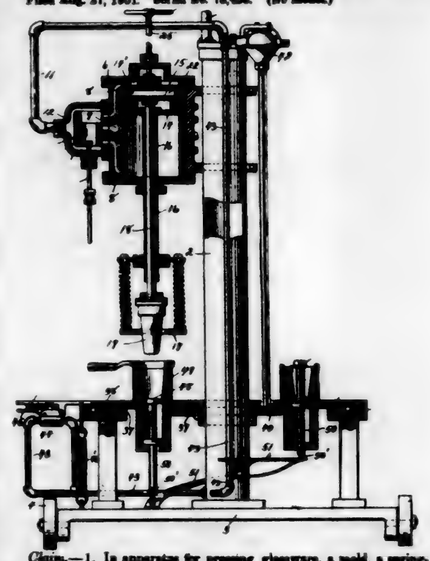


2. A lubricating device for an electric motor, comprising a vertical armature-shaft rotatably mounted in an upper and a lower bearing, a longitudinal passage-way extending through said shaft from its upper end to a point in proximity to the lower bearing, one or more lateral passage-ways at the upper end of the shaft connecting said longitudinal passage-way with the upper bearing-face of the shaft, an exit at the lower part of said passage-way by means of which the oil can pass to the lower bearing-face of the shaft, a stationary oil-cup mounted at the upper end of the shaft and in position to permit oil to pass into the longitudinal passage-way, whereby the amount of oil supplied to the upper bearing is automatically regulated and the oil for the lower bearing is supplied without making contact with the upper bearing.

708,825. **TOOL FOR OIL-WELLS, &c.** WILLIAM J. DEHLAP, Erie, Pa. Filed Apr. 11, 1902. Serial No. 102,494. (No model.)

Claim.—In a device of the type set forth, the combination of a casing having its upper and lower portions interiorly threaded, a sleeve threaded in the lower portion of said casing, an enlarged portion carried by the sleeve of the same diameter as the casing and having its upper side abutting against the lower edge of the casing, said sleeve and enlarged portion being apertured, a stem received within said aperture, a head on the lower end of the stem of the same diameter as said casing and adapted to have its vertical movement limited by engagement of its upper side with the under side of the enlarged portion of the sleeve, the lower end of said head being externally screw-threaded, the upper end of the stem being threaded, a nut in the upper end of the stem, a spiral spring encircling the stem and engaging the nut and the upper end of the sleeve, substantially as described.

708,826. **GLASS-PRESS.** PHILLIP REELING, Moundsville, W. Va., assignor of one-half to George Lafayette Caldwell, Wellsburg, W. Va. Filed Aug. 27, 1901. Serial No. 73,456. (No model.)



Claim.—1. In apparatus for pressing glassware, a mold, a spring-plate, a spring-plate carrier and a pressing-plunger capable of independent movement, plate-carrier-actuating means, and means for subjecting the plunger to force or pressure substantially uniform throughout the pressing stroke and of less degree than that applied to the spring-plate carrier.

2. In apparatus for pressing glassware, a cylinder, a hollow main piston, a spring-plate carried thereby, an auxiliary piston movable in the main piston, a pressing-plunger carried by the auxiliary piston, the main-piston chamber being provided with a fluid-inlet over the auxiliary piston, and a mold.

3. In apparatus for pressing glassware, a cylinder, a hollow main piston provided with a fluid-inlet, a tubular stem extending from said piston, a spring-plate carried by the stem, an auxiliary piston movable in the main piston, a stem extending from the auxiliary piston through the tubular stem of the main piston, a plunger on the auxiliary-piston stem, and a mold.

4. In apparatus for pressing glassware, a mold, a pressing-plunger, plunger actuating mechanism, means for regulating the force or pressure of the actuating mechanism on the plunger during the pressing stroke, and means for accelerating the movement of the plunger during the latter part of its pressing stroke.

5. In apparatus for pressing glassware, a mold-carrier, a motor therefor, a motor-controlling device, and carrier-securing mechanism adapted to actuate said device.

6. In apparatus for pressing glassware, a mold-carrier, a motor therefor, a motor-controlling valve, and carrier-securing means adapted when released from the carrier to hold the valve open.

7. In apparatus for pressing glassware, a mold-carrier, a motor therefor, a motor-controlling valve, a spring-actuated latch adapted normally to lock the carrier, and an operative connection between the latch and valve, whereby when the carrier is released the valve is opened.

8. In apparatus for pressing glassware, a hollow column forming an air-reservoir, pressing mechanism including a power cylinder communicating with the column, a mold-carrier, and a carrier actuating air-motor communicating with the column.

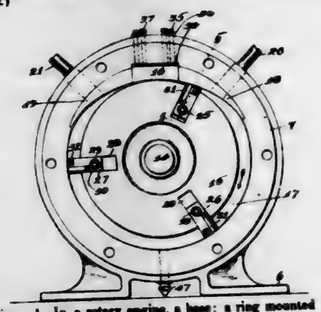
9. In apparatus for pressing glassware, a hollow column forming an air-reservoir, pressing mechanism, a mold-carrier, a latch normally engaging and securing the carrier, an air-motor for actuating the carrier, a pipe extending from the column to the motor, and a valve in the pipe adapted to be opened by the latch when the latter is released from the carrier.

708,827. **DOOR OR WINDOW ALARM.** JOHN G. EBERSFELD, Chicago, Ill., assignor, by direct and mesne assignments, to John J. Hovey, John F. Dean, and R. Adam Brechvogel, Chicago, Ill. Filed June 3, 1901. Serial No. 62,977. (No model.)

Claim.—1. In a burglar-alarm, a shell comprising two bowl-shaped parts having their connection adjacent and their peripheries approximately contiguous, the upper one of said parts constituting an alarm-bell; a central plate secured to the lower of said shell parts and extending across the device from the peripheries of said shell parts; an arm fixed to and extending in both directions from said lower shell part, one end of said arm having prongs for engaging an exterior object, and the other end of said arm having a turned-up portion perforated to form a guide; a main arbor mounted in and extending through said central plate, and secured at one end to said bell; a pulsative device inclosed between said central plate and said bell for sounding the latter; a spring-casing inclosed between said lower shell part and said central plate, said spring-casing being connected to said main arbor for driving said pulsative device; a spring connected at one end to said arbor and at the other end to said spring-casing; a plate slidingly mounted on said central plate and constituting a detent for controllably retaining said pulsative device; and a controlling-rod secured to said detent, said rod extending through the perforated turned-up guide portion of said fixed arm, and said controlling-rod having means for engaging an exterior object.

2. In a burglar-alarm, the combination of a main framework, a mainspring-casing, a main arbor, a mainspring secured at one end to said casing and at the other end to said arbor, an alarm-bell attached to said arbor for winding said spring, a ratchet-and-pawl device connecting said arbor and the main framework for preventing the accidental improper release of the mainspring, a pulsative escapement device geared to said mainspring-casing for sounding said bell; a detent operating upon said escapement, said detent having a slot for receiving a guide-pin and having a transverse arm passing through an aperture in the central plate of the main frame, and said detent being slidably mounted upon said central plate and making contact therewith for the greater portion of the length of said central plate thereby affording a firm bearing for said detent; a controlling-rod secured to the transverse arm of said detent upon the side of said central plate opposite to the major portion of said detent; said rod having means for engaging an exterior object and prongs upon said framework for engaging a second exterior object whereto the device is adjusted.

708,328. ROTARY ENGINE. ALBIN C. REX and ADOLF F. CEDERQUIST, St. Louis, Mo. Filed Feb. 18, 1902. Serial No. 94,648. (No model.)



Claim.—1. In a rotary engine, a base; a ring mounted upon and formed integral with the base to form a cylinder; plates attached one to each side of said cylinder and forming the cylinder-heads, there being an eccentric cam-groove in the inner face of one of said cylinder-heads, and a concentric groove in the inner face of the other cylinder-head; a cam-plate adjustably mounted in said concentric groove and having an eccentric cam-groove matching the first cam-groove; a shaft mounted in bearings through the centers of said cylinder-heads; a rotary piston mounted upon the shaft in the cylinder and having a concentric periphery; an abutment recessed into said ring and adjustably bearing against the periphery of said piston; inclined approaches mounted in said ring one upon each side of said abutment; wing-valves mounted to reciprocate radially in slots in said piston; and trunnions extending from said wing-valves into said cam-grooves, substantially as specified.

2. In a rotary engine, a cylinder; a shaft mounted in the cylinder; a piston upon the shaft in the cylinder, said piston having a concentric periphery; wing-valves mounted to slide radially in the piston; an abutment 16 recessed into the cylinder to engage the periphery of the piston, said abutment being adjustably mounted by means of the studs 35 rigidly fixed in the abutment and projecting outwardly through the cylinder; the nuts 36 on the outer ends of said studs to draw the abutment outwardly; and the screws 37 screw-seated through the cylinder with their points in engagement with the abutment to press the abutment inwardly, substantially as specified.

3. In a rotary engine, a cylinder; a shaft mounted in the cylinder; a piston upon the shaft in the cylinder, said piston having a concentric periphery; wing-valves mounted to slide radially in the piston; an abutment 16 recessed into the cylinder to engage the periphery of the piston, said abutment being adjustably mounted by means of the studs 35 rigidly fixed in the abutment and projecting outwardly through the cylinder; the nuts 36 on the outer ends of said studs to draw the abutment outwardly; the screws 37 screw-seated through the cylinder with their points in engagement with the abutment to press the abutment inwardly; and the inclined approaches 18 and 19 mounted one on each side of the abutment, there being ports 22 and 23 leading through the cylinder and through the approaches to the steam-chamber, and there being ports 23' and 24 leading from said ports 22 and 23 to the abutment, substantially as specified.

4. A rotary engine comprising a base; a ring mounted upon and formed integral with the base and forming a cylinder; plates attached to said ring and forming cylinder-heads, there being an eccentric cam-groove in the inner face of one of the cylinder-heads; and a concentric cam-groove in the inner face of the other cylinder-head; a cam-plate adjustably mounted in said concentric groove and having an eccentric cam-groove matching the first cam-groove; a shaft mounted in bearings at the centers of the cylinder-heads; a rotary piston mounted upon the shaft in the cylinder, the periphery of the piston being concentric; an abutment recessed into said ring and adjustably bearing against the periphery of the piston; inclined approaches mounted in the ring one upon each side of said abutment; wing-valves mounted to reciprocate radially in slots in said piston and having trunnions extending into said eccentric cam-grooves; the studs 38 rigidly fixed in the cam-plate and extending outwardly through the head of the cylinder; the nuts 39 upon the outer ends of said studs to draw the cam-plate outwardly; and the set-screws 40 screw-seated through the end 9 with their points engaging the cam-plate, substantially as specified.

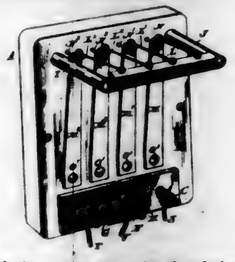
5. In a rotary engine, the cylinder-head 9 having a concentric groove in its inner face; the cam-plate 12 adjustably mounted in said groove, there being a recess 41 formed in the inner face of said cam-plate; a concentric piston mounted beside said cylinder-head and the cam-plate; an adjustable abutment mounted to engage the periphery of said piston and move downwardly into said recess 41; the packing-plate 42 mounted in said recess 41; the studs 43 fixed in the plate 42 and extending outwardly through the slots in the cylinder-head; and nuts upon the outer ends of said studs for adjusting said plate 42, substantially as specified.

6. In a rotary engine, a concentric piston; a wing-valve mounted to slide radially in recesses in the piston, there being grooves in the outer edge and each end of said valve; packing-strips mounted in said grooves, said packing-strips being right-angled bars mounted parallel in the outer edge of the valve, the end of one bar extending down on one end of the valve, and the end of the other bar extending down on the other end of the valve; and springs for pressing said packing-strips yieldingly outwardly, substantially as specified.

708,329. LIGHTNING-ARRESTER. CHARLES H. EGAN, Durham, N. C., assignor to Julian S. Carr, Durham, N. C. Filed Mar. 11, 1901. Renewed Apr. 22, 1902. Serial No. 104,222. (No model.)

Claim.—1. In a lightning-arrester, the combination of a base; main line-terminals carried thereby; a ground normally insulated from said terminals; a conductor connected with one of said terminals; a series of fuses connected to said conductor; a closed circuit intermediate one of said fuses and the other line-terminal; and means for cutting in each of the fuses in succession as the preceding fuse is blown.

2. In a lightning-arrester, the combination of a base; main line-terminals mounted thereon; a ground insulated from the terminals against the passage of normal current; a frame supported by the base and electrically connected to one of the main line-terminals; a series of fuses connected to the frame; a series of spring members connected to said fuses; a connection intermediate one of said members and the second of the main line-terminals; contacts arranged to act in conjunction with the members when released by the fusing of the links; and connections between said contacts and the fixed ends of the spring members.



3. In a lightning-arrester, the combination of a base; main line-terminals carried thereby; a ground insulated from said terminals against the passage of current of normal strength; a conductor connected with one of said main line-terminals; a series of fuses connected to said conductor; a closed circuit intermediate one of said fuses and the other line-terminal, said circuit including a spring member held under stress by the fuse; and means for cutting in each of the fuses in succession as the preceding fuse is blown.

4. In a lightning-arrester, the combination of a base; main line-terminals carried thereby; a ground normally insulated from said terminals; a conductor connected with one of said terminals; a series of fuses connected to said conductor; a closed circuit intermediate one of said fuses and the other line-terminal; and a series of spring members connected to each of the succeeding fuses, adapted and arranged to close the circuit as its fuse is blown.

5. In a lightning-arrester, the combination of a base; main line-terminals carried thereby; a ground insulated from said terminals against the passage of normal current; a conductor connected with one of said terminals; a series of fuses connected to said conductor; a closed circuit intermediate the first of said fuses and the other line-terminal, said circuit including a spring member held under stress by the fuse; a series of spring members carried by the base and connected to the fuses; a series of contacts arranged in line with the ends of said spring members; cross connections between said contacts and the fixed ends of the adjacent spring members; and a connection between the other line-terminal and the first of said contacts.

6. In a lightning-arrester, the combination of a suitable base; conducting-plates D, E, mounted thereon; main line-terminals connected respectively to said plates; a ground connection carried by said base adjacent to the plates but normally insulated therefrom; a conducting-frame carried by the base; connections intermediate one of said terminals and said frame; a series of fuse-links connected to said frame; a series of spring-arms carried by the base and having their free ends attached to the links; a series of contacts mounted in the base beneath the free ends of said spring-arms; connections between said contacts and the fixed ends of the adjacent spring-arms; and a connection between the other line-terminal and the last of the series of spring-arms.

708,330. PROCESS OF OBTAINING FOOD EXTRACTS. OTTOKAR EICHELBAUM, Berlin, Germany. Filed Mar. 23, 1901. Serial No. 100,536. (No specimens.)

Claim.—A process for producing a food-stuff similar to meat extract, consisting in mixing milk with a peptonizing ferment and subjecting it to the operation of the said ferment; then mixing therewith diluted mineral acids and heating, and, after the lactose contained in the milk has been split into its glucoses by the action of the acids, neutralizing the acids; then mixing yeast with the liquid to ferment the glucoses obtained from the lactose, and after fermentation is complete, filtering and concentrating the liquid.

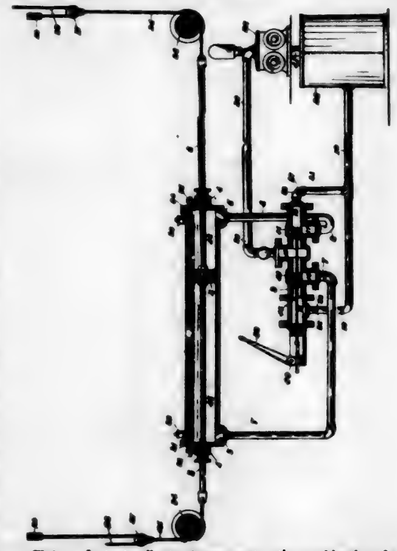
708,331. PROCESS OF TREATING FINE IRON ORES FOR BLAST-FURNACES. ALEXANDER D. ELBERS, Hoboken, N. J. Filed May 9, 1902. Serial No. 106,653. (No specimens.)

Claim.—1. The method of compacting fine iron ores, which consists in intimately mixing fine iron ores with moderate quantities of pulverized slag of suitable composition, and in burning such mixes to clinker under rotating action, substantially as described.

2. The method of compacting fine iron ores, which consists in mixing said fine ores with pulverized slag, burning such mixes to a clinker and maintaining the mass in constant agitation during the burning to effect the segregation of the plastic clinker into lumps, substantially as and for the purpose described.

3. The method of compacting fine iron ores, which consists in mixing said fine ores with pulverized slag of the singulo-silicate type or of an oxygen ratio of one to one, low in alumina, burning such mixes to a clinker, and maintaining the mass in constant agitation during the burning to effect the segregation of the plastic clinker into lumps substantially as and for the purpose described.

708,332. STEERING APPARATUS FOR VESSELS. PHILIP L. RISDON, San Francisco, Cal. Filed Aug. 28, 1901. Serial No. 73,580. (No model.)



Claim.—In hydraulic steering apparatus, the combination of a main steering-cylinder provided with air-escape valves 30 and water-escape valves 35, a controlling-cylinder provided with air-inlet valves 38, a force-pump for maintaining pressure in the system, a tank for receiving the circulating liquid, a pipe from the pump to the controlling-cylinder, return-pipes from the controlling-cylinder to the tank, and pipes from the controlling-cylinder to the main steering-cylinder, substantially as specified.

708,333. CYANID COMPOUND AND PROCESS OF MAKING SAME. GEORG ERLWEIN and ALBERT FRANK, Berlin, Germany. Filed Feb. 27, 1902. Serial No. 96,936. (No specimens.)

Claim.—1. Composition containing cyanid of calcium destined to serve as a substitute for cyanids of the alkalies consisting in a molten mass of cyanid of calcium and a metallic chlorid.

2. Composition containing cyanid of calcium destined to serve as a substitute for cyanids of the alkalies consisting in a molten mass of cyanid of calcium and chlorid of sodium.

3. Process of manufacturing a composition containing cyanid of calcium consisting in heating a mixture of cyanamid of calcium, carbon and a metallic chlorid until the mass melts.

4. Process of manufacturing a composition containing cyanid of calcium consisting in heating a mixture of cyanamid of calcium, carbon and chlorid of sodium until the mass melts.

708,334. ELECTRIC ACCUMULATOR-PLATE. ALEXANDER FISCHER, Berlin, Germany. Filed June 21, 1902. Serial No. 112,634. (No model.)

Claim.—1. Accumulator-plate comprising in combination: a plate of lead folded into serpentine form; tongues cut out of said plate at the apex of each fold and bent outward; and active mass disposed between said folds; substantially as set forth.

2. The combination with a serpentine-folded accumulator-plate of tongues cut out of said plate at the apex of each fold and bent outward; substantially as set forth.

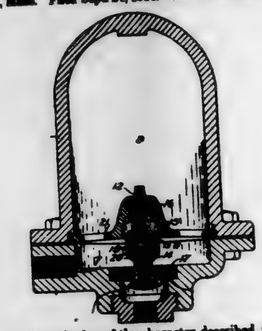
3. The combination with a serpentine-folded accumulator-plate of tongues cut out of said plate at the apex of each fold and bent outward.

and stiffening-pieces folded with said plate at intervals in the height thereof; substantially as set forth.

4. The method of producing accumulator-plates which consists in: (1) folding a sheet of lead into serpentine form; (2) cutting tongues out of said plates at the apex of said folds and bending said tongues outward; substantially as set forth.

5. The method of producing accumulator-plates which consists in: (1) folding a sheet of lead into serpentine form; (2) cutting tongues out of said plate at the apex of said folds and bending said tongues outward; filling the grooves of said plate with active mass; and giving the plate the desired shape; substantially as set forth.

708,335. **FLOW-ARRESTING DEVICE.** HENRY A. PERK, Newton, Mass., assignor, by mesne assignments, to Everett D. Chadwick, Brookline, Mass. Filed Sept. 21, 1900. Serial No. 30,678. (No model.)



Claim.—1. In a device of the character described, the combination of a chamber having an inlet and an outlet, a valve controlling said outlet, means for opening said valve, means operated by the pressure of the fluid entering said chamber for exerting a closing force on the valve, and means whereby the effective force holding said valve closed is automatically neutralized after a predetermined interval.

2. In a device of the character described, the combination of a chamber provided with an inlet and an outlet, a valve arranged to control the flow of a fluid through said outlet, means for holding the valve normally open, means for closing the valve arranged to be operated by the pressure of said fluid, and means for rendering said pressure inoperative after a predetermined interval.

3. In a device of the character described, the combination of a chamber provided with an inlet and outlet, a movable member arranged to be operated by fluid-pressure exerted in said chamber, a flow-controlling device operative with said member and arranged to arrest the flow of the fluid through the outlet when said member is acted upon by the pressure thereof, and means for rendering the pressure on said member inoperative after a predetermined interval.

4. In a device of the character described, the combination of a movable member arranged to be operated by fluid-pressure, a valve controlled by said movable member and arranged to be held closed thereby when said member is acted upon by said pressure, means for automatically equalizing the pressures on both sides of said movable member after a predetermined interval, and means for opening said valve.

5. In a device of the character described, the combination of a chamber provided with an inlet and an outlet, a movable plate or diaphragm closing one side of said chamber, a valve connected with said diaphragm and arranged to close said outlet when the diaphragm is acted upon by the pressure of the fluid in said chamber, means for opening said valve, and means for equalizing the pressures on both sides of said diaphragm after a predetermined interval.

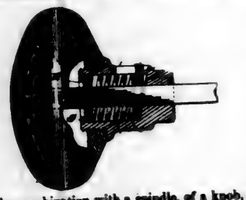
6. In a device of the character described, the combination of a chamber provided with an inlet and an outlet, a reservoir separated from said chamber by a movable partition, a valve carried by said partition and arranged to close said outlet, and means for opening said valve, said partition being provided with an open passage-way leading from said chamber to said reservoir.

7. In a device of the character described, the combination of a chamber provided with an inlet and an outlet, a reservoir adjacent to said chamber, a movable partition between said chamber and reservoir provided with an open passage adapted to permit a gradual flow of fluid between the chamber and reservoir, a valve connected with said partition and adapted to close the outlet from said chamber, and means for opening said valve.

8. In a device of the character described, the combination of a chamber and a reservoir separated by a flexible diaphragm, said chamber being provided with an inlet and an outlet, a valve attached to said diaphragm and arranged to close the outlet, said valve having the upper portion of its stem hollow and thereby providing a passage between said chamber and reservoir, a straining device surrounding the lower end of said hollow stem and communicating therewith, and means for opening said valve

---

708,336. **DOOR-KNOB.** JAMES R. FLETCHER, Stamford, Conn., assignor to The Yale & Towne Manufacturing Company, Stamford, Conn. Filed June 10, 1902. Serial No. 111,042. (No model.)



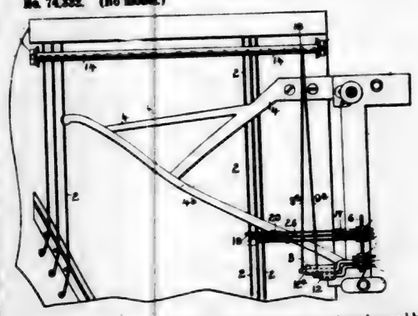
Claim.—1. The combination with a spindle, of a knob, a clamping-plate located within the shank of the knob and normally resting in an inclined or oblique position therein, the said plate having a peripheral lug projecting through a slot in the knob-shank and a spring for yieldingly holding the clamping-plate in position.

2. The combination with a spindle, of a knob, a spindle-clamping plate located within the shank of the knob and provided with a lug projecting through a slot in the knob-shank, and a spring for yieldingly holding said plate in a position to clamp the spindle.

3. The combination with a spindle, of a knob, a spindle-clamping plate located within the shank of the knob and provided with a lug projecting through a slot in said shank, a spring for yieldingly holding said plate in a position to clamp the spindle, and a disk secured within the inner end of the shank and locking the spring within the shank.

4. In combination with a knob-shank, a movable clamping-plate carried in the shank, a spring also carried in the shank which tends to throw the clamping-plate into the locked position, and means for compressing the spring and releasing the clamping-plate so that the spindle can be removed from the shank.

708,337. **MECHANICAL STRINGED MUSICAL INSTRUMENT.** RICHARD GABRIELSKY, Jersey City, N. J. Filed Sept. 4, 1901. Serial No. 74,332. (No model.)



Claim.—1. In a mechanical musical instrument, a damping-rod having an eccentric adapted to be applied to the strings, in combination with star-wheels and intermediate actuating mechanism for turning the rod and automatically making the instrument play piano or forte, substantially as described.

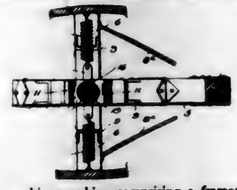
2. In a mechanical musical instrument, the combination with the strings, of a damping-rod, supported adjacent thereto and having an eccentric, and mechanism for automatically turning the rod and thereby causing its eccentric to bear upon and to be removed from the strings, for producing a piano or forte effect, substantially as described.

3. In a mechanical musical instrument, the combination with the strings, of a damping-rod having an eccentric, and supported transversely adjacent to the strings, star-wheels and intermediate actuating mechanism for turning said rod to cause its eccentric to bear upon or be removed from the strings, for producing a piano or forte effect, substantially as described.

4. In a mechanical musical instrument, the combination with the strings, of a damping-rod having an eccentric supported transversely thereto, star-wheels, crank-levers adapted to be engaged by the star-wheels, and connections from said crank-levers to said damping-rod, for turning it, for automatically making the instrument play piano or forte, substantially as described.

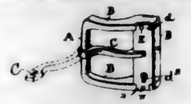
5. In a mechanical musical instrument having strings, a rod having a damping cam or eccentric and mounted transversely adjacent to the strings, in suitable bearings, in combination with crank-levers, connections therefrom to said rod for turning its eccentric toward or from the strings and means for actuating said levers, for automatically making the instrument play piano or forte, substantially as described.

708,338. **WASHING-MACHINE.** PAUL H. GREDGE, Sherbrooke, Canada. Filed Sept. 26, 1901. Serial No. 76,584. (No model.)



Claim.—A washing-machine comprising a framework, a vertical shaft, a slotted bearing, a movable stop-plate loosely mounted on said shaft, and movably disposed in the slot of said bearing, a vessel mounted on the bearing and the shaft for oscillatory movement and springs connecting the said vessel with the said stop-plate to move the latter diagonally across said bearing as the vessel is moved in one direction, substantially as and for the purpose specified.

708,339. **LOCK-BUCKLE.** CHARLES A. GOODEY, Woonsocket, R. I. Filed Feb. 14, 1902. Serial No. 94,081. (No model.)



Claim.—1. In a lock-buckle, the combination with the movable tongue, having a hole in its end, of a lock-case lock mechanism comprising a spring-bolt, a spring-catch for engaging said bolt when it is withdrawn from the tongue in the act of unlocking and a thumb-piece on said catch projecting through the lock-case.

2. In a lock-buckle, the combination with the movable tongue, having a hole in its end, of a lock mechanism comprising a case, a stationary key-plate partially filling one end thereof and carrying a key-post, a sliding bolt-plate movable over the key-plate, and having a flange at one end, a spring confined between said flange and the end of the case, and an abutment on the other end of the bolt-plate adjacent to the key-post

3. In a lock-buckle, the combination with the movable tongue, having a hole in its end, of a lock-case having an opening for said tongue, a stationary key-plate in said case carrying a post, a bolt-plate movable over the key-plate and having a flange *f*, recess *f'*, beveled lug *f''* and abutment *f'''*, a helical spring between the flange and the end of the case.

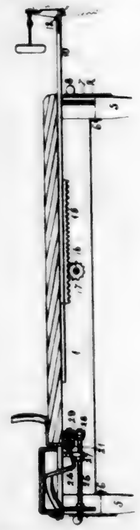
4. In a lock-buckle, the combination with the movable tongue C, having a hole *c* in its end, of a lock-case D having an opening *d'*, a bolt-plate F having a flange *f*, recesses *f'*, *f''*, beveled lug *f'''* and abutment *f''''*, a stationary key-plate G behind the bolt-plate, having recesses *g*, *g''* and notch *g'*, a spring I, and a spring-catch L having a thumb-piece M projecting through the case.

708,340. **FRACTURE APPARATUS.** JOSEPH P. GORDON, Rockford, Ill. Filed Nov. 22, 1901. Serial No. 83,333. (No model.)

Claim.—1. In a fracture apparatus, the combination of a table proper, of adjustable hooked arm-supports and an adjustable foot-section.

2. In a fracture apparatus, the combination of a table proper, of arm-supports, a bar located at the foot of the table and provided with a toothed rack and a pinion meshing with the rack.

3. In a fracture apparatus, the combination of a table proper, a hinged head-section, arm-supports having a pivotal connection with the table proper and capable of folding within the head portion, and an extensible bar at the foot of the table.



4. In a fracture apparatus, the combination of a table proper, a stationary shaft, two yokes movable on the shaft, a bracket moved by each yoke and means for moving the yokes.

708,341. **PORTABLE WARDROBE.** PETER D. GRAAFF, Fresno, Cal. Filed Apr. 27, 1901. Serial No. 57,749. (No model.)

Claim.—A portable wardrobe comprising a top, sides and back, brackets extending centrally downward from the under side of the top having a detachable rack suspended thereby, hooks secured to the lower front edge portion of the back, a rod extending longitudinally on the under front surface portion of the top having a support centrally arranged to hold and prevent sagging of the same, the opposite ends of the rod being curved and bent to form therewith transverse straight right-angular branch arms having their terminal ends secured to said back, rings slidably mounted on the rod and its arms, a sectional curtain connected to said rings of the rod and arms whereby said curtain is movable on the rod and also from the rod to the straight arms, or vice versa, by means of said curvature at the intersection of said rod and said arms, substantially as specified.

708,342. **APPARATUS FOR MOUNTING PHOTOGRAPHS.** ISAAC G. GRANT, Bozeman, Mont. Filed Oct. 23, 1901. Serial No. 79,694. (No model.)

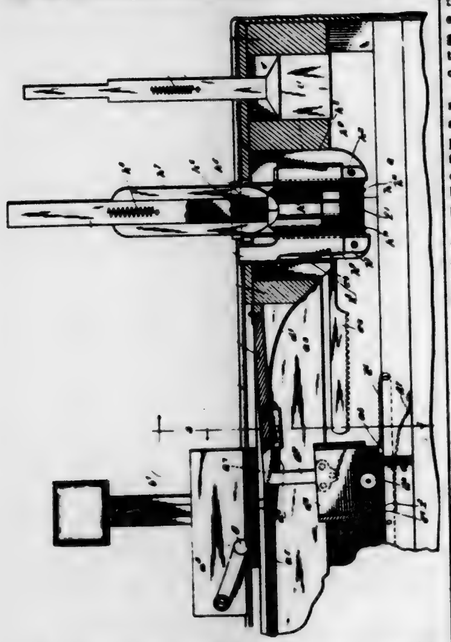
Claim.—1. In a picture-applying apparatus the combination of a base, a carriage thereon, means on the carriage for applying the picture to the mount, and a frisket mounted on the base and movable to cover and uncover a mount placed on the base.

2. The combination of a base, a carriage thereon, means on the carriage for applying the picture to the mount, a frisket mounted on the base for the purpose specified, and devices actuated by the movement of the carriage, for actuating the frisket.

3. The combination of a base, a carriage thereon, picture-applying devices on the carriage, a frisket on the base for the purpose specified, a gear in connection with the frisket, and a rack on the carriage, the rack riding over the gear to actuate the frisket.

4. The combination of a base, a frisket mounted thereon for the pur-

pose specified, a rock-shaft whereon the frisket is mounted, a gear attached to the rock-shaft, a carriage on the base, a rack on the carriage, the rack riding over the gear, and picture-applying devices on the carriage.



5. The combination of a base, a carriage thereon, a paste-applying device on the carriage, a picture-case on the carriage, means on the carriage for forcing the pictures successively from the case, and a stamp also on the carriage for finishing the operation of applying the picture.

6. In a picture-applying apparatus, the combination of a base, a frisket mounted thereon for the purpose specified, a rock-shaft whereon the frisket is mounted, a gear attached to the rock-shaft, a carriage on the base, a rack on the carriage, the rack riding over the gear to operate the frisket, a paste-applying device on the carriage, means on the carriage for carrying the pictures, and means also on the carriage for separately discharging the pictures from the carriage.

7. In a picture-mounting apparatus, the combination of a base, a carriage thereon, a paste-applying device mounted on the carriage and working over the base, means on the carriage for carrying the pictures and means also on the carriage for forcing the pictures from the carriage.

8. The combination of a base, a carriage thereon, a paste-applying device mounted on the carriage and working over the base, a case vertically movable on the carriage, a stamp within the case, a plunger within the case, a cross-head having limited movement on the plunger, a relatively strong spring connecting the cross-head and stamp, and a relatively weak spring sustaining the case.

9. The combination of a base, a carriage thereon, a case vertically movable on the carriage, a relatively weak spring sustaining the case in normal position, a stamp movable within the case, a plunger, a cross-head having limited movement on the plunger, and a relatively strong spring engaging the cross-head and stamp, said cross-head being capable of engaging the case, for the purpose specified.

10. The combination of a support, a case movable vertically on the same, a stamp movable within the case, means for yieldingly holding the case, a spring connected to the stamp, and a cross-head connected to the spring and adapted to engage the case for the purpose specified, said spring being stronger than the means for yieldingly holding the case.

11. The combination of a base, a carriage thereon, a picture-applying device mounted on the carriage, a dog sustained on the base, and a part connected to the picture-applying device, with which part the dog coacts for the purpose specified.

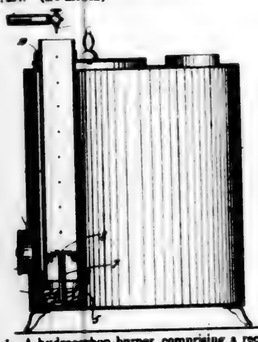
12. The combination of a base having a part with a guide-groove and an offset therein, a carriage on the base, and a paste-applying device on the carriage and movable relatively thereto, said paste-applying device comprising a part running in the guide-groove, whereby as the offset of the groove is reached, the paste-applying device is moved into operative position.

13. The combination of a frame having a part with a guide-groove therein, a carriage on the frame, a paste-applying device hingedly mounted on the carriage and having a lateral projection fitting in the said guide-groove, the guide-groove having an offset portion, and a spring lying in the groove at the offset portion to engage and deflect the said projection of the paste-applying device.

14. In a picture-applying device, the combination of a frame, a carriage thereon, a paste-applying device movably mounted on the carriage and engaging an irregular surface on the frame, whereby to throw the paste-applying device into and out of active position, means for applying the pictures, said means including a shouldered member, a dog supported on the frame and engageable with said shouldered member, and means being mounted on the carriage and tending to return the carriage to its position of rest.

15. In a picture-applying device, the combination of a frame, a carriage thereon, a paste-applying device, means for applying the pictures, said means being mounted on the carriage and including a shouldered member movable with the picture-applying means, a dog supported on the frame and engaging the shouldered member, and a spring tending to return it to its inactive position.

708,843. HYDROCARBON-BURNER FOR STOVES OR FURNACES. GEORGE A. GREEER, Rogers, Tex. Filed Dec. 27, 1901. Serial No. 87,437. (No model.)



Claim.—1. A hydrocarbon-burner, comprising a receptacle, an air-inlet tube having its lower portion terminating within said receptacle and forming therewith an intermediate space or opening for the passage of a combustible fluid, and a splash device extending upwardly from the receptacle and terminating within the lower open portion of said air-tube.

2. A hydrocarbon-burner comprising a receptacle, an air-inlet tube having its lower open end terminating within said receptacle and forming therewith an intermediate space or opening for the free passage of a combustible fluid, a splash device within the lower end of the tube, an air-inlet independent of the air-tube and arranged to supply air to the receptacle around or outside of the tube, and means for feeding liquid fuel to the splash device.

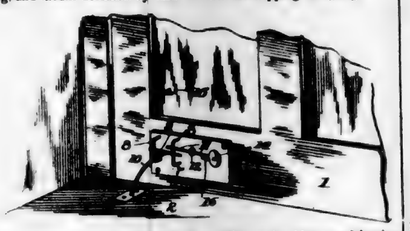
3. The combination with a stove or furnace, of a burner-receptacle having communication therewith and adapted to be charged with a mass of absorbent material, an air-inlet tube extending into said receptacle to terminate above the level of the absorbent material therein and forming with said receptacle an intermediate space or opening for the free passage of a combustible mixture, a splash device within the lower open end of the air-tube and adapted to permit a liquid spray to impinge the tube, and means for feeding liquid fuel against the splash device.

4. A hydrocarbon-burner comprising a receptacle, an air-inlet tube extending into said receptacle and adjustable vertically with relation thereto, whereby the volume of air supplied by the tube to the receptacle may be varied, a splash device surrounded by said tube, and means for feeding hydrocarbon against the splash device.

5. A hydrocarbon-burner, comprising a receptacle, an air-tube extending into the same and having an open upper end, a splash device surrounded by said air-tube, and a sight-feed device having a drip-nozzle disposed to view above the air-tube and adapted to drop a liquid directly upon the splash device.

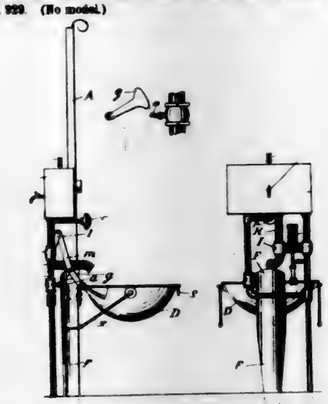
708,844. COMBINED DOOR-CHECK AND BURGLAR-ALARM. WILLIAM F. GEIER, Carnegie, Pa. Filed July 8, 1902. Serial No. 114,747. (No model.)

Claim.—1. A device of the type set forth, comprising a plate with guides thereon, a curved rod having its lower end removably secured in the floor, and carrying a T-head on its upper end operating in said guides, a gong, and means actuated by said T-head for tripping the gong.



2. A device of the type set forth, consisting of guides, a rod having its lower end removably secured in the floor and carrying a head on its other end operating in said guides, a gong, and pivoted means adapted to be actuated by said head of the rod for tripping the gong.

708,845. WATERING TROUGH, BOWL, OR BASIN. NORMAN W. GREWOLD, Honolulu, Hawaii. Filed Nov. 11, 1901. Serial No. 81,929. (No model.)



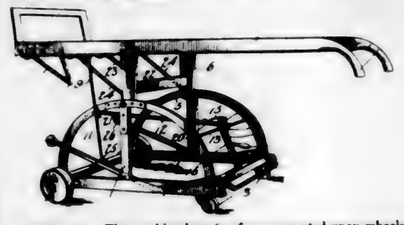
Claim.—1. In a watering-trough for animals a hinged bowl or basin adapted to be moved on its hinged bearings to a vertical position so as to empty its contents: a closed tank supported at an elevation higher than the bowl or basin and connected by a pipe with a source of water-supply, an air-valve in the top of the tank: a pipe leading downward from the bottom of the tank so as to discharge into the bowl or basin: a valve in the feed-pipe and a valve in the discharge-pipe and means operated by the raising and lowering of the bowl or basin whereby said valves are opened and closed alternately so as to successively admit water into the tank and then discharge it into the bowl substantially as described.

2. In a watering-trough for animals a bowl or basin provided with a discharge-spout on one side and supported on hinged bearings on each side of said spout, a latch adapted to engage with the opposite rim of said bowl or basin when it is elevated and closed: a waste-spout adapted to receive the contents of the bowl when it is tipped to a vertical position and a rigid arm attached to said bowl and adapted to operate a spray within the bowl or basin as it is opened and closed, substantially as described.

3. In a watering-trough for animals a bowl or basin supported on hinged bearings and adapted to be raised to a vertical position: means for alternately filling and emptying said bowl or basin: and a spray-pipe connected with the water-supply and operated by the movements of the bowl or basin in opening or closing whereby a spray of fresh water is ejected into and against the bottom of the bowl each time it is raised and lowered substantially as described.

4. In a watering-trough for animals, a bowl or basin adapted to be raised to a vertical position on hinged bearings: means for filling the bowl or basin when it is lowered to a horizontal position, and for emptying its contents when it is raised to a vertical position, and a thin wall or screen extending on each side and above the trough or basin, substantially as described.

708,846. TRUCK. GEORGE H. GROSVIR, SIMON BRILLARD, and JOSEPH L. LABRANCHE, Waterville, Me. Filed May 14, 1902. Serial No. 107,296. (No model.)



Claim.—1. The combination of a frame mounted upon wheels and having upright devices connected by a cross-rod, a truck-platform having a pair of oppositely-disposed hangers depending therefrom and movably engaging the said rod, a break-joint connection between one end of the platform and frame, a rod extending longitudinally from the said joint under the before-mentioned rod and having a depending toe at the rear terminal thereof, a slotted standard rising from the rear end of the frame and through which the rod with the toe movably extends, and a spring-catch device supported by the slotted standard to lock the rod with the toe.

2. The combination with a frame, of a truck-platform pivotally mounted at an elevation thereon, a break-joint connection between one end of the platform and frame, a rod extending longitudinally from the said connection to the rear of the frame, a lock device for holding the rod against movement, and levers pivoted to the opposite inner side portions of the frame and bent at an angle, the rear ends of the levers having rollers therein and the front ends or extremities connected by a transverse bar which serves as a treadle.

3. The combination with a frame, of a truck-platform mounted thereon and adapted to swing in a vertical plane, rods pivoted together and connecting one end of the platform with the adjacent end of the frame, an operating-rod extending from the connected ends of said rods, a trip for imparting longitudinal movement to the operating-rod, and a lock for said rod.

4. The combination with a frame, of a truck-platform mounted thereon and adapted to swing in a vertical plane, rods connected to the platform and plane and pivoted to each other, an operating-rod extending from the said rods, a guide therefor, a trip within the guide and engaging the rod and adapted to impart longitudinal movement thereto, and a spring-catch adapted to lock the operating-rod in position.

708,847. RAILROAD-BED. MARTIN HAAS, Kalamazoo, Mich. Filed June 30, 1902. Serial No. 113,730. (No model.)

Claim.—1. The combination in a cement railroad-bed, of an upper and lower embedded series of wires or strips and internally-screw-threaded sockets having rigid connection with said wires or strips, substantially as described.

2. The combination in a cement railroad-bed of embedded wires, embedded sockets each having means adapted for engagement with said embedded wires, and a screw-threaded perforation adapted to receive a headed and threaded bolt, the latter having suitable means for engaging and securing the rails, substantially as described.

3. The combination with a cement road-bed, of an upper and lower series of wires or strips, one series arranged transversely and the other series longitudinally within the said bed, substantially as described.

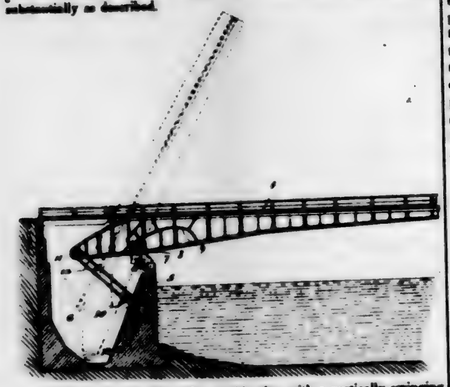
4. The combination with a cement railroad-bed of an upper and lower twisted or corrugated series of wires or strips, one series arranged transversely and the other longitudinally within the said bed, substantially as described.

5. The combination with a cement road-bed, of embedded transverse and longitudinal wires or strips as specified, internally-screw-threaded sockets having perforated side ribs with the perforations adapted to receive wires embedded in the bed and threaded bolts adapted to enter the said sockets and engage and secure the track-rails, substantially as described.

708,848. BASCULE-BRIDGE. CHARLES F. HALL, Chicago, Ill. Filed Dec. 7, 1901. Serial No. 85,018. (No model.)

Claim.—1. In a bascule-bridge, the combination with a vertically-

swinging span, of an abutment supporting the weight of the same, contacting supporting-surfaces on the abutment and span respectively, having a sliding movement relatively to each other, and a pivoted tension-link connecting the heel of the span with a fixed point on the abutment, substantially as described.



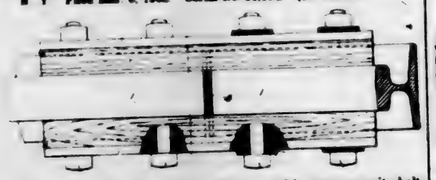
2. In a bascule-bridge, the combination with a vertically-swinging span, of an abutment supporting the weight of the same, a way or track on one of said elements, a fulcrum-roller journaled in or upon the other and contacting said way and having a relative traveling movement thereover, and a pivoted tension-link connecting the heel of the span with a fixed point on the abutment, substantially as described.

3. In a bascule-bridge, the combination with a vertically-swinging span, of an abutment supporting the weight of the same, a fulcrum-roller journaled in or upon the upper end of the abutment beneath the span, a way or track formed in or upon the span above and slidingly contacting said roller, and a tension-link pivoted at one end to the heel of the span and at its opposite end in the abutment, substantially as described.

4. In a bascule-bridge, the combination with a vertically-swinging span, of an abutment supporting the weight of the same, a fulcrum-roller journaled in or upon the upper end of the abutment beneath the span, a way or track formed in or upon the span and overlying said roller, said way and roller having contacting friction-surfaces, means for rotating said roller, and a controlling device for the heel of the span, substantially as described.

5. In a bascule-bridge, the combination with a vertically-swinging span, of an abutment supporting the weight of the same, a roller journaled in or upon the upper end of the abutment beneath the span, a tension-link pivotally connecting the heel of the span to the abutment, and a curved way or track on the span engaging the roller and so formed and located relatively to the center of gravity of the span and the arc of travel of its heel as that the span shall be in substantial equilibrium at all points of its movement, substantially as described.

708,849. **INSULATED-RAIL JOINT.** GEORGE L. HALL, Brooklyn, N. Y. Filed Mar. 6, 1902. Serial No. 96,894. (No model.)

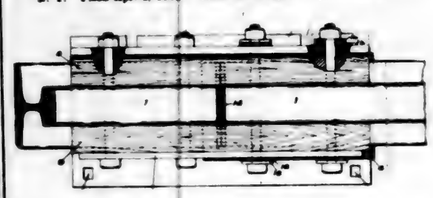


Claim.—1. An insulated-rail joint comprising two opposite bolt-plates extending across the joint, two insulating-blocks extending across the joint one on each side of the rail ends and between them and the corresponding bolt-plate, a plurality of bolts extending through the bolt-plates, insulating-blocks and rail ends, insulating-bushings adapted to insulate every of said bolts passing through one of the rail ends from said bolt-plates and means of maintaining the rail ends from contact with each other.

2. An insulated-rail joint comprising two opposite bolt-plates extending across the joint, one or both provided with an integral spike-plate, two insulating-blocks extending across the joint one on each side of the rail ends and between them and the corresponding bolt-plate, a plurality of bolts extending through the bolt-plates, insulating-blocks and rail ends, insulating-bushings adapted to insulate every of said bolts passing through one of the rail ends from said bolt-plates and means of maintaining the rail ends from contact with each other.

3. An insulated-rail joint comprising two opposite bolt-plates extending across the joint, one or both provided with an integral spike-plate having the part thereof opposite the part of the bolt-plate at which the rail ends are joined formed so as to be in substantially the same vertical plane with said bolt-plate, two insulating-blocks extending across the joint one on each side of the rail ends and between them and the corresponding bolt-plate, a plurality of bolts extending through the bolt-plates, insulating-blocks, and rail ends, insulating-bushings adapted to insulate every of said bolts passing through one of the rail ends from said bolt-plates, and means of maintaining the rail ends from contact with each other.

708,850. **INSULATED-RAIL JOINT.** GEORGE L. HALL, Brooklyn, N. Y. Filed Apr. 3, 1902. Serial No. 101,867. (No model.)



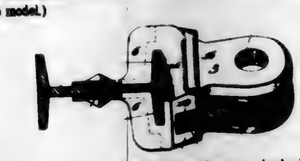
Claim.—1. An insulated-rail joint comprising a rail-chair having a bridge-plate and a bolt-plate, said bridge-plate being provided with additional metal at one end thereof, insulating material between one of the rail ends and said bridge-plate, a metal band separated from the chair and opposing said bolt-plate and extending across the joint, two insulating-blocks, one between said bolt-plate and the rail ends and the other between said band and the rail ends and both extending across the joint, a plurality of bolts extending through the bolt-plate, insulating-blocks, rail ends, and band, insulating-bushings adapted to insulate every of said bolts passing through the rail end insulated from said bridge-plate from both said bolt-plate and said band, and means of maintaining the rail ends from contact with each other.

2. An insulated-rail joint comprising a rail-chair having a bridge-plate and a bolt-plate, said bridge-plate being provided with additional metal at one end thereof, insulating material between one of the rail ends and said bridge-plate, means of holding said insulating material in proper position on said bridge-plate, a metal band separated from the chair and opposing said bolt-plate and extending across the joint, two insulating-blocks, one between said bolt-plate and the rail ends and the other between said band and the rail ends and both extending across the joint, a plurality of bolts extending through the bolt-plate, insulating-blocks, rail ends, and band, insulating-bushings adapted to insulate every of said bolts passing through the rail end insulated from said bridge-plate from both said bolt-plate and said band, and means of maintaining the rail ends from contact with each other.

708,851. **RAIL-JOINT.** JOHN E. HAMMOND, Sullivan, Ind., assignor of one-half to Wm. E. Aydelotte, Sullivan, Ind. Filed Oct. 2, 1901. Serial No. 77,484. (No model.)

Claim.—In a rail-joint, the combination with the meeting ends of railroad rails; of the fish-plates having pairs of arms with extensions at right angles therewith slidably connected one within the other so that the bases of the meeting ends of the rails will rest centrally on the middle extensions of the plates, the sides of the plates being adapted to abut against the outer edges of the bases of the rails, said plates being also provided with inwardly-projecting portions which overlap and form flush joints with the opposite upper surfaces of the bases of the rails, and said inwardly-projecting portions extending vertically upward on opposite sides of the webs of the rails and secured flush therewith, whereby the bottoms, side edges and upper portions of the bases of the rails and the webs thereof are wholly inclosed by the construction of said fish-plates, thereby forming a rigid joint and preventing the fish-plates and rails from moving either longitudinally or laterally, substantially as specified.

708,852. **BRAKE-BEAM FULCRUM.** PHILIP T. HANDIGES, St. Louis, Mo., assignor of one-half to Damascus Brake Beam Company, St. Louis, Mo., a Corporation. Filed Jan. 11, 1902. Serial No. 89,236. (No model.)



Claim.—1. As a new article of manufacture, a brake-beam fulcrum comprising a pair of socket clamp members, and a jaw seated and held within said members, substantially as described.

2. The combination with a brake-beam, of a jaw and a pair of socket clamp members interlockingly engaged and adapted to hold said jaw between them, substantially as described.

3. A brake-beam fulcrum comprising a pair of socket clamp members grooved to fit over the flanges of a brake-beam, and having forwardly-extending wings; and a jaw seated and held between said wings, substantially as described.

4. A brake-beam fulcrum comprising a pair of socket clamp members grooved to fit the flanges of a brake-beam, and having forwardly-projecting wings, mating flanges carried by said wings adapted to abut against each other, and a jaw seated and held between said wings, substantially as described.

5. A brake-beam fulcrum comprising a pair of socket clamp members having a body portion adapted to fit the brake-beam, wings projecting from said body, bosses carried by said wings, and a jaw positioned between said wings and having recesses adapted to receive said bosses, substantially as described.

6. A brake-beam fulcrum comprising a pair of socket clamp members having a grooved body portion adapted to fit the flanges of the brake beam, wings projecting obliquely from said body portion, flanges projecting from each of said wings having tongues adapted to abut against the tongues of the mating socket clamp members, bosses located on the inside faces of said wings, and a jaw seated between said wings having recesses adapted to receive said bosses, substantially as described.

708,853. **COMPOSITION OF FIREPROOF WALL-PLASTER.** CHARLES R. HARRIS and CHRISTOPHER C. BARRICK, Los Angeles, Cal. Filed Feb. 13, 1902. Serial No. 93,962. (No specimens.)

Claim.—1. The herein-described composition of matter, consisting of clay, calcined plaster, cement, asbestos fiber and glue, substantially as described and for the purpose specified.

2. A dry powder for plaster consisting of clay, calcined plaster, cement, asbestos fiber and glue, in substantially the proportions stated.

3. A dry powder for plaster consisting of clay, calcined plaster, cement, asbestos fiber and glue in substantially the proportions stated and coloring-matter.

708,854. **FIREPROOF WALL-PLASTER.** CHARLES R. HARRIS and CHRISTOPHER C. BARRICK, Los Angeles, Cal. Filed Feb. 27, 1902. Serial No. 96,941. (No specimens.)

Claim.—1. The herein-described composition of matter, consisting of clay, calcined plaster, sand, cement, asbestos and glue, substantially as and for the purpose specified.

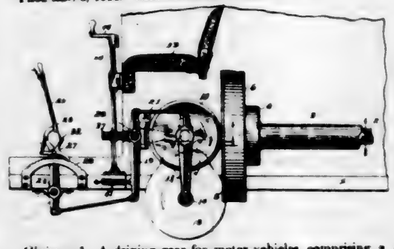
2. A new article of manufacture consisting of a dry composition for plaster in powdered form and consisting of clay, calcined plaster, sand, cement, asbestos and glue in substantially the proportions stated.

708,855. **COMBINED POCKET RULE, SQUARE, COMPASSES, AND COMB.** CHARLES P. HARTLEY, Washington, D. C. Filed June 2, 1902. Serial No. 109,973. (No model.)

Claim.—1. A device of the class set forth, having teeth at one side, an opening in one extremity in alinement with the inner end walls of the spaces between the teeth, a straight edge at the side opposite that having the teeth, and scale-marks on opposite faces of the portion of the device from which the teeth extend, said scale-marks extending inwardly from the said straight edge.

2. A device of the class set forth having teeth at one side projecting from a back formed with a straight edge, the said back having scale-marks on opposite sides thereof and the teeth terminating at a distance from one end of the device to provide a square member which has an opening at the center thereof.

708,856. **COMBINED DRIVING-GEAR AND BRAKE FOR MOTOR-VEHICLES.** HERBERT H. HENSHEIM, St. Louis, Mo., assignor to International Motor Company, St. Louis, Mo., a Corporation of Missouri. Filed Apr. 8, 1901. Serial No. 54,964. (No model.)



Claim.—1. A driving-gear for motor-vehicles comprising a main operating-shaft, a friction-wheel at one end thereof, a shaft 14, upwardly-extending arms pivoted to the shaft 14, a friction-disk supported between the arms and adapted to engage the friction-wheel, a shaft 20, rock-levers pivoted to the shaft 20 and connections 21 between the upper end of the pivoted arms and the upper ends of the rock-levers, and means for operating the rock-levers to throw the friction-disk into and out of engagement with the friction-wheel, substantially as described.

2. In combination with motor-driven instrumentalities, speed-changing devices in communication therewith comprising opposing friction-disks, means for shifting one of the disks across the face of the other, a brake carried by the disk-shifting means, and means for swinging the shiftable disk toward and from the other disk and into engagement with the brake; substantially as described.

3. In combination with motor-driven instrumentalities, speed-changing devices in communication therewith comprising opposing disks, means for shifting one of the disks across the face of the other, a brake movable with said shiftable disk, and means for causing a frictional engagement between said shiftable disk and the brake, substantially as described.

4. A combined driving-gear and brake for motor-vehicles, comprising a revolvable friction-plate, a friction-wheel mounted to engage said friction-plate and shiftable across the face thereof, a brake shiftable with the friction-wheel, and means for retracting said friction-wheel from engagement with said friction-plate and forcing the same into contact with said brake; substantially as described.

5. A combined driving-gear and brake for motor-vehicles, comprising a revolvable friction-plate, a friction-wheel mounted to engage said friction-plate and shiftable across the face thereof, a brake shiftable with the friction-wheel, and means operating by its initial movement to retract the friction-wheel from engagement with the friction-plate, and by further movement to force said friction-wheel into contact with the brake; substantially as described.

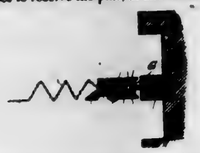
6. A combined driving-gear and brake for motor-vehicles, constructed with a friction-plate adapted to revolve continuously in a given direction, a friction-wheel mounted to engage said friction-plate on either side of the center of said plate, a brake for said friction-wheel and adapted to be shifted therewith, and a ball-bearing for receiving the thrust of said friction-plate, substantially as specified.

7. A combined driving-gear and brake for motor-vehicles, having a friction-wheel 10 provided with a peripheral friction-surface 35, a continuously-revolving friction-plate, means for urging said friction-wheel into contact with said friction-plate, a toothed rack for moving said friction-wheel nearer to or farther from the periphery of said friction-plate, and a brake carried by said toothed rack and adapted to engage said frictional surface of said friction-wheel, substantially as specified.

8. In a driving-gear for motor-vehicles, devices for changing the speed of the vehicle, a combined hand and foot lever for controlling said devices, a toothed sector, a pawl having an arm to be engaged by the operator's foot, an auxiliary handle on said lever, and a connection between said auxiliary handle and said pawl, substantially as specified.

708,857. **WINDOW-SCREEN.** ELDRIDGE G. HOLDEN, Philadelphia, Pa. Filed Nov. 21, 1901. Serial No. 83,113. (No model.)

Claim.—1. In a window-screen, a wire-cloth, a side frame comprising two strips between which the screen is clamped, one of said strips having two beveled edges, the other strip having a beveled edge opposite to that of the beveled outer edge of the other strip, pins extending transversely of the groove formed by the beveled edges of the strips, and hooks having recesses to receive the pins, as and for the purpose described.



2. The combination in a window-screen, a wire-cloth, of side frames attached to each side edge of the wire-cloth, a vertical groove formed in the outer edge of each of said side frames, pins extending through the side frames and across the groove, right-angle screws secured in the window-casing, said screws having a portion extending upward parallel with the window-casing, behind which the pins are adapted to be held when the screen is in position, vertical folds or convolutions formed in the wire-cloth, and means for locking the screen in place whereby the spring of the vertical folds or convolutions will hold the screen locked in position, as and for the purpose specified.

3. In combination in a window-screen, a wire-cloth, of side frames attached to each side edge of the wire-cloth, a vertical groove formed in the outer edge of each of the side frames, pins extending through the side frames and across the groove, right-angle screws secured in the window-casing, said screws having a portion extending upward parallel with the window-casing behind which the pins are adapted to be held when the screen is in position, notches formed in this upward parallel portion of the right-angle screws, in which the pins are adapted to lie so as to lock the screen in position, and vertical folds or convolutions formed in the wire-cloth, said folds or convolutions adapted to exert a spring-pressure to hold the pins within the notches of the right-angle screws, as and for the purpose specified.

708,358. **MECHANICAL TOY.** ALEXANDER HOSRATH, Reynolds, Ind. Ter. Filed May 19, 1902. Serial No. 107,991. (No model.)

Claim.—1. A mechanical toy, comprising a suitable casing having a doorway, a revolvable carrier within said casing, a series of objects, and means for slidably mounting said objects on said carrier.

2. A mechanical toy comprising a suitable casing, a carrier revolubly mounted therein and having radial arms, a series of objects, and means carrying said objects and fitted to the carrier to rotate therewith within the casing and capable of slidable movement on the arms of said carrier.

3. A mechanical toy comprising a suitable casing, a revolubly carrier having radial guides, objects having supporting means slidably mounted on the guides of the carrier, and means for limiting the radial movements of the objects with respect to the carrier.

4. A mechanical toy, comprising a suitable casing having a doorway, a rotary carrier provided with two series of radial arms, stops on said arms at different distances from the axis of rotation of the carrier, and objects having supporting means slidably mounted on said arms and limited in their radial movements by the stops.

5. A mechanical toy, comprising a suitable casing having a doorway, a revolubly carrier within said casing and provided with arms, slotted sleeves slidably fitted to arms of the carrier, stops passing through said slots of the sleeve and restraining the sleeves from axial displacement on said carrier, and means for rotating said carrier.

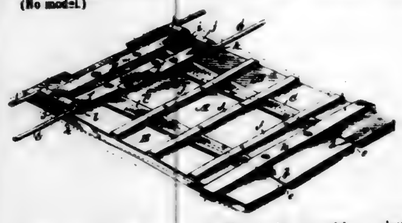
708,359. **HARNESS-BUCKLE.** CARROLL H. JOHNSON and LUTHER H. CLEMENTS, Lake City, Mo. Filed Feb. 7, 1902. Serial No. 93,055. (No model.)

Claim.—1. In a buckle, an integral frame comprising side cheeks connected by four cross-pieces, and a hollow wedge-block adapted to lie within said frame, said wedge-block having two inclined outer faces, and a transverse rib between said faces, substantially as described.

2. In a buckle, an integral frame comprising side cheeks connected by four cross-pieces, and a hollow wedge-block adapted to lie within said frame, said wedge-block having two inclined outer faces, and a transverse rib between said faces, one of said faces having a recess and a shoulder 14 therein, substantially as described.

3. In a buckle, an integral frame comprising side cheeks connected by two outer cross-pieces and three inner cross-pieces the intermediate inner cross-piece having a projection on its inner face, and a hollow substantially triangular wedge-block adapted to lie within said frame, said wedge-block having two inclined outer faces and a transverse rib between said faces, one of said faces being recessed to form a shoulder, as 14, substantially as described.

708,860. **LOADING OR UNLOADING DEVICE.** MILLARD F. JOHNSON, Plum River, Ill. Filed June 27, 1902. Serial No. 113,526. (No model.)



Claim.—1. A loading and unloading device comprising a platform consisting of a central stationary section and pivoted side sections adapted to be extended to increase the width of the platform, substantially as and for the purpose set forth.

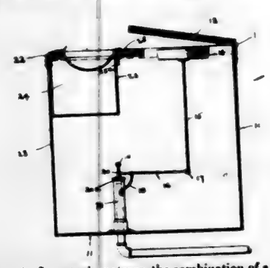
2. A loading and unloading device comprising a platform consisting of a central stationary section and pivoted side sections, said sections being beveled upon their inner or adjoining edges, substantially as and for the purpose described.

3. A loading and unloading device comprising a platform consisting of a central stationary section and pivoted side sections, and guard-plates secured to the central stationary section and overlapping the pivoted side sections, substantially as and for the purpose specified.

4. A loading and unloading device comprising a platform consisting of a central stationary section and pivoted side sections, and pivoted or hinged keepers provided with suitable handles, substantially as and for the purpose set forth.

5. A loading and unloading device comprising a platform consisting of a central stationary section and pivoted side sections, and hinged or pivoted handles provided with bolts adapted to abut against the edges of the pivoted sections to hold them closed and to engage bolt-holes therein to hold them extended, substantially as and for the purpose specified.

708,861. **STOCK-WATERER.** JOHN W. KELLEY and CYRUS W. ADKINS, Hastings, Iowa. Filed Oct. 31, 1901. Serial No. 80,614. (No model.)

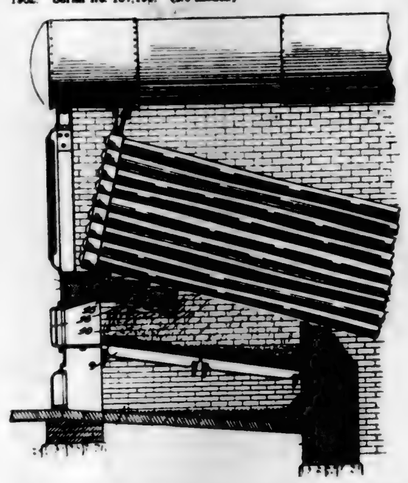


Claim.—1. In a stock-waterer, the combination of a water-tank, and open-topped trough hinged to the tank having one or more openings in its sides, and having a solid bottom mounted in the tank to project below the water-level thereof, and a grating hinged to the tank over the trough partially below the water-level thereof for the purposes stated.

2. In a stock-waterer, a combination of a water-tank provided with a supply-pipe, a stopper in said supply-pipe, means for automatically removing and inserting said stopper into the supply-pipe, a trough in the upper corner of the tank and hinged to it, one or more openings in its interior side, a grating protector for the trough partially below its water-level and hinged to the tank, and a cover for that portion of the tank not protected by the grating and trough for the purposes stated.

3. In a stock-waterer, a combination of a tank having a water-supply pipe, a float 14, a rod 15 connected therewith, a rod 16 pivotally connected with the rod 15, a rod 20 having a stopper on its lower end pivotally attached to the rod 16, a brace 18 attached to the pipe 21 and pivotally attached to the rod 16, which float, rods and stopper are to act in conjunction with each other in regulating the supply-water, a cover 12, attached to the tank and in the upper front portion of the tank, a trough, with one or more openings in the side thereof, to permit the flow of the water into it, hinged to the end of the tank 23, a handle on said trough, a grating hinged to the tank directly over the trough having the side pieces 28, the end pieces 29 and the metal cross-bars 30 partially extending into the trough and below the water-level in it for the purposes stated.

708,362. **SMOKE-CONSUMER.** JOSEPH P. KELLY, St. Louis, Mo., assignor of one-half to Ora E. Overpeck, St. Louis, Mo. Filed May 13, 1902. Serial No. 107,199. (No model.)



Claim.—1. The combination with a boiler-furnace, having a fire-box, side walls extending upwardly from the fire-box, and a front wall having a fuel-opening leading to the fire-box; of a baffle-plate extending backwardly from the front wall above the fuel-opening; said baffle-plate consisting of I-beams having their forward ends embedded into the front wall and extending backwardly, and tile interlocked with the I-beams so as to protect the I-beams from the heat, and so as to be supported by the I-beams; substantially as specified.

2. The combination with a boiler-furnace having a fire-box; of a baffle-plate extending backwardly from the front wall above the grate, said baffle-plate consisting of beams supported by the front wall and the side walls; and tile having grooves in their ends to receive said beams, thereby covering the beams with the tile and supporting the tile, the distance between the end faces of said grooves being greater than the vertical dimension of the tile, and greater than the horizontal dimension longitudinally of the beams, substantially as specified.

708,363. **ART OF ENAMELING METAL WARE.** GEORGE W. KITCHEN, Newark, N. J. Filed Dec. 5, 1901. Serial No. 84,773. (No specimens.)

Claim.—1. The herein-described process of enameling which consists first, in coating the cleaned article with a thin layer of cohesive and non-corrosive metal, then applying an enamel which upon heating will cooct with and only partially oxidize and permeate the coating metal.

2. The herein-described process of enameling which consists first, in coating the cleaned article with a thin layer of cohesive and non-corrosive metal, then applying an enamel composed of feldspar, borax, soda-ash, saltpeter, fluor-spar, cryolite and a coloring-matter in such proportions that such enamel will upon heating partially oxidize and permeate the metal layer, and finally heating to flux and set the enamel.

4. The herein-described process of enameling which consists in coating an iron or steel body with a thin layer of cohesive and non-corrosive metal, then applying an enamel which upon heating will cooct with only the outer surface of the coating metal.

5. The herein-described process of enameling which consists first, in coating the cleaned article with a thin layer of cohesive and non-corrosive metal, then applying an enamel composed of fusible materials and a coloring-matter, and which enamel upon heating will set free an acid which will cooct with and only partially oxidize and permeate the non-corrosive coating, and act upon the coloring-matter, to produce in the finished article a surface having a high gloss and a wavy or foliated appearance, and finally heating to flux and set the enamel.

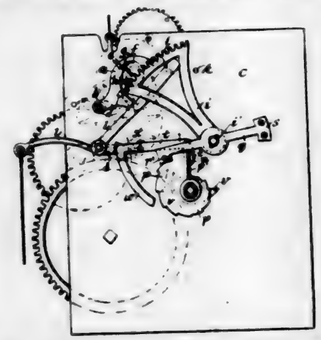
6. The herein-described process of enameling which consists first, in coating the cleaned article with a thin layer of cohesive and non-corrosive metal, then applying an enamel which upon heating will develop boracic acid sufficient in quantity to only partially oxidize and permeate the applied metal coating, and finally heating to flux and set the enamel.

7. As a new article of manufacture, a metallic vessel or other article carrying a superposed film of another metal partially oxidized and permeated in spots, and upon said film an enamel or glaze.

8. As a new article of manufacture, a vessel or other article having a base of a corrosive metal, an enameled surface, and a layer of non-corrosive metal, partially oxidized and permeated in spots, interposed between the base and the enamel.

9. As a new article of manufacture, a metallic vessel or other article having its entire surface, pores, indentations and inequalities covered and filled with a thin cohesive layer of metal, said layer of metal partially oxidized and permeated in spots, and an enamel coating situated over said metal layer.

708,364. **REPEATING CLOCK.** JAKOB KIESELS, Schwenningen, Germany. Filed June 3, 1901. Serial No. 62,965. (No model.)



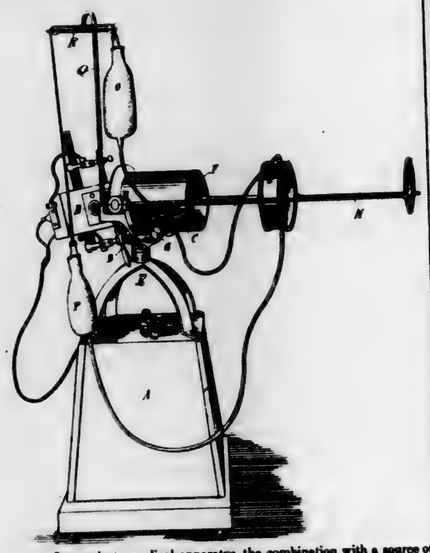
Claim.—1. In a repeating clock, the combination with the segment, of an arresting-lever, adapted to arrest the movement of the segment, and a cam controlling the striking mechanism and engaging said lever.

2. In a repeating clock, the combination with the segment, of a forked arresting-lever, and a cam forming a part of the striking mechanism and arranged within the fork of said lever provided on one side with a pin adapted to engage the lever and on the other side with a pin adapted to engage the segment, the said lever being provided with a pin adapted to engage the segment and with a second pin adapted to engage the shoulder of the said cam.

3. In a repeating clock, the combination of the segment, the repeating lever, an arresting-lever bearing on the repeating lever, and adapted to engage the segment, and a cam forming a part of the striking mechanism and adapted to engage both the segment and the arresting-lever.

708,365. **ELECTROMEDICAL APPLIANCE.** JOHN H. KLOBE and ARTHUR T. KLOBE, New York, N. Y. Filed Aug. 26, 1901. Serial No. 73,262. (No model.)

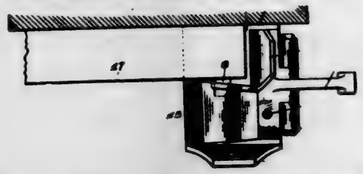
Claim.—1. In an electromedical apparatus, the combination with a source of light, of means for absorbing heat-rays from the light comprising a cell having transparent walls, ports in said cell, a receptacle for a heat-absorbing fluid, a flexible connection between such receptacle and one of said ports, a second receptacle, and a flexible connection between said second receptacle and another of said ports, said receptacles being adapted to be raised and lowered alternately above and below said cell, whereby a constant flow of the heat-absorbing fluid through the cell may be produced, as set forth.



2. In an electromedical apparatus, the combination with a source of light, of condensing-lenses forming the sides of a cell, ports in said cell, a receptacle for a heat-absorbing fluid, a flexible connection between said receptacle and one of said ports, a second receptacle, and a flexible connection between said second receptacle and another of said ports, said receptacles being adapted to be raised and lowered alternately above and below the said cell, whereby a constant flow of the heat-absorbing fluid through the cell may be produced, as set forth.

3. In an electromedical apparatus the combination of a hood or casing capable of universal adjustment, an arc-lamp, a focusing-lens, and condensing-lenses forming the sides of a cell, ports in said cell, a receptacle for a heat-absorbing fluid, a flexible connection between said receptacle and one of said ports, a second receptacle, a flexible connection between said second receptacle and another of said ports, and means for raising and lowering said receptacles alternately above and below the said cell, whereby a constant flow of the heat-absorbing fluid through the cell may be produced, substantially as and for the purposes set forth.

708,366. CAR-DOOR FITTING. GREGORY KRYCOSKI and EDWARD A. LOWRIE, St. Louis, Mo., assignors of one-fourth to Stanislaw A. Czerniewski. Filed Apr. 17, 1902. Serial No. 103,304. (No model.)



Claim.—1. An improved car-door fitting comprising a fastening-plate adapted to be secured to the side of the car; a base-plate extending horizontally outwardly from the upper end of said fastening-plate; a guide-plate extending upwardly from the outer end of said base-plate and adapted to limit the outward motion of the car-door when the door is open; a hinge member extending backwardly from the base-plate; a second hinge member connected to the first hinge member; a stop-plate extending upwardly from the second hinge member and adapted to engage the rear side of the door, when the door is closed, to prevent the door from sliding open; and a second stop-plate extending forwardly from said second hinge member beside the first stop-plate and adapted to engage the outer face of the door when the door is closed and hold the door against the side of the car, substantially as specified.

2. An improved car-door fitting comprising a fastening-plate adapted to be secured to the side of the car; a base-plate extending horizontally outwardly from the upper end of said fastening-plate, and having a central opening; a guide-plate extending upwardly from the outer end of said base-plate and adapted to limit the outward motion of the car-door when the door is open; a hinge member extending backwardly from the base-plate; a second hinge member connected to the first hinge member; a stop-plate extending upwardly from the second hinge member and adapted to engage the rear side of the door, when the door is closed, to prevent the door from sliding open; a second stop-plate extending forwardly from said second hinge member beside the first stop-plate and adapted to engage the outer face of the door when the door is closed and hold the door against the side of the car; and a third stop extending backwardly from said second hinge member and adapted to pass upwardly through said central opening when the door is open and engage the inner face of the door to hold the door outwardly against said guide-plate and prevent the door from swinging inwardly against the face of the car, substantially as specified.

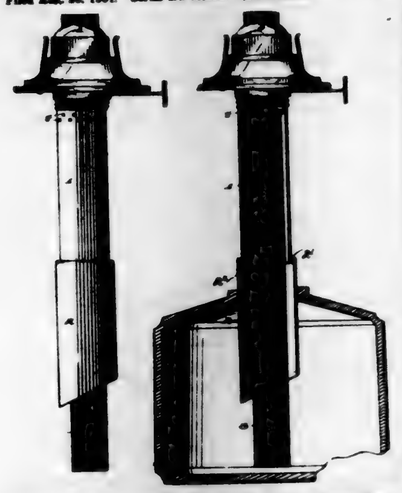
3. An improved car-door fitting comprising a fastening-plate adapted to be secured to the side of the car; a base-plate extending horizontally outwardly from the upper end of said fastening-plate, and having a central opening; a guide-plate extending upwardly from the outer end of said base-plate and adapted to limit the outward motion of the car-door when the door is open; a hinge member extending backwardly from the base-plate; a second hinge member connected to the first hinge member; a stop-plate extending upwardly from the second hinge member and adapted to engage the rear side of the door, when the door is closed, to prevent the door from sliding open; a second stop-plate extending forwardly from said second hinge member beside the first stop-plate and adapted to engage the outer face of the door when the door is closed and hold the door against the side of the car; a third stop extending backwardly from said second hinge member and adapted to pass upwardly through said central opening when the door is open and engage the inner face of the door to hold the door outwardly against said guide-plate and prevent the door from swinging inwardly against the face of the car; and a removable pin to be inserted through said second hinge member and through said base-plate to hold the first and second stops in position, substantially as specified.

708,367. CAR-DOOR FITTING. GREGORY KRYCOSKI and EDWARD A. LOWRIE, St. Louis, Mo., assignors of one-fourth to Stanislaw A. Czerniewski. Filed Apr. 17, 1902. Serial No. 103,305. (No model.)

Claim.—1. A car-door fitting comprising a fastening-plate adapted to be secured to the side of the car; a base-plate extending horizontally outwardly from the upper end of said fastening-plate; an outer guide-plate extending upwardly from the base; an inner guide-plate extending upwardly from the base; a stop-plate extending upwardly from the base and connecting the rear ends of the guide-plates; a spring-snap attached to the stop-plate in position to engage the door; there being a recess in the door to receive the snap and hold the door open; said stop-plate serving to limit the backward motion of the door; and said guide-plates serving to hold the door from swinging inwardly against the side of the car, and to hold the door from swinging outwardly, substantially as specified.

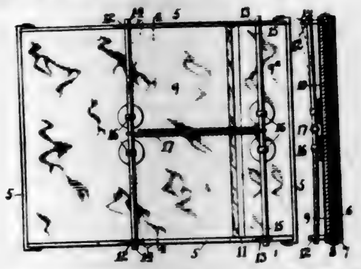
2. A car-door fitting comprising a fastening-plate adapted to be secured to the side of the car; a base-plate extending horizontally outwardly from the upper end of said fastening-plate; an outer guide-plate extending upwardly from the base; an inner guide-plate extending upwardly from the base; a stop-plate extending upwardly from the base and connecting the rear ends of the guide-plates; a spring-snap attached to the stop-plate in position to engage the door; there being a recess in the door to receive the snap and hold the door open; said stop-plate serving to limit the backward motion of the door, and said guide-plates serving to hold the door from swinging inwardly against the side of the car, and to hold the door from swinging outwardly; a recess-plate embedded into the car-door to receive the snap; and a handle on the snap for manually releasing the snap from the recess, substantially as specified.

708,368. LAMP-BURNER. FREDERIC LEHMANN, Allegheny, Pa. Filed Aug. 26, 1901. Serial No. 73,538. (No model.)



Claim.—In a lamp-burner, an integral sleeve of equal diameter throughout secured in the lamp, the edge of the upper extremity of said sleeve being bent inwardly to form an integral right-angular annular flange, an integral burner-tube of equal diameter throughout adapted for sliding movement in said sleeve, the edge of the lower extremity of said burner-tube being bent outwardly to form an integral right-angular flange for frictional engagement with the inner circumference of said sleeve, the periphery of the burner-tube being frictionally engaged by said flange of the sleeve, the burner-tube having a series of openings near the upper end thereof, and limited in its upward movement by engagement of its flange with the flange of the sleeve, the said burner-tube being exteriorly threaded at its upper end to receive the burner, the oil when the lamp is upset traveling through the interior of the sleeve and the burner and flowing through the said openings in the burner-tube, both of said flanges frictionally engaging and securing the inner circumference of the sleeve and the periphery of the burner-tube in any position the burner-tube assumes, substantially as described.

708,369. PHOTOGRAPHIC-PRINTING FRAME. WILLIAM H. LEWIS, Huntington, N. Y., assignor to James H. Smith, Chicago, Ill. Filed Dec. 15, 1900. Serial No. 39,968. (No model.)



Claim.—1. The combination with a frame, of a removable back composed of two members having a padded facing on the under sides and hinged together on their upper sides by a web of flexible light-proof material, and means for removably securing said back in said frame.

2. The combination of the frame 5; hinged back 9, 9ª; suitable clamps 14, 15 for securing the back, and the spring 17 for supporting the upper member of the back in inclined position, as described.

3. The combination of the frame 5; hinged back 9, 9ª; clamp-rods 14, 15; lugs 12, 13, and supporting-spring 17, substantially as and for the purposes described.

4. The combination with a frame, of a removable back composed of two members, having padded facings on their under sides, and hinged together on their upper sides by a web of flexible light-proof material, clamps for removably securing said back to said frame, and a spring for supporting one of said members in inclined position.

5. In photographic-printing frames the combination with a frame of a hinged back, composed of two members, each of such members being provided with spring clamp-rods, rigidly secured to the back thereof, and adapted to secure the back in the frame by springing the clamp-rods under suitable stationary lugs on the frame.

708,370. PHOTOGRAPHIC-PLATE HOLDER. WILLIAM H. LEWIS, Huntington, N. Y., assignor to James H. Smith, Chicago, Ill. Filed Dec. 15, 1900. Serial No. 39,967. (No model.)

Claim.—1. The combination with a plate-holder having the usual double slides between which is formed a closed chamber, of a hermetically-sealed flexible air-tube secured in said chamber between and adapted to cushion said slides, and a suitable fabric covering secured over said tube against which the slides bear.

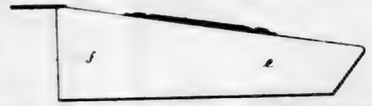
2. The combination with a plate-holder, having the usual slide, of a closed chamber in the head of said holder, of a tubular cushion positioned in said chamber, said cushion being closed at both ends by heads and a suitable fabric covering secured over said tube and adapted to be pressed by said tube against said slide.

3. In a plate-holder for photographic cameras, the combination of a suitable frame 4 a sliding shutter 7 and a packing device consisting of a tube 9 of elastic material, hermetically closed at its ends so as to confine an inclosed body of air and inserted in a recess in the frame in position to be compressed by contact with the sliding shutter and to form a tight joint with the inner surface thereof so as to exclude light, substantially as described.

4. The combination of the frame 4, sliding shutter 7, the packing device consisting of a hermetically-closed tube 9 of elastic material and a covering-strip 10 for said tube, substantially as, and for the purposes described.

5. The combination of the frame 4, partition 5, shutters 7, 7, and a hermetically-sealed elastic packing-tube 9 interposed between the opposed surfaces of the shutters 7, 7, substantially as and for the purposes set forth.

708,371. BED-PAN COVER. HELEN C. LIPPS, Boston, Mass. Filed June 12, 1902. Serial No. 111,257. (No model.)



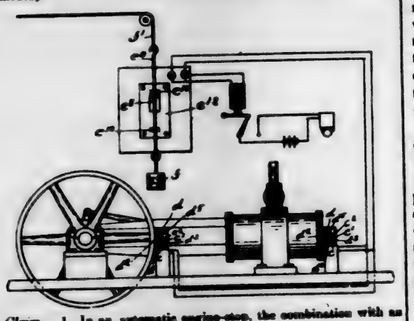
Claim.—1. As a new article of manufacture a bed-pan cover comprising a top and a skirt surrounding the top and joining the same at the edge thereof, the top being inclined to the free edge of the skirt and one end of the skirt being at an obtuse angle to the free edge of the skirt and the other end at a right angle thereto, substantially as set forth.

2. As a new article of manufacture, a bed-pan cover comprising a top and a skirt surrounding the top and joining the same at the edge thereof, the top being inclined to the free edge of the skirt and one end of the skirt being at an obtuse angle to the free edge of the skirt, and the other end at a right angle thereto, and the cover at one end being semi-elliptical and at the other end being tapering so as to provide for the change in shape of the skirt from the obtuse angle at one end to the right angle at the other end in causing the bed-pan cover to surround and conform to the outline of the bed-pan, substantially as set forth.

3. As a new article of manufacture, a bed-pan cover, comprising a top and a skirt surrounding the top and joining the same at the edge thereof, the top being inclined to the free edge of the skirt and one end of the skirt being at an obtuse angle to the free edge of the skirt and the other end at a right angle thereto, and a handle upon the cover for lifting and carrying the same, and a perforated flap h at one end of the cover for suspending the same from a fastening device, substantially as set forth.

4. As a new article of manufacture, a bed-pan cover of india-rubber or similar material, comprising a top and a skirt surrounding the top and joining the same at the edge thereof, the top being inclined to the free edge of the skirt and one end of the skirt being at an obtuse angle to the free edge of the skirt and the other end at a right angle thereto, substantially as set forth.

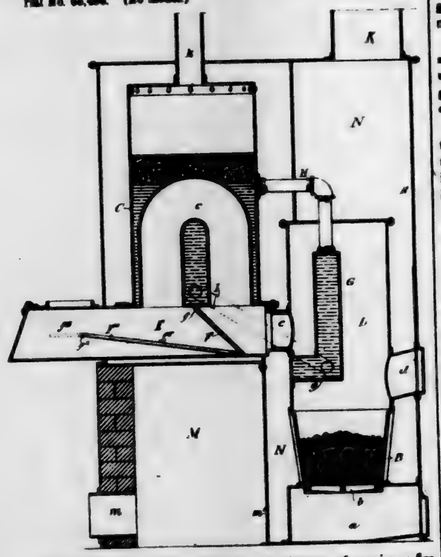
708,372. AUTOMATIC ENGINE-STOP. NATHANIEL C. LOCKE, Salem, Mass., assignor to Locke Regulator Company, Salem, Mass., a Corporation of Maine. Filed Jan. 2, 1902. Serial No. 88,166. (No model.)



Claim.—1. In an automatic engine-stop, the combination with an engine, means for shutting off steam to the engine comprising an electromechanical actuating mechanism and a circuit therefor, of a circuit-operating device for said circuit located close to said engine and arranged to be operated by contact with a distorted part thereof, substantially as described.

2. In an automatic engine-stop, the combination with an engine, means for shutting off steam to the engine comprising electromechanical actuating mechanism and a circuit therefor, and an alarm also operated by said circuit, of a circuit-operating device for said circuit located close to said engine, and arranged to be operated by contact with a distorted part thereof, substantially as described.

708,378. COMBINED HOT-AIR AND WATER OR STEAM HEATER. ARBAN L. LOGAN, Montalare, Pa. Filed July 16, 1901. Serial No. 66,696. (No model.)



Claim.—1. The combination in a heating-furnace, of a casing, a fire-pot, a combustion-chamber mounted above the fire-pot, a water-receptacle within the combustion-chamber and forming a partition therefor, a horizontal flue communicating with the combustion-chamber, said partition being so formed that the products of combustion will have an indirect passage to the flue, a U-shaped flue communicating with the horizontal flue, a damper within the horizontal flue between the inlet and outlet of the U-shaped flue, and means for operating the damper from the outside of the furnace, substantially as described.

2. The combination in a combined heating-furnace, of a casing, a fire-pot, a combustion-chamber mounted on the fire-pot within the casing, a water-receptacle mounted within the combustion-chamber and forming a partition for the combustion-chamber, so that the products of combustion will have an indirect passage therethrough, a horizontal flue communicating with the combustion-chamber on one side of the partition, a water chamber or boiler mounted above the horizontal flue, a flue within the water-chamber and communicating with the horizontal flue, pipes forming communication between the upper portion of the water-receptacle and the water-chamber, and a pipe forming communication between the lower portion of the water-receptacle and the lower portion of the water-chamber, substantially as described.

3. The combination in a heating-furnace, of a casing, a fire-pot, a cylindrical combustion-chamber mounted above the fire-pot, a transverse water-receptacle mounted within the combustion-chamber and forming a partition, the space in front of the partition communicating with the fire-pot, a horizontal flue communicating with the space back of the partition so that the products of combustion will pass over the water-receptacle and down to the flue, a damper in said flue, means for operating said damper, a water receptacle or boiler mounted above the flue and having a passage therein for the products of combustion, the damper being arranged to close the said passage, substantially as described.

708,374. SPINNING-SPINDLE. CHARLES E. LOVEJOY, Lowell, Mass., assignor to Sawyer Spindle Company, of Maine. Filed Dec. 23, 1901. Serial No. 86,940. (No model.)

Claim.—1. In a spinning-spindle, a supporting-case, an oil-snout having an upright inlet portion, enlarged at its upper end to form a raised guard extended around the top of the inlet-opening, and a cover pivotally mounted on the guard having a body portion to enter the guard.

2. In a spinning-spindle, a supporting-case provided with an oil-snout, having an upright inlet portion, a flange on the top of the latter, upturned and extended around the top of said inlet portion, to form a guard-wall around the entrance of the inlet, and a cover for the inlet pivotally mounted on the inwardly-extended portions of said ribs.

3. In a spinning-spindle, a supporting-case provided with an upturned oil-snout having an enlarged top to form a cup-like guard around the entrance of the oil-inlet, a pivotally-mounted cover on the snout, having its body portion adapted to snugly enter said guard and close the inlet, and an overhanging finger-piece on the cover.

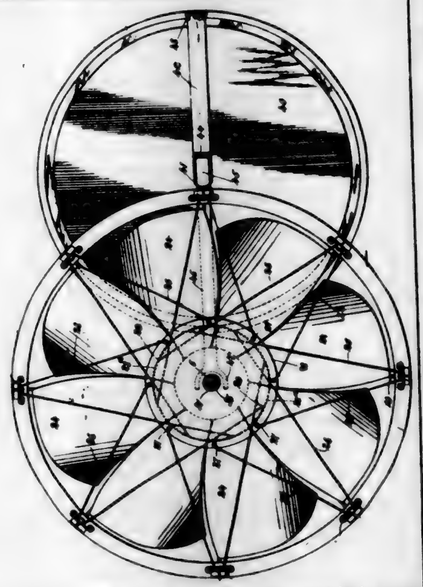
708,375. WINDMILL. THEODORE W. LOWE, Stockton, Cal. Filed Mar. 15, 1902. Serial No. 98,330. (No model.)

Claim.—1. A device of the class described, comprising a shaft, a rim having arms attached to the shaft, a series of elastic vanes clamped to the shaft and each having a side edge portion thereof attached to an arm of the rim, said vanes being normally held by the inherent elasticity thereof in the plane of the rim and the other side edges of the vanes being free or unconfined, and means connected with said free edges of the vanes to positively displace them and to vary the active area of the vanes by bending or deflecting the same with relation to the plane of the rim.

2. A device of the class described, comprising a shaft, a carrier-ring mounted fast on the shaft to rotate therewith, a series of pliable vanes clamped to the shaft and each having one edge confined on the carrier-ring, a semirotary element loosely sleeved on the shaft, and means for imparting a slidable and rotary movement to said element, and connections between the adjusting element, the carrier-ring and the free edges of the pliable vanes.

3. A device of the class described, comprising a shaft, a rim having arms attached to the shaft, a series of elastic vanes attached to the shaft and to arms of the rim along one side edge of each vane, said vanes being normally held by their inherent elasticity in the plane of the rim, and the other side edges of the vanes being unconfined, a slidable and semirotary element having connection with the free edges of said vanes, a retractor opposing the slidable movement of said element in one direction only, and means for imparting slidable movement to said element.

4. A device of the class described, comprising a shaft, a rim having arms attached to the shaft, a series of elastic vanes attached to said shaft and to arms of the rim along one side edge of each vane, said vanes being normally held by their inherent elasticity in the plane of the rim, and the other side edges of the vanes being unconfined, a slidable disk having operative connection with the shaft and adapted to turn thereon simultaneously with its slidable movement, and individual connections between said disk and the free or unconfined edges of said vanes, whereby the movement of the disk in one direction serves to positively displace the elastic vanes with relation to the plane of the rim.



5. A device of the class described, comprising a shaft having a cam-slotted extremity, a rim having arms attached to the shaft, a series of elastic vanes attached to said shaft and to arms of the rim along one side edge of each vane, said vanes being normally held by their inherent elasticity in the plane of the rim, and the other side edges of said vanes being unconfined, a slidable and semirotary element loosely fitted on said shaft and having means arranged to travel in the cam-slotted portion thereof, a spring opposing the slidable movement of said element in one direction only, and individual connections between the slidable element and the free or unconfined edges of said vanes.

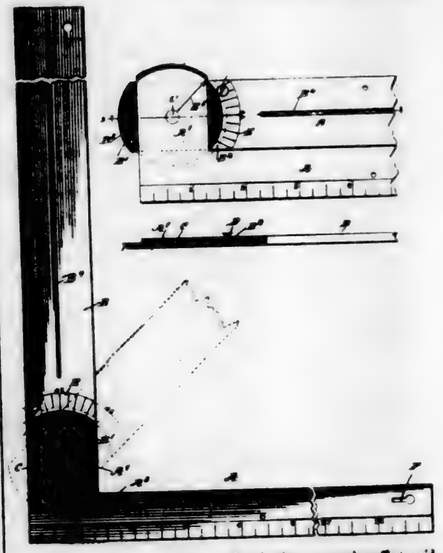
6. A device of the class described, comprising a shaft, a carrier-ring made fast with the shaft and having guide devices disposed in oblique positions, a series of vanes made fast with the shaft and connected with the carrier-ring, a semiturning element slidably mounted on the shaft, and cables attached to the vanes, reeved around the guide devices and fastened to the semiturning element.

7. A device of the class described, comprising a shaft having an intermediate threaded portion and a cam-slotted extremity, a hub secured to said shaft, a rim united by a series of rods to said hub, a nut screwed on said threaded portion of the shaft, a sleeve fitted loosely on the shaft and seated against said nut, a loose bearing-collar inclosing said sleeve and also seated against the nut, a disk provided with a sleeve which is loosely fitted on the shaft and is arranged to slide within the first-named sleeve, a spring surrounding the two sleeves and having one end seated against the bearing-collar and its other end seated against said disk, a pin attached to the sleeve of the disk and extending through the cam-slotted extremity of the shaft, a series of vanes attached to the hub and to the arms of the rim, and individual connections between the disk and the unconfined edges of said vanes.

708,376. SQUARE. AXEL L. LUNDGREN, Pullman, Ill. Filed Feb. 14, 1902. Serial No. 94,080. (No model.)

Claim.—1. A square, comprising two members pivoted together, one member being provided with an angular offset having a segmental and beveled end, and with a segmental undercut or bearing, and the other member having its pivoted end segmental and beveled and provided with a segmental undercut, as set forth.

2. A square, comprising two members pivoted together, the pivotal ends of the members being reduced at their inner contacting faces, one member being provided with a segmental and beveled end and with a segmental undercut, and the other member having its pivoted end segmental and beveled and provided with a segmental undercut, as set forth.



3. A square, comprising a member having an angular offset, said offset being reduced in thickness and having a segmental and beveled end, a segmental undercut and an index, and a longitudinally-slotted member having one end reduced in thickness and pivoted to the angular offset of the first member, the reduced portion having a segmental and beveled end and provided with a segmental undercut and with a graduation adjacent to said undercut, as set forth.

4. A square comprising a member provided at one end with an angular offset having a beveled end and an undercut at its opposite end, the said offset being provided with an index, and a longitudinally-slotted member longer than the first member and having one end pivoted thereto, said slotted member having its end beveled and provided with an undercut opposite the beveled end and a graduation at said undercut, the said members being provided with stops to limit the swinging movement thereof, as set forth.

5. A square, comprising two members of unequal length and pivoted together, each member being provided at its free end with a keyhole-slot, and points of unequal length and provided with headed pins for engaging the slots of the members, as set forth.

708,377. CORN-SHOCK CARRIER. NEWTON W. LYON, Brighton, Iowa. Filed May 28, 1902. Serial No. 109,310. (No model.)

Claim.—1. A shock-carrier, comprising a suitable platform, a winding-shaft mounted on said platform, impalement-stems projecting from the platform and disposed near said shaft, and a binding cable or chain adapted to be coiled on the shaft and to cooperate with the impalement-stems in holding a shock on the platform.

2. A shock-carrier, comprising a suitable platform, a winding-shaft mounted thereon, a series of impalement-stems projecting from the platform and disposed in a position parallel to the shaft, a binding cable or chain detachably connected to said shaft and arranged to be wound thereon, said cable and chain being disposed in cooperative relation to the im-

palement-stems, and means for rotating the shaft with a step-by-step movement.

3. A shock-carrier, comprising a suitable platform, a winding-shaft mounted thereon and provided with a feed-ratchet, a series of impalement-stems fixed to said platform, a binding cable or chain detachably connected with the shaft and adapted to be wound thereon, said cable or chain being disposed in cooperative relation to the impalement-stems, a lever having a feed-pawl adapted for engagement with the ratchet of said shaft, and a locking-pawl also arranged to engage with said ratchet.

4. A shock carrier or vehicle, comprising a suitable platform, a binding cable or chain, and impaling devices attached to the platform in cooperative relation to the binding devices.

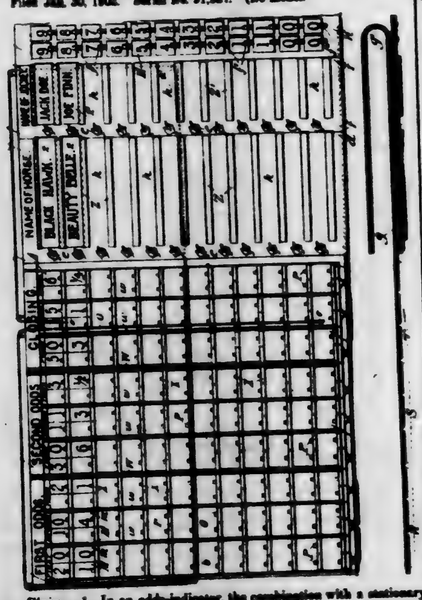
5. A shock carrier or vehicle, comprising a platform having a front runner, rear runners located a short distance in advance of the rear end of the platform, a winding-shaft having a suitable binding cable or chain, and impaling devices attached to said platform in cooperative relation with the binding devices.

708,378. **BOX-STRAP HOLDER.** JAMES R. MACMURRAY, Chicago, Ill. Filed Apr. 24, 1902. Serial No. 104,566. (No model.)

Claim.—1. A holder for a coil of box-strap, comprising a frame composed of the two bars A and B hinged together at one end to extend parallel to each other when the frame is closed and form the coil-receiving space between them, a coil-journaling stud on the inner face of one of said bars, a lip *c* on the free end of one of said bars and a latch on the opposite bar to engage with said lip, substantially as described.

2. A holder for a coil of box-strap, comprising a frame composed of the bar A having a flange *b* at one end and the bar B hinged at one end to said flange to form the coil-receiving space between the bars, a coil-journaling stud on the inner face of one of said bars extending close to the face of the opposing bar when the frame is closed and forming the sole journaling-support for the coil, and a latch on the free end of one bar for engaging with the adjacent end of the opposite bar, substantially as described.

708,379. **ODDS-INDICATOR.** DAVID W. MARION, Baltimore, Md. Filed Jan. 30, 1902. Serial No. 91,927. (No model.)



Claim.—1. In an odds-indicator, the combination with a stationary schedule-board provided with holding-compartments for a series of name-bearing cards, of a flexible rack movable horizontally behind the schedule-board and provided with means for holding numeral-bearing cards in rows and in alinement with the schedule-board compartments, so as to display in order the first, second and closing odds, as and for the purpose specified.

2. In an odds-indicator, the combination with a stationary schedule-board provided with name-receiving spaces or compartments, of a flexible rack movable horizontally behind the schedule-board and divided off into sections for respectively containing the first, second and closing odds, the flexible rack being further divided off horizontally and provided with means for holding numeral-bearing cards arranged in horizontal rows and alining with the spaces on the schedule-board to represent in figures the first, second and closing odds, substantially as described.

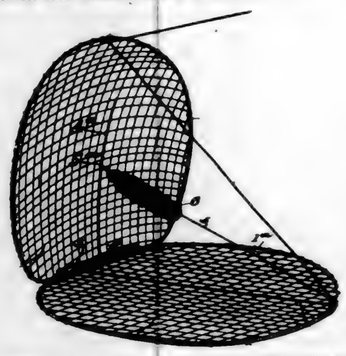
3. In an odds-indicator, the combination with a stationary schedule-board provided with name-receiving spaces or compartments, of a flexible rack movable horizontally behind the schedule-board and divided by heavy vertical lines into sections and each section subdivided by other vertical lines into column-spaces, the several columns of the sections having means for holding numeral-bearing cards in horizontal alinement with the spaces or compartments of the schedule-board, for displaying the first, second and closing odds, substantially as set forth.

4. In an odds-indicator, the combination with a stationary schedule-board provided with name-receiving spaces or compartments, and a track having one end extended laterally on one side of the schedule-board and its other end recurved behind the same, of a flexible rack mounted to travel on the track and movable behind the schedule-board, said rack being divided off to receive and having means for holding odds-indicating cards in alinement with the name spaces or compartments of the schedule-board, and means for shifting the flexible rack, substantially as described.

5. In an odds-indicator, a frame comprising a track at the base, a superimposed guide-rail, and a stationary schedule-board having name-receiving spaces, of a flexible rack having its lower portion mounted on the track and its upper portion in engagement with the guide-rail, and means for moving said rack behind the schedule-board, the rack being divided off into vertical columns and horizontal rows and provided with holders for engaging and displaying odds-indicating cards in alinement with the name-spaces of the schedule-board, substantially as described.

6. In an odds-indicator, a frame comprising a track at the bottom, a superimposed guide-rail, and a stationary schedule-board having name-receiving spaces, of a flexible rack mounted on the track and stayed by the guide-rail, said rack having means for holding and displaying odds-indicating cards in alinement with the name-spaces on the schedule-board, and an operating cord or cable fastened at an intermediate point to the flexible rack and running from thence in opposite directions around guide-pulleys on the frame, substantially as and for the purpose specified.

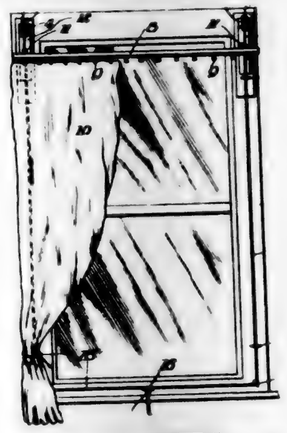
708,380. **FISH-TRAP.** GEORGE MERLE, Brooklyn, N. Y. Filed Nov. 20, 1901. Serial No. 83,066. (No model.)



Claim.—A trap of the class described consisting of a top portion and a bottom portion hinged together at one side, the body portion of each of said parts being composed of open network, said trap being also provided with a spring at the hinge for holding the separate parts thereof open and a cord connected with the top portion centrally thereof and passed through a ring or eye at the free edge of the bottom portion and then through a ring or eye at the free edge of the top portion, substantially as shown and described.

708,381. **WINDOW-CURTAIN BRACKET.** ALMA C. MILLER, McKeesport, Pa. Filed June 5, 1902. Serial No. 110,309. (No model.)

Claim.—In a device of the type set forth, the combination with a window-frame, of a base-plate carrying an arm bifurcated at its outer end with a pulley mounted in the bifurcated portion, an eyelet carried by the base-plate, a curtain-pole having hooks on its lower side to receive the curtain, hooks on the upper side of the pole with cords engaging said hooks, passing over said pulley and through the eyelets carried by the base-plate, eyelets carried by the window-frame at the corners thereof, and an eyelet secured intermediate the width of said window-frame, said cord adapted to pass through said eyelets and have their free ends knotted and passed through said eyelet located intermediate of the window-frame, with the knotted portion on the under side of the eyelet, substantially as described.



708,382. **METHOD OF SPLITTING SKINS.** FREDERICK W. MOORE, Lynn, Mass., assignor to Charles A. Moore, New York, N. Y. Filed Oct. 11, 1901. Serial No. 78,336. (No specimens.)

Claim.—1. The method of splitting skins consisting in applying to one or both surfaces of a skin a backing of cloth, or equivalent device, and then subjecting the backed skin to a splitting device, under compression, as set forth.

2. The method of treating skins consisting in preparing a tanned skin by trimming its irregular surface and edges, then applying to one or both of its surfaces a backing of cloth, or equivalent device, and then subjecting the reinforced skin to a splitting device, under compression, as set forth.

708,383. **MANTLE-SUPPORT.** JOHN E. MURRAY and JOSEPH J. HOOVER, Washington, Pa. Filed Mar. 10, 1902. Serial No. 97,456. (No model.)

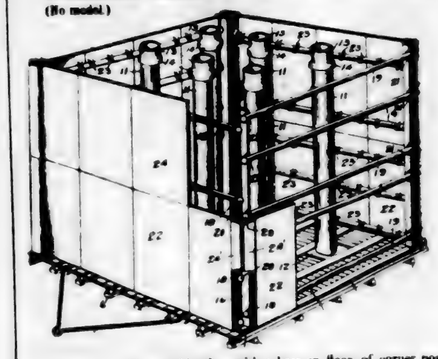
Claim.—1. In a mantle-support, the combination of a mantle-holder, a sleeve frictionally engaging said mantle-holder, said sleeve having its upper end flared outwardly and terminating in a vertical flange, and an inner integral flange arranged in vertical alinement with the bore of the said sleeve the said flared portion forming a seat adapted to support the lower portion of a mantle between the said flanges.

2. In a mantle-support, the combination with a mantle-holder formed on its sides with integral stops, and a mantle-wire-receiving sleeve formed integral with the lower edge of the mantle holder, and having its upper end extending above the upper edge of the said holder, of a sleeve adapted to be slid onto the upper portion of the mantle-holder and engaging the stops thereof, said sleeve provided at its upper end with two integral flanges spaced apart and forming a seat therebetween, and a looped wire having its lower end secured in the said first-named sleeve and adapted to receive a mantle.

3. In a mantle-support, the combination of a mantle-holder, and a cylindrical sleeve engaging said mantle-holder and having its upper end flared outwardly and provided with a pair of vertically-arranged annular flanges arranged one within the other and formed integral with the said flared upper end of the said sleeve.

4. In a mantle-support, the combination of a mantle-holder, and a cylindrical sleeve engaging said mantle-holder, and having its upper end flared outwardly, said flared portion being provided with a pair of vertically-arranged parallel flanges arranged one within the other, and forming a seat therebetween for the lower end of a mantle, said outer flange extending above the inner flange, substantially as described.

708,384. **ANNEALING-RECEPTACLE FOR CASTINGS.** ALLAN W. MCCLARY, St. Paul, Minn. Filed Apr. 12, 1901. Serial No. 55,461. (No model.)



Claim.—1. The combination, with a base or floor, of corner posts or standards thereon, removable rods connecting said posts, a series of sections suspended on said rods, and removable flues provided on said base.

2. The combination, with a base or floor, of angle-bars having a series of notches provided at the corners thereof, a series of rods removably fitting said notches and tying said bars together, and a series of sections suspended on said rods.

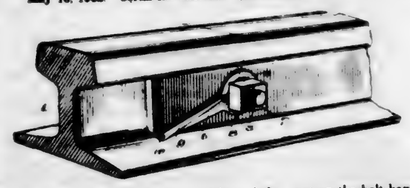
3. An annealing-receptacle comprising a base or bottom having flue-holes, flues removably arranged over said holes, and walls removably arranged upon said base around said flues and divided horizontally into a series of independent sections, substantially as described.

4. An annealing-receptacle comprising a base or bottom made up of a series of blocks and parallel rails, alternately arranged, and provided with a series of flue-holes, a series of flues fitting over said holes, means for binding said blocks and rails together, and walls composed of separable sections resting upon said base and inclosing said flues, substantially as described.

5. An annealing-receptacle comprising a base composed of a series of parallel rails suitably spaced, a filling material provided with flue-holes for the space between said rails, means for binding said filling material and said rails together, flues fitting over said holes, and walls divided into separable sections removably supported upon said base and inclosing said flues, substantially as described.

6. An annealing-receptacle, comprising a base or bottom, flues removably arranged on said base, and walls removably arranged upon said base around said flues and divided horizontally into a series of independent bottomless sections.

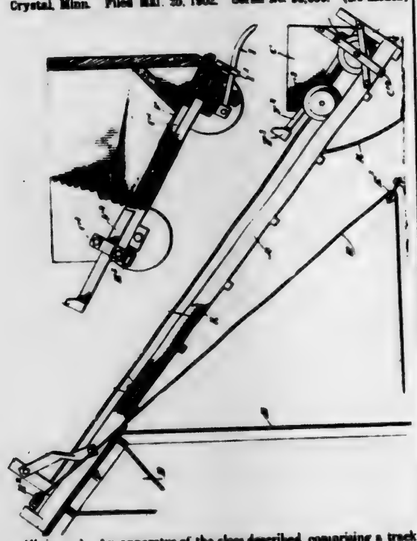
708,385. **NUT-LOCK.** LESLIE MCCONNELL, Brewton, Ala. Filed May 10, 1902. Serial No. 106,780. (No model.)



Claim.—1. A nut-lock comprising a bolt, a nut on the bolt having an annulus of ratchet-teeth, an arm having a washer encircling the bolt, said arm being held against backward movement, and a pawl pivoted to the arm and adapted to engage the annulus of ratchet-teeth.

2. A nut-lock comprising a bolt, a nut on the bolt having an annular hub on one side which is provided with ratchet-teeth, an arm having a washer encircling the bolt, said arm being held against backward movement, and a pawl pivoted to the arm and adapted to engage the ratchet-teeth aforesaid.

708,386. **AUTOMATIC CAR AND ELEVATING-TRACK.** WILSON L. MCLAUGHLIN, Clearlake, Iowa, and JAMES R. SWENSON, Lake Crystal, Minn. Filed Mar. 25, 1902. Serial No. 99,899. (No model.)



Claim.—1. An apparatus of the class described, comprising a track, a car mounted to travel thereon and having a sliding gate at its bottom, and abutments at the ends of the said track for alternately engaging the gate, to slide the same alternately into an open and closed position, as set forth.

2. An apparatus of the class described, comprising a track, a car mounted to travel thereon and having a sliding gate at its bottom, abutments at the ends of the said track for alternately engaging the gate, to slide the same alternately into an open and closed position, and a locking device for the said gate, to hold the same locked when the gate is in a closed position, the said locking device being controlled and unlocked by the abutment at the discharge end of the track, immediately previous to the abutment opening the gate for dumping the contents of the car, as set forth.

3. An apparatus of the class described, comprising an inclined track, a car mounted to travel thereon, a sliding gate at the bottom of the car, having a frame external of the car, and abutments at the end of the track, adapted to be engaged by the said frame, to open and close the gate, as set forth.

4. An apparatus of the class described, comprising an inclined track a car mounted to travel thereon, a sliding gate at the bottom of the car having a frame external of the car, and abutments at the ends of the track adapted to be engaged by the said frame, to open and close the gate, the side arms of the gate-frame having notches for engaging a fixed part on the car, to lock the gate in a closed position and one of the abutments having a cam device for moving the notched side arms out of engagement with the fixed part, to unlock the gate immediately previous to opening the same, as set forth.

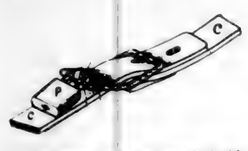
5. An apparatus of the class described, having an inclined track provided with a toothed rack, a car mounted to travel on the said track, a safety-dog hung on the car and adapted to engage the said rack, and a crank-shaft on the track having its crank-arm adapted to engage the safety-dog, to swing the same out of engagement with the rack whenever it is desired to return the car, as set forth.

6. An apparatus of the class described, having an inclined track provided with a toothed rack, a car mounted to travel on the said track, a safety-dog hung on the car and adapted to engage the said rack, means on the track for engaging the safety-dog, to swing the same out of engagement with the rack whenever it is desired to return the car, and a retaining device on the car adapted to be engaged by the said dog when swung out of engagement with the rack, as set forth.

7. An apparatus of the class described, having a car, a safety-dog fulcrumed on the car, a spring-catch on the said car, and a manually-controlled device in the path of the dog to throw the latter into engagement with the spring-catch, as set forth.

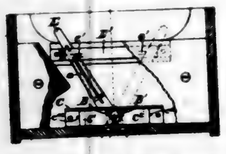
8. An apparatus of the class described, having a track, a car traveling thereon, a safety-dog on the car, a spring-catch for holding the said safety-dog in an inactive position, and an abutment on the track for engaging the dog, to swing the latter out of engagement with the spring-catch, as set forth.

708,387. **BUCKLE.** DONALD M. MCLEAN, Boston, Mass. Filed Jan. 7, 1902. Serial No. 88,812. (No model.)



Claim.—A buckle having its tongue provided with a perforated enlargement at its end, said tongue, when the buckle is in use, resting on the cross-bar of the buckle with the said enlargement projecting upward, whereby a padlock having its hasp in the perforation of the enlargement may swing forward or back on the buckle.

708,388. **FILE.** LUTHER C. MCNEAL, Rochester, N. Y. Filed Sept. 3, 1901. Serial No. 74,153. (No model.)



Claim.—1. In a file for cards and the like, a frame, a pair of locking-bars, an operating-plate attached transversely to each end of each bar, there being oppositely-arranged recesses in the operating-plates of each pair, an operating-bar provided with means engaging said oppositely-arranged recesses, and means for turning said operating-bar, whereby the locking-bars are separated and brought together, substantially as described.

2. In a file for cards and the like, a frame, a pair of locking-bars, an operating-plate attached transversely to each end of each bar, there being oppositely-arranged recesses in the operating-plates of each pair, stops for limiting the throw of said plates, an operating-bar provided with means engaging said oppositely-arranged recesses, and means for turning said operating-bar, whereby the locking-bars are separated and brought together, substantially as described.

3. In a file for cards and the like, a frame, a pair of locking-bars, an operating-plate on the end of each bar in which the end of the bar is inserted, there being oppositely-arranged recesses in the operating-plates of each pair, an operating-bar provided with means engaging said oppositely-arranged recesses, and means for turning said operating-bar, whereby the locking-bars are separated and brought together, substantially as described.

4. In a file for cards and the like, a frame, a pair of locking-bars, an operating-plate on each end of each bar in which the end of the bar is inserted, there being oppositely-arranged recesses in the operating-plates of each pair, stops for limiting the throw of said plates, an operating-bar provided with means engaging said oppositely-arranged recesses, and means for turning said operating-bar, whereby the locking-bars are separated and brought together, substantially as described.

5. In a file for cards and the like, a frame, a pair of locking-bars having reduced ends, an operating-plate having a perforation fitting upon each reduced end of said locking-bar, there being oppositely-arranged recesses in the operating-plates of each pair, an operating-bar provided with teeth simultaneously engaging said oppositely-arranged recesses, and means for turning said operating-bar, whereby the locking-bars are separated and brought together, substantially as described.

6. In a file for cards and the like, a frame, a pair of locking-bars having reduced ends, an operating-plate having a perforation fitting upon each reduced end of each locking-bar, there being oppositely-arranged recesses in the operating-plates of each pair, an operating-bar provided with teeth adapted to engage simultaneously said oppositely-arranged recesses, means for turning said operating-bar whereby the locking-bars are separated and brought together, and spring-catch devices for holding said locking-bars in their extreme positions of separation and proximity, substantially as described.

7. In a file for cards and the like, a frame, a pair of locking-bars, an operating-plate having a socket fitting upon each end of each bar, there being oppositely-arranged recesses in the operating-plates of each pair, an operating-bar provided with means engaging said oppositely-arranged recesses, a lever set on the end of said operating-bar for turning the same, whereby the locking-bars are separated and brought together, and spring-catch devices for retaining said lever in the positions corresponding to the extreme separation and proximity of the locking-bars, substantially as described.

8. In a file for cards and the like, a frame, a pair of locking-bars, an operating-plate having sockets fitting upon each end of each bar, there being oppositely-arranged recesses in the operating-plates of each pair, an operating-plate provided with teeth engaging said oppositely-arranged recesses, and a lever having a U-shaped end, one arm of which is perforated to set on the end of said locking-bar, whereby the locking-bars are separated and brought together, a plate on said frame having projections, and a spring for pressing said lever into engagement with said projections, whereby the locking-bars are held in their extreme positions of separation and proximity, substantially as described.

9. In a file for cards and the like, a frame, a pair of locking-bars, an operating-plate for each end of each locking-bar having a socket for the end of the locking-bar and a perforation for the passage therethrough of the other locking-bar, there being also perforations having oppositely-arranged recesses in the operating-plates of each pair, a guide-plate at each end of the frame having grooved ways for a pair of said operating-plates, an operating-bar having oppositely-arranged teeth engaging said oppositely-arranged recesses, and means for turning said operating-bar, whereby the locking-bars are separated and brought together, substantially as described.

10. In a file for cards and the like, a frame, a pair of locking-bars, an operating-plate for each end of each locking-bar having a socket for the end of the locking-bar, and a perforation for the passage therethrough of the other locking-bar, there being also perforations having oppositely-arranged recesses in the operating-plates of each pair, a guide-plate at each end of the frame having grooved ways for a pair of said operating-plates, stops for limiting the throw of the plates, an operating-bar having oppositely-arranged teeth engaging with the recesses in a pair of the operating-plates, and means for turning said operating-bar, whereby the locking-bars are separated and brought together, substantially as described.

11. In a file for cards and the like, a frame, a follower-block adapted to move along said frame, a plate in said frame having a downwardly-turned edge set underneath the follower-block and as long as the path of movement thereof, and a plate attached to said block engaging and fitting upwardly against said downwardly-turned edge, whereby the follower-block is held in the frame and its movements are guided therein, substantially as described.

12. In a file for cards and the like, a frame, a follower-block adapted to move along said frame, a plate in said frame having a downwardly-turned edge set underneath the follower-block, and a plate attached to said block and having a grooved portion engaging and fitting upwardly against said downwardly-turned edge, whereby the follower-block is held in the frame and its movements are guided therein, substantially as described.

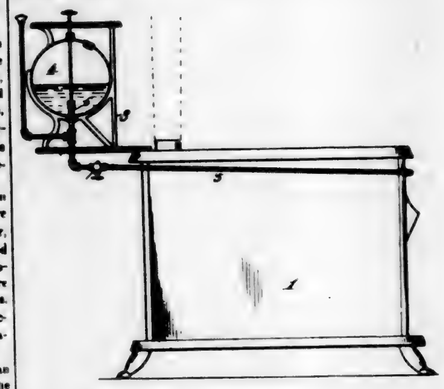
13. In a file for cards and the like, a frame, a follower-block adapted to move along said frame, a plate in said frame having a downwardly-turned edge set underneath the follower-block and as long as the path of movement thereof, and a plate attached to said block engaging and fitting upwardly against said downwardly-turned edge, whereby the follower-block is held in the frame and its movements are guided therein, and a spring-operated lever attached to said follower-block and adapted to press downwardly on said plate, substantially as described.

14. In a file for cards and the like, a frame, a follower-block adapted to move along said frame, a plate in said frame having a downwardly-turned edge set underneath the follower-block, and a plate attached to said block and having a grooved portion engaging and fitting upwardly against said downwardly-turned edge, whereby the follower-block is held in the frame and its movements are guided therein, and a spring-operated lever attached to said follower-block and adapted to press downwardly on said plate, substantially as described.

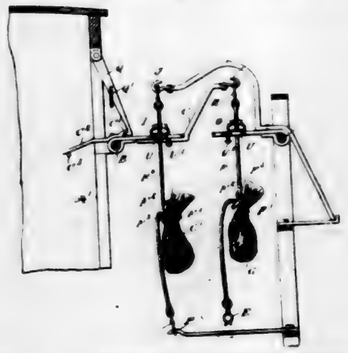
708,389. **HYDROCARBON-BURNER.** JOHN W. NEUHAUS, Louisville, Ky. Filed May 13, 1902. Serial No. 107,135. (No model.)

Claim.—The combination of a tank for containing liquid fuel, a supply-pipe for conducting the fuel from said tank and having a valve, an air-blast pipe connected with the supply-pipe between said valve and tank, and having a mouthpiece, and a second valve for controlling the feed of fuel from the tank through said supply-pipe.

708,389.



708,390. **MAIL DELIVERING AND CATCHING DEVICE.** WILLIAM J. NOBLE, Philadelphia, Pa., assignor of one-half to Ella McGinnis Princeton, N. J. Filed Apr. 10, 1902. Serial No. 102,244. (No model.)



Claim.—1. A mail delivering and catching device, comprising arms mounted to swing and to slide lengthwise on their pivots, one of the arms being located on a car and the other on a track station, a hook on the free end of each arm, to suspend a pouch, and a receiving device on each arm, for receiving a pouch, the receiving device being arranged between the hook and the pivot of the arm, as set forth.

2. A mail delivering and catching device, comprising arms mounted to swing and to slide lengthwise on their pivots, one of the arms being located on a car and the other on a track-station, a hook on the free end of each arm, to suspend a pouch, a receiving device on each arm, for receiving a pouch, the receiving device being arranged between the hook and the pivot of the arm, and catches for engaging the arms, to hold the same set in pouch-exchange position, as set forth.

3. A mail delivering and catching device, comprising arms mounted to swing and to slide lengthwise on their pivots, one of the arms being located on a car and the other on a track-station, a hook on the free end of each arm, to suspend a pouch, a receiving device on each arm, for receiving a pouch, the receiving device being arranged between the hook and the pivot of the arm, and catches for engaging the arms, to hold the same set in pouch-exchange position, the catches being arranged to release the arms on the latter sliding longitudinally on their pivots, as set forth.

4. A mail delivering and catching device, comprising arms, of which one is mounted to swing and to slide longitudinally on a car and the other is similarly mounted on a track-station, a suspending device on each arm for supporting a pouch, a receiving device on each arm for receiving the pouch, the suspending device on one arm and the receiving device on the other arm lying in the same vertical plane, at the time the parts are set in pouch-exchanging position and the car passes the station, and a hook fixed at the track-station and adapted to be engaged by the lower end of the pouch-suspending device, as set forth.

5. A mail delivering and catching device, comprising arms mounted to swing and to slide lengthwise on their pivots, one of the arms being located on a car and the other on a track-station, a hook on the free end of each arm, to suspend a pouch, a receiving device on each arm, for receiving a pouch, the receiving device being arranged between the hook and the pivot of the arm, catches for engaging the arms, to hold the same set in pouch-exchange position, and springs pressing the arms at their fulcrums, to hold the arms yieldingly in position for the catches to engage the arms, as set forth.

6. A mail delivering and catching device, provided with a suspension device for a pouch, and comprising a flexible tie, and a tie-plate having spaced apertures for the passage of the tie to form a loop or noose in the tie at one side of the tie-plate, as set forth.

7. A mail delivering and catching device, provided with a suspension device for a pouch, and comprising a flexible tie, a tie-plate having spaced apertures for the passage of the tie to form a loop or noose in the tie at one side of the tie-plate, and a stop on the tie, to abut against the face of the tie-plate, as set forth.

8. A mail delivering and catching device, provided with a suspension device for a pouch, and comprising a flexible tie, a tie-plate having spaced apertures for the passage of the tie to form a loop or noose in the tie at one side of the tie-plate, and open spring-hooks on the ends of the tie, as set forth.

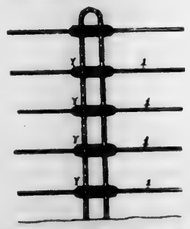
9. A mail delivering and catching device, comprising arms mounted to swing and to slide lengthwise on their pivots, one of the arms being located on a car and the other on a track-station, a hook on the free end of each arm, to suspend a pouch, a receiving device on each arm, for receiving the pouch, the receiving device being arranged between the hook and the pivot of the arm, and guideways leading to the entrance ends of the receiving devices, as set forth.

10. A mail delivering and catching device, comprising arms mounted to swing and to slide lengthwise on their pivots, one of the arms being located on a car and the other on a track-station, a hook on the free end of each arm, to suspend a pouch, and a receiving device on each arm, for receiving the pouch, the receiving device being arranged between the hook and the pivot of the arm, the said arms being arranged to clear each other on the car passing the station and the hook of one arm standing above the receiving device of the other arm, at the time the car passes the station, as set forth.

11. A mail-bag delivering and catching device, comprising two arms, one on a car, and the other on a track-station and each mounted to swing and to slide longitudinally, and provided with a hook at its free end and with a receiving device between the hook and pivot, springs on the pivots of the arms and pressing on opposite sides of the said arms, catches for holding the arms in operative positions and flexible pouch-ties provided with spring-hooks for engaging the hooks of the said arms, as set forth.

12. A mail-bag delivering and catching device, comprising two arms, one on a car and the other on a track-station and each mounted to swing and slide longitudinally, said arms being provided with a hook at its end, a receiving device between the hook and pivot, a guideway leading to the receiving device, and a pin on the under side of the guideway, springs for holding the arms normally from sliding, catches for holding the arms in operative positions, and flexible pouch-ties provided with spring-hooks at their ends, as set forth.

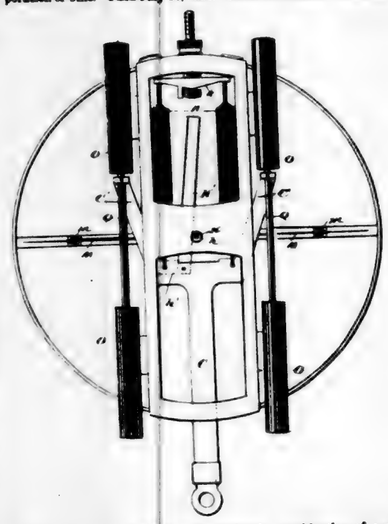
708,891. **WIRE FENCE.** ISAAC B. O'NEAL, Kokomo, Ind., assignor of one-half to H. H. Hartgrove, Kokomo, Ind. Filed Feb. 14, 1902. Serial No. 94,053. (No model.)



Claim.—1. In a wire fence, the combination with the horizontal line-wires, of a vertical stay embodying two parallel corrugated strands connected at their upper ends and straddling the line-wires, and a clamp having its ends bent in opposite directions and embracing the line-wire to bend the latter to the stay, substantially as described.

2. In a wire fence, the combination with the horizontal line-wires, and the corrugated vertical stay straddling the line-wires, of a substantially Z-shaped clamp for each line-wire, each clamp having its ends engaged with the line-wires at opposite sides of the stay, substantially as described.

708,892. **SPRING-BALANCE SCALE.** ORANGE O. OHIAS, Dayton, Ohio, assignor to the Computing Scale Company, Dayton, Ohio, a Corporation of Ohio. Filed July 26, 1897. Serial No. 646,004. (No model.)



Claim.—1. In a spring-balance scale, the combination of a vertically-movable runner, a horizontal rotatable spindle, a pinion secured to said spindle, and a rack secured to the runner and engaging with said pinion, with two vertical pneumatic dash-pots, each having its upper end open, which dash-pots are fixed on opposite sides of the runner and below the scale-spindle, plungers in said dash-pots and connecting-rods which are connected at their lower ends to said plungers and at the upper ends with the runner; substantially as described.

2. In a spring-balance scale, the combination with the scale-frame and two vertical dash-pot cylinders which are open at the upper ends, said cylinders being placed on opposite sides of the scale center, with a vertically-movable spring-supported runner, having two arms which extend upward and laterally to points above the open ends of the dash-pots, plungers in the dash-pots and rods connecting said plungers and runner-arms; substantially as and for the purpose specified.

3. In a spring-balance scale, the combination of a spring-suspended draft-bar, having at its lower end means for suspending the load, with two oppositely-located fixed dash-pot cylinders, their pistons, piston-rods pivotally connected with the draft-bar and connected at the ends with the pistons, an indicating mechanism and a connection between the indicating mechanism and draft-bar located intermediate the dash-pot cylinders; substantially as described.

4. In a spring-balance scale, the combination with a spring-suspended draft-bar having at its lower end means for suspending the load, and an indicator operatively connected with and moved by the draft-bar, of a fixed dash-pot cylinder, a piston and a piston-rod connecting said piston and draft-bar, the connection between the piston and draft-bar being sufficiently loose in the direction of the length of the piston-rod to permit the indicator to reach a final state of rest when moved in either direction uninfluenced by the resistance of the piston; substantially as described.

5. In a spring-balance scale, the combination with a rotary indicator, a spring-suspended draft-bar centrally connected with the indicator for rotating the same and having on its lower end means for suspending the load, of fixed dash-pot cylinders located on opposite sides of the connection between the indicator and draft-bar, pistons in said cylinders and piston-rods pivotally and loosely connecting the pistons and draft-bar, the loose connection being in the direction of the length of the piston-rods and being sufficient to permit the indicator to come to a final state of rest when moved in either direction without being influenced by the pistons.

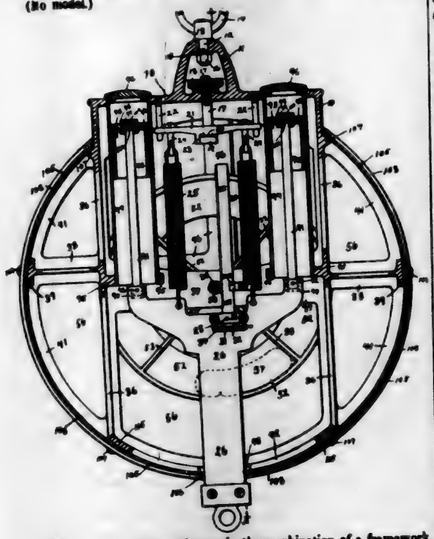
6. In a spring-balance scale, the combination of a draft-bar, a rotatable spindle mounted above the draft-bar, a driving connection between the draft-bar and spindle and an indicator moved by the spindle, of springs for supporting the draft-bar and counterbalancing the load connected with the draft-bar on opposite sides of the driving connection with the spindle, fixed dash-pot cylinders also located on opposite sides of said driving connection, pistons in said cylinders and piston-rods for said pistons pivotally connected with the draft-bar; substantially as described.

7. In a spring-balance scale, the combination of the scale-frame, and two vertical dash-pots supported by said frame on opposite sides of the scale center, plungers in said dash-pots, the vertically-movable runner having laterally-extended arms, and rods connecting said plungers and laterally-extended arms.

8. In a spring-balance scale, the combination of a draft-bar, a rotatable spindle mounted above the draft-bar, a driving connection between the draft-bar and spindle, of springs for supporting the draft-bar and counterbalancing the load connected with the draft-bar on opposite sides of the driving connection with the spindle, fixed dash-pot cylinders also located on opposite sides of said driving connection, pistons in said cylinders and piston-rods for said pistons pivotally connected with the draft bar.

9. In a spring-balance scale, the combination of a vertically-movable spring-supported runner, a horizontal rotatable spindle, a driving connection between the runner and spindle, two vertical dash-pots secured on opposite sides of the runner, pistons in said dash-pots, and pivotal connections between said pistons and the runner.

708,893. **WEIGHING AND PRICE SPRING-BALANCE SCALE.** ORANGE O. OHIAS, Dayton, Ohio, assignor to the Computing Scale Company, a Corporation of Ohio. Filed Dec. 27, 1897. Serial No. 663,733. (No model.)



Claim.—1. In a computing-scale, the combination of a framework, a casing inclosing said framework, a shaft provided with end bearings in said framework, indicating-disks mounted on said shaft between the bearings, within the framework and adjacent to each side of said casing, the indicating-disk adjacent to one side of said casing being provided with weight-indicating characters and the indicating-disk adjacent the opposite casing being provided with a series of sets of values computed at different rates per unit, exposing-openings in opposite sides of the casing for said indicating-disks, the exposing-opening for the value-indicating disk being provided adjacent to its edge with a series of characters indicating the prices at which the different values on the value-indicating disk were computed, and means for imparting a revolvable movement to said shaft proportionate to the weight of merchandise placed upon said scale, substantially as specified.

2. In a computing-scale, the combination of a framework, a shaft provided on opposite ends with bearings in said framework, indicating-disks mounted adjacent to the opposite ends of said shaft between the bearings and within the framework, one of said disks being provided with weight-indicating characters and the other disk being provided with a series of sets of characters indicating values at different rates per unit, a casing inclosing said framework and disks and shaft, openings at top and bottom in said casing through which the supporting and draft mechanism extend, exposing-openings in opposite sides of said casing for said indicating-disks the exposing-opening for the value-indicating disk being provided adjacent its edge with a series of price-indicating characters corresponding to the prices at which the different values on the value-indicating disk were computed, and means for imparting a revolvable movement to said shaft proportionate to the weight of merchandise placed upon said scale, substantially as specified.

3. In a computing-scale, the combination of a shaft, a frame provided with bearings for said shaft, indicating-disks rigidly mounted upon opposite ends of said shaft, a pinion loosely mounted on said shaft, a rack meshing with said pinion, a collar rigid with said pinion, a series of spring-strips rigidly secured at one end to said collar, a corresponding series of scale rigidly carried by one of said disks and adapted to slidingly engage the free ends of said spring-strips, a casing inclosing said parts, openings at top and bottom in said casing through which the supporting and draft mechanisms extend, exposing openings in opposite sides of said casing for said indicating-disks, and means for imparting a vertical movement to said rack proportionate to the weight of merchandise placed upon said scale, substantially as specified.

4. In a computing-scale the combination of a revolvable indicating-disk, a series of concentric sets of graduated and numbered values on said disk computed at different rates per unit, a casing for said disk, an exposing-opening in said casing varying in width in accordance with the distance between adjacent numbered graduations on the disk and adapted to expose only the numbered graduation next below the graduation indicating the true value and those graduations intermediate, and a series of price-per-unit characters adjacent one edge of said exposing-opening and adapted to designate the values indicated by said disk, substantially as specified.

5. The combination of a framework, a casing for said framework, an indicator, a draft-bar adapted to move said indicator, connections 91 loosely pivoted to opposite sides of said draft-bar, pistons 93 loosely pivoted to said connections, cylinders 94 supported rigidly in said framework and of a larger diameter than said pistons 93, and a head 96 in one end of said cylinders, substantially as specified.

6. The combination of a framework, an indicator carried by said framework, a draft-bar adapted to move said indicator, connections loosely pivoted to opposite sides of said draft-bar and to thimbles 99, secured to pistons 93 by pins 100 passing through said thimbles and through projections 96 of said pistons, cylinders 94 rigid in said framework and of larger diameter than and receiving said pistons, and heads 96 for and closing one end of said cylinders, substantially as specified.

7. In a spring-balance, the combination of a spring-supported draft-bar, a revolvable shaft, an indicator driven by said shaft, a pinion on said shaft, a rack carried by said draft-bar and meshing with said pinion, a pivot 28 connecting said rack-bar to said draft-bar and a plate 29 rigid with said draft-bar, and a spring-strip 32 supported at each end by said draft-bar and engaging the lower edge of said rack to retain the same in mesh with said pinion, substantially as specified.

8. The combination of an indicating-ring 52 having indicating characters upon its face, a series of arms 53 substantially U shape in cross-section connecting said ring with projections 54 of collar 55, a revolvable shaft supporting and driving said collar, a casing for said ring, and an exposing-opening in said casing for said ring, substantially as specified.

9. The combination of a frame 10, a wall 105 about its periphery, end walls 56 and 62, rings 108 substantially J shape in cross-section upon each edge of said wall 105 and securing and concealing the edges of said walls 56 and 62, said rings 108 being secured to said walls 105 and to said frame 10 substantially as specified.

10. The combination of a frame, a threaded nut 18 exposed upon said frame and supporting bolt 17 having head 19 supporting bar 21, a projection 20 forming the bearing between said bar 21 and head 19, a projection 23 of bar 21, engaging head 19, guides 22 rigid with said frame and provided with bearings in said bar 21, springs 25 supported by said bar 21, a draft-bar supported by said springs, a revolvable shaft supported by said frame, an indicator driven by said shaft, and a rack-and-pinion connection between said shaft and draft-bar, substantially as specified.

11. The combination of a shaft mounted in suitable bearings, an indicating-disk rigidly secured to and near each end of said shaft, a pinion loosely mounted on said shaft, a series of radial spring-strips rigid with and radiating from said pinion, a corresponding series of loops rigid upon one of said indicators, V-shaped edges in said loops adapted to engage the ends of said spring-strips, indicating characters upon said indicating-disks, a casing inclosing said parts, exposing-openings in said casing for designating said characters, and means for imparting a revolvable movement to said pinion proportionate to the weight of merchandise, substantially as specified.

12. In a spring balance scale the combination with the frame or casing, the longitudinally-movable goods-support and the supporting-springs connecting said support and casing and arranged on diametrically oppo-

site sides of the center of the line of draft of the goods-support, of pneumatic cylinders having their lower ends open and arranged with the line of their longitudinal centers in the same plane as the longitudinal centers of the supporting-springs, pistons working in said cylinders and piston-rods directly connecting the pistons with the goods-support and having their lines of draft in the plane of the longitudinal centers of the springs and cylinders, whereby the action of the springs and cylinders and pistons does not deflect the goods-support from its line of draft when the goods are applied to or removed therefrom.

13. In a spring-balance scale, a casing and a rotary indicator combined with a freely-suspended goods-support, a rack-bar interposed between the goods-support and indicator, springs connecting the goods-support and casing and a pneumatic differential governor interposed between the goods-support and casing, said goods-support, rack-bar, springs and pneumatic differential governor, all having their longitudinal axes and lines of draft in a single coincident plane and so arranged that the resultant resistance of each is in a line coinciding with that of each of the others; substantially as described.

14. In a spring-balance scale, a casing having a single point of suspension at top and a rotary indicator journaled in the casing, combined with a freely-suspended goods-support, a rack-bar, interposed between the goods-support and indicator, springs connecting the goods-support and casing and a pneumatic differential governor interposed between the goods-support and casing, said casing-support, goods-support, rack-bar, springs and pneumatic differential governor all having their longitudinal axes and lines of draft in a single coincident plane and so arranged that the resultant resistance of each is in a line coinciding with that of each of the others, substantially as described.

15. In a spring-balance scale, the combination of the scale-frame, a vertically-movable spring-suspended runner having on its lower end means for attaching the load, a horizontal spindle mounted on the frame above the runner, a pinion on the spindle, and a rack connected with the runner and engaging with said pinion, with two vertical dash-pot cylinders supported by the frame and lying on opposite sides of the spindle with their axes in the same vertical plane (at right angles to the spindle) in which the runner lies and moves, plungers freely movable in said dash-pots, and rods which are connected with said plungers and parts of the runner which are in line with the axes of the dash-pot cylinders.

708,894. PROCESS OF BURNING BRICK. JOHN PECK, Haverstraw, N. Y. Filed May 23, 1902. Serial No. 108,679. (No specimens.)

Claim.—The herein-described process of burning brick in kilns, which consists first in subjecting the kiln to the action of a fire fed with atomized oil and maintaining this fire until the kiln has been heated, and second, in stopping said oil-fire and continuing the burning of the kiln by a fire fed with soft or bituminous coal or other similar fuel.

708,895. DEVICE FOR DIGGING DITCHES. OSCAR PETERSON and JOSEPH H. CLARK, Chicago, Ill. Filed Apr. 15, 1901. Serial No. 55,852. (No model.)

Claim.—1. A digging device comprising a movable frame, one or more digging-shafts connected therewith, said digging shaft or shafts each provided with a non-cutting screw for moving the material acted upon, and a series of cutting-blades connected to each of said screws.

2. A digging device comprising a movable frame, a motor mounted thereon, one or more digging-shafts adjustably connected with said frame and operatively connected with said motor, each shaft provided with a screw which acts to transport the material acted upon, said screw provided with a series of detachable cutting blades or knives which project beyond the edge of the screw.

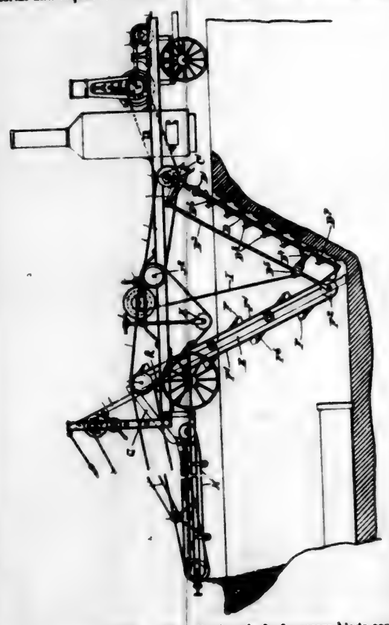
3. A digging device comprising a movable frame, two digging-shafts adjustably suspended from said frame side by side, and means for adjusting said digging-shafts at their ends farthest from said frame so as to vary the angular relation between them.

4. A digging device comprising a movable frame, two digging-shafts adjustably connected therewith, means for rotating said shafts, a screw associated with each shaft, each screw provided with a series of detachable cutting-blades which project beyond the edge of the screw, and means for moving said screws so as to change their angular relation.

5. A digging device comprising a movable frame, two digging-shafts suspended therefrom, each provided with two screws of opposite pitch which engage the material to be acted upon so as to convey it toward a point between the ends of the shafts, said screws provided with detachable cutting-blades, an elevator associated with said digging-shafts and adapted to receive the material from the screws and convey it to a distant point.

6. A digging-shaft comprising a shaft proper, a screw-blade connected therewith, a series of knives detachably connected with said screw-blade and projecting beyond the edge thereof.

7. A ditch-digging device comprising a movable frame, a motor mounted thereon, two digging-shafts movably connected with said frame and adapted to be moved to and from each other so as to vary the angular relation between them, each shaft provided with a screw adapted to convey the loosened material to a given point, a series of detachable cutting-blades connected with said screw and projecting beyond the edge thereof, a conveyer adapted to receive the material from said screws and lift it to a given point, and a back-filling conveyer adapted to receive the material and deposit it in the ditch at a distance from the digging-shaft.



8. The combination with a digging-shaft of a screw-blade connected thereto, one or more knives consisting of two parts at an angle to each other, said knife or knives connected with the screw-blade so as to project beyond the edge thereof.

708,896. PROCESS OF TANNING. WILHELM H. PHILIPPI, Bürgel-Offenbach, Germany. Filed Nov. 4, 1901. Serial No. 81,113. (Specimens.)

Claim.—1. The process of tanning skins or hides, consisting in subjecting the skins or hides to the usual preparatory treatment before the tanning process, and then immersing them in a solution of tar in a suitable solvent until the tanning is accomplished, substantially as set forth.

2. The process of tanning skins or hides, consisting in subjecting the skins or hides to the usual preparatory treatment before the tanning process, and then immersing them in a solution of tar in turpentine-oil, substantially as set forth.

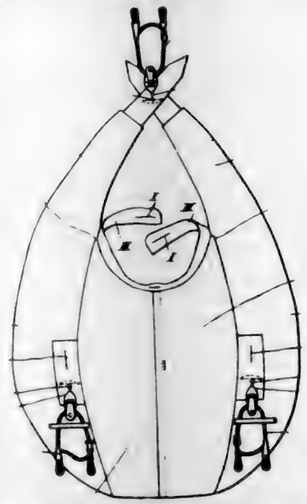
3. The process of tanning skins or hides, consisting in subjecting the skins or hides to the usual preparatory treatment before the tanning process, then immersing them in a solution of tar and turpentine and then treating them with carbolic acid, substantially as described.

4. The process of tanning skins or hides, consisting in subjecting the skins or hides to the usual preparatory treatment before the tanning process, then immersing them in a solution of tar in a solvent and then treating them with carbolic acid, substantially as described.

5. The process of tanning skins or hides, consisting in subjecting the skins or hides to the usual preparatory treatment before the tanning process and then immersing them in a solution of tar in turpentine and carbolic acid, substantially as set forth.

708,897. COMBINED SHIRT-FRONT AND BRACES. MARGARETTA R. POORE, London, England, assignor to Richard Poore, Herne Hill, London, England, and William Bradley, Wood Green, Middlesex, England. Filed May 22, 1902. Serial No. 108,575. (No model.)

Claim.—1. A shirt-front, flaps secured a portion of their length to the sides of said shirt-front and the remaining portion of their length free of the shirt-front and adapted to be passed down the back of the wearer and crossing each other at their ends, said flaps provided with buttonholes at each side of the shirt-front and buttonholes registering with each other in their free ends, in combination with suspender-straps adapted to engage in the buttonholes at the side of the shirt-front and in the registering buttonholes in the free end of the flaps.



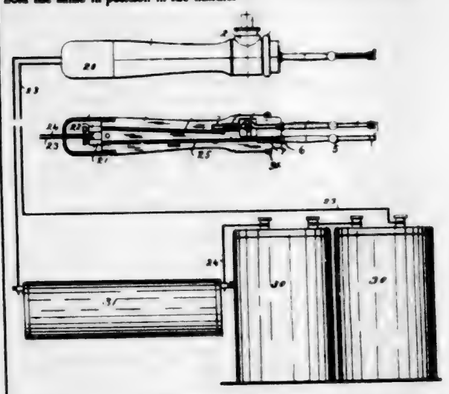
2. A shirt-front, flaps secured a portion of their length to the sides of said shirt-front and the remaining portion of their length free of the shirt-front and adapted to be passed down the back of the wearer and crossing each other at their ends, said flaps provided with buttonholes at each side of the shirt-front and buttonholes registering with each other in their free ends, in combination with suspender-straps adapted to engage in the buttonholes at the side of the shirt-front and in the registering buttonholes in the free end of the flaps, and loops secured to the outer face of said flaps at the sides of the shirt-front for retaining said suspender-straps in position.

3. A shirt-front, a flap at each side of said shirt-front, each of said flaps extending a portion of its length the entire length of the side edges of the shirt-front and suitably secured thereto and the remaining portion of the length of the said flaps being free of the shirt-front and adapted to be passed down the back of the wearer and crossing each other at their ends, each of said flaps provided with a plurality of buttonholes at each side of the shirt-front and further provided in their free ends with a buttonhole, the buttonholes in the ends of the flaps registering with each other, in combination with suspender-straps adapted to engage in the buttonholes at the sides of the shirt-front and in the registering buttonholes in the ends of the flaps, substantially as shown and described.

708,898. ELECTRICAL GAS-LIGHTER. JAMES G. POPPERT, Milwaukee, Wis. Filed Jan. 7, 1902. Serial No. 88,815. (No model.)

Claim.—1. An electrical igniter, comprising a handle; a laterally-extending push-button; a fixed electrode projecting from the handle; an axially-oscillating electrode, having a resilient arm adapted to engage the fixed electrode, and yieldingly pass the same; an arm projecting from the oscillating electrode into the path of the push-button; a coiled spring located on the oscillating electrode with one arm secured to the handle, and the other engaged under the push-button arm of said electrode; and electrical conductors leading from a suitable source of current-supply and electrically connected with said electrode; said handle being made in longitudinally-divided sections, adapted to inclose the inner ends of the electrodes and the actuating-spring of the oscillating electrodes.

2. An electrical igniter, comprising a handle; a fixed electrode having end-to-end connection therewith; an oscillatory electrode, arranged for positive make-and-break contact with the fixed electrode; a push-button extending laterally from the handle, and having operative connection with the oscillatory electrode; a spring for retracting said electrode; flexible conductors connecting the electrodes with a suitable source of current-supply; said oscillatory electrode being provided with suitable bearings in the interior of said handle; and a ferrule connected with the handle and projecting therefrom to support said electrode exteriorly, and hold the same in position in the handle.



708,899. RAILWAY SIGNALING DEVICE. HARRY PRATT, Kenilworth, Ill. Filed Feb. 12, 1902. Serial No. 93,663. (No model.)

Claim.—1. A railway signaling device comprising an operating-lever which is adapted for actuation by a part depending from the locomotive, a transmitting device located at a distance from the operating-lever comprising a part which is adapted to be thrown upwardly into the path of the actuating part of a signaling device carried by a locomotive, operative connections between said transmitting device and the lever, and means for locking said projecting part of the transmitting device in its uppermost position embracing a lever which is thrown toward the track-rail when the transmitting device is locked, said lever being adapted for engagement by the locomotive-wheel to swing the same therefrom and to release the locking means of the transmitting device to permit the parts to be restored to their inoperative positions.

2. A railway signaling device comprising an operating-lever which is adapted to be actuated by a part projecting from a locomotive, a transmitting device located at a point distant from the operating-lever, said transmitting device embracing an endwise-movable bar, a finger pivoted on a plate which is supported on the railway-track, and is loosely connected with the bar, whereby, upon endwise movement of the bar, the finger is thrown into an upright position, operative connections between said bar and said operating-lever, means for locking said bar to hold the finger in an upright position, and means for releasing said bar to permit the finger to be restored to its inoperative position.

3. A railway signaling device comprising an operative lever which is adapted to be actuated by a part projecting from the locomotive, a transmitting device comprising an endwise-movable bar, operative connections between said bar and the operating-lever, a finger pivoted to a plate supported on the bracket and loosely connected with the bar, whereby, when said bar is moved endwise, the finger is thrown upwardly into the path of the projecting part of a signaling device carried by a locomotive, a locking-lever engaging said bar for holding said finger in its upright position, said lever being adapted for contact with the wheel of the locomotive for releasing said bar and permitting the finger to return to its inoperative position.

4. A railway signaling device comprising an operating-lever which is adapted to be actuated by parts depending from the locomotive, a transmitting device comprising an endwise-movable bar, operative connections between said bar and lever, a finger pivoted to a plate supported on the track and having loose pivotal connection with the bar, whereby, when said bar is moved endwise, the finger is swung upwardly into the path of an actuating part of a signaling device carried by a locomotive, a bell-crank lever pivoted to said plate, one arm of which is adapted to engage a downwardly-opening notch in said bar to lock the finger in its operative position, and a cam-surface on the other arm of the lever adapted to be engaged by the wheel of the locomotive for releasing said lever from the bar.

5. A railway signaling device comprising a horizontally-swinging operating-lever, which is located between and normally inclined to the

track-rails, rigid arms on said operating-lever, two transmitting devices, one located in front and the other in rear of the operating-lever and at a distance therefrom, each comprising a part which is adapted to be thrown upwardly into the path of the actuating member of a signaling device carried by a locomotive, rigid rods connecting said arms of the lever with the movable parts of the transmitting devices, means for locking the projecting members of the transmitting devices in their uppermost positions, and means operated by a part on the locomotive for releasing said members to permit the same to be restored to their inoperative positions.

708,400. HOLLOW GRATE-BAR. THEODORE J. PRITCHARD, Sunshine, La. Filed Apr. 14, 1902. Serial No. 102,747. (No model.)

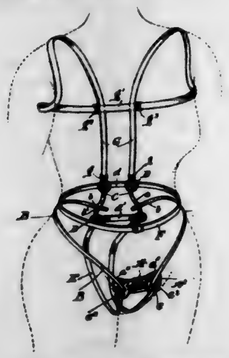
Claim.—A hollow grate-bar, comprising a longitudinal tubular member of substantially J shape closed at one of its ends and provided upon each of its sides with a series of separate vent-holes, each hole being provided with an eyelid integral with said tubular member and forming an arch over said hole, said member being further provided with a plurality of substantially funnel-shaped ash-pockets integral therewith, each of said ash-pockets being provided with a removable cap, substantially as described.

708,401. DOOR CATCH AND BUFFER. FRENCH E. RAMSDELL and HENRY C. MUDDIMAN, Manassas, Va. Filed Apr. 3, 1902. Serial No. 101,182. (No model.)

Claim.—1. A door catch and buffer comprising an outer frame having a back and two sides, an inner frame having an angular front and two sides, and pivoted in said outer frame, a contact-face on said inner frame to yieldingly receive the impact of the closing door, another face to engage the edge of the door when closed, and means to restore the inner frame to its normal position when released from the door-pressure.

2. A door catch and buffer having an outer frame provided with attaching-wings and screw-holes therein, and having a back and two sides, an inner frame having two sides and pivotal connection with said outer frame, and contact-faces disposed at an angle to each other, a spring to hold the inner frame in normal position and a cushion interposed between the door and said faces substantially as herein specified.

708,402. ABDOMINAL AND BACK SUPPORTER. HOWARD C. RASH and LEON C. RASH, Salina, Kans., assignors to the Natural Body Brace Company, Salina, Kans., a Corporation of Kansas. Filed Apr. 1, 1902. Serial No. 100,956. (No model.)



Claim.—1. The front plate formed in two separable sections overlapped at their adjacent ends to form a rigid sliding connection, and means for securing the two sections separably together in their adjusted positions: substantially as set forth.

2. The front or abdominal plate or pad formed in two separable sections, one section having guides, and the other section having an open slot, and in sliding connection with said guides, and a set-screw extending through one section and through the said open slot in the other section; substantially as described.

3. The combination with the front plate provided with a marginal flange cut away at its upper corners, of the hip-straps pivoted at their forward ends to the said front plate and extending through the said cut-away portions, and headed studs projecting from the front plate in the path of the lower edges of the hip-straps to prevent them from dropping down too low.

4. A combined abdominal and back supporter, comprising curved spring hip-straps, an abdominal plate secured to the front ends of said hip-straps and formed in two separable rigidly-connected sections, and a back-supporting device connecting the rear ends of said hip-straps; substantially as described.

5. A combined abdominal and back support, comprising curved spring hip-straps, an abdominal plate secured to the front ends of said hip-straps and formed in two separable sections, back-springs secured between their ends to the rear ends of said hip-straps, back-pads secured to the upper and lower ends of the back-springs, a belt connecting the two upper back-pads, and adapted to pass around the waist to be connected at its ends above and independent of the abdominal plate, and a connection between the lower back-pads; substantially as described.

6. A combined abdominal and back supporter, comprising curved spring hip-straps, an abdominal plate secured to the front ends of said hip-straps and formed in two separable and adjustably-connected sections sliding one upon the other, back-springs adjustable laterally and vertically between their ends on the rear ends of the hip-straps, connected back-pads on the lower ends of the back-springs, back-pads on the upper ends of the back-springs, and a waistband or belt secured at its middle to said upper back-pads, and adapted to be fastened together at its ends above and independent of the abdominal pad; substantially as described.

7. A combined abdominal and back supporter, comprising the curved spring hip-straps, having a series of round holes in their rear ends, a sectional separable abdominal plate connecting the front ends of the hip-straps, back-springs at the rear ends of the hip-straps, provided with a series of square apertures, screws passed through said holes and apertures, and having squared portions for the said square apertures, and smooth round portions for the said round holes, nuts on the outer ends of the screws, connected pads on the lower ends of the back-springs, upper pads on the upper ends of the back-springs, and a waistband or belt connecting the upper back-pads, and adapted to be fastened at its ends above and independent of the abdominal plate; substantially as described.

8. A combined abdominal and back supporter, comprising the flanged front plate formed in two separable sections with its flange cut away at its upper corners, a headed stud on each section, curved spring hip-straps pivoted at their front ends to said sections and extending through said cut-away portions, back-springs adjustably connected to the rear ends of the hip-straps, connected pads on the lower ends of the back-springs, pads on the upper ends of the back-springs, a waistband or belt connecting said upper plates or pads at its middle, and adapted to encircle the waist above the abdominal plate or pad, and perineal straps connected to the lower back-pads and provided at their ends with slides having key-hole-slots to engage the headed studs on the abdominal plate; substantially as described.

9. A combined abdominal, back and shoulder supporter or brace, comprising the curved spring hip-straps, the separable abdominal plate at the front ends of the hip-straps, the back-springs connected to the rear ends of the hip-straps, the lower connected back-pads on the lower ends of the back-springs, the perineal bands connecting the lower back-pads with the abdominal plate, the waistband connecting the upper back pads or plates, and adapted to pass around the waist above and independent of the abdominal plate and the shoulder-straps connected at their lower ends to the upper back-pads; substantially as described.

10. A combined abdominal and back supporter, comprising the curved spring hip-straps having a series of round holes in their rear ends, a sectional separable abdominal plate connecting the front ends of the hip-straps, back-springs at the rear ends of the hip-straps provided with a series of square apertures, screws passed through said holes and apertures and having squared portions for the said square aperture and smooth round portions for the said round holes, nuts on the outer ends of the screws, pads on the lower ends of the back-springs and pads on the upper ends of the back-springs.

11. A combined abdominal and back supporter, comprising curved spring hip-straps, an abdominal plate secured to the front ends of the hip-straps and formed in two separable rigidly-connected sections, back-supporting springs at the rear ends of the hip-straps, means whereby the back-springs may be adjusted along the rear ends of the hip-straps and also vertically on the hip-straps, and pads carried by the ends of the said back-springs.

708,403. BICYCLE SADDLE-POST. OSCAR F. REEVE, Saginaw, Mich. Filed Mar. 12, 1901. Serial No. 50,842. (No model.)

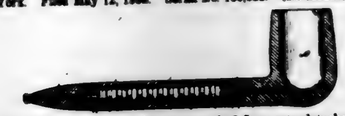
Claim.—1. A seat-post adapted to be secured in a seat-post socket, and comprising a tubular stem, a sleeve having telescopic connection therewith, a spring within the tubular stem, a spring-support connected to the sleeve, and exposed means for adjusting the tension of the spring, substantially as described.

2. A seat-post comprising a tubular stem, a sleeve having telescopic connection therewith and secured against other than slidable longitudinal movement with relation thereto, a spring within the tubular stem, a spring-support, and exposed means for adjusting the tension of the spring, substantially as described.

3. A seat-post comprising a tubular stem, a sleeve having telescopic connection therewith and secured against other than slidable longitudinal movement with relation thereto, a spring within the tubular stem, within the lower end of the stem a spring-support movable with relation to the stem and fixed with relation to the sleeve, and means at the upper end of the stem for adjusting the tension of the spring without removing the stem from the sleeve, substantially as described.

4. A seat-post comprising a tubular stem and a sleeve having telescopic connection and secured against other than slidable longitudinal movement with relation to each other, a spring within the tubular stem, within the lower end of the stem a spring-support movable with relation to the stem and fixed with relation to the sleeve, a plug in the lower end of the stem, a recoil-cushion within the stem below the spring-support and above the plug, and exteriorly-disposed means at the upper end of the stem for adjusting the tension of the spring, substantially as described.

708,404. SMOKING-PIPE. CHARLES P. REMORZ, Tully, New York. Filed May 12, 1902. Serial No. 106,933. (No model.)

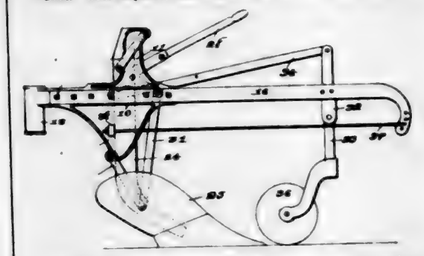


Claim.—1. A tobacco-pipe composed of five parts, detachably connected to each other, viz., a bowl, a mouthpiece, a screw-plug, a stem connected to the mouthpiece and the screw-plug, and a core filling the bore of the stem and having on its exterior surface a parallel series of grooves extending around the axis of the core in a direction at right angles to the axis, and connected with each other by two sets of shorter longitudinal grooves.

2. A tobacco-pipe, the stem of which contains a removable core formed on its exterior surface with a single longitudinal rib, a series of parallel transverse grooves extending around the axis of the core and terminating on opposite sides of the rib, and longitudinal grooves arranged alternately on opposite sides of the rib and connecting the transverse grooves.

3. A tobacco-pipe the stem of which contains a solid removable core formed on its exterior surface with a series of transverse grooves extending around the axis of the core, a longitudinal rib, interrupting the continuity of each annular groove, longitudinal grooves arranged alternately on opposite sides of the rib and connecting the transverse grooves, and end grooves transversely arranged at the opposite ends of the core connected with the longitudinal grooves.

708,405. SULKY PLOW. WILLIAM W. ROBINSON, Des Moines, Iowa. Filed Sept. 13, 1901. Serial No. 75,267. (No model.)



Claim.—1. The combination with the frame of a riding-plow of a standard-supporting frame connected with the plow-frame and vertically slotted to receive a plow-standard, the front edge of the slot being vertical at its upper end and inclining downwardly and forwardly at its lower end, the rear edge of the slot being inclined downwardly and forwardly at its upper end and vertical at its lower end and the sides of the slot being straight and parallel, a plow-standard mounted in the slot and in an engagement, in its lowered position with the vertical portions at the back and front of the slot, and in engagement with the sides of the slot, when in any position levers pivoted to the top portion of the standard-supporting frame in front of the slot and projected rearwardly and downwardly and pivoted to the top portion of the standard, and levers pivoted to the lower portion of the standard-frame and extended in the rear of the slot downwardly and forwardly and pivoted to the lower portion of the standard and means for elevating and lowering the standard.

2. The combination with the frame of a riding-plow of a standard-supporting frame connected with the plow-frame, and vertically slotted, the forward edge of the slot being vertical at its upper end and inclined downwardly and forwardly at its lower end, the rear portion of the slot being inclined downwardly and forwardly at its upper end and vertically at its lower end and the sides of the slot being parallel a standard mounted in said slot and when in its lowered position, engaging both the front and back edges of the slot, means for elevating and lowering the plow-standard and means for tilting the lower end of the standard forwardly and upwardly when elevated, a colter pivoted to the plow-frame to be capable of moving from a substantially vertical position rearwardly and upwardly and means for moving the said colter simultaneously with the movement of the plow-standard.

3. The combination with the frame of a riding-plow of a standard-supporting frame fixed to the plow-frame and vertically slotted, the forward edge of the slot being vertical at its upper end portion and inclined downwardly and forwardly at its lower end portion, the rear edge of the slot being inclined downwardly and forwardly at its upper end portion and vertically at its lower end portion, the sides of the slot being parallel, a plow-standard passed through said slot and when in its lowered position engaging the vertical portions at the front and back of the slot, and when in its elevated position engaging only the sides of the slot, and means for elevating and lowering the plow-standard.

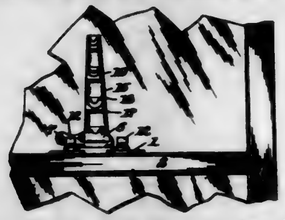
4. The combination with the frame of a riding-plow of a standard-supporting frame, having a vertical slot therein, the sides of the slot being parallel, the front edge of the slot being vertical at its upper end and inclined downwardly and forwardly at its lower end, the rear edge of the slot being inclined downwardly and forwardly at its upper end and vertically at its lower end, the said inclined portions being separated from each other a materially greater distance than the vertical portions are separated, a plow-standard mounted in said slot and when in its lowered position engaging the sides of the slot and the vertical portions of the front and rear edges of the slot and when in its elevated position engaging the sides of the slot only, and means for moving the plow-standard from a position, where its front and rear edges engage the vertical portions of the slot to a position tilted forwardly and upwardly at its lower end where it engages only the sides of the slot, for the purposes stated.

5. The combination with the frame of a riding-plow of a standard-supporting frame connected with the plow-frame and vertically slotted to receive a plow-standard, the front edge of the slot being vertical at its upper end and inclining downwardly and forwardly at its lower end, the rear edge of the slot being inclined downwardly and forwardly at its upper end and vertically at its lower end, and the sides of the slot being straight and parallel, a plow-standard mounted in the slot and in an engagement in its lowered position with the vertical portions of the back and the front of the slot, and in engagement with the sides of the slot, when in any position levers pivoted to the top portions of the standard-frame in front of the slot and projecting rearwardly and downwardly and piv-

end to the top portion of the standard and levers pivoted to the lower portion of the standard-frame in the rear of the slot and extending downwardly and forwardly and pivoted to the lower portion of the standard and means for elevating and lowering the standard, and means for locking the plow-standard in its elevated position.

6. The combination with the frame of a riding-plow of a standard-supporting frame connected with the plow-frame and vertically supported to receive a plow-standard, the front edge of the slot being vertical at its upper end and inclining downwardly and forwardly at its lower end, the rear edge of the slot being inclined downwardly and forwardly at its upper end and vertically at its lower end and the sides of the slot being straight and parallel, a plow-standard mounted in the slot and in an engagement in its lowered position with the vertical portions of the back and front of the slot and in engagement with the sides of the slot, when in any position, levers pivoted to the top portions of the standard and projecting rearwardly and downwardly and pivoted to the top portion of the standard, and levers pivoted to the lower portion of the standard-frame and extending downwardly and forwardly and pivoted to the lower portion of the standard and means for elevating and lowering the standard, a lever fulcrumed to the slotted frame, a link pivoted to said lever and to the plow-standard, said link passing the fulcrum of said lever when the plow-standard moves from its lowered to its elevated position.

708,406. SASH LOCK AND LIFT. CHARLES W. ROBISON, McKees Rocks, Pa. Filed May 10, 1902. Serial No. 106,745. (No model.)



Claim.—1. In a device of the type set forth, the combination of a standard secured to the mid-rail of the upper sash, with shelves arranged in pairs on the standard, each alternate shelf having a downwardly-projecting flange, a frame carried by the mid-rail of the lower sash with a cam-lever pivotally mounted on the frame, and a flange carried by the cam-lever, the under face of the cam-lever engaging and guided by one of said shelves, the flange of the succeeding shelf engaging the flange of the cam-lever, when the latter is in its locked position, and means for automatically locking the handle of the cam-lever, when the latter is locked to the standard.

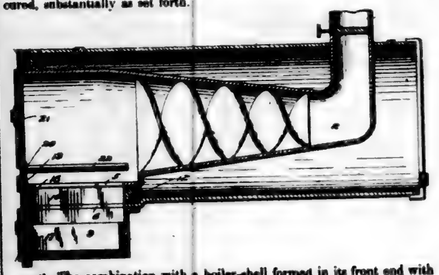
2. In a device of the type set forth, the combination of a standard secured to the mid-rail of the upper shelf and carrying engaging means, a frame mounted on the mid-rail of the lower sash, with a cam-lever, pivoted to the frame, depressible means secured to the frame and adapted to engage the cam-lever and means on the casing to limit the movement of the cam-lever, whereby the latter may be locked between the last-named and the depressible means.

3. A device of the type set forth, comprising a standard secured to the mid-rail of the upper sash and carrying engaging means, with a frame secured to the mid-rail of the lower sash and having a cam-lever pivoted thereto, said frame having openings formed therein, with springs secured to the frame and inclining upwardly and having their ends bent downwardly and outwardly, with the outwardly-bent portion engaging the under side of the frame adjacent said openings thereby limiting the upward movement of the spring, and stops carried by the casing, with the handle of the cam-lever adapted to be received between said stops and downwardly-bent portions of the springs.

4. A device of the type set forth, consisting of a standard secured to the mid-rail of the upper sash, with engaging means thereon, a frame having openings therein and carrying a pivoted cam-lever with a handle thereon secured to the mid-rail of the lower sash, depressible means carrying shoulders secured to the frame and operating in the said openings with steps carried by the frame, the handle of the cam-lever when actuated depressing said depressible means and being locked between said steps and the shoulder of the depressible means.

708,407. STEAM-BOILER. JOSEPH A. SCHLEIER, Pelham, Minn. Filed Nov. 21, 1901. Serial No. 83,116. (No model.)

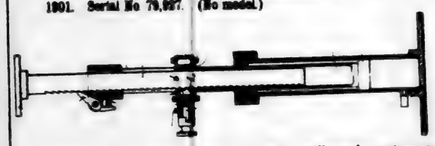
Claim.—1. The combination with a boiler-shell formed in its front end with a longitudinal recess or opening, of a flue located within the boiler-shell and formed with a registering recess or opening, a spiral re-tarder located within said flue, and a yoke-frame comprising a vertically-disposed yoke to which the front ends of the shell and flue are secured and by which they are spaced apart, and provided with a longitudinally-disposed yoke to which the walls of the said recesses or openings are secured, substantially as set forth.



2. The combination with a boiler-shell formed in its front end with a longitudinally-disposed recess or opening; of a flue located within the boiler-shell and formed with a registering recess or opening, and a yoke-frame comprising a vertically-disposed yoke to which the front ends of the shell and flue are secured and by which they are spaced apart and provided with a laterally-disposed yoke to which the walls of said recesses or openings are secured, substantially as and for the purpose specified.

3. The combination with a boiler-shell formed in its front end with a longitudinally-disposed recess or opening; of a flue located within the boiler-shell and formed with a registering recess or opening, and a yoke-frame comprising a vertically-disposed yoke to which the front ends of the shell and flue are secured and by which they are spaced apart and provided with a laterally-disposed yoke to which the walls of said recesses or openings are secured, and an ash-box arranged below said openings, substantially in the manner set forth.

708,408. COMBINED LIFTING-JACK AND AIR-PUMP. JOSEPH G. SCHMIDT and WILLIAM P. MUELLER, Milwaukee, Wis., assignors of one-third to Charles P. Herrmann, Milwaukee, Wis. Filed Oct. 25, 1901. Serial No. 79,927. (No model.)



Claim.—1. An upright air-pump having a hollow piston stem and an attachment in the form of a shank vertically adjustable in said stem.

2. An upright air-pump having a head-bracket, a hollow lever-controlled piston-stem, a retractive spring-controlled pawl carried with said piston-stem for the engagement of a rack-toothed shank engageable with said bracket and stem to be vertically adjustable therein, a shank-detent in connection with the aforesaid bracket, and means for holding the pawl in retracted position.

3. An upright air-pump having a hollow piston-stem provided with an upper collar, lever-trunnions extending from the collar, a pawl in one of the trunnions for engagement with a rack-toothed shank guided in the piston-stem, a trunnion-plug having an outer clutch-face and constituting a guide for a stem of the pawl, a spiral spring intermediate of the pawl and trunnion-plug, a clutch-faced knob on the pawl-stem for match-fit engagement with said plug, a shank-guide head-bracket in connection with the pump-cylinder, and a spring-controlled shank-detent in connection with said bracket.

4. An upright air-pump having its piston-stem made hollow for the engagement of a shank vertically adjustable therein, a lever in connection with the piston-stem, and means for regulating throw of the lever.

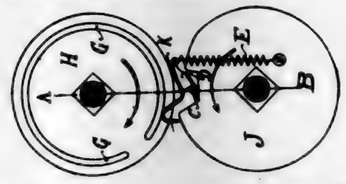
5. An upright air-pump having its piston-stem made hollow for the engagement of a shank vertically adjustable therein, a head-bracket on the pump-cylinder, a lever in connection with said stem, and an adjustable fulcrum-link connecting the lever and bracket.

6. An upright air-pump having a lever-controlled hollow piston-stem and a head-bracket, a rack-toothed headed shank guided in the bracket and piston-stem, a spring-controlled detent in connection with said bracket, a retractive spring-controlled pawl carried with said piston-stem to engage said shank, a spring-controlled shank-detent in connection with the aforesaid bracket, means for holding the pawl in retracted position, and a fulcrum-link connecting the piston-stem lever with said bracket.

7. An air-pump having an attachment in the form of a vertically-adjustable lifting-jack.

8. An air-pump, a rack-toothed lifting-jack engageable with the piston-stem of the pump, an actuating-lever for the piston-stem, a pawl carried with the lever to be engageable with the lifting-jack shank, and a detent for holding said shank in vertically-adjusted position.

708,409. GRIPPING MECHANISM FOR PRINTING-PRESSES. MAX SCHMIDT and EUGEN J. GEISLER, Dresden, Germany. Filed May 21, 1901. Serial No. 61,281. (No model.)



Claim.—1. A gripping mechanism for printing-presses consisting in combination with a printing-cylinder and an impression-cylinder, of a gripping-bar hinged within the impression-cylinder, means connected with the bar and with the impression-cylinder for normally retaining the said bar in a lowered position, releasing-arms carried by the bar, and means carried by the printing-cylinder and engaging the arms for elevating the bar.

2. In a gripping mechanism for printing-presses consisting in combination with an impression and a printing cylinder, of a gripping-bar mounted in a slot formed in the impression-cylinder, means arranged in the said slot for hinging the bar to the impression-cylinder, springs connected to the impression-cylinder and with the bar for retaining the latter normally in a lowered position, releasing-arms connected with the bar, and an offset carried by the printing-cylinder and engaging with the arms for elevating the same.

3. In a gripping mechanism for printing-presses consisting in combination with a printing-cylinder and an impression-cylinder, the latter provided with a suitable slot and a flattened portion, of a clamping-bar suitably connected to the impression-cylinder within the slot thereof, means carried by the impression-cylinder and connected with the bar for normally retaining the same in engagement with the said flattened portion thereof, means for elevating the said bar from its engagement with the flattened portion of the impression-cylinder, and means carried by the printing-cylinder and adapted to engage with the elevating means for operating the same.

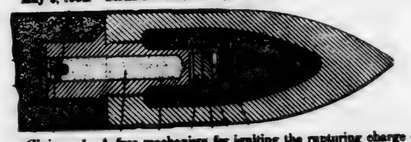
4. In a gripping mechanism for printing-presses, the combination with a printing and an impression-cylinder, of a gripping-bar extending transversely of the impression-cylinder and suitably mounted therein, means for hinging the said bar within the impression-cylinder, means connected to the ends of the impression-cylinder and engaging with the bar for normally retaining the same in a lowered position, bow-shaped releasing-arms carried by said bar, and means carried by the end of the printing-cylinder and during the travel of the latter engaging with the said arms to elevate the said bar, the latter adapted to resume its normal position through the action of the said retaining means when the means carried by the printing-cylinder is out of engagement with the arms.

5. In combination, an impression-cylinder and a printing-cylinder provided with a spring-controlled gripping mechanism and an offset, respectively, said offset adapted to engage said gripping mechanism for releasing it.

708,410. OVERDRAW-CHECK FOR BRIDLES. JOHN B. SCHOTT, Quincy, Ill. Filed Jan. 8, 1902. Serial No. 88,846. (No model.)

Claim.—A bridle, comprising a crown-piece, a single section of spring-wire bent six times at right angles and in the same plane so as to present a central raised loop and a pair of upturned ends in alinement therewith, a flexible plate secured upon said crown-piece and provided centrally with a longitudinal slot for engaging said loop and also provided with holes for engaging said upturned ends, said slot and said holes being in alinement with each other, a buckle secured upon said flexible plate, and a flexible strap engaged by said buckle and disposed within said central raised loop.

708,411. PROJECTILE. JOHN B. SEMPLE, Sewickley, Pa. Filed May 9, 1902. Serial No. 106,800. (No model.)



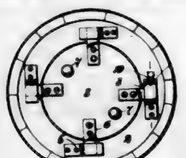
Claim.—1. A fuse mechanism for igniting the rupturing charge of a projectile in combination with a pyrotechnic compound, means for igniting said compound, and common means for connecting said parts to a projectile, substantially as set forth.

2. A mechanism for igniting the rupturing charge of a projectile in combination with a pyrotechnic compound, means for igniting said compound, said parts being united in a common structure and means for attaching such structure to a projectile, substantially as set forth.

3. The combination of a plug or block, mechanism for igniting the rupturing charge of a projectile arranged at one end of said block, a chamber for a pyrotechnic compound formed within the block, means for igniting the said compound arranged at the opposite end of the block or plug, and means for connecting the plug or block to a projectile, substantially as set forth.

4. The combination of a plug or block having a socket or recess at one end and provided with a chamber extending from the opposite end, mechanism for igniting the rupturing charge of a projectile arranged in the socket or recess, and a pyrotechnic compound and its igniting mechanism arranged within the chamber, and means for connecting the plug or block to a projectile, substantially as set forth.

708,412. BARREL-HEAD FASTENING. EDWARD C. SHEARS, La Porte, N. D. Filed Jan. 9, 1902. Serial No. 89,011. (No model.)



Claim.—In a barrel-head fastening a ring-like member secured to a barrel, and a member removably engaging with the ring-like member, locking-plates attached to the ring-like member, and plates attached to the removable member and adapted to engage the outer sides of the first-named plates, the said plates secured to the removable member having inclined upper surfaces, one interlocking pair of plates having their ends turned upward and perforated to receive a sealing-wire, substantially as specified.

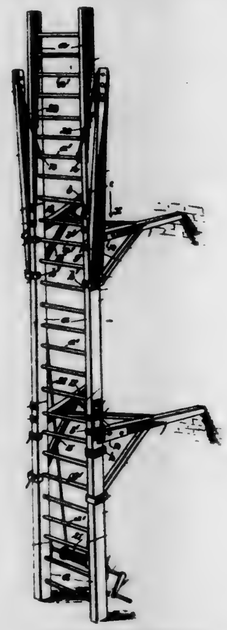
708,418. EXTENSION-LADDER. WILLIAM H. SIBLEY, Wittenberg, Canada, assignor to himself, Harry Judson Crowe, Bridgetown, Nova Scotia, Canada, and Edgar Prior Crowe, Lower Stewiacke, Nova Scotia, Canada. Filed Nov. 26, 1901. Serial No. 83,551. (No model.)

Claim.—1. In an extension-ladder, a plurality of ladder-sections detachably connectible in sequence, a plurality of clip-bands on the side bars of each ladder-section near the upper end, two derrick-arms removably connectible with the clip-bands on the ladder-sections, and a windlass device on the lower ladder-section, and flexible connections between said windlass device and the other ladder-sections, for raising or lowering said ladder-sections.

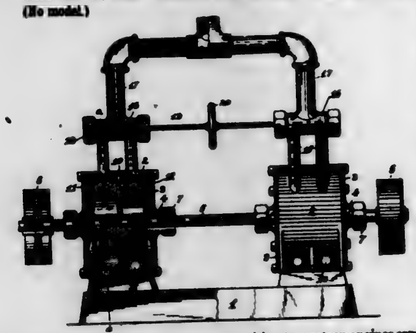
2. In an extension-ladder, a plurality of ladder-sections connectible in sequence, two derrick-arms removably securable on the upper portion of each ladder-section, a pulley held to rotate on the upper end of each derrick-arm, a windlass device on the lower part of the lower ladder-section, and flexible connections wrapped at one end on the windlass device and extended upward to engage with the pulleys.

3. An extension-ladder, comprising a plurality of ladder-sections, connectible in sequence, a windlass on the lower section, two flexible connections extended upward from the windlass, two derrick-arms removably held on side bars of a ladder-section near its upper end, a pulley on the

upper end of each derrick-arm engaged by a respective flexible connection, and a hook on the upper end of each flexible connection, adapted to engage a lower rung of a ladder-section for its elevation when the windlass is rotated.



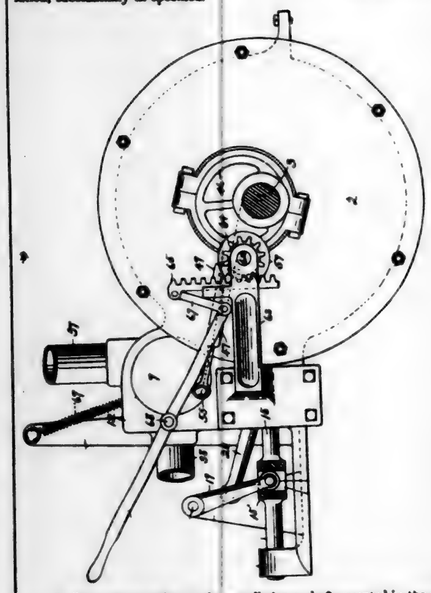
708,414. ROTARY ENGINE. EDWARD L. SELL, Woodward, Okla. Filed Jan. 15, 1900. Renewed July 15, 1902. Serial No. 115,741. (No model.)



Claim.—The improved engine, comprising two rotary engines separated a distance, a main shaft 5 which is common to both engines, two separate valve-casings, one for each of said engines, a rotary valve in each casing, a rotary shaft 19 extending between said valve-casings and being connected to both valves, and a single handhold located on said rotary shaft and adapted to move the latter and thereby simultaneously rotate the valves to admit an equal amount of steam into both engines and to start them at the same time.

708,415. ROTARY ENGINE. EDWARD L. SELL, Gage, Okla. Filed Dec. 4, 1901. Serial No. 84,693. (No model.)

Claim.—1. In a rotary engine, a piston-cylinder, a shaft mounted through the center of the cylinder, a cylindrical drum mounted upon the shaft in the cylinder, an abutment slidingly mounted in position to extend into the cylinder and engage the periphery of the drum, an abutment-rod attached to the abutment and slidingly mounted and having a vertical slot at its center, an antifriction-roller mounted in said slot, a rocker-arm supporting said roller, a rock-shaft supporting said rocker-arm, a second rocker-arm attached to the opposite end of the rocker-shaft, an eccentric-rod attached to the second rocker-arm, an eccentric for operating the eccentric-rod, a spur-pinion attached to the eccentric, and a segmental gear attached to the piston-shaft in position to engage the spur-pinion as required to move the abutment out of the way of the piston at each revolution, substantially as specified.



2. In a rotary engine, a piston-cylinder, a shaft mounted in the center of the cylinder, a piston mounted on the shaft in the cylinder, a sliding abutment mounted in position to extend into the cylinder and engage the piston, a port for admitting steam to one side of the sliding abutment, a rocking valve in position to control the passage through said port, a spring in position to hold the rocking valve in position to control the passage through said port, a spring in position to hold the rocking valve normally closed, an eccentric mounted on piston-shaft, a sleeve extending from the eccentric, an eccentric-rod slidingly mounted in the sleeve, a crank attached to the valve and to said eccentric-rod, a collar mounted on said sleeve, a pawl carried by said collar and in position to removably engage a notch in said sleeve, a tension-spring connecting the sleeve to the eccentric-rod, and an adjustable projection mounted in position to be struck to operate the pawl and release the sleeve as required to release the valve and allow said tension-spring to return it to its normal cut-off position, substantially as specified.

3. In a rotary engine, a piston-cylinder, a shaft mounted in the center of the cylinder, a drum mounted on the shaft in the cylinder, a piston extending from the drum and engaging the inner surface of the cylinder, an abutment slidingly mounted in position to extend into the cylinder and engage the periphery of the drum, locking means for holding the abutment in its normal position against the drum, a tension-spring attached in position to exert its influence toward removing the abutment from its contact with the drum, trip mechanism for unlocking the abutment and the geared connection between the piston-shaft and the abutment whereby the abutment is withdrawn out of the way of the piston at each revolution, the tension of said spring serving to assist in starting the abutment, thereby relieving the shock on the other parts, substantially as specified.

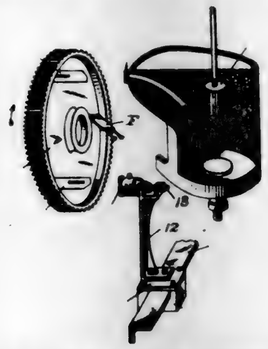
4. In a rotary engine, a sliding abutment mounted in position to cooperate with the piston, lock mechanism for holding the sliding abutment in its normal position, trip mechanism for unlocking the abutment, and geared mechanism for sliding the abutment out of the way of the piston, substantially as specified.

5. In a rotary engine, a piston-cylinder; a shaft mounted in the center of the cylinder; a piston mounted on the shaft and engaging the inner face of the cylinder; a sliding abutment mounted in position to cooperate with the piston; means whereby the abutment is locked in its normal position; trip mechanism for unlocking the abutment; and geared mechanism for sliding the abutment out of the way of the piston, substantially as specified.

6. In a rotary engine, a piston-cylinder; a shaft mounted through the center of the cylinder; a cylindrical drum mounted upon the shaft in the cylinder; a piston extending from the drum to the inner face of the cylinder; a sliding abutment mounted in position to extend into the cylinder and engage the periphery of the drum; means whereby the abutment is locked in its normal position; trip mechanism for unlocking the abutment; and geared mechanism for sliding the abutment out of the way of the piston, substantially as specified.

7. In a rotary engine, a piston-cylinder; a shaft mounted through the center of the cylinder; a cylindrical drum mounted upon the shaft in the cylinder; a piston extending from the drum to the inner face of the cylinder; a sliding abutment mounted in position to extend into the cylinder and engage the periphery of the drum; means whereby the abutment is locked in its normal position; trip mechanism for unlocking the abutment; geared mechanism for sliding the abutment out of the way of the piston; a port leading into the cylinder to one side of the sliding abutment; a valve controlling the passage through said port; and an adjustable means of regulating the valve so as to cut off the steam at any desired point of the piston in the revolution, substantially as specified.

708,416. ATTACHMENT FOR LINOTYPE-MACHINES. ASA D. SMITH, Worcester, Mass. Filed Jan. 21, 1902. Serial No. 90,670. (No model.)

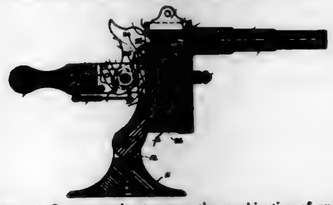


Claim.—1. In a linotype-machine, the combination of the rotatable mold-carrier, the trimming-knife, and an attachment adapted to be secured in position to clean and oil the rear face of a mold after the same has passed the trimming-knife.

2. As an article of manufacture, an attachment for linotype-machines, comprising a spring press-plunger carrying an oil-reservoir having projecting wicking or other fibrous material, and means for securing the plunger in place to clean and oil the rear faces of the mold.

3. In an attachment of the class described, the combination of a bracket or support, means for clamping said bracket or support upon the cross-bar or frame of a linotype-machine, a spring press-plunger mounted in said bracket, an oil-reservoir carried by the plunger, said oil-reservoir having projecting wicking or fibrous material, and a stop-collar for limiting the motion of the spring press-plunger, the said attachment being adapted to clean and oil the rear faces of the molds.

708,417. MAGAZINE TOY GUN. IRVING T. SMITH, Brooklyn, N. Y. Filed Jan. 15, 1902. Serial No. 89,808. (No model.)



Claim.—1. In a magazine toy gun, the combination of an operating-lever firmly secured on one end of the lock-mechanism center-pin, a spring-actuated hammer revolubly mounted on said pin and provided on its rear lower portion with a rounded shoulder, and arms projecting from said pin in opposite directions and carrying one a cylinder-revolving pawl and the other a dog adapted to engage said shoulder.

2. In a magazine toy gun, the combination of operating means firmly secured on one end of the lock-mechanism center-pin, a hammer revolubly mounted on said pin, and means carried by said pin for retracting and releasing said hammer to fire the gun.

3. In a magazine toy gun, the combination of operating means firmly secured on one end of the lock-mechanism center-pin, a hammer revolubly mounted on said pin, means carried by said pin for retracting and releasing said hammer to fire the gun, and means carried by said pin to successively present the cartridges to said hammer.

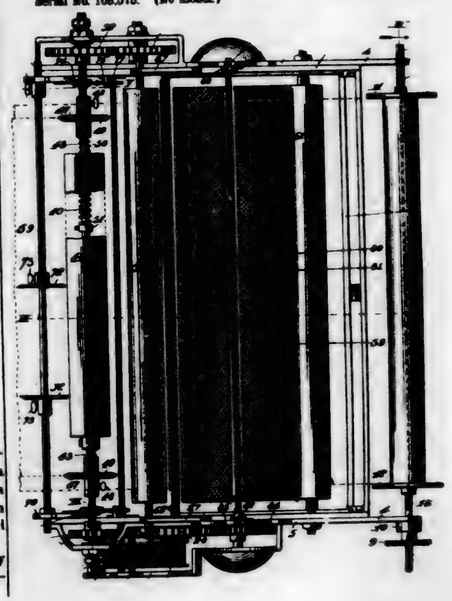
4. An improved magazine toy gun, comprising the barrel, a cylindrical shell arranged at the inner end of the barrel and embodying a fixed portion and a hinged portion, a cylinder revolubly mounted in said shell and provided on its rear face with rearwardly-projecting teeth, operating means firmly secured on one end of the lock-mechanism center-pin, a hammer revolubly mounted in said pin, and means carried by said pin for retracting and releasing said hammer to fire the gun.

5. An improved magazine toy gun, comprising the carriage, a barrel, a cylindrical shell embodying a fixed portion mounted on said carriage and connected with the inner end of said barrel and a hinged portion, a cylinder revolubly mounted in said shell and provided on its rear face with rearwardly-projecting teeth, operating means firmly secured on one end of the lock-mechanism center-pin, a hammer revolubly mounted on said pin, means carried by said pin for retracting and releasing said hammer to fire the gun, and means carried by said pin to successively present the cartridges to said hammer.

708,418. BRAIDING ATTACHMENT FOR SEWING-MACHINES. LUELLA SMITH, Alliance, Nebr., assignor of one-half to James M. Dickey, Monon, Ind. Filed May 10, 1901. Serial No. 59,676. (No model.)

Claim.—A sewing-machine attachment comprising a frame having end posts, guides between which trimming is held, screws connecting the guides to the posts, whereby the guides are horizontally adjustable with relation to each other and to the posts without moving the frame, said frame having a plurality of bars, one of which is adapted to rest on the trimming in operation, whereby proper tension of the trimming is maintained.

708,419. WALL-PAPER TRIMMING AND PASTING MACHINE. JACOB P. SPROOT, St. Louis, Mo., assignor to Avery Wall Paper Machine Company, St. Louis, Mo., a Corporation. Filed Apr. 19, 1902. Serial No. 103,575. (No model.)



Claim.—1. In a wall-paper-pasting machine, the combination of means for applying paste to the paper; and a support for the roll of paper, comprising a pair of uprights, one of which is spring-held to the other, substantially as described.

2. In a wall-paper-pasting machine, the combination of means for applying paste to the paper; and means for holding the roll of paper, comprising a fixed upright, a loosely-supported upright and a spring by which said loosely-supported upright is yieldingly held with relation to said fixed upright, substantially as set forth.

3. In a wall-paper-pasting machine, the combination of means for applying paste to the paper; and means for supporting the roll of paper, said roll-supporting means comprising a rod, an upright fixed to said rod, a second upright loosely mounted on said rod, and a spring providing a connection between said uprights and adapted to hold said loosely-mounted upright toward said fixed upright, substantially as described.

4. In a wall-paper-pasting machine, the combination of means for applying paste to the paper; and means for supporting the roll of paper; said roll-supporting means comprising a longitudinally-movable rod, means for adjusting said rod longitudinally, and a pair of paper-roll-receiving uprights mounted on said rod and one of which is spring-held toward the other, substantially as described.

5. In a wall-paper-pasting machine, the combination of means for applying paste to the paper; and means for supporting the roll of paper; said roll-supporting means comprising a longitudinally-movable rod, means for supporting said rod, an adjustment-nut mounted on said rod, an upright fixed to said rod, a second upright loosely mounted on said rod, and a spring providing connection between said uprights for the purpose of holding said loosely-mounted upright toward said fixed upright, substantially as described.

6. In a wall-paper pasting and trimming machine, the combination with a frame, of a pasting-roller, a feed-roller, a pressure-roller mounted above said feed-roller, trimming-cutters between which said paper is adapted to be passed, a roller carried by the shaft of one of said trimming-cutters, and slitting-cutters arranged in proximity to said last-named rollers, substantially as described.

7. In a wall-paper pasting and trimming machine, the combination with a frame, of a pasting-roller, trimming-cutters between which said paper is adapted to be passed, a roller carried by the shaft of one of said trimming-cutters, and slitting-cutters yieldingly held in proximity to said last-named roller, substantially as described.

8. In a wall-paper pasting and trimming machine, the combination with a frame, of a pasting-roller, trimming-cutters between which said paper is adapted to be passed, a roller carried by the shaft of one of said trimming-cutters, swinging bearing-bars, a shaft mounted in said bearing-bars, slitting-cutters carried by said shaft and arranged in proximity to said last-named roller, and springs connected to said bearing-bars and adjustably connected to the frame of the machine, substantially as described.

9. In a wall-paper pasting and trimming machine, the combination with a frame, of a pasting-roller, trimming-cutters between which said paper is adapted to be passed, a roller carried by the shaft of one of said trimming-cutters, swinging bearing-bars, a shaft mounted in said bearing-bars, slitting-cutters carried by said shaft and arranged in proximity to said last-named roller, springs connected to said bearing-bars and adjustably connected to the frame of the machine, and a stop-screw arranged to limit the movement of said bearing-bars, substantially as described.

10. In a wall-paper-pasting machine, the combination of a pasting-roller, a paste-pan mounted beneath said pasting-roller, and a spring-controlled catch adapted to engage and support said paste-pan, substantially as described.

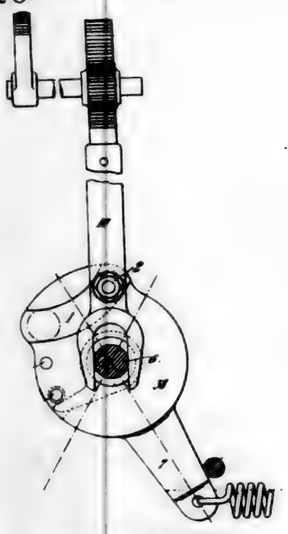
11. In a wall-paper-pasting machine, the combination of means for supporting a roll of paper, and means for rewinding said paper; said rewinding means comprising a spool consisting of a rod and a V-shaped strip applied to said rod, and means for operating said spool to wind the paper thereonto, substantially as described.

12. In a wall-paper-pasting machine, the combination of means for supporting a roll of paper, and means for rewinding said paper, said rewinding means comprising a spool consisting of a rod and a V-shaped strip applied to said rod, bearing-supports for said spool, means for operating said spool to wind the paper thereonto, and spring-held catches adapted to engage said spool to hold it in its bearings, substantially as described.

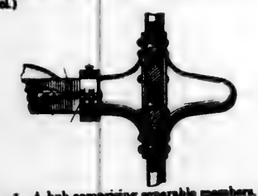
708,420. RELIEF-COLOR-STAMPING PRESS. ROBERT F. SPROULS, London, England, assignor to Photoxylo Die Press, Limited, London, England. Filed Mar. 31, 1902. Serial No. 100,864. (No model.)

Claim.—In a relief-color-stamping press, a cam for working the color-brush, consisting of a disk provided with an offset having in its face a groove in the form of a circular arc in which is engaged a roller mounted on the reciprocating rod which works the brush-gear, substantially as described.

708,420



708,421. VEHICLE-HUB. EDMOND B. STEARNS, Eldorado, Kans., assignor of three-fourths to Wesley R. Songer, George H. Wise, and Waltman Joseph, Potwin, Kans. Filed Jan. 22, 1902. Serial No. 90,516. (No model.)



Claim.—1. A hub comprising separable members, one of which has an outwardly-projecting sleeve with a smooth outer surface and the other an outwardly-projecting tube with a smooth bore to frictionally fit over said sleeve, the tube having an outer integral closed extremity which is normally located in advance of the outer end of the sleeve to form an oil-receptacle, the two members also having opposing radially-projecting flanges which are spaced apart to receive wheel-spokes, and means for securing said flanges.

2. A hub comprising separable members, one of which has an outwardly-projecting sleeve with a smooth outer surface and the other an outwardly-projecting tube with a smooth bore to frictionally fit over said sleeve, the tube having an outer integral closed extremity which is normally located in advance of the outer end of the sleeve to form an oil-receptacle, the two members also having opposing radially-projecting flanges which are spaced apart to receive wheel-spokes, means for securing said flanges combined with an axle-spindle to fit in the sleeve, said spindle having a spiral groove thereabout which extends full length of the spindle and communicates with said outer receptacle.

3. A hub having an outer closed portion combined with an axle having a spindle on which said hub is removably fitted, and an annular clamp comprising hinged sections, one of the sections carrying a pivoted locking-stirrup with a set-screw therein, and the other a lug for engagement by said stirrup and screw.

708,422. COMPOSITION SUITABLE FOR USE IN MAKING TOY BUILDING-BLOCKS OR THE LIKE. JACOB STEPHAN, Cleveland, Ohio, assignor of one-half to Godfrey Fugman, Cleveland, Ohio. Filed Jan. 30, 1902. Serial No. 92,560. (No specimens.)

Claim.—1. A composition consisting of a dry mixture comprising, as ingredients, whiting and a whitish or light-colored or bright sand or pulverized rock material, approximately in the proportions specified, and a small quantity of dark sand or pulverized rock material, and a binding liquid mixed with the dry mixture in the proportions required to render the resulting mass plastic and bind and hold the ingredients of the dry mixture together.

2. A composition comprising a dry mixture composed of a whitish or light-colored or bright sand or pulverized rock material, plaster-of-paris, whiting and dark sand or pulverized rock material in about the proportions, by measure, of one part of whiting, one part of plaster-of-paris, and three parts of the whitish or bright sand, with the dark sand equal in quantity to about one per cent. of the dry mixture, and a binding liquid mixed with the dry mixture approximately in the proportions specified.

3. A composition consisting of a dry mixture composed of whiting and sand or pulverized rock material, approximately in the proportions specified, and a binding liquid mixed with the dry mixture and comprising, as ingredients, white lead, zinc-white, vegetable oil, and paint-drier.

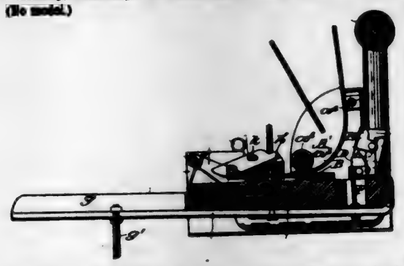
4. A composition consisting of a dry mixture comprising whiting and sand or pulverized rock material, approximately in the proportions specified, and a binding liquid mixed with the dry mixture and comprising, as ingredients, white lead, zinc-white, linseed-oil, and paint-drier, approximately in the proportions specified.

5. A composition consisting of a dry mixture comprising sand or pulverized rock material and whiting, approximately in the proportions specified, and a binding liquid mixed with the dry mixture in the proportions of about ten per cent. of the liquid and ninety per cent. of the dry mixture, with the liquid comprising, as ingredients, white lead, zinc-white, vegetable oil, and paint-drier.

6. A composition composed of a dry mixture and a binding liquid mixed with the mixture and binding or holding the ingredients of the dry mixture together, with the dry mixture comprising, as ingredients, sand or pulverized rock material, plaster-of-paris and whiting approximately in the proportions specified, and with the binding liquid comprising, as ingredients, white lead, zinc-white, vegetable oil and paint-drier approximately in the proportions specified.

7. A composition comprising a dry mixture and a binding liquid mixed with the dry mixture approximately in the proportions specified, with the dry mixture comprising, as ingredients a whitish or light-colored or bright sand or pulverized rock material, plaster-of-paris, whiting, and dark sand or pulverized rock material approximately in the proportions specified, and with a binding liquid comprising, as ingredients, white lead, zinc-white, vegetable oil, and paint-drier in approximately the proportions specified.

708,423. MACHINE FOR AFFIXING POSTAGE-STAMPS OR LABELS UPON ENVELOPS, CARDS, &c. ROBERT H. STROUD, Galesburg, Ill., assignor of two-thirds to William O. B. Bradley and John P. McCaffery, Galesburg, Ill. Filed Apr. 1, 1902. Serial No. 100,894. (No model.)



Claim.—1. In a machine for the purpose set forth, a base having thereon a water-supply tank, a moistener below the end of a pipe connected with the water-tank, a reciprocating carriage which travels in the rear of the moistener, two cutters each pivotally mounted at right angles to the other, and a plate which provides a space open on two sides, substantially as shown.

2. In a machine for the purpose set forth, the combination with a plate having an opening to receive an envelop, a moistening device constructed to contact with a part of the envelop in its passage beneath the plate to moisten each part of the envelop, a blade coacting with one edge of the plate and a blade coacting with the other edge and with the first-mentioned blade, the blades being relatively movable with respect to each other to sever a piece from a sheet, one of the blades having a flat portion of sufficient width to cover the severed portion of the sheet, for the purpose set forth.

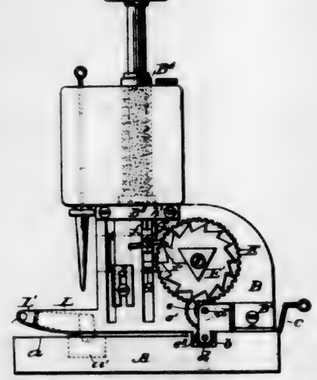
3. In a machine for clipping and affixing rectangular pieces from a gummed sheet, the combination with a pivoted and upwardly-movable moistening-pad, fixed lower cutters and movable upper cutters arranged in line therewith and at right angles to each other, a carriage carrying a gummed sheet, means for moving the carriage step by step and means for depressing the upper cutters, substantially as shown.

4. In a machine for the purpose set forth, a carriage having a rack-bar rigidly attached thereto, a rod for supporting the carriage said carriage being in swinging and in sliding engagement therewith, a stop and clutch mechanism for engagement with the rack-bar, comprising a pivotally-supported dog, a pawl which overlies one side of the dog and the end thereof, the overlying side of the pawl arranged to engage the teeth of the ratchet-plate, substantially as set forth.

5. In a machine for the purpose set forth, the combination of a reciprocating carriage, a supporting-rod therefor, a stop and release mechanism comprising a fixed ratchet-plate which moves in unison with the carriage, a pawl with which the vertical members of the teeth of the ratchet-plate engage, a dog also engaged by the same portion of the ratchet-teeth, means for swinging the dog and the pawl when the latter is engaged by the ratchet-plate to provide a space between the dog and pawl for the passage of one teeth of the ratchet-plate, a spring-drum, a flexible connection between the drum and the carriage, a lever with which the stop and release mechanism is connected, a pivoted bar connected to the dog, fixed lower cutter and movable upper cutters carried by the base, the upper cutters being in movable engagement one with the other, and a rod connecting one of the upper cutters with the pivoted bar to operate the upper cutters when the bar is depressed, substantially as shown.

6. In a device for the purpose set forth, the combination of a base a carriage supporting frame attached to the base, a carriage movable on the frame, a ratchet-plate attached to the carriage, a spring-actuated drum mounted on the base, a flexible connection attached to the drum and to the carriage, a lever pivoted to the under side of the base, a stop and release mechanism actuated by the lever for engagement with the ratchet-plate, a pair of pivoted cutters arranged at right angles to each other, a spring for lifting one of the cutters, fixed lower cutters which coöperate with the pivoted cutters, means for connecting one of the blades to the lever, means carried by said blade for engagement with the pivoted blade at right angles thereto, and a moistener in proximity to the cutting-blades, substantially as shown.

708,424. STAMP-AFFIXING MACHINE. ROBERT H. STROUD, Galesburg, Ill., assignor of two-thirds to William O. B. Bradley and John P. McCaffery, Galesburg, Ill. Filed Apr. 16, 1902. Serial No. 103,142. (No model.)



Claim.—1. In a stamp or label affixing machine, the combination with a base provided at one end with a spring-depressed moistening-pad, a water-supply tank above the pad, and a water-receptacle below the pad, of a frame provided with feed-rolls and actuating mechanism therefor, such mechanism including a ratchet-wheel, trips carried by the frame, a plunger having a flat plate at its lower end, an oscillating pawl carried by the plunger to engage one of the trips on its upward movement and the ratchet-wheel on its downward movement, a pivoted dog carried by the plunger to engage the other trip and release the pawl, and a blade which is raised by a spring and depressed by engagement with a stud on the plunger as the plunger is moved downward, substantially as shown and for the purpose set forth.

2. In a stamp or label affixing machine, the combination with a reciprocating plunger, a frame having an overhanging portion one end of which carries a spring-depressed moistening device, feed-rollers on the opposite side of the overhanging frame from the moistening device, a flat portion between the feed-rolls and the moistening device, of a train of gears for actuating the feed-rolls, a ratchet-wheel included in the train,

3. In a stamp-affixing device, means for feeding and pressing a stamp upon a moistened surface, a moistening device comprising a pivotally-supported and spring-depressed frame, a pad-carrying frame pivoted to the spring-depressed frame to be susceptible of an oscillating movement thereon, and means for applying water to the moistening-pad, substantially as shown.

4. In a stamp-affixing-machine, the combination with a base, of a frame attached to the base to overhang the major portion of the ear a, a moistening device pivotally attached to one end of the overhanging frame, and a plunger carried by an intermediate part of the overhanging part of the frame, feed mechanism to one side of the overhanging portion of the frame, the feed mechanism having feed-rollers above and below the base, a fixed cutter adjacent to the feed-rolls, and a pivoted cutter-spring actuated in one direction and depressed by the plunger when the same is lowered, substantially as shown and for the purpose set forth.

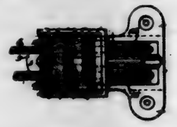
5. In a stamp-affixing machine, the combination of a plunger which is spring-actuated in one direction, an oscillating pawl attached to a rock-shaft which is carried by the plunger, a dog pivoted to the plunger, a tumbler on the rock-shaft with which the dog engages, stops carried by the frame with which the dog and pawl engage, and a ratchet-wheel for operating the feed mechanism said ratchet-wheel being turned by the pawl on its downward stroke, for the purpose set forth.

6. In combination with a plunger having on one side a projecting stud, of a blade-spring actuated in one direction, an open-ended slot through the blade into which the stud passes to depress the blade on the downward movement of the plunger and raise the same on the upward stroke thereof, and a spring which engages the slot in the blade and the base to hold the blade normally raised, substantially as shown.

7. In a stamp-affixing machine, the combination of a frame having a vertical slot, a reciprocating plunger attached to the frame, a rock-shaft carried by the plunger, a tumbler on one end of the rock-shaft, a pawl attached to the other end, a dog pivoted to the plunger to engage the tumbler, a stop with which the pawl engages to set the same and limit the upward movement of the plunger, a trip in line with the dog, feed-rollers actuated by the pawl, and a cutter which is depressed by the plunger, the parts being organized substantially as shown and for the purpose set forth.

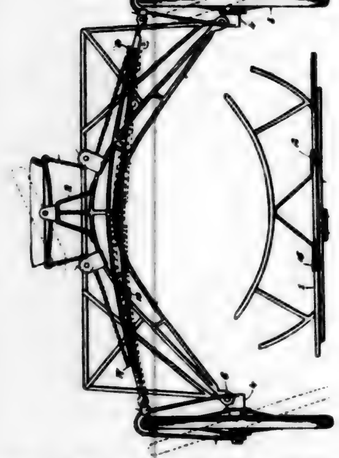
8. In a stamp-affixing machine, the combination of a frame having a vertical slot therethrough, a stop-plate adjacent to the upper end of the slot, an adjustable trip-plate carried by the frame, a rock-shaft having on one end an adjustable pawl and on the other end a tumbler which is engaged by a dog, one end of the dog being in line with the adjustable trip-plate, and a feed mechanism operated by a ratchet-wheel which is engaged by the pawl during a part of the downstroke of the plunger, substantially as shown.

708,426. APPARATUS FOR OPERATING VENETIAN BLINDS. Thomas Shennerton, Christchurch, New Zealand. Filed Apr. 3, 1902. Serial No. 101,598. (No model.)



Claim.—1. The combination in apparatus for the purpose indicated of a drum having recesses upon its circumferential periphery and revolving with the cord-pulleys of a Venetian blind, operating-cords passing over said cord-pulleys, a pivoted trip-lever the rear end of which has a projection adapted to engage in any one of said recesses, a cross-bar at the forward end of said trip-lever, and pivoted grip-levers serrated at their lower ends and having projections from their upper ends adapted to be engaged by said cross-bar when the rear end of the trip-lever is raised as specified.

2. The combination in apparatus for the purpose indicated of grip-levers having serrations at their lower ends said levers being pivoted above the operating-cords of a Venetian blind and normally tending to grip same by the weight of the blind upon the cords projections from the grip-levers, a pivoted trip-lever having a bar adapted to engage such projections a projection from the rear end of the trip-lever adapted to engage in any



Claim.—1. In a sulky, an axle, wheel-spindles having swinging connection with the axle, yokes extended upward from the spindles, a shifting bar connecting with said yokes, a rocking seat on the axle, connections between said seat and said bar, a post carried by the bar, and a loop on the axle through which said post passes, substantially as specified.

2. In a sulky, an axle, wheel-spindles pivoted to the axle, yokes extended upward from the spindles, a shifting bar having pivotal connection with said yokes, a seat mounted to rock on the axle, pulleys supported on the axle, and chains extended from the opposite sides of the seat around said pulleys and connected with opposite ends of the shifting bar, substantially as specified.

708,427. DEHLDOME-COVERING. Franklin S. Thomas and Leopold Thomas, East Stroudsburg, Pa. Filed Sept. 24, 1901. Serial No. 76,431. (No model.)

Claim.—1. The combination, in a demijohn-covering, of a wooden disk or bottom having sockets, *b*, in its outer edge, and an annular bevel, *d*, on its under side, with the cushion-base D, composed of reed strips *g*, *h*, *i*, which bear upon the outer edge and annular bevel of the disk, engage and bind the ribs C in place and project beneath the lower surface of the said disk or bottom, all substantially as herein shown and described.

2. In a demijohn-covering, the disk or bottom B, consisting of veneer layers *a*, *b*, *c*, the middle layer, *b*, having radial slots *f*, and the bottom one, *c*, an annular bevel *d*, which said layers, *a*, *b*, *c*, are rigidly joined by glue or other suitable means in such manner that those in contact will be crossed in relation to each other with respect to their grains, all substantially as herein set forth.

708,428. GREENHOUSE CONSTRUCTION. Frank Van Arsdel, Jersey City, N. J. Filed Apr. 16, 1902. Serial No. 103,324. (No model.)

Claim.—1. In greenhouse construction, the combination of the metallic frame part, the glass plate, and a yielding or spring-like fastening extending between the metallic frame-bar and the glass plate, for the purpose specified, said fastening being formed of spring-wire bent to produce an intermediate coil for engagement with the said frame part and end portions separated from each other to engage the glass at different points thereon.

3. In greenhouse construction, the combination of the metallic frame-bar having the longitudinally-disposed web, the glass plates lying on the frame-bar at opposite sides of the web, a transverse pin carried in the web, and yielding or spring-like fastenings at the ends of the pin and bearing on the glass plates, for the purpose specified, said fastenings being formed of spring-wire bent to produce an intermediate coil encircling the pin and end portions separated from each other to engage the glass plates at different points.

4. The combination of the metallic frame part, a pin carried thereby, overlapping glass plates resting on the frame part, and a spring-fastening comprising a length of spring-wire bent to produce an intermediate coil encircling the pin and end portions separated from each other, one end portion lying on top of the top plate and the other end portion lying on top of the other plate and against the adjacent edge of the top plate.

5. The combination of the metallic frame part, a pin carried thereby, overlapping glass plates resting on the frame part, and a spring-fastening comprising a length of spring-wire bent to produce an intermediate coil encircling the pin and end portions separated from each other, one end portion lying on top of the top plate and the other end portion lying on top of the other plate and against the adjacent edge of the top plate, the last-named end of the spring-fastening being turned laterally with respect to the frame part, so as to engage its side with said edge of the top glass plate.

6. A spring-fastening for greenhouse construction, said fastening being formed of a length of spring-wire bent to produce an intermediate coil and having its end portions projected oppositely from each other to bear on the glass plates at different points, one of said end portions being turned laterally to present its side to the end edge of one adjacent glass plate.

708,429. PROCESS OF PRINTING WITH SULFUR DYES. Ernst Vortmann, Oerdingen, Germany. Filed June 13, 1902. Serial No. 111,884. (No specimens.)

Claim.—1. The process for printing with sulfur dyes upon textile fabrics which consists in mixing dyestuff, free from sulfuret of alkali with sulfur and alkalies, printing the mixture upon a textile fabric and steaming and developing the dye upon the fabric.

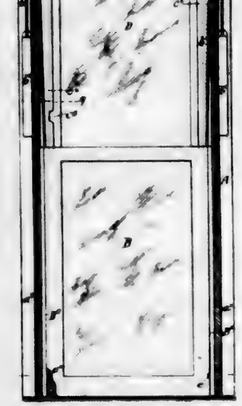
2. The process for printing with sulfur dyes upon textile fabrics which consists in purifying the dyestuff, mixing the same with sulfur and carbonate of alkali, printing the mixture upon a fabric and steaming and developing the dye stuff upon the said fabric.

708,430. WINDOW FRAME AND SASH. Charles L. Wall, Philadelphia, Pa. Filed May 13, 1902. Serial No. 107,076. (No model.)

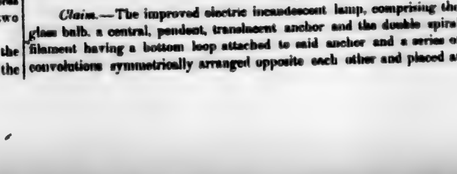
Claim.—1. The combination of a window-frame having weight-boxes, guideways for the lower sash, a removable piece secured to the frame so that access may be had to said boxes, a sash having strips at each side, pins on the strips arranged to enter openings in the sash, one of said strips being of flexible material so that it can be bent to allow its pin to clear the opening in the sash and thereby permit the removal of said strip, substantially as described.

2. The combination of a window-frame having ways formed by permanent beading, upper and lower sashes arranged to travel in said ways, the beading between the sashes extending part way down the frame, the lower sash having strips detachably secured to each side so that when one of the strips is removed the sash can be pushed to one side to allow the other strip to be removed, with an upper sash also less than the width of the frame, with counterbalancing devices for the two sashes, substantially as described.

3. The combination in a frame having ways, a beading between the upper and lower sashes, a rabbet on the lower sash extending over the

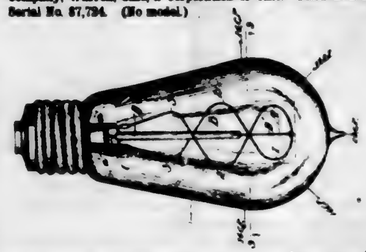


708,431. BED-FRAME. Frederick W. Walker, Utica, N. Y. Filed Oct. 5, 1900. Serial No. 32,131. (No model.)



Claim.—In a bed-frame, the combination of angle-bar side rails provided with end coupling-hangers, each hanger having a flange secured to the vertical flange of a rail, the hangers extending vertically above the horizontal planes of said rails, the hangers at one end of the frame provided with elevated abutments 21, above said rails, angle cross-bars between the ends of said rails and resting directly on the top flanges of the rails, means for adjusting one of said cross-bars longitudinally of said rails, the other cross-bar having its vertical flange held against said abutments of said hangers, and the shouldered clips 17, secured at 18, on the horizontal flanges of said rails inwardly of said bar and projecting under the top flanges of the rails and lapping outwardly over the horizontal flange of the cross-bar, substantially as described.

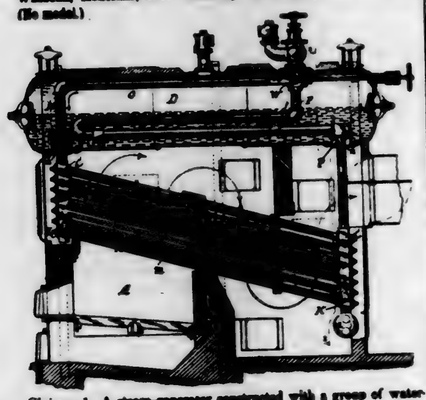
708,432. INCANDESCENT ELECTRIC LAMP. Glenn C. Webster, Warren, Ohio, assignor to the Sterling Electrical Manufacturing Company, Warren, Ohio, a Corporation of Ohio. Filed Dec. 30, 1901. Serial No. 87,794. (No model.)



Claim.—The improved electric incandescent lamp, comprising the glass bulb, a central, pendent, translucent anchor and the double spiral filament having a bottom loop attached to said anchor and a series of convolutions symmetrically arranged opposite each other and placed at

different distances from the anchor, as shown and described for the purpose specified.

708,433. SUPERHEATER FOR STEAM-GENERATORS. HENRY WEBBER, Montclair, N. J. Filed Apr. 27, 1901. Serial No. 57,949. (No model.)



Claim.—1. A steam-generator constructed with a group of water-tube sections, and having one of said sections forming said group, partitioned therefrom and connected to communicate with the steam-space and steam-outlet, to form a steam-superheating section, as set forth.

2. A steam-generator having a steam-superheating space partitioned therefrom, as described, provided with an auxiliary safety-valve adjusted to open in advance of the main safety-valve of the generator, as set forth.

708,434. MACHINE FOR STRINGING TOBACCO. CHARLES G. WELLS, Hartford, Conn., assignor to The Firm of Pealsee and Wells, a copartnership composed of Charles G. Wells and Augusta Pealsee, Windsor, Conn. Filed June 28, 1898. Serial No. 113,124. (No model.)

Claim.—1. The combination, with a bed having devices for hanging leaves by their stems, of a movable punch or needle constructed to retain a cord and to insert such cord in the stems.

2. The combination, with a bed having a series of kerfs, of a stem-retaining device in each of said kerfs, a perforating instrument adapted to receive and carry a cord; and means for actuating said perforating instrument.

3. The combination, with a grooved block having transverse recesses, of points projecting into said recesses, and upon which the stems of the leaves are impaled; and a tool working in the groove of the block and constructed to carry a cord through the stems.

4. The combination, with a bed having a series of recesses and a groove intersecting each of said recesses, of stem-retaining devices in said recesses; and a punch or needle adapted to receive and carry a cord through the stems.

5. The combination, with a bed having a series of recesses, of stem-retaining devices in said recesses; a series of ejectors; a movable punch or needle adapted to carry a cord through the stems; means for actuating said punch; and means for actuating the ejectors.

6. The combination, with a bed-plate having a series of projections, slotted on their ends, of stem-retaining devices between said projections; ejectors; a movable punch or needle adapted to receive and carry a cord; means for actuating said punch; and means for actuating said ejectors.

7. The combination, with a bed-plate, of a block having a series of transverse passages; an impaling-point in each of said transverse passages; a series of ejectors, one in each of the passages; a movable punch or needle adapted to carry a cord; means for actuating the punch; and means for actuating said ejectors.

8. The combination, with a bed, of a block having a series of transverse kerfs and a longitudinal bore intersecting said kerfs; a belt carrying a punch or needle movable in said bore; and means for actuating said belt.

9. The combination, with a bed having transverse passages, of a block having a longitudinal guideway; a punch or needle movable in said guideway; a belt to which said punch is secured; and a movable cover for said block inclosing the belt and punch.

10. In a tobacco-stringing machine, the combination, with a movable cord-carrying tool, of means for hanging tobacco-leaves by their stems in the path of said tool.

11. The combination, with a bed having retaining devices for tobacco-leaves, of a movable perforating and cord-carrying tool; a belt to which said tool is secured; and means for actuating the belt.

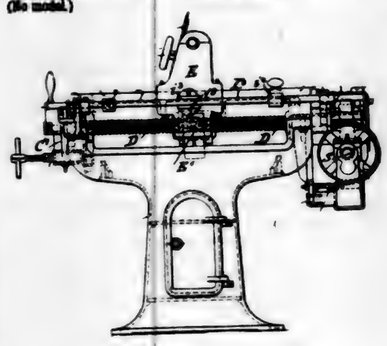
12. In a tobacco-stringing machine, the combination, with a plate having transverse passages separated by slotted projections, and also having a guideway, of means upon which the stems of tobacco-leaves may be impaled; a punch or needle constructed to carry a cord; means for actuating said punch or needle; and devices for ejecting the strung leaves.

13. The combination, with a plate having transverse passages and slotted projections between said passages, of impaling-points, one located in each passage, upon which tobacco-leaves may be hung by their stems; a series of ejectors; and an eccentrically-pivoted block for actuating said ejectors.

14. In a tobacco-stringing machine, the combination, with a guide-block, of a punch or needle reciprocative in said guide-block; a belt to which said punch or needle is secured, said belt being movable in a groove of the guide-block; and pulleys having a sprocket connection with said belt.

15. In a tobacco-stringing machine, the combination, with a guide-block having a longitudinal groove, of a belt movable on said block; pulleys over which the belt passes; means for actuating one of said pulleys; a cover-plate upon the block; a punch or needle, the shank of which is secured to the run of the belt passing over the block, said punch or needle being adapted to carry a cord; and means for retaining tobacco-leaves in position to have their stems perforated by said punch and strung upon the cord.

708,435. MACHINE FOR SHAVING ELECTROTYPES. FERDINAND WEBER, Brooklyn, N. Y. Filed July 27, 1901. Serial No. 69,997. (No model.)



Claim.—1. In a stereotype-shaving machine, the combination with the bed-plate, of a knife-head guided on the same, a shaving-knife supported by said knife-head, means for reciprocating the knife-head, a stop-gage guided in a recess of the bed-plate, a lower yoke-shaped piece secured to said stop-gage, and means, in said yoke-shaped piece, for raising or lowering said stop-gage, substantially as set forth.

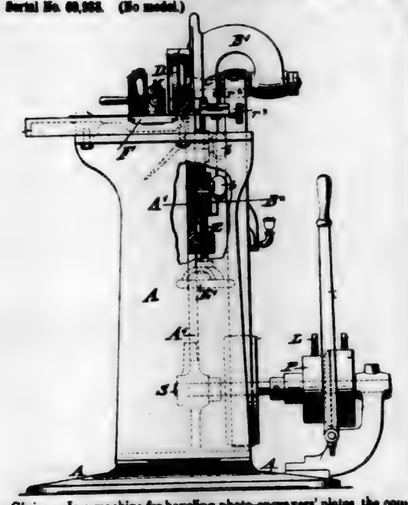
2. In a stereotype-shaving machine, the combination, with the bed-plate, of a stop-gage guided in a recess of the bed-plate, an eccentric engaging the lower portion of said stop-gage, and means for turning said eccentric for raising or lowering the stop-gage, substantially as set forth.

3. In a stereotype-shaving machine, the combination, with the knife-head, of a transverse knife-bar in said head, inclined ways on which said bar is adjusted, a shaving-knife attached to said bar, a transverse shaft provided with eccentric rings, a worm-gear for turning said shaft, and means by which said rings engage the knife-bar for adjusting the same, substantially as set forth.

4. In a stereotype-shaving machine, the combination, with the knife-head, of a transverse knife-bar guided in said head, a shaving-knife attached to said knife-bar, means for adjusting the knife-bar in the knife-head, and an indicating device actuated by the knife-bar for indicating the adjustment of the shaving-knife, substantially as set forth.

5. In a stereotype-shaving machine, the combination with the knife-head, of a transverse knife-bar guided on said head, a shaving-knife attached to said knife-bar, means for adjusting said knife-bar in the knife-head, and an indicating device actuated by the knife-bar and consisting of a graduated dial-plate, a pointer and motion-transmitting gearing between the knife-bar and the pointer for moving the latter over the dial and indicating the required adjustment of the knife-bar, substantially as set forth.

708,436. MACHINE FOR BEVELING PHOTO-ENGRAVERS' PLATES. FERDINAND WEBER, Brooklyn, N. Y. Filed July 27, 1901. Serial No. 69,998. (No model.)

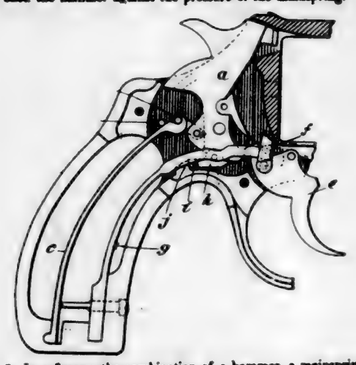


Claim.—In a machine for beveling photo-engravers' plates, the combination, of a supporting-frame, a table on the same provided with longitudinal ways, a reciprocating slide-plate guided in said ways, a vertically-adjustable yoke-shaped support, a vertical web depending from said table, ways provided in said web, the inner arm of said support being guided in the ways of said web, a screw and hand-wheel on said web for adjusting said support, a clamping-screw for securing said support in adjusted position, and a rotatable beveling-disk mounted on said support, substantially as set forth.

708,437. REVOLVER-LOCK. JOSEPH H. WEBSTER, Springfield, Mass. Filed Mar. 15, 1901. Serial No. 51,872. (No model.)

Claim.—1. In a firearm, a pivoted hammer, a mainspring connected to said hammer and tending to throw it forward, a safety-catch pivoted to the hammer, an incline on the frame against which said safety-catch bears with cam action to rebound the hammer, and a spring acting on said catch to force it along the incline, all combined.

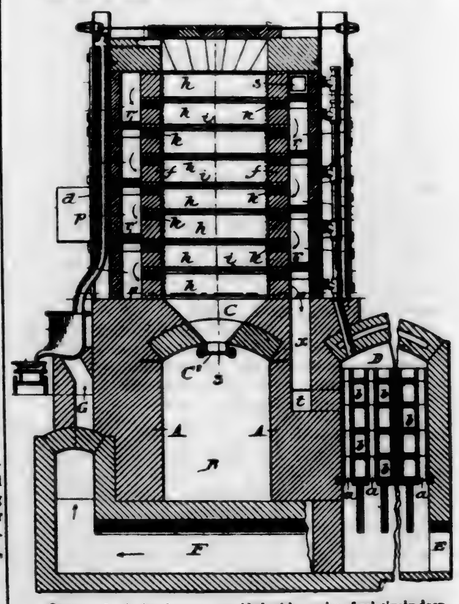
2. In a firearm the combination of a pivoted hammer, a mainspring connected to the hammer to throw it forward, a safety-catch pivoted to the hammer, and an incline on the frame with which said safety-catch engages in certain positions as described, said incline acting as a cam to force back the hammer against the pressure of the mainspring.



3. In a firearm the combination of a hammer, a mainspring acting on the same to force it to striking position, a safety-catch pivoted to the hammer, a cam or incline in the frame with which said safety-catch makes contact in certain positions, and the trigger-spring engaging said catch to force it along the incline, thereby rebounding the hammer.

4. In a firearm, the combination of a hammer and mainspring a safety-catch pivoted to the hammer, an incline in the frame against which the free end of the catch bears in certain relations, and automatic means operating to force said catch along the incline, thereby rebounding the hammer.

708,438. ZINC-FURNACE. WILLIAM C. WETHERILL, Joplin, Mo. Filed Oct. 12, 1900. Serial No. 32,655. (No model.)



Claim.—1. A zinc-furnace, provided with a series of relatively deep, long and narrow charge-containing chambers, and removable tile combustion-flues separating said chambers from each other and forming the walls thereof, whereby the furnace may be charged and discharged without dismantling it, the destructive effects of the slags are largely obviated and the loss of zinc by absorption is materially reduced; substantially as described.

2. A zinc-furnace, provided with a series of relatively deep, long and narrow charge-containing chambers, and removable tile combustion-

flues forming a zigzag passage and constituting the division-walls of said chambers, whereby the furnace may be charged and discharged without dismantling it, the destructive effects of the slags are largely obviated and the loss of zinc by absorption is materially reduced; substantially as described.

3. A zinc-furnace, provided with a series of relatively deep, long and narrow charge-containing chambers, removable tile combustion-flues separating said chambers from each other, said chambers being provided with top feed-openings and bottom discharge-openings, and exit-pipes for connecting the chambers with a condenser, whereby the furnace may be charged and discharged without dismantling it, the destructive effects of the slags are largely obviated and the loss of zinc by absorption is materially reduced; substantially as described.

4. A zinc-furnace, provided with a series of relatively deep, long and narrow charge-containing chambers, separated from each other by removable combustion-flues, said combustion-flues consisting of hollow tiles extending entirely across the said chambers and supported at their ends upon partition-walls, the ends of the tiles being joined by connecting-passages beyond said partition-walls, whereby the furnace may be charged and discharged without dismantling it, the destructive effects of the slags are largely obviated and the loss of zinc by absorption is materially reduced; substantially as described.

5. A zinc-furnace, provided with a series of relatively deep, long and narrow charge-containing chambers, separated by removable combustion-flues, said combustion-flues consisting of hollow tiles located one above the other and extending entirely across the said chambers and supported at their ends upon partition-walls, the ends of the tiles being joined by connecting-passages beyond said partition-walls, and luting material located in recesses between the top of one tile and the base of another throughout the series, whereby the furnace may be charged and discharged without dismantling it, the destructive effects of the slags are largely obviated and the loss of zinc by absorption is materially reduced; substantially as described.

6. A zinc-furnace, provided with a series of relatively deep, long and narrow charge-containing chambers, separated from each other by removable combustion-flues, said combustion-flues consisting of hollow tiles extending entirely across the said chambers and supported at their ends upon partition-walls, the ends of the tiles being joined by connecting-passages beyond said partition-walls, and flat arches above the several series of combustion-flues whereby the furnace may be charged and discharged without dismantling it, the destructive effects of the slags are largely obviated and the loss of zinc by absorption is materially reduced; substantially as described.

7. A zinc-furnace, provided with a series of relatively deep, long and narrow charge-containing chambers, separated from each other by removable combustion-flues, said combustion-flues consisting of hollow tiles extending entirely across the said chambers and supported at their ends upon partition-walls, the ends of the tiles being joined by connecting-passages beyond said partition-walls, and flat arches above the several series of combustion-flues, and luting material located in recesses between the top of one tile and the base of another throughout the series, and between the uppermost tiles and the bases of the arches whereby the furnace may be charged and discharged without dismantling it, the destructive effects of the slags are largely obviated and the loss of zinc by absorption is materially reduced; substantially as described.

8. A zinc-furnace, provided with a series of relatively deep, long and narrow charge-containing chambers, separated from each other by removable combustion-flues, said combustion-flues consisting of hollow tiles extending transversely of the chambers, and provided at their lower edges with overhung recesses; substantially as described.

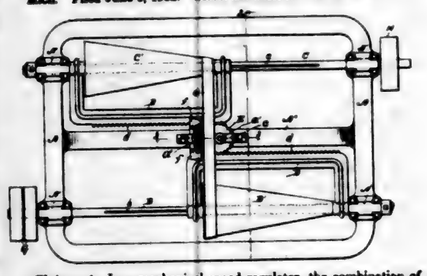
9. A zinc-furnace, provided with a series of relatively deep, long and narrow charge-containing chambers, separated from each other by removable combustion-flues, said combustion-flues consisting of hollow tiles having projections extending along their bases and within their lower edges, thereby forming luting-recesses and outlying overhung vapor-conveying recesses; substantially as described.

10. A zinc-furnace, provided with a series of relatively deep, long and narrow charge-containing chambers, separated from each other by removable combustion-flues, said combustion-flues consisting of tiles of the general configuration of truncated prisms, provided along their bases with lugs or shoulders extending longitudinally thereof; substantially as described.

11. A zinc-furnace, provided with charge-containing chambers and means for externally heating the same, condenser-pipes leading from said chambers and passing through a temperature-regulating compartment within the furnace-walls, and doors for said compartment adapted to be open or closed as desired whereby the temperature of said compartment is regulated; substantially as described.

12. A zinc-furnace, provided with charge-containing chambers and means for heating the same externally, condenser-pipes leading from the chambers, and metal-pots into which said condenser-pipes discharge, said metal-pots being located in the path of the waste products of combustion on their passage to the chimney-stack; substantially as described.

708,439. SPEED-REGULATOR. HENRY P. WHITE, Kalamazoo, Mich. Filed June 9, 1902. Serial No. 110,949. (No model.)



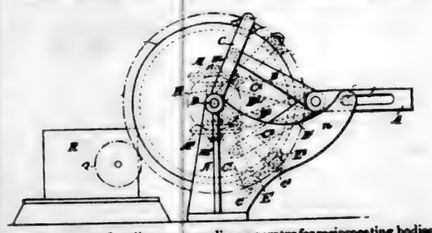
Claim.—1. In a mechanical speed-regulator, the combination of a frame A; shafts B and C supported in suitable bearings in said frame; a driven tapered cone; a driving tapered cone, the like ends of which point in the same direction, slidably mounted upon said shafts; yokes D, D, having racks *d* thereon engaging said cones; a gear F adapted to engage said racks; a belt *a* connecting said cones; guides *a'*, *a'*, to retain said belt in position; and means for controlling said gear, whereby the relative positions of said cones may be shifted to vary the relations of their speed, as specified.

2. In a mechanical speed-regulator, the combination of a supporting-frame; a driven tapered cone adapted to be connected to a source of power; a driving tapered cone adapted to be connected to the machine it is designed to operate, said cones being arranged parallel and with their like ends pointing in the same direction; a belt connecting said cones; connecting means for said cones whereby they may be adjusted an equal distance in opposite directions to vary the relation of their speed, as specified.

3. In a mechanical speed-regulator, the combination of cones adapted to revolve upon their axes, arranged parallel so that their like ends point in the same direction; a belt connecting said cones; means for retaining said belt in proper position; and means for changing the relative lateral position of said cones to vary the relation of their speeds.

4. In a mechanical speed-regulator, the combination of cones adapted to revolve upon their axes, arranged parallel so that their like ends point in the same direction; a belt connecting said cones; and means for changing the relative lateral position of said cones to vary the relation of their speeds.

708,440. DISTANCE-RECORDING APPARATUS FOR RECIPROCATING BODIES. EDWIN A. WHITEHEAD, Broken Hill, New South Wales, Australia. Filed Nov. 11, 1901. Serial No. 81,800. (No model.)



Claim.—1. In a distance-recording apparatus for reciprocating bodies the combination with a frame, a shaft and bearings therefor in said frame, of wheels on said shaft, means in connection with the reciprocating bodies whereby said wheels are rotated, a gear-wheel free on said shaft, and an epicyclic train of gears whereby motion is transmitted from the said wheels to the said gear-wheel, substantially as and for the purposes set forth.

2. In a distance-recording apparatus for reciprocating bodies, the combination with a frame, a shaft and bearings therefor in said frame, of wheels on said shaft, means in connection with the reciprocating bodies whereby said wheels are rotated, a gear-wheel free on said shaft and means for transmitting motion from the said wheels to the said gear-wheel so that the revolutions imparted to the said gear-wheel in a given time are proportional to the sum of the revolutions of the said wheels in the same time, substantially as set forth.

3. In a distance-recording apparatus for reciprocating bodies, the combination with a frame, a shaft and bearings therefor in the said frame, of grooved wheels on said shaft, means in connection with the reciprocating bodies for actuating said grooved wheels in opposite directions, a gear-wheel free on said shaft, and an epicyclic train of gears between one of said grooved wheels and said gear-wheel the parts being so connected together and to the said shaft that the said gear-wheel in a given time is caused to revolve proportionally to the sum of the revolutions of the said grooved wheels in the same time, substantially as specified.

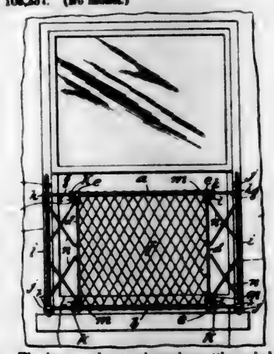
4. In a distance-recording apparatus for reciprocating bodies, the combination with a frame, a shaft and bearings therefor in said frame, of two grooved wheels on said shaft one free thereon and the other keyed thereto, a bevel-gear integral with the free grooved wheel, means in connection with the reciprocating bodies for revolving said grooved wheels, a gear-wheel free on said shaft, a bevel-gear integral therewith, a hub connected to said shaft, and bevel-gears carried by said hub and meshing with the said gears integral respectively with the said gear-wheel and the grooved wheel free on the shaft, whereby motion may be transmitted from the said grooved wheels to the said gear-wheel, substantially as specified.

5. In a distance-recording apparatus for reciprocating bodies, the combination with a frame, shaft and bearings therefor, of a grooved wheel free on said shaft, a grooved wheel fixed on said shaft, a gear-wheel free on said shaft, an epicyclic train of gears between said gear-wheel and the free grooved wheel, rods connected to the reciprocating bodies, rocker-arms on said shaft having longitudinal slots therein, links connecting said rods and said rocker-arms, means for varying the movement of the rocker-arms for a given stroke, and means carried by the said rocker-arms for imparting motion to the said grooved wheels and thence through the epicyclic train to the gear-wheel, substantially as specified.

6. In a distance-recording apparatus for reciprocating bodies, the combination with a frame, shaft and bearings therefor, of a grooved wheel free on said shaft, a grooved wheel fixed on said shaft, a gear-wheel free on said shaft, an epicyclic train of gears between said gear-wheel and the free grooved wheel, rods connected to the reciprocating bodies, rocker-arms on said shaft having longitudinal slots therein, links connecting said rods and said rocker-arms, bolts passing through the slots in the said rocker-arms, collars on said bolts over which the ends of the said links fit, and means carried by said rocker-arms for imparting motion to the said grooved wheels in opposite directions to operate the gear-wheel, substantially as specified.

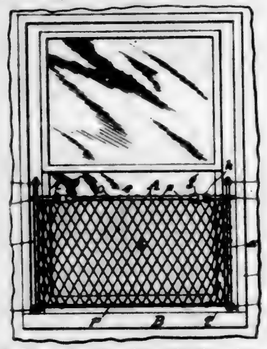
7. In a distance-recording apparatus for reciprocating bodies, the combination with a frame, shaft and bearings therefor, of a grooved wheel free on said shaft, a grooved wheel fixed on said shaft, a gear-wheel free on said shaft, an epicyclic train of gears between said gear-wheel and the free grooved wheel, rods connected to the reciprocating bodies, rocker-arms on said shaft having longitudinal slots therein, links connecting said rods and said rocker-arms, bolts passing through the slots in the said rocker-arms, collars on said bolts over which the ends of the said links fit, and eccentric wedges carried by said rocker-arms and bearing in the grooves of said grooved wheels for imparting motion to the same to turn said gear-wheel, substantially as specified.

708,441. NURSERY WINDOW-GUARD. GEORGE C. WILLIAMS and EDWARD A. WILLIAMS, Brooklyn, N. Y. Filed Apr. 16, 1902. Serial No. 103,237. (No model.)



Claim.—The improved extension wire-netting window-guard comprising, in combination, the main-wire-web-carrying frame consisting of the vertical end rods, and upper and lower tubular members fixedly connected at the angles, a supporting-rod carried in the outer extremities of telescopic rods carried in said tubular members, yoke-clamps coupling the telescoping rods and an end rod of the wire-netting frame, extension-wires intermediate of the said end rods of the wire-netting frame, and the supporting-rod carried by the telescopic rods, said main wire web and intermediate extension-wires both being in one piece.

708,442. BOWED NURSERY WINDOW-GUARD. GEORGE C. WILLIAMS and EDWARD A. WILLIAMS, Brooklyn, N. Y. Filed Apr. 16, 1902. Serial No. 103,236. (No model.)



Claim.—1. In an adjustable wire-netting bowed nursery window-guard, the combination with the upper bow-frame comprising the middle inverted channel-bar, inverted elbow channel parts lapped and riveted at one end to the ends of the middle bar respectively, and inverted channel end bars pivoted in the other ends of the elbow parts; of the supporting-rods adapted to be attached to the window-frame, said end bars and supporting-rods connected by said rods being inserted in eyes of the end bars.

2. In an adjustable wire-netting bowed nursery window-guard, the combination with the upper bow frame-bar comprising the middle inverted channel-bar, inverted elbow channel parts lapped and rivited at one end to the ends of the middle bar respectively, and inverted channel end bars pivoted in the other ends of the elbow parts; of the supporting-rods adapted to be attached to the window-frame and connected to the ends of said channel end bars, the continuous wire placed in the channels of the several parts of the frame-bar, and secured to the respective parts at intervals along the middle of the channels, and the wire-netting interwoven along the upper edge with said wire.

3. In an adjustable wire-netting bowed nursery window-guard, the combination with the upper bow frame-bar comprising the middle inverted channel-bar, inverted elbow channel parts lapped and riveted at one end to the ends of the middle bar respectively, and inverted channel end bars pivoted in the other ends of the elbow parts, of the supporting-rods adapted to be attached to the window-frame, and connected to the ends of said channel end bars, the continuous wire placed in the channels of the several parts of the frame-bar and secured to the respective parts, at intervals along the middle of the channels, the wire-netting interwoven along the upper edge with said wire, and the lower frame-bar jointed at the angles of the guard and secured to the supporting-rods and having the lower edge of the wire-netting interwoven with it.

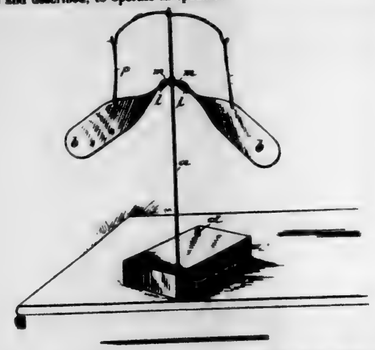
708,443. AUTOMATIC FAN. JEFF D. WILLIAMS, Dunning, Ark. Filed Oct. 29, 1901. Serial No. 80,466. (No model.)

Claim.—1. In an automatic fan of the class described, comprising spring driving-gear, a rigid frame in which the same is mounted, a fan-carrying shaft having a collar fixed thereon, and a detachable bearing for said shaft, composed of two bars arranged horizontally on the upper portion of the frame, one of them being pivoted and the other fixed, and their meeting ends being curved as described, and the slidable keeper, for locking the bars together, as shown and described.

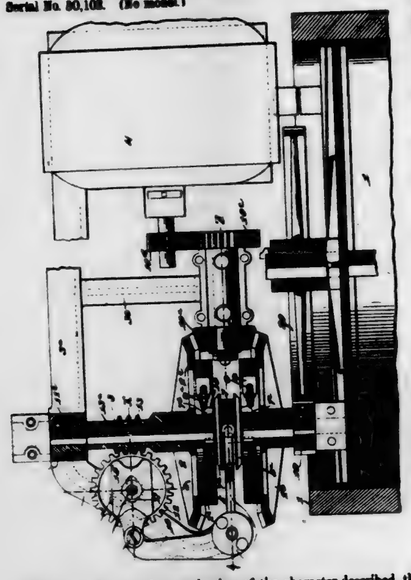
2. In an improved automatic fan of the class described, the combination, with the fan-shaft having links and arms fixed thereon at different points, fan-blades adapted for attachment to said links, and adjustable devices connecting the blades with the arms and serving to support them in the manner shown and described.

3. In an automatic fan of the class described, the combination, with the fan-shaft, having links and arms fixed thereon at different elevations, of fan-blades which are detachably engaged with the links, cords or their equivalent connecting the fan-blades with the outer ends of the said arms, and adapted to be shortened or extended for the purpose of adjusting the angle of the blades, substantially as shown and described.

4. In an improved automatic fan of the class described, the combination with the fan-shaft and links secured thereto, of arms also attached to the shaft but at a higher point, and arranged in a different vertical plane, and fan-blades adapted for attachment to the said links, and means for connecting the blades with the free ends of the arms, substantially as shown and described, to operate as specified



708,444. REVERSING MECHANISM FOR WASHING-MACHINES. DAVID R. WILLOCK, Kansas City, Mo. Filed Oct. 26, 1901. Serial No. 80,103. (No model.)



Claim.—1. In reversing mechanism of the character described, the combination of a driven shaft, gearing loosely arranged thereon, a shiftable coupling arranged to slide upon said shaft and yet turn therewith, a driving-shaft geared to the said driven shaft, means for shifting said coupling, means for oppositely actuating said shifting means from said driven shaft, and spring-pressed means for engaging said coupling with either of the gears of said driven shaft, substantially as set forth.

2. In reversing mechanism of the character described, the combination of a driven shaft, gearing loosely arranged on said shaft, a shiftable coupling arranged to slide on said shaft and yet turn therewith, a driving-shaft geared to said driven shaft, means for shifting said coupling, means for oppositely actuating said shifting means from said driven shaft, a bevel-ended notched bar carried by said coupling and spring-pressed studs carried by said gearing and adapted to engage said notched bar, substantially as set forth.

3. In apparatus of the character described, automatically-reversing mechanism comprising a common shaft, gearing loosely mounted upon said shaft, spring-equipped rings concentric with said gearing, a laterally-movable shipping collar arranged on said shaft, intermediately of said gears, a cam carried by said collar, means applied to the springs of said rings for engaging said cam, means for automatically actuating from said shaft said collar, and means for actuating said shaft, substantially as set forth.

4. In apparatus of the character described, automatically-reversing mechanism comprising a common shaft, duplicate gears loosely arranged upon said shaft, an intergeared worm gearing and wheel arranged in connection with said shaft, means to couple up said shaft and said duplicate gearing, means to effect connection between said worm-gearing, and said means of coupling and means for actuating said shaft, substantially as set forth.

5. In apparatus of the character described, automatically-reversing mechanism comprising a common shaft, duplicate gears loosely arranged thereon, a gear common to the first-named gearing, a worm-and-wheel gearing arranged in connection with said shaft, a cam suitably arranged in position, and a lever carried by said cam, said cam being engaged by a projection on said wheel, and means actuated by said lever and adapted to effect the coupling of said shaft and said duplicate gearing, substantially as set forth.

6. In apparatus of the character described, automatically-reversing mechanism comprising a common shaft, duplicate gears arranged loosely thereon, a worm and friction-coupling arranged in connection with said shaft, spring-equipped rings carried by said duplicate gearing, screw-bolts carried by said springs of said rings, a hub interposed between said duplicate gearing and rings, a collar applied to said hub and equipped with a bevel-ended cam adapted to engage said screw-bolts, means for effecting connection between said worm-and-wheel gearing and collar to move the last-named with its cam endwise, and means for actuating said shaft, substantially as set forth.

7. In apparatus of the character described, automatically-reversing mechanism comprising a shaft, duplicate gears adapted to be driven simultaneously in opposite directions, means for clutching or coupling said duplicate gearing and shaft together, a worm-and-wheel gearing actuated from said shaft, a cam suitably arranged in position, and actuated from said worm-and-wheel gearing, and a lever carried by said cam and having prongs or a shipper engaging said coupling, and means for transmitting motion from said shaft, substantially as set forth.

8. In apparatus of the character described, automatically-reversing mechanism comprising a shaft, duplicate gears loosely mounted thereon, means for simultaneously driving the wheels of said gearing in opposite directions, means for coupling said gearing and said shaft together, worm-and-wheel gearing arranged upon said shaft, a cam having lateral opposite convexed surfaces or faces and a slot therethrough a fixed pivot pin or stud passing through said slot, a lever carried by said cam and a shipper carried by said cam and connected up with said coupling, means for actuating said lever from said cam, and means for transmitting motion from said shaft, substantially as set forth.

708,445. AUTOMATIC GATE. JAMES H. WILSON, Mount Ayr, Iowa. Filed May 8, 1902. Serial No. 106,426. (No model.)

Claim.—1. In an automatic gate, the combination with a hinged and horizontally-swinging gate, of latch mechanism comprising a latch-lever, latch-bars operatively connected therewith and adapted to be moved thereby simultaneously in opposite directions, and a double keeper on the latch-post consisting of portions adapted to be individually engaged by the respective latch-bars.

2. In an automatic gate, the combination with a hinged and horizontally-swinging gate, of a latch-lever fulcrumed thereon, latch-bars operatively connected with said lever and simultaneously movable in opposite directions, a single keeper-strip with which one of said latch-bars is adapted to engage, and parallel keeper-strips between which the other latch-bar is adapted to engage, the several keeper-strips being mounted upon the latch-post.

3. In an automatic gate, the combination with a hinged and horizontally-swinging gate, of a latch-lever fulcrumed intermediate its ends on the gate, latch-bars operatively connected with said latch-lever at opposite sides of its fulcrum, a spring for vibrating the latch-lever in one direction, an operating-rope for drawing the lever in an opposite direction, a latch-post, and a double keeper on the latch-post comprising a single keeper-strip with which one of the latch-bars is adapted to engage, and parallel keeper-strips with which the other latch-bar is adapted to engage.

4. In an automatic gate, the combination with a hinged and horizontally-swinging gate, of a lever extension on the gate projecting in rear of the hinged post, a spider pivotally mounted on the lever extension comprising radiating-arms, operating-ropes connected with one arm of the spider, a gate-latch, a latch-rope extending from the latch and bifurcated to form branches which connect with lateral arms of the spider, and a pin extending through the inwardly-projecting arm of the spider and adapted to engage the branches of the latch-rope, substantially as and for the purpose specified.

708,446. EAR-MUFF. LOUIS WILS. Morris, Ill., assignor of one-half to Lars Hansen, Morris, Ill. Filed Feb. 14, 1902. Serial No. 94,063. (No model.)

Claim.—1. An ear-muff, comprising a suitable covering for the ear, a clamping device associated with said covering and adapted to clamp it to the ear, so that it will be held in proper position, said clamping device adapted to be moved out of the plane of the covering to release the ear.

2. An ear-muff, comprising a suitable frame, a covering therefor, a clamping device movably connected with said frame and adapted to clamp the ear, so as to hold the muff in position, said clamping device comprising a part or loop through which the ear passes and a second part cooperating therewith.

3. An ear-muff, comprising a frame, a suitable covering therefor, a clamping device attached to the frame and comprising two parts between which the ear is clamped, one part engaging the back of the ear and the other the outer face thereof.

4. An ear-muff, comprising a frame, a suitable covering therefor, a clamping device attached to the frame and comprising two parts between which the ear is clamped, said clamping parts movably connected to the frame, one of said parts engaging the frame when in its clamping or holding position so as to hold or lock the parts in said position.

5. An ear-muff, comprising a suitable frame, a covering therefor, and an adjusting device for adjusting the size of the ear-receiving opening of the muff, so as to fit different ears, said adjusting device normally fixed during the use of the muff, the ear-receiving opening remaining unchanged when the proper adjustment is secured.

6. An ear-muff, comprising a frame, a covering therefor, a clamping device comprising two parts movably connected with said covering and between which the ear is clamped, and an adjustable part connected with one of said parts so as to adjust the ear-receiving opening of the muff to fit different-sized ears.

7. An ear-muff, comprising a suitable frame, a covering therefor, a two-part clamping device associated therewith and adapted to clamp the muff to the ear, both parts of said clamping device movable in a plane at an angle to the frame of the muff.

8. An ear-muff, comprising a frame, a covering therefor, a two-part clamping device pivotally connected to said frame, one within the other, one adapted to receive the ear and engage the back thereof and the other adapted to be moved to engage the outer face of the ear, so as to hold the parts in position.

708,447. COMBINATION-TOOL. JESSE L. WOOD, Fulton, and WALLACE G. LAWRENCE, Cordova, Ill. Filed Dec. 10, 1901. Serial No. 85,333. (No model.)

Claim.—1. The combination of a stationary jaw, a shank fastened thereto and having a longitudinal slot and also a rack, a slide mounted on the shank and comprising a movable jaw, a worm mounted in the slide and working with the rack of the shank, and a screw-driver attached to the slide and lying movably in the slot of the shank.

2. The combination of a stationary jaw, a shank fastened thereto and having a longitudinal slot and also a rack, a slide mounted on the shank and comprising a movable jaw, a worm mounted in the slide and working with the rack of the shank, a screw-driver attached to the slide and lying movably in the slot of the shank, and a handle carried by the end of the shank opposite the stationary jaw, said handle having a longitudinal passage therein forming a continuation of the slot in the shank and through which passage the screw-driver may be projected.

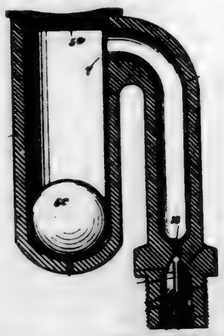
3. The combination of a stationary jaw, a shank fastened thereto and having a longitudinal slot and also a rack, a slide mounted on the shank and comprising a movable jaw, a worm mounted in the slide and working with the rack of the shank, a screw-driver attached to the slide and lying movably in the slot of the shank, and a handle carried by the end of the shank opposite the stationary jaw, said handle having a longitudinal passage therein forming a continuation of the slot in the shank and through which passage the screw-driver may be projected, the outer end of said passage in the handle being angular in cross-sectional form to permit its use as a wrench.

4. The combination of a stationary jaw, a shank fastened thereto and having a longitudinal slot, a slide mounted on the shank and comprising a movable jaw, and a screw-driver attached to the slide and lying movably in the slot of the shank.

5. The combination of a stationary jaw, a shank fastened thereto and having a longitudinal slot, a slide mounted on the shank and comprising a movable jaw, a screw-driver attached to the slide and lying movably in the slot of the shank, and a handle carried by the shank opposite the stationary jaw, the handle having a passage therein forming a continuation of the slot in the shank and through which passage the screw-driver may be projected.

6. A tool, comprising a stand having a rack thereon, a stationary jaw, a movable jaw sliding on the stand, a worm mounted on the movable jaw and meshed with the rack for the purpose specified, and a screw-driver attached to the movable jaw and moving therewith, the tool having a passage therein in which the screw-driver is movable, substantially as described.

708,448. OILING DEVICE. ALBERT O. WYMAN, Putnam Falls, Mass., assignor of one-half to Cyrus L. Glynn, Boston, Mass. Filed Nov. 23, 1901. Serial No. 83,283. (No model.)

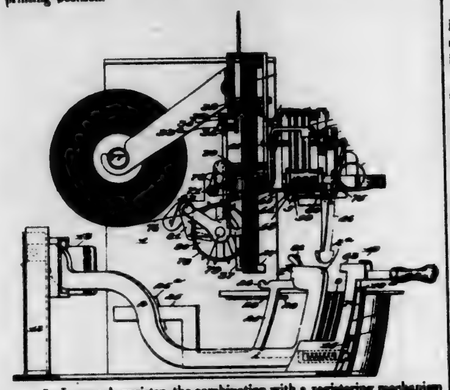


Claim.—An oiling device comprising a cylindrical cup or receptacle open at one end and provided with a removable cap, a spherical ball or body placed in said cup or receptacle a tubular member connected with one side of said cup or receptacle, near the cup end thereof and ranging parallel with and slightly longer than said cup or receptacle, the free end of said tubular member being provided with a valve-seat and a port or passage formed therein, and means for regulating the flow of oil through said port or passage, consisting of a split screw-threaded plug having a conical end and a port or passage, substantially as shown and described.

708,449. CASH-REGISTER. PHILIP YOS, Dayton, Ohio, assignor, by mesne assignments, to National Cash Register Company, Jersey City, N. J., a Corporation of New Jersey. Filed Sept. 19, 1898. Serial No. 691,230. (No model.)

Claim.—1. In a cash-register, the combination with graduated indicating-tablets arranged in banks, registering-wheels, one for each bank, operating devices coöperating with said indicators, and independent means for each wheel for throwing it into connection with its respective operating device when one of the tablets of its bank is operated.

2. In a cash-register, the combination with a printing-segment having a rack formed thereon, means for moving said segment, an alining device arranged to engage said rack, and a platen carrying a spring-arm which is arranged to operate the alining device before the platen reaches printing position.



3. In a cash-register, the combination with a registering mechanism arranged in banks, of operating devices for the same, an operating-lever and independent means for each bank arranged to be moved by the operating-lever to throw the operating devices of that particular bank into operative position.

4. In a cash-register, the combination with a series of independent indicating-tablets, of a lever arranged to actuate said tablets, and means controlled by the lever for positively locking all the remaining tablets in normal position when one is operated.

5. In a cash-register, the combination with a series of indicator-plates arranged one in front of the other and having apertures of graduated lengths, of a movable registering-frame extending through all of said apertures and arranged to be engaged and raised by the lower walls of the same.

6. In a cash-register, the combination with a plurality of indicating-tablets having coinciding graduated apertures, of a movable frame extending through all of said apertures, a registering mechanism connected to said frame, and devices for operating the tablets.

7. In a cash-register, the combination with a series of indicating-tablets, of a swinging lever for raising any one of said tablets, a movable operating device mounted on said lever and means for alining said device with any of the several tablets when the lever is swung laterally.

8. In a cash-register, the combination with a series of independent indicating-tablets, arranged in banks, pivoted yokes coöperating with the respective banks of indicators, registering-wheels one for each yoke, independent devices for throwing said wheels into connection with their respective yokes and a lever for operating the tablets and said throwing devices.

9. In a cash-register, the combination with a plurality of indicating-tablets arranged in series, of means for raising the tablets of the different series successively to indicating position, registering-wheels, devices for moving said wheels into operating position, means actuated by said indicators to turn the registering-wheels, and means for retracting the registering-wheels to normal position

10. In a cash-register, the combination with a registering mechanism, of a series of devices for operating the same arranged substantially in a line, an operating-lever and movable alining means mounted on said lever and arranged to move in alinement with the operating devices.

11. In a cash-register, the combination with a series of indicating-tablets, of a pivoted operating-lever, an operating device movably mounted on said lever, and spaced stationary strips arranged to receive and guide said device to cause it to properly operate the desired tablet.

12. In a cash-register, the combination with a plurality of indicating-tablets, each comprising a plate provided with a lifting-arm at its lower end and formed with an aperture having a projection on one of its walls, of wings projecting through said apertures and arranged to engage said projections to hold the tablets elevated, operating-yokes also extending through said apertures, means for releasing said wings, operating devices arranged to engage the lifting-arms, and a registering mechanism connecting to said operating-yokes.

13. In a cash-register the combination with operating devices, of a counter comprising a series of counter-wheels, and a single operating-lever arranged to throw any desired one of the counter-wheels into connection with the operating devices and operate it to the desired extent.

14. In a cash-register the combination with a register-operating mechanism, arranged in banks, of a counter comprising a series of wheels each of which is operated by its respective bank, an operating-lever and independent means for each bank arranged to be operated by said lever to throw its respective counter alone into operative position.

15. In a cash-register, the combination with a registering mechanism, of a bank of indicating-tabbts, a lever adapted to move any one of said tablets to indicating position, and means for locking all the remaining tablets when one is moved from normal position.

16. In a cash register the combination with printing devices arranged side by side and having alining teeth formed thereon, of means for moving said devices, a pivoted alining device arranged to simultaneously engage the teeth of all of said printing devices, and a platen mounted independently of the alining device and provided with a flexible arm arranged to operate said alining device before the platen raises to printing position.

17. In a cash-register the combination with a frame having grooves formed therein, of a registering mechanism, a pivoted operating-lever having a lug which extends under a portion of the frame and normally holds the lever down but which may be brought into alinement with the grooves to allow the lever to be raised at certain points and a spring-actuated member mounted on the lever and arranged to coöperate with said frame to prevent backward movement of the lever.

18. In a cash-register the combination with an operating mechanism, of an operating-lever capable of both lateral and vertical movements and a movable latch on said lever for compelling a lateral movement of the lever at a period between the upward and downward strokes of said lever.

19. In a cash-register the combination with an operating mechanism, of an operating-lever capable of both lateral and vertical movements, means for guiding said lever vertically after its initial movement, and devices for preventing a return movement of the lever in the same vertical plane.

20. In a cash-register the combination with an operating mechanism, of an operating-lever capable of both lateral and vertical movements, and devices for compelling a lateral movement of said lever between its first and final vertical movements.

21. In a cash-register the combination with a registering mechanism, of indicating-tablets, a lever arranged for operating any one of said tablets and a shiftable device movably mounted upon said lever and arranged to be shifted by its movements and also be elevated thereby so as to engage and actuate the desired indicator.

22. In a cash-register the combination with a plurality of indicating-tablets having graduated apertures of a movable frame extending through said apertures, a pivoted printing-segment, means connecting said segment and frame and devices for operating the indicators.

23. In a cash-register, the combination with the registering-wheels and a registering mechanism, of indicating-tablets arranged to actuate the same to register amounts equal to the numerical designation of the operated tablets, a swinging lever for raising any one of said tablets and means for alining a movable part of said lever with the desired tablet.

24. In a cash-register the combination with a plurality of indicating-tablets having graduated apertures, of a pivoted frame extending through said apertures, a registering mechanism, means connecting said frame and mechanism and devices for operating the tablets.

25. In a cash-register, the combination with registering mechanism comprising independently-actuated registering-wheels, devices for turning said register-wheels, an operating-lever and independent means for each bank arranged to be moved by the operating-lever to throw one of the register-wheels into mesh with the operating devices.

26. In a cash-register the combination with a plurality of indicating-tablets having graduated apertures, of a pivoted frame extending through said apertures, a pivoted printing-segment, a link connecting said frame and segment, and means for operating said tablets.

27. In a cash-register the combination with a registering mechanism, of an operating-lever capable of both lateral and vertical movements, means connecting said lever to said mechanism, a frame having grooves each with a flange at its lower end, and a plunger carried by the lever and coöperating with said flanges.

28. In a cash-register, the combination with a registering mechanism, of an operating-lever having a lug which normally prevents it from rising, means connecting said lever to said mechanism, a wall having vertical grooves formed therein to receive said lug, a flange partly closing the lower end of each groove, and a plunger on said lever adapted to move through said grooves.

29. In a cash-register, the combination with a plurality of indicating-tablets formed with apertures of different depths, and having locking-shoulders, of a frame extending through said apertures and arranged to be moved by the walls of the same, registering mechanism connected to said frame and means for raising said tablets whereby the registering mechanism is actuated and the frame moved over the shoulders to lock the remaining tablets.

30. In a cash-register, the combination with a plurality of indicating-tablets having graduated apertures, of a movable frame extending through said apertures, a printing device connected to said frame and means for raising the tablets.

31. In a cash-register, the combination with a plurality of indicating-tablets having graduated apertures, of a movable frame extending through said apertures, a rack carried by said frame, a registering mechanism operated by said rack, and means for raising the tablets.

32. In a cash-register, the combination with a series of indicating-tablets having graduated apertures, of a movable frame extending through said apertures, a rack on said frame, a registering-wheel having a pinion arranged to mesh with said rack, and operating means for raising said tablets and moving said pinion into mesh with the rack.

33. In a cash-register, the combination with the register-wheels, the printing-segments and a platen, of an operating-lever movable in one direction to adjust the printing-segments and in another direction to actuate the platen.

34. In a cash-register, the combination with a series of plates having coinciding graduated apertures and arranged one in front of the other, of a movable frame extending through all of said openings, a registering-wheel normally disengaged from said frame, actuating devices for said plates and means for bringing the registering-wheel into engagement with the movable frame during one movement of the latter.

35. In a cash register, the combination with a plurality of plates formed with coinciding graduated apertures, of a movable frame extending through all of said openings so as to be moved to a greater or less extent according to the plate operated, a register-wheel arranged to be operated by the movable frame, and a single lever for actuating said plates.

36. In a cash-register, the combination with register-wheels, of operating-plates arranged in banks and adapted to be independently actuated, a lever arranged to actuate said plates, shifting means, one for each register-wheel and arranged to be actuated by said lever to shift the registering mechanism into connection with the operating-plates.

37. In a cash-register, the combination with a registering mechanism, of indicating-tablets of different numerical designations arranged to operate the registering mechanism to record the amount of the numerical designation of the operated tablet, a lever arranged to actuate any one of said tablets, and means for locking all the remaining tablets in position when one is operated.

38. In a cash-register, the combination with a series of indicating-tablets arranged approximately in a straight line, of a pivoted operating-lever, and a movable alining means mounted on said lever and arranged to move in alinement with said tablets so as to be capable of lifting the same regardless of the position of the lever carrying said alining means.

39. In a cash-register, the combination with operating devices, of a counter comprising a series of counter-wheels and an operating-lever for the operating device arranged to be adjusted to throw any desired one of the counter-wheels into connection with the operating devices and move the same by a single operation.

40. In a cash-register, the combination with operating devices, of a counter comprising a series of wheels normally out of connection with the operating devices and transfer means between said wheels and an operating-lever arranged to be adjusted to throw any desired one of the counter-wheels into connection with the operating devices.

41. In a cash-register, the combination with operating devices, of a counter comprising a series of counter-wheels, and an operating-lever arranged to be moved in one direction to select the desired counter-wheel and in another direction to bring said wheel into connection with the operating devices.

42. In a cash-register, the combination with operating devices, of a counter comprising a series of counter-wheels and an operating-lever arranged to be moved horizontally to select the desired counter-wheel and vertically to throw the same into connection with the operating devices.

43. In a cash-register, the combination with operating devices, of a counter comprising a series of counter-wheels mounted on longitudinally-movable shafts, and a lever arranged to operate any one of said shafts to bring its counter-wheel into connection with the operating devices.

44. In a cash-register, the combination with graduated indicating-tablets arranged in banks, registering-wheels, one for each bank, operating devices coöperating with said indicators, independent means for each wheel for throwing it into connection with its respective operating device, and a lever arranged to operate any one of said tablets and simultaneously actuate the respective throwing means.

45. In a cash-register, the combination with graduated indicating-tablets arranged in banks, registering-wheels one for each bank, operating devices coöperating with said indicators, levers for the respective wheels for throwing them into connection with the operating devices, and a hand-lever arranged to operate any one of said tablets and the respective throwing-lever.

46. In a cash-register, the combination with graduated indicating-tablets arranged in banks, registering-wheels one for each bank, operating devices carrying racks and coöperating with said indicators, independent means for the respective wheels for throwing them into connection with the racks, and a lever arranged to operate any one of said tablets and the respective throwing means.

47. In a cash-register, the combination with a plurality of indicating-tablets formed with apertures having locking-shoulders, of a frame extending through said apertures and arranged to be moved by the walls of the same whereby when one tablet is raised the frame is moved over the locking-shoulders of the remaining tablets.

48. In a cash-register, the combination with a plurality of indicating-tablets having graduated apertures, of a movable frame extending through said apertures, a movable printing device connected to the frame, and means for operating the tablets.

49. In a cash-register, the combination with a registering mechanism, of a series of devices for operating the same arranged in a straight line, a pivoted lever, an operating device movably mounted on said lever, and means for alining said movable device with the operating devices as the lever is moved about its fulcrum.

50. A cash-register comprising a series of indicators, a support a member pivotally secured to the latter, an operating-lever hinged to said member and coöperating with said indicators when operated for elevating any one of said indicators, a suitable printing device and suitable mechanism coöperating with the lever and said printing device.

51. A cash-register comprising a series of indicators, a support, a member pivotally secured to the latter, an operating-lever hinged to said member and adapted to coöperate with the indicators for raising any one of the same, a rocking frame actuated by said lever, a printing device operated by said lever, and suitable gearing interposed between said rocking frame and printing device.

52. A cash-register comprising a suitable casing, a series of indicators located within the same, a support, a member pivotally secured to the latter, an operating-lever hinged to said member and adapted to coöperate with the ends of the indicators to raise the latter, a rock-frame actuated by said lever, a printing device operated by said lever, and inking means operated by said frame.

53. In a cash-register the combination with a series of indicators, a support, a member pivotally mounted on said support, a lever hinged to said member and coöperating with the indicators to elevate the same, printing-types controlled by said lever and printing mechanism also controlled by said lever.

54. In a cash-register the combination with a series of indicators, a support, a member pivotally secured to the latter, an operating-lever hinged to said member, and adapted to coöperate with the free ends of said indicators for elevating any one of the same, a rocking frame actuated by said lever, said casing having a slot formed therein for the lateral movements of said lever and vertical passages for permitting vertical movements of said lever, a printing device and mechanism coöperating with the lever and printing device.

55. In a cash-register the combination with a lever having both lateral and vertical movements of a series of indicators arranged to be elevated by said lever, a rocking frame actuated by said lever, an ink-ribbon, strip-feeding devices and means connecting both the ink-ribbon and strip-feeding devices to the rocking frame.

56. In a cash-register a printing device consisting of supporting-rollers, a ribbon connecting the same and arranged to be fed thereby, rollers for supporting and feeding a paper strip in proximity to the ink-ribbon, but at an angle thereto, a rocking frame and means connecting said frame and the respective feed-rollers whereby the ribbon and paper strip are simultaneously fed.

57. In a cash-register the combination with a series of indicators, of a register, register-actuating means controlled by the indicators, and a lever arranged when moved laterally to select a desired indicator and when moved vertically to bring the register and register-operating mechanism into connection and operate the selected indicator.

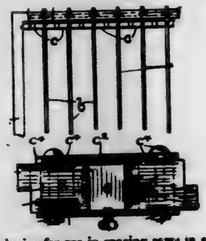
708,450. SAW-SPACING DEVICE. FRANK YOST, Lorain, Ohio. Filed Feb. 10, 1902. Serial No. 93,414. (No model.)

Claim.—1. A new and improved device of the character set forth comprising two plates, blocks secured between said plates and arranged to slide in and out between said plates and means for securing said plates together, substantially as described and for the purpose set forth.

2. A new and improved spacing device for saws, comprising two plates, blocks secured between said plates and arranged to slide in and out between said plates, means for forcing said blocks outward between said plates and means for limiting the outward movement of said blocks, substantially as described and for the purpose set forth.

3. A new and improved device for spacing saws in a gang-frame, comprising two plates, blocks arranged between said plates and adapted

to slide in and out between said plates, means for forcing said blocks outward between said plates and means for supporting the device between the saws composing the gang, substantially as described and for the purpose set forth.



4. A spacing device for use in spacing saws in a gang-frame, comprising two plates, blocks secured between said plates and arranged to slide in and out between said plates, said blocks having their adjacent faces inclined and capable of touching only at their lower ends, a wedge arranged between the said blocks and means for locking the said wedge between the said plates, substantially as described and for the purpose set forth.

5. A spacing device for use in spacing saws in a gang-frame, comprising two plates, blocks arranged between said plates, said blocks having their adjacent faces inclined and capable of touching only at their lower ends, slots formed in said blocks, bolts passing through said slots and securing said plates together, a wedge arranged between the said blocks and a set-screw mounted in one of the said plates and adapted to engage the said wedge, substantially as described and for the purpose set forth.

708,451. TROLLEY-WHEEL. WARREN W. ASHALE, Grand Rapids, Mich., assignor to Appliance Company, Limited, Grand Rapids, Mich., a Corporation of Michigan. Filed Jan. 7, 1902. Serial No. 88,807. (No model.)

Claim.—1. The combination of a trolley-wheel, a tubular axle fixed in the wheel and projecting therefrom, and bearings engaging both the interior and exterior surfaces of the tubular axle, substantially as described.

2. The combination of a trolley-wheel, a tubular axle fixed in the wheel and projecting laterally therefrom, a harp having bearings engaging the outer surfaces of the ends of the tubular axle, and a bearing extending through the axle and attached to the respective sides of the harp and rigidly connecting the same, substantially as described.

3. The combination of a trolley-wheel, a tubular axle in the wheel and projecting laterally therefrom, a harp made in two parts and connected at one end by a bolt, and at the other end by a bearing engaging the interior of the tubular axle, and bosses on the harp having bearings engaging the outer surfaces of the tubular axle, substantially as described.

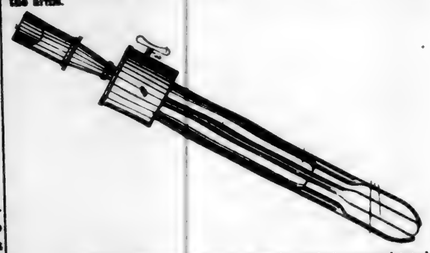
4. The combination of a trolley-wheel, a tubular axle in the wheel and projecting laterally therefrom, a harp having tubular bosses forming external bearings for the axle, screw-threaded openings in the bosses, a screw-threaded tube engaging the threads in the bosses and having lateral openings and also forming an internal bearing for the axle, and a removable plug in said tube, substantially as described.

5. The combination of a trolley-pole, a harp having two parts attached to the pole at one end and having tubular bosses at the other end having bearing-surfaces at their adjacent ends, and reduced and screw-threaded openings at their outer ends, a screw-threaded tube rigidly connecting the bosses and having lateral openings, removable plugs in said tube, a rotative tubular axle internally engaging the tube and externally engaging the bearings in the bosses, and a trolley-wheel mounted on the axle, substantially as described.

708,452. DILATOR. ERNST DEMP, Magdeburg, Germany. Filed July 1, 1902. Serial No. 113,921. (No model.)

Claim.—1. A dilator comprising a tubular casing having exterior grooves providing longitudinal recesses on its outer side, the arms pivoted to the casing so as to seat in the recess within the circumference of the casing and provide a relatively smooth surface, and means for opening and closing the arms.

2. A dilator comprising a corrugated tubular casing having interior and exterior grooves providing longitudinal air-passages on its inner side and longitudinal recesses on its outer side, the arms pivoted to the casing so as to seat in the recesses within the circumference of the casing and provide a relatively smooth surface, and means for opening and closing the arms.



3. A dilator comprising an interiorly and exteriorly grooved tubular casing providing longitudinal air-passages on its inner side and longitudinal recesses on its outer side, the arms pivoted to the casing so as to seat within the recesses and extending beyond the casing and means for opening and closing the arms.

4. A dilator comprising an interiorly and exteriorly grooved tubular casing providing longitudinal air-passages on its inner side and longitudinal recesses on its outer side, the arms pivoted to the casing so as to seat within the recesses, the intermediate sleeve fitted within the casing, the injecting-tube fitted within the intermediate sleeve, and means for opening and closing the arms.

5. A dilator comprising an interiorly and exteriorly grooved tubular casing providing longitudinal air-passages on its inner side and longitudinal recesses on its outer side, the arms, the disk located within the casing having headed pins extending through the casing whereby the arms are pivoted to the casing at their inner ends so as to seat within the recesses, and means for opening and closing the arms.

6. A dilator comprising an interiorly and exteriorly grooved tubular casing providing longitudinal air-passages on its inner side and longitudinal recesses on its outer side, having longitudinal slots at their inner ends, the arms pivoted to the casing so as to seat within the recesses and adapted to enter the longitudinal slots at their inner ends, and means for opening and closing the arms.

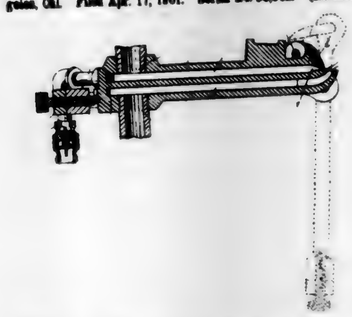
7. A dilator comprising a grooved tubular casing providing longitudinal air-passages on its inner side and longitudinal recesses on its outer side, the arms pivoted to the casing within the recesses, having guide-pins at their inner ends, the head to which the casing is secured, the drum located within the head, having a worm-wheel, and an inner plate formed with curved slots which receive the guide-pins, and a shaft mounted in the head having a worm-gear whereby the worm-wheel is oscillated to operate the drum which in turn rotates the inner plate thereof for opening and closing the arms.

8. A dilator comprising a grooved tubular casing providing longitudinal air-passages on its inner side and longitudinal recesses on its outer side, the arms pivoted to the casing within the recesses, and having guide-pins at their inner ends, the head to which the casing is secured, having an inner plate formed with radial guide-slots through which the guide-pins project, the drum, located within the head, having a worm-wheel, and an inner plate formed with curved slots which receive the guide-pins, and a shaft mounted in the head having a worm-gear whereby the worm-wheel is oscillated to operate the drum which in turn rotates the inner plate thereof for opening and closing the arms.

9. A dilator comprising a grooved tubular casing providing longitudinal air-passages on its inner side and longitudinal recesses on its outer side, having longitudinal slots at their inner ends, the arms having guide-pins at their inner ends and seating in the recesses and adapted to enter the longitudinal slots at their inner ends, the disk having headed pins whereby the arms are pivoted to the casing within the recesses at their inner ends, the head to which the casing is secured, having an inner plate formed with radial guide-slots through which the guide-pins project, the drum, located within the head, having a worm-wheel, and an inner plate formed with curved slots which receive the guide-pins, and a shaft mounted in the head having a worm-gear whereby the worm-wheel is oscillated to operate the drum which in turn rotates the inner plate thereof for opening and closing the arms.

10. A dilator comprising a grooved tubular casing providing longitudinal air-passages on its inner side and longitudinal recesses on its outer side, the arms having guide-pins at their inner ends, and seating in the recesses, the disk having headed pins whereby the arms are pivoted to the casing within the recesses, at their inner ends, the head to which the casing is secured, having an outer plate formed with air-openings and an inner plate formed with air-openings and radial guide-slots through which the guide-pins project, the drum having an outer plate formed with air-openings and a worm-wheel, and an inner plate formed with curved slots which receive the guide-pins, and shaft mounted in the head having a worm whereby the worm-wheel is oscillated to operate the drum which in turn rotates the inner plate thereof for opening and closing the arms.

708,453. HYDROCARBON-BURNER. WILLIAM H. BEST, Los Angeles, Cal., assignor of one-half to William Adelbert Cooper, Los Angeles, Cal. Filed Apr. 17, 1901. Serial No. 56,312. (No model.)



Claim.—1. A hydrocarbon-burner furnished with an oil-outlet with an orifice to discharge an expansive fluid across said outlet approximately in the plane thereof to induce a vacuum therein to draw the oil therethrough and to strike said oil and thoroughly atomize the same; a movable nozzle-piece independent of the oil-outlet to partially close said orifice for effective operation of the burner; and means extending rearwardly from the nozzle for operating said nozzle-piece from the rear.

2. In a hydrocarbon-burner, the combination of a body furnished with two chambers for oil and an expansive fluid, respectively, one of the chambers being furnished with an inlet and with a nozzle for oil and the other chamber being furnished with an inlet and open rearwardly of the oil-outlet; a nozzle-piece to form a closure for the end of said chamber and to leave an opening for the escape of expansive fluid from said chamber; and means extending rearwardly from the nozzle for operating said nozzle-piece.

3. In a hydrocarbon-burner, the combination of a body furnished with two superposed chambers for oil and an expansive fluid respectively, one of the chambers being furnished with an inlet and with a nozzle for oil, and the other chamber being furnished with an inlet and being open rearwardly of the oil-outlet; a nozzle-piece hinged to the body of the burner to form a closure for the end of said chamber and to leave an opening for the escape of expansive fluid from said chamber; and means for holding the nozzle-piece in its closed position.

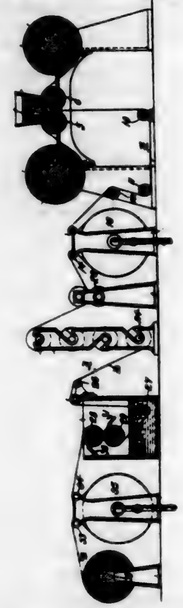
4. In a hydrocarbon-burner, the combination of a body furnished with two superposed chambers for oil and an expansive fluid respectively, one of the chambers being furnished with an inlet and with a nozzle for oil, and the other chamber being furnished with an inlet and being open rearwardly of the oil-outlet; a nozzle-piece hinged to the body of the burner to form a closure for the end of said chamber and to leave an opening for the escape of expansive fluid from said chamber; and a latch for latching the nozzle-piece in its closed position.

5. In a hydrocarbon-burner, the combination of a body furnished with two superposed chambers for oil and an expansive fluid respectively, one of the chambers being furnished with an inlet and with a nozzle for oil, and the other chamber being furnished with an inlet and being open rearwardly of the oil-outlet; a nozzle-piece hinged to the body of the burner to form a closure for the end of said chamber and to leave an opening for the escape of expansive fluid from said chamber; a latch-piece hinged to the nozzle-piece and extending rearwardly to the rear end of the body; and a set-screw screwed through said latch-piece and engaging the body to draw the nozzle-piece firmly into position.

6. A hydrocarbon-burner comprising a body furnished with superposed chambers for oil and an expansive fluid, respectively, one of the chambers being furnished with an inlet and with a nozzle for oil, and the other chamber being furnished with an inlet and with a nozzle for an expansive fluid, and a burner-body support, integral with the burner-body, the upper face of which lies at an angle converging forwardly toward the floor of the expansive-fluid chamber, substantially as set forth.

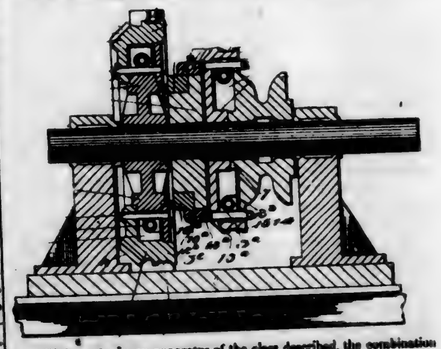
7. In a hydrocarbon-burner, the combination of a body furnished with two chambers for oil and an expansive fluid, respectively, one of the chambers being furnished with an inlet and with a nozzle for oil, and the other chamber being furnished with an inlet and open rearwardly of the oil-outlet; a nozzle-piece hinged to the body of the burner to form a closure for the end of said chamber and to leave an opening for the escape of expansive fluid from said chamber; and means for operating the nozzle-piece to open and close the same.

708,454. METHOD OF WATERPROOFING PAPER. CHARLES S. BIRD and JOHN B. HAMCOCK, East Walpole, Mass., assignors to F. W. Bird and Son, a firm composed of Charles S. Bird, East Walpole, Mass. Filed Oct. 22, 1901. Serial No. 79,531. (No specimens.)



Claim.—The process in the art of manufacturing waterproof paper fabric which consists in feeding two sheets, or webs, of paper between compressing means, simultaneously feeding waterproofing material therebetween, cooling and compressing the compound fabric, subjecting the surfaces of the compound fabric to fluid waterproofing material, and cooling the fabric.

708,455. SHIP'S WINDLASS. CHARLES W. BLAKE, Port Republic, N. J. Filed May 11, 1901. Serial No. 59,782. (No model.)



Claim.—1. In an apparatus of the class described, the combination with a shaft, of a compensating load-take up member thereon, and a subsequently-effective member controlled by the shaft and brought into service thereby under excessive strain on the first-named member.

3. In an apparatus of the character described, the combination of a shaft, a compensating load-take-up member, and a driving compensating member operatively connected through the shaft with the first member to drive the latter in one direction and subsequently brought into service by the take-up member under excessive strain, thereon.

3. In an apparatus of the character described, the combination of a shaft, a compensating load-take-up member thereon, and a driving compensating member connected to the shaft for propelling the latter and the load member and adapted to be brought into service through reverse motion of the shaft under strain which exhausts the compensating capacity of the load member.

4. In an apparatus of the character described, the combination of a shaft, a load-take-up member thereon, a compensating driving member on the shaft, and means for limiting the driving member to rotation in one direction.

5. In an apparatus of the character described, the combination of a shaft, a load-take-up member idly mounted thereon, a clutch arranged to make one section of said load member fast with the shaft, and a compensating driving member on the shaft arranged to be brought into service through backward motion of the shaft.

6. In an apparatus of the character described, the combination of a shaft, a two-part load-take-up member having one section made fast to the shaft and said parts adapted to have a limited turning movement relative to one another, and a two-part cushioned driving member, one part of which is fast with the shaft and adapted, on backward movement of the shaft, to automatically bring the cushions into service.

7. In an apparatus of the character described, the combination of a shaft, a two-part cushioned load member thereon, and a two-part power-gear having cushion devices arranged to be brought into service by the backward motion of the shaft.

8. In an apparatus of the character described, the combination of a shaft, a two-part cushioned load member thereon, a two-part power-gear having cushion devices and fitted to said shaft, and means to restrain the power-gear from turning in a backward direction.

9. In an apparatus of the character described, the combination with a shaft, of a compensating member having two sections, one of which is revolubly with the shaft and the other is provided with a ratchet, a pawl engaging said ratchet, and cushion devices between the sections of said member.

10. In an apparatus of the character described, the combination with a shaft, of a compensating member having two sections and intermediate cushion devices between said sections, a clutch for making one section fast with the shaft, a brake-surface on one section of the member, and a movable brake element in cooperative relation to the brake-surface and adapted to control the rotation of the member when unattached from the shaft.

11. The combination with a shaft, of a wildcat or chain-wheel comprising a member loose on the shaft and provided on one side with a series of lugs or abutments and on its other side with a laterally-extending coupling-section, and a companion member also idly fitted to the shaft and provided with lugs or abutments disposed in opposing relation to the corresponding lugs on the first-named member, cushion devices between the opposing lugs of the two members, a clutch-head fast with the shaft, a series of locking-dogs slidably mounted in the clutch-head and arranged for engagement with the coupling-section of one shaft member, and a cam-ring carried by the clutch-head and engaging with said locking-dogs.

12. The combination with a shaft, of a wildcat or chain-wheel having companion members both fitted loosely on said shaft, said members being provided on their opposing sides or faces with lugs or abutments which are projected laterally into opposing relation, a series of cushion-springs each fitted between two of the faces of a pair of lugs in the respective members to cushion the relative movement thereof when the wildcat turns in one direction, a series of other cushion devices each fitted between other opposing faces of the pair of abutments of the respective members to cushion the relative movement thereof when the wildcat turns in the opposite direction, and means for making one member of the wildcat fast with the shaft.

13. In apparatus of the character described, the combination of a driven shaft, a wildcat or wheel adapted to receive the strain or strain of a chain or hawser and comprising sections movable one within the plane of the other and springs arranged between said sections, and a clutch or coupling comprising a disk fixed or keyed to said shaft, a cam-ring carried by said disk, and lugs or dogs actuated by said cam-ring and carried by said disk and engaging said wildcat or wheel, substantially as set forth.

14. A wildcat loosely supported upon a driven shaft, and having a lateral coupling-section provided with internal abutments and an independent, movable coupling-section connected to said shaft fit against rotation and having counterpart abutments yieldingly connected to the aforesaid abutments, and a movable ring mounted upon one of said sections and having a spiral peripheral rib and a dog engaging said rib and the other one of said sections, substantially as set forth.

15. In apparatus of the character described, the combination of a driven shaft and a wildcat or wheel adapted to receive thereon the strain or strain of a chain or hawser, and comprising sections or parts movable one with the other and springs arranged between said sections, and a locking pin or key engaging sockets or openings in the sections of said wildcat to couple or connect up said sections, substantially as set forth.

16. A wildcat loosely supported upon a driven shaft, and comprising yieldingly-connected-together sections, a power-gear fixed upon said shaft and comprising yieldingly-connected-together sections, and a coupling device for effecting connection between said wildcat-sections and said shaft, substantially as set forth.

708,456. PROCESS OF MAKING CELLULOSE ACETATE. RAHU W. BOSSEN, Boston, Mass. Filed June 25, 1901. Serial No. 65,987. (No specimens.)

Claim.—1. The process of preparing cellulose esters, which consists in removing the alkali metal of the viscose with formation of a haloid salt in presence of an organic acid radical.

2. The process of preparing cellulose acetate, which consists in removing the alkali metal of the viscose with formation of a haloid salt in presence of the radical of a fatty acid.

3. The process of preparing cellulose acetate which consists in removing the alkali metal from viscose with formation of a haloid salt in presence of acetyl.

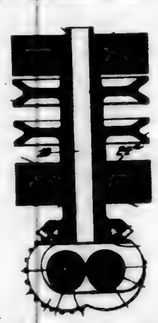
708,457. PROCESS OF PURIFYING CELLULOSE ESTERS. RAHU W. BOSSEN, Boston, Mass. Filed June 28, 1901. Serial No. 66,605. (No specimens.)

Claim.—1. The method of purifying cellulose acetate, which consists in removing the excess of reagents by treatment with naphtha, substantially as described.

2. The method of purifying cellulose acetate, which consists in dissolving out any excess of acetic anhydride in naphtha, substantially as described.

3. The method of purifying cellulose acetate with recovery of excess of reagents, which consists in washing out the excess of reagents by treatment with naphtha, and recovery of the reagents from the naphtha by fractional distillation, substantially as described.

708,458. SPINNING-HEAD. FRANK A. BREEZE, Forest Mills, Ontario, assignor of one-half to James Wilson, Richmond township, Ontario, Canada. Original application filed Nov. 7, 1900, Serial No. 35,777. Divided and this application filed Jan. 6, 1902. Serial No. 88,679. (No model.)



Claim.—1. In a spinning-frame, a spinning-head comprising revoluble members driven in the same direction at different speeds, a gear carried by one of said members, a pair of drawing-rolls mounted in the other member and said rolls provided at their opposite ends respectively with gears which counterpoise the weight of the rolls and both of said gears having intermeshing engagement with the gear on said other member to be driven positively thereby, and tension devices in cooperative relation to the otherwise free ends of said rolls and adapted to normally force the same toward each other; the arrangement of the rolls and the gears mounted thereon being such that centrifugal energy developed by high speed of the spinning-head tends to normally force the rolls together and to exert proper drawing and twisting action on the sliver or roving, as set forth.

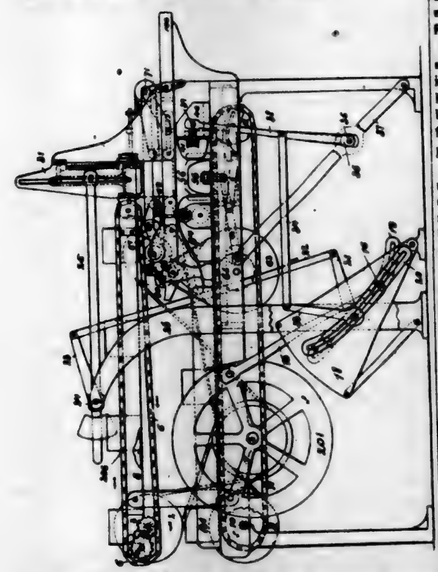
2. In a spinning-frame, a twisting and drawing head comprising concentric members revolubly in the same direction and at different speeds, a pair of counting rolls mounted in one member to rotate therewith and each roll provided at one end with a yieldable bearing, said bearings being located at opposite ends of the respective rolls, and gearing connecting both of said rolls operatively with the other member and adapted to positively rotate both rolls on their axes at equal angular velocity, whereby centrifugal force of the rolls developed by high speed of the spinning-head tends to normally force the rolls into cooperative relation, substantially as described.

3. In a spinning-head, a twisting and drawing head comprising concentric members revolubly in the same direction and at different speeds, a slotted foot-block fast with one of said members, a pair of rolls each having one end journaled in a stationary bearing in the foot-block and its other end loosely fitted in a slot of the foot-block, the loosely-mounted portions of said rolls lying at opposite ends of the rolls respectively, springs in cooperative relation to the loosely-mounted ends of said rolls and tending to normally force them together, and gears between the rolls and the other head member for positively rotating both rolls on their axes, as and for the purposes described.

4. In a spinning-frame, a twisting and drawing head comprising concentric members revolubly in the same direction and at different speeds, a foot-block fast with one of said members and provided with plates having slots at their opposite ends, spring-actuated bearings in said slots of the plates, a pair of counting rolls each having one end engaged by said bearings and its other end mounted in an opening of one plate, said spring-actuated bearings tending to move the rolls normally toward each other, a bevel-gear secured to the stationary supported end of each roll, and a driving-gear fast with one head member and engaging with the gears of both rolls to positively drive the latter, substantially as described.

5. In a spinning-frame, a twisting and drawing head comprising a tubular spindle, a sleeve concentric with the spindle and provided with a driving bevel-gear, a foot-block secured fast to the spindle, spring-actuated bearings supported by the foot-block, a pair of counting rolls carried by the foot-block and each roll having one end engaged by one of said bearings and its other end mounted in a stationary bearing, said bearings engaging with opposite ends of the respective rolls and tending to normally hold the latter in cooperative relation, and bevel-gears made fast with the rolls at the ends thereof which are in stationary bearings and said gears intermeshing with the driving-gear to positively propel both of the rolls, substantially as described.

708,459. BOX-WRAPPING MACHINE. EDWARD W. BRYANT, New York, N. Y., assignor of one-half to John J. Carroll, New York, N. Y. Filed Apr. 19, 1900. Serial No. 13,421. (No model.)



Claim.—1. In a box-wrapping machine the combination of a paper-feed plane having an opening therein, a vertically-moving plunger working through said opening and means for bridging said opening consisting of shears arranged to be opened by the upward movement of said plunger and a bridging device carried on said shears and arranged to be carried across the opening in the paper-feed plane by the opening movement of the shears, substantially as and for the purposes set forth.

2. In a box-wrapping machine the combination of a paper-feed plane having an opening therein and means for bridging such opening to permit the passage of the wrappers thereacross, such means consisting of shears, a sliding device carried by said shears, bridging fingers carried by said device and means for opening and closing said shears, substantially as and for the purposes set forth.

3. In a box-wrapping machine having a paper-feed plane with an opening therein, the combination of shears, 103, pivotally attached to a fixed support, means for opening and closing said shears and a device carried by said shears and arranged to be carried forward by the closing movement thereof and operating in its forward movement to turn down a fold of the box-wrapper and bridge the opening in the paper-feed plane, substantially as and for the purposes set forth.

4. In a box-wrapping machine the combination of a paper-feed plane having an opening therein, means for intermittently bridging said opening, upper and lower paper-feed rollers and bands, and means for raising and lowering said upper rollers, substantially as and for the purposes set forth.

5. In a box-wrapping machine the combination with a paper-feed plane of a set of paper-feed rollers and bands fixed in position in relation thereto and a set of upper feed rollers and bands superimposed thereon and set in a vertically-movable cradle and means for raising and lowering said cradle, substantially as and for the purposes set forth.

6. In a box-wrapping machine the combination of a vertically-movable cradle carrying a set of feed-rollers, means for raising and lowering the same, a paper-feed table and detents arranged to be moved vertically by the movements of said cradle and, when lifted, to project above said table, substantially as and for the purposes set forth.

7. The combination of the rock-bars, 19, 20, having the oppositely-arranged curved slots therein, the fixed plates, 18, 18, having straight slots therein and the pin, 16, carried by the arm, 15, and engaging the said several slots, and feeding and folding mechanism adapted to be operated by the movement of the said rock-bars, substantially as and for the purposes set forth.

8. In a box-wrapping machine the combination of the rock-bars, 19, 20, means for alternately moving said rock-bars, a vertically-moving plunger adapted to be operated by the movement of one of said rock-bars and a horizontally-moving plunger or push-block arranged to be operated by the movement of the other of said rock-bars, and delivery-chains into engagement with which the box is brought by the forward movement of said push-block, substantially as and for the purposes set forth.

9. In a box-wrapping machine the combination of a horizontally-moving plunger or push-block, means for imparting motion thereto, folding-shares carried thereby, vertically-movable folding-shares and box-holding uprights and means, arranged to be operated by the forward-and-back movement of the push-block, for moving said vertically-movable folding-shares, and box-holding uprights, substantially as and for the purposes set forth.

10. In a box-wrapping machine the combination of a horizontally-moving plunger or push-block, means for imparting motion thereto, vertically-movable folding-shares and box-holding uprights and means, arranged to be operated by the forward-and-back movement of the push-block for moving said folding-shares and uprights, substantially as and for the purposes set forth.

11. In a box-wrapping machine the combination of a horizontally-moving plunger or push-block, means for imparting motion thereto, vertically-movable folding-shares and means, arranged to be actuated by the movements of the push-block, for raising and lowering said folding-shares, substantially as and for the purposes set forth.

12. In a box-wrapping machine the combination of a horizontally-moving plunger or push-block, means for imparting motion thereto, vertically-movable uprights arranged when in their elevated position to receive and hold a box in position on a delivery-plane and means actuated by the movements of said push-block for raising and lowering said uprights.

13. In a box-wrapping machine the combination of a paste-tank, a paste-feed roller dipping therein, a paste-distributing roller, in contact with said paste-feed roller, and an eccentrically-mounted paste-applying roller arranged to rotate freely upon its support and to make intermittent contact with said paste-distributing roller, substantially as and for the purposes set forth.

14. In a box-wrapping machine the combination of a paste-distributing roller mounted in pivoted supports, means for limiting the range of movement of said supports and an eccentrically-mounted paste-applying roller arranged to rotate freely upon its support and to make intermittent contact with said paste-distributing roller, substantially as and for the purposes set forth.

15. In a box-wrapping machine a paste-applying roller, consisting of a cylindrical, eccentrically-mounted core and a sleeve surrounding said core and free to rotate thereon, substantially as and for the purposes set forth.

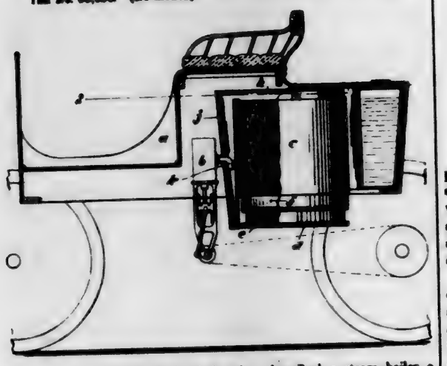
16. In box-wrapping machine the combination of a paste-applying roller comprising an eccentrically-mounted core and a sleeve free to rotate thereon and means for positively rotating said core substantially as and for the purposes set forth.

17. In a box-wrapping machine the combination of a vertically-moving plunger, a paper-feed plane having an opening therein, a discharge-table located below the paper-feed plane and constituting a box-support and means, arranged to be operated by the movements of said plunger for intermittently bridging said opening and at the same time turning down a fold of the box-wrapper substantially as and for the purposes set forth.

18. In a box-wrapping machine the combination of a paper-feed plane having an opening therein, a discharge-table located below the paper-feed plane and constituting a box-support and means arranged to intermittently bridge said opening and at the same time turn down a fold of the box-wrapper, substantially as and for the purposes set forth.

708,430. FLUE CONSTRUCTION FOR STEAM-CARRIAGES.

JAMES H. BULLARD, Springfield, Mass., assignor to Overman Automobile Company, Chicopee, Mass., a Corporation. Filed Nov. 2, 1900. Serial No. 35,250. (No model.)



Claim.—1. In a vehicle of the class described, a steam-boiler, a burner for heating it, a hood inclosing the upper end of the boiler for receiving the products of combustion from the burner, said flue having substantially horizontal divergent branches, which are provided with outlets to the atmosphere and are arranged on either side of said hood to the rear of the center of the boiler, said branches together forming a through-passage for disposing of atmospheric currents which might otherwise reverse or check the normal draft of the burner, in combination with a flue downwardly extending from that part of the hood lying at the front of the boiler; and an exhaust-pipe from the engine entering said flue and downwardly turned therein, substantially as described.

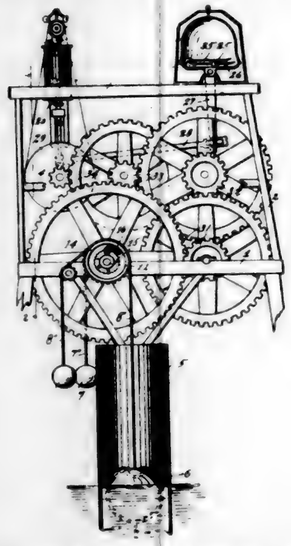
2. In a vehicle of the class described, a steam-boiler, a burner for heating it, a hood inclosing the upper end of the boiler for receiving the products of combustion from the burner, a flue for disposing of the products of combustion connected with that portion of the hood at the front end of the boiler, and extending downward to a point beneath the body of the vehicle, and an exhaust-pipe from the engine entering said flue and downwardly turned therein, substantially as described.

708,461. TIDAL MOTOR.

ELMER E. CADE, Skagway, Alaska. Filed Sept. 3, 1901. Serial No. 74,235. (No model.)

Claim.—1. A motor of the nature indicated, comprising a buoyant weight, a casing for guiding said buoyant weight, a pair of drive-weights, a shaft, a pair of reciprocal wheels intermittently operably related to said shaft, belts on said wheels arranged to lift said drive-weights alternately by rise and fall of the buoyant weight, and means for guiding one of the belts carried by the lower end of the guiding means for the buoyant weight.

2. A motor of the nature indicated, comprising a buoyant weight, a casing for guiding said buoyant weight, a pair of drive-weights, a shaft, a pair of wheels loosely mounted on said shaft, ratchet mechanism connecting the wheels and shaft, belts on said wheels arranged to lift said drive-weights alternately by rise and fall of said buoyant weight, a speed-regulating device coöperatively connected with said shaft, and means for guiding one of the belts carried by the lower end of said casing.



3. A motor of the nature indicated, comprising a buoyant weight, a pair of drive-weights, a shaft, a pair of wheels loosely mounted on said shaft, ratchet mechanism connecting the wheels and shaft, belts on said wheels arranged to lift said drive-weights alternately by rise and fall of said buoyant weight and an escapement coöperatively connected to said shaft comprising an air-cylinder and a governor adapted to regulate the egress of air from the cylinder.

4. A motor of the nature indicated, comprising a buoyant weight, a casing for guiding said buoyant weight, a pair of drive-weights, a shaft, a pair of reciprocally-rotative chain-wheels mounted loosely on said shaft each having a pawl pivotally mounted thereon, ratchets fixed on the shaft in coöperative relations with respective pawls, link belts on said wheels arranged to lift said drive-weights alternately by rise and fall of the buoyant weight and means for guiding one of the link-belts carried by the lower edge of said casing.

5. A motor of the nature indicated, comprising a vertically-reciprocal buoyant weight, a guide-casing therefor, a pair of drive-weights, a shaft journaled above said casing, a pair of reciprocally-rotative chain-wheels mounted loosely on said shaft, a pawl pivotally mounted on each wheel, ratchets fixed on the shaft in coöperative relations with respective pawls, link belts on said wheels each fixed by one end to a respective drive-weight and by the opposite end to the buoyant weight and adapted to raise the drive-weight alternately by rise and fall of the buoyant weight, means connected to the lower edge of the guide-casing for guiding the belt connected to the lower portion of the buoyant weight, and means to regulate the falling speed of the drive-weights.

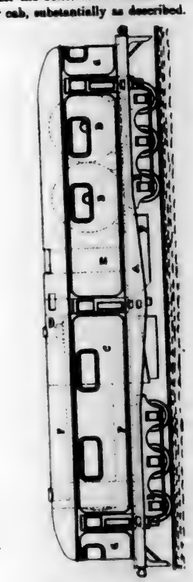
6. A device of the nature indicated, comprising, a buoyant weight, a vertically-disposed guide-casing therefor, a pair of drive-weights, a drive-shaft journaled above the casing, a pair of reciprocally-rotative chain-wheels mounted loosely on said shaft each having a pawl pivotally mounted thereon, ratchets fixed on said shaft in coöperative relations with respective pawls, link belts on said wheels arranged to lift said drive-weight alternately by rise and fall of its buoyant weight, a pair of guide-wheels carried by the lower end of the guide-casing for guiding one of the link belts, an air-cylinder carrying a piston, a governor related to the ports of egress of said cylinder, and speed-multiplying gearing operably connected to said drive-shaft and piston.

708,462. VEHICLE TO BE USED IN ELECTRIC TRACTION ON RAILWAYS.

GEORGE CAWLEY, Westminster, England. Filed June 3, 1902. Serial No. 110,120. (No model.)

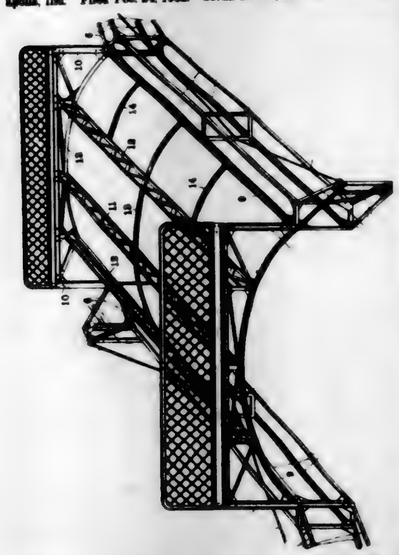
Claim.—1. An electric vehicle, having a supporting-bogie at each end thereof and carrying a boiler, water-tanks above and below the boiler, and fuel-bunkers at one end of the boiler with engines and dynamos on the other side of the fuel-bunkers, substantially as described.

2. An electric vehicle, having a supporting-bogie at each end thereof and carrying a boiler, water-tanks above and below the boiler, and fuel-bunkers at one end of the boiler with engines and dynamos on the other side of the fuel-bunkers, in combination with a cab at each end of the vehicle and passages within the vehicle-body communicating from one part to the next throughout the vehicle, whereby access can be had from one cab, past the boiler and fuel-bunkers, to the engine-room and then to the other cab, substantially as described.



708,468. BRIDGE CONSTRUCTION.

GEORGE M. CHENEY, Indianapolis, Ind. Filed Feb. 24, 1902. Serial No. 96,252. (No model.)



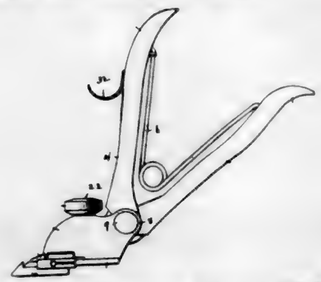
Claim.—1. A combined abutment and wing-walls consisting of a metallic framework approximating the desired form of abutment and attached wing-walls and adapted to contain and be embedded in cement.

2. A combined abutment and wing-walls consisting of a metallic framework approximating the marginal lines thereof, an intermediate bracing-frame forming part of the abutment-frame, and tie-rods extending from said bracing-frame to the ends of said wing-wall frames, the whole adapted to receive and be embedded in cement.

3. In a bridge structure, the combination with the end trusses, of a plurality of beams extending between and connected to the same, and a plurality of struts extending between the several beams parallel with the end trusses and increasing in number from the center of the arch toward each end.

708,464. HAIR-CLIPPER.

GEORGE H. COATES, Worcester, Mass. Filed Jan. 11, 1901. Serial No. 42,935. (No model.)



Claim.—1. The combination with the head of a hair-clipper of a pair of lugs to receive the handles, a bolt held by said lugs, a stationary handle removably attached to said head by said bolt and having a projecting prong engaging the head, whereby said handle is held from turning on said bolt, substantially as described.

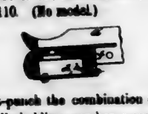
2. The combination with a pivoted handle and a reciprocating cutting-plate, of a lever intermediate between said plate and said handle, said handle and said lever having coacting surfaces placed obliquely to the axis of said plate and said handle, whereby the rocking motion of said handle is communicated to said lever, substantially as described.

3. The combination with the movable plate of a hair-clipper of a lever provided with spiral teeth, a pivoted handle having spiral teeth engaging the teeth on said lever, substantially as described.

4. The combination with the stationary cutting-plate of a hair-clipper, of a comb-plate provided at its ends with upturned clasps adapted to embrace the ends of the stationary cutting-plate, said clasps having flanges 25 overlapping the cutting-plate and having slits 26 and openings 27 forming elastic jaws, substantially as described.

708,465. TICKET-PUNCH.

HERBERT COTTRELL, Newark, N. J., assignor to L. A. Sayre & Co., Newark, N. J., a Firm. Filed Jan. 2, 1902. Serial No. 88,110. (No model.)



Claim.—In a ticket-punch the combination of a receptacle for the clippings recessed in the die-holding member, a cover upon the lower side thereof adapted to slide longitudinally in guides; a stop-screw inserted in the said cover to serve as a push-knob to open and close the same; and a latch to fasten the said cover in a closed position, substantially as described.

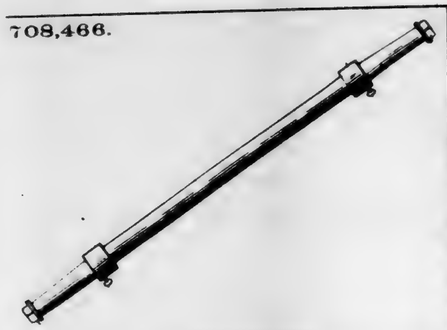
708,466. AXLE.

WILLIAM H. DAVIS, Beaver Meadow, Ala. Filed Nov. 20, 1901. Serial No. 83,004. (No model.)

Claim.—1. An axle comprising a central pipe, internally-threaded collars engaged with the ends of the pipe and having flat bearing-faces at their outer ends, and spindles having their inner ends threaded and adjustably engaged with the threads of the collars for projection therefrom to different extents, said spindles being without surface projections, to permit of direct contact of the hub-boxes with the end faces of the collars, and means for holding the spindles at different points of their adjustments.

2. An axle comprising a central member having terminal, internally-threaded collars having flat bearing end faces, and spindles having their inner ends threaded and adjustably engaged with the threads of the collars to project to different extents from the collars, said spindles being without surface projections, to permit direct contact of the hub-boxes with the end faces of the collars, and means for holding the spindles at different points of their adjustments.

708,466.



708,467. STITCHED SEAM. GEORGE H. DUROUD, Bridgeport, Conn., assignor to Wheeler & Wilson Manufacturing Company, Bridgeport, Conn., a Corporation of Connecticut. Filed July 13, 1901. Serial No. 68,173. (No model.)

Claim.—A stitched seam, comprising a series of stitches and a fabric, such as a glove, in which said stitches are made, said seam consisting of superposed interlocked triplets of thread of equal length.

708,468. WINDOW-SHADE HOLDER. JAMES H. DONALDSON, Chicago, Ill. Filed Aug. 5, 1901. Serial No. 70,891. (No model.)

Claim.—1. In a curtain-holder, the combination with a tubular stick of a non-rotative extension-rod therein, means for holding the extension-rod yieldingly in an adjusted position, a shoe, an adjustable adjusting-bar forming the connection between the shoe and the extension-rod and adapted normally to be engaged in the end of the stick, but withdrawable therefrom for purposes of adjustment.

2. In a curtain-holder, the combination with a stick having a tubular end, of a non-rotative longitudinally-movable extension-rod therein, positive bearings within the end of the stick adjacent to the ends of the extension-rod, a spring engaging the extension-rod between said bearings and adapted to return the rod to its adjusted position when moved outwardly or inwardly of the stick, a shoe, an adjusting-bar rotatively engaged on the shoe and having screw-threaded engagement with the extension-rod, and held from rotation by the end of the stick but withdrawable therefrom for purposes of adjustment.

3. In combination, a curtain-stick having a tubular end, of an extension-rod movable longitudinally in said stick and provided at its inner end with a shoulder and at its outer end with a nut and adapted to slide through fixed bearings within the stick, a spring secured on the extension-rod between said bearings and acting to return the extension-rod to its adjusted position when moved outwardly or inwardly therefrom, a shoe, an angular adjusting-bar rotatively engaged thereon and engaging in a complemental aperture at the end of the stick and having screw-threaded engagement with the extension-rod, said adjusting-bar when withdrawn from the end of the stick being adjustable longitudinally of the rod.

4. In a curtain-holder the combination with a tubular stick of a casing therein, a non-rotative extension-rod therein, a spring on said extension-rod, a shoe, an adjustable adjusting-bar forming the connection between the shoe and the extension-rod and adapted to be engaged in and withdrawable from the outer end of the casing.

5. In a curtain-holder the combination with a tubular stick of a casing secured in the end thereof, a non-rotative extension-rod adapted for longitudinal movement within the casing, a friction-shoe adjustably connected therewith and movable longitudinally of the stick, stops adapted to limit the movement of the extension-rod and a spring engaged on the extension-rod and adapted to force the said rod outwardly as a brake.

6. In a curtain-holder the combination with a tubular stick adapted for attachment to a curtain of a casing, an extension-rod longitudinally movable therein, a spring within the casing controlling the movements of the extension-rod and acting to force the same outwardly therefrom, a shoe, a bar forming an adjustable connection between the shoe and extension-rod and a shank on said bar adapted to engage in or be drawn from a complemental aperture in the end of the casing.

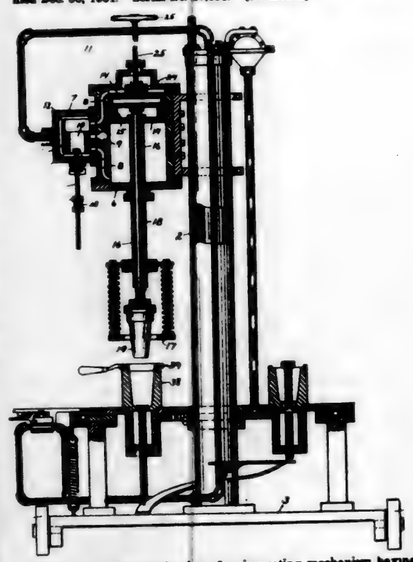
7. In a curtain-holder the combination with a tubular stick of a casing, an end-threaded non-rotative extension-rod longitudinally movable within the casing, a spiral spring adapted to the rod, a nut and washer adjustable upon the rod and adapted to receive the pressure of the outer end of the spring and to permit adjustment of the tension of the same, a shoe, an adjusting-bar rotatively attached thereto and provided with a threaded aperture to receive the end of the extension-rod and a milled disk on said adjusting-bar.

8. In a curtain-holder the combination with a tubular stick of a tubular casing therein, an end-threaded non-rotative extension-rod longitudinally movable in the stick, a slotted cap engaged on the inner end of the casing through which the inner flattened end of the extension-rod passes, a washer upon the rod adapted to bear against the cap, a nut and washer adjustable upon rod, a spring upon the rod acting to press against the washer, an adjusting-bar adjustably secured upon the outer end of the extension-rod and a shoe carried upon the outer end of the adjusting-bar, substantially as described.

9. In a curtain-holder the combination with a tubular stick of a casing therein, an extension-rod, and a spring secured in said casing, an adjusting-bar adjustably secured upon the outer end of the extension-rod and having a journal at the outer end thereof provided with an annular groove therein, a shoe having a hub to fit the journal and a tangential pin passing through the hub into and across the groove in the journal of the extension-bar, substantially as described.

10. The combination with a tubular stick of a spring-controlled, non-rotative extension-rod therein, bearings in the stick acting to limit the movements of said rod, a shoe, and an adjusting-bar engaged thereon and having screw-threaded engagement with the extension-rod and normally engaged in and held from rotation by the stick and adapted to be withdrawn from the stick against the tension of the spring for purposes of adjustment.

708,469. STROKE-REGULATING MECHANISM FOR GLASS-PRESSERS, &c. PHILLIP REBLIN, Moundsville, W. Va., assignor of one-half to George Lafayette Caldwell, Wellsburg, W. Va. Original application filed Aug. 27, 1901, Serial No. 73,456. Divided and this application filed Dec. 30, 1901. Serial No. 87,060. (No model.)



Claim.—1. The combination of reciprocating mechanism having a piston-chamber and means for actuating said mechanism, a piston carried by the reciprocating mechanism and movable in the chamber thereof, means for supplying fluid under pressure to the piston-chamber for actuating said piston, and a plunger connected to the piston.

2. The combination of a cylinder, a recessed piston therein and open thereto, an auxiliary piston having limited movement in the recessed piston, and a plunger connected to the auxiliary piston.

3. The combination of a cylinder, a hollow main piston therein having valved communication therewith, an auxiliary piston having limited movement in the main piston, and a plunger connected to the auxiliary piston.

4. The combination of a cylinder, a hollow main piston having a port communicating with the cylinder, a valve for said port, valve-actuating means movable with the piston and projecting from the cylinder, an auxiliary piston movable in and with the main piston, and a plunger connected to the auxiliary piston.

5. The combination of a cylinder, a hollow main piston therein having a valve-seat in its exterior communicating with the piston-cavity, a valve adjustable toward and from the seat, a stem projecting from the valve through the cylinder, an auxiliary piston movable in and with the main piston, and a plunger connected with the auxiliary piston.

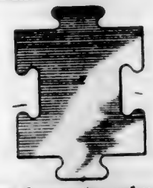
6. The combination of a plunger, power-cylinder, a piston operating therein to reciprocate the plunger, and means for checking the exhaust from the inactive side of the piston during the first portion of the pressing stroke and accelerating the same during the latter portion of the stroke.

7. The combination of a plunger, a power-cylinder, a piston operating therein to reciprocate the plunger, a valved main exhaust for the cylinder and a contracted permanently open exhaust therefor, and means operating before the completion of the stroke to open the main exhaust.

8. The combination of a plunger, a power-cylinder, a piston operating therein to reciprocate the plunger, a pipe extending from the cylinder-exhaust formed with a port, a spring-closed valve slidable on the pipe, and an operative connection between the piston and said valve.

9. The combination of exhaust-pipe 30 having a valve-controlled main exhaust 31 and auxiliary contracted openings 35, and rotatable ring 36 covering openings 35 and formed with openings 36 adapted to register therewith.

708,470. TILE. ALFRED L. FLOOD, Chicago, Ill., assignor of one-half to William L. Weber, Chicago, Ill. Filed Feb. 28, 1902. Serial No. 95,647. (No model.)



Claim.—1. A wall, floor or other surface, made up of a series of separate, uniform and interchangeable tiles, having marginal dovetailed recesses and corresponding interlocking projections, one in the middle of each side and alternating around the margin, and both extending through the entire tile thickness, so that they can be locked together to form a substantially continuous surface of pieces held together against lateral strain by such interlocking marginal parts.

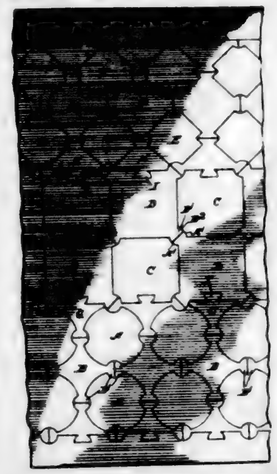
2. A wall, floor or other surface, made up of a series of separate, uniform and interchangeable tiles, having marginal dovetailed recesses and corresponding interlocking projections, one in the middle of each side and alternating around the margin, and both extending through the entire tile thickness, so that they can be locked together to form a substantially continuous surface of pieces held together against lateral strain by such interlocking marginal parts, the tiles being four-sided, with two recesses on opposite margins and two projections on opposite margins.

708,471. TILE. ALFRED L. FLOOD, Chicago, Ill., assignor of one-half to William L. Weber, Chicago, Ill. Filed Feb. 28, 1902. Serial No. 95,648. (No model.)

Claim.—1. A floor-covering consisting of a series of flat tiles with edges at right angles with the floor-surface and provided with interlocking marginal projections and recesses to prevent them from separating one from another in response to lateral strain and supplementary projections from the under side of some of said tiles and a floor to receive the extended lower surfaces of such tiles said floor provided with recesses to receive such supplementary projections, the parts related so that the pressure exerted by the expansion of the tiles which are not provided with the supplementary projections is exerted in a plane parallel with the surface of the floor-covering.

2. The combination of a floor having a series of recesses therein with a series of flat tiles which rest upon such floor some of them having projections to be received into such recesses, said flat tiles provided with edge faces at right angles to the floor-surface and provided with interlocking marginal projections and recesses to prevent them from separating one from another in response to lateral strain, the parts arranged so that the lateral strain due to the expansion of the tiles which have no supplementary projections is exerted in a line parallel with the surface of the floor-covering and the under surface of the tiles about their edges resting firmly upon the floor-body, the supplementary projections being dovetailed and filling material in the space within the recesses about the dovetailed projections.

708,472. TILE. ALFRED L. FLOOD, Chicago, Ill., assignor of one-half to William L. Weber, Chicago, Ill. Filed Mar. 3, 1902. Serial No. 96,200. (No model.)



Claim.—1. A floor, wall or other surface composed of a series of tiles of different shapes or forms, one form consisting of a circular tile cut away at various points to provide circular recesses, the other having circular engaging faces provided with interlocking projections adapted to fit such circular recesses.

2. The combination with a series of circular tiles of a binding or interlocking tile adapted to be interposed between the circular tiles and provided with interlocking projections which engage such circular tiles.

3. The combination of a series of surface-forming flat tiles with interlocking edges to form when thus interlocked an extended flat surface, such interlock consisting of a curved recess in the edge of one of such tiles and curved projections on adjacent tiles, two of such projections lying in engagement with each of said recesses.

4. A floor, wall or other surface made up of a series of dissimilar tiles, provided with curved recesses of greater width at the mouth and curved interlocking projections, the curved projections adapted to fit into the curved recesses, substantially as described.

5. A floor, wall or other surface made up of a series of tiles of various shapes, said tiles having their outer boundary interrupted by projections and recesses, the faces of the projections adapted to engage the faces of the recesses, such engaging faces being arcs of circles and such recesses of greatest width at their mouths.

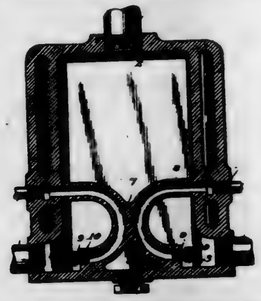
708,478. TRACK-SANDER. WILLIAM C. GARDNER, Altoona, Pa. Filed Apr. 22, 1902. Serial No. 104,301. (No model.)

Claim.—1. A track-sander, comprising a sand-receiving chamber surrounded by a steam-pocket, and a sand-discharging device arranged within the chamber.

2. A track-sander, comprising a sand-receiving chamber surrounded by a steam-pocket, a sand-discharging device arranged within the chamber, and jet-nozzles carried by the discharge device.

3. A track-sander, comprising a sand-receiving chamber surrounded by a steam-pocket, said chamber being provided with outlets, a sand-discharging device arranged within the chamber, and provided with discharge-openings alined with the outlets, and jet-nozzles carried by the discharge-openings.

4. A track-sander, comprising a chamber surrounded by a steam-pocket, means for feeding sand thereto, a partition arranged within the chamber and provided with passages having opposite discharge-openings, jet-nozzles arranged in the discharge-openings, means for feeding steam to the passages to discharge the sand, means for supplying steam to the pockets, and an exhaust adapted to control the supply of steam in the pockets.



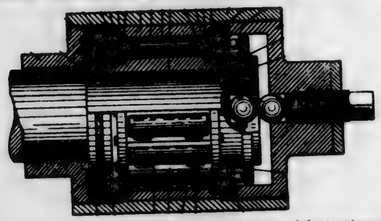
5. A track-sander, comprising a sand-receiving chamber surrounded by a steam-pocket, and a sand-discharging device arranged within the chamber, and formed integral therewith.

6. A track-sander, comprising a sand-receiving chamber surrounded by a steam-pocket, and provided with outlets, a partition within the chamber and formed integral therewith, said partition being provided with passages having oppositely-located inlet and discharge openings.

708,474. WIRE-STRETCHER. FREDERIC C. GARTON, Schoolhouse, W. Va. Filed Nov. 2, 1901. Serial No. 80,981. (No model.)

Claim.—As a new article of manufacture, a combined wire stretcher and holder comprising a bar having a curved split claw at its forward end, said bar being curved or bowed substantially in the form of a semi-circle adjacent to the forward end, a hook arranged upon the bar between the claw and curved portion, and a shank carrying a plurality of hooks arranged upon opposite sides of the curved portion and also upon the opposite side of the bar, substantially as described.

708,475. ROLLER-BEARING. ALBERT E. HENDERSON, Toronto, Canada. Filed Apr. 10, 1902. Serial No. 102,236. (No model.)



Claim.—1. In a roller-bearing the combination of the bearing-rollers, retaining-rings for the bearing-rollers, tie-rods having apertures therein provided with median end grooves, and spacers contained in the apertured tie-rods held from contact therewith by the median end grooves, substantially as specified.

2. In a roller-bearing the combination of the bearing-rollers, retaining-rings for the bearing-rollers, tie-rods having apertures therein provided with median end grooves, and spacing-rollers contained in the apertured tie-rods having tapering pins journaled in the median end grooves, substantially as specified.

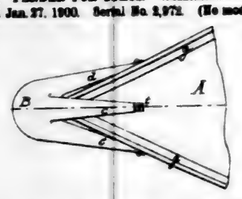
3. In a roller-bearing the combination of the bearing-rollers having centrally-located conical recesses in the ends thereof terminating in horizontally-disposed bores, retaining-rings fitted with tapering pins having conical points journaled in the conical recesses of the bearing-rollers, apertured tie-rods for holding the retaining-rings relatively to the bearing-rollers and spacing-rollers contained in the apertured tie-rods, substantially as specified.

4. In a roller-bearing the combination of the bearing-rollers, retaining-rings for the bearing-rollers, tie-rods for holding the retaining-rings together and independently-rotatable abutting rings to contact the ends of the bearing-rollers, substantially as specified.

5. In a roller-bearing the combination of the journal a sleeve therefor, bearing-rollers encircling the sleeve, retaining-rings for the bearing-rollers, tie-rods for holding the retaining-rings together, a sleeve inclosing the retaining-rings, independently-rotatable abutting rings fitted to the sleeves engaging the ends of the bearing-rollers, and adjusting-nuts fitted on the sleeve to prevent the longitudinal displacement of the rotatable abutting rings, substantially as specified.

6. In a roller-bearing the combination of the bearing-rollers, sectional retaining-rings for the bearing-rollers, the separable parts of which have overlapping joints, and a series of tie-rods interposed between the bearing-rollers and passing through the overlapping joints of the retaining-rings to hold the sections of the retaining-rings relatively to each other, and to the bearing-rollers, said tie-rods being provided with apertures therethrough, and antifriction devices mounted in said apertures and adapted to contact the bearing-rollers.

708,476. FENDER FOR BOATS. WILLIAM H. HIGGINS, Boston, Mass. Filed Jan. 27, 1900. Serial No. 2,972. (No model.)



Claim.—1. A fender for boats consisting of two flexible triangular members sewed together around their edges, stuffing between them, means for securing the prongs to the boat, and a web for attaching the center of the device to the boat, as and for the purpose set forth.

2. A fender for boats consisting of a flexible body portion, three arms or prongs of equal length, means for securing the ends of said prongs to the sides and top of the boat respectively, a lug or tongue attached to the center of the body portion and connected with the nose of the boat, and a yielding stuffing material thicker in the body of said covering than in said prongs, as and for the purpose set forth.

3. A fender for boats, consisting of a flexible body portion, a plurality of prongs of equal length, a web for securing the body portion to the boat, means for securing the ends of said prongs to the sides and top of the boat respectively, and a yielding stuffing material thicker in the body of said covering than in said prongs, as and for the purpose set forth.

4. As a new article of manufacture, the head or fender in tripod form composed of curled hair and rawhide and provided with the lug or tongue to be attached to the stem of boat, substantially as described.

708,477. EMERGENCY-BRAKE. WILLIAM W. HOPKINS, St. Louis, Mo., assignor of one-half to Wilson P. H. Turner, Normandy, Mo. Filed July 18, 1901. Serial No. 68,793. (No model.)

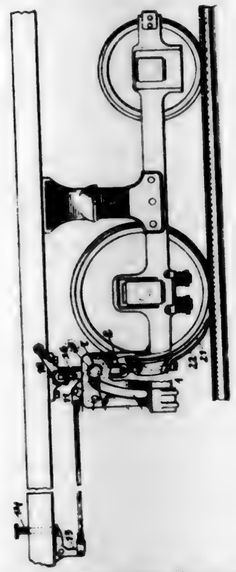
Claim.—1. In a car-brake mechanism, suitable plates supported adjacent to the rails, and means for moving said plates onto the rails to form treads for the flanges of the car-wheels where the rails are provided with flanges, and for the tread-surfaces where there are no flanges on the rails, substantially as specified.

2. The improved car-brake, consisting of the usual brake mechanism, means for lowering a portion of the same out of its normal position, and curved plates carried by the brake mechanism and adapted to rest upon the rails when the brake mechanism is lowered to pass entirely under and thereby form treads for the car-wheels, substantially as specified.

3. The improved car-brake mechanism, consisting of suitable brake-shoes, means for upholding them in normal position, means whereby the brake-shoes may be lowered, and tread-plates carried by said brake-shoes and adapted to rest upon the flanges of the rails to form treads for the flanges of the wheels and thereby entirely support the wheels above the rails, substantially as specified.

4. The improved car-brake mechanism, consisting of suitable brake-shoes, means for supporting the brake-shoes in normal position, curved tread-plates carried by said brake-shoes, means for lowering the brake-shoes so that the said plates will rest upon the rails and form treads or runners for the wheels, and suitable connections between the brake-shoes and the car-body so that the weight of the brake-shoes and the resistance

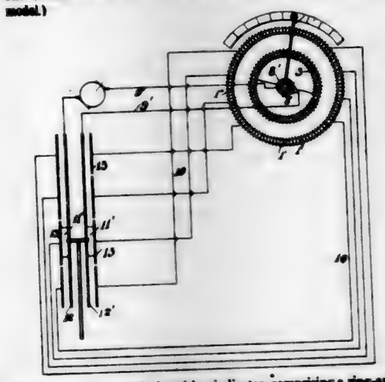
of the plates under the wheels will be supported by the car-body, substantially as specified.



5. In a car-brake mechanism, suitable plates supported near the flanges of the rails, and means for moving said plates in position to form treads for the flanges of the wheels, so that the entire weight of the car will be upon the flanges of the wheels, as and for the purpose set forth.

6. In a car-brake mechanism suitable plates supported above the flanges and heads of the rails, and means for lowering said plates into position upon the said flanges and heads to form treads for the flanges of the wheels where the rails are provided with flanges and for the tread-surfaces where there are no flanges on the rails.

708,478. ELECTRICAL POSITION-INDICATOR. ALBERT S. HUBBARD, Greenwich, Conn. Filed Feb. 20, 1902. Serial No. 94,913. (No model.)



Claim.—1. An electrical position-indicator, comprising a ring-armature provided with a winding and with energizing-circuit connections, an index device connected to said armature, an annular field-magnet with a ring-winding, and a switch device connected to the object whose position is to be indicated and having a plurality of contacts electrically connected to different parts of the said winding and to an energizing-circuit.

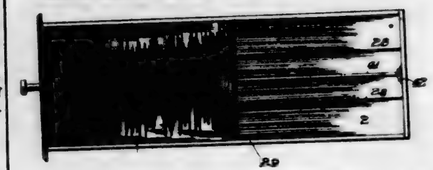
2. An electrical position-indicator, comprising a ring-armature provided with a winding and with energizing-circuit connections, an index device connected to said armature, an annular field-magnet with a ring-winding, and a switch device connected to the object whose position is to be indicated and having a plurality of contacts electrically connected to different parts of the said winding and to an energizing-circuit.

3. An electrical position-indicator comprising an annular field-magnet provided with a series of coil-sections, a ring-armature having energizing-circuit connections, windings on said armature to divide the current around and polarize the same, said armature mounted to move in response to polarization of the field-magnet, an index controlled by the movements of said armature, a switch device having contact-pieces connected to the object whose position is to be indicated, and said contact-pieces connected with the corresponding coil-sections of the field-magnet.

4. An electrical position-indicator comprising an annular field-magnet provided with a series of coil-sections, a ring-armature having energizing-circuit connections, windings on said armature to divide the current around and polarize the same, said armature mounted to move in response to polarization of the field-magnet, an index controlled by the movements of said armature, a switch device having contact-pieces connected to the object whose position is to be indicated, said contact-pieces connected with the corresponding coil-sections of the field-magnet, said switch device being of such construction as to pass from one contact-piece to the adjacent contact-piece without breaking circuit.

5. An electrical position-indicator comprising an annular field-magnet provided with a series of coil-sections, a ring-armature having energizing-circuit connections, windings on said armature to divide the current around and polarize the same, said armature mounted to move in response to polarization of the field-magnet, an index controlled by the movements of said armature, a switch device having contact-pieces connected to the object whose position is to be indicated, said contact-pieces connected with the corresponding coil-sections of the field-magnet, the interval between adjacent contact-pieces being so small with relation to the switch device that said switch device will maintain contact with adjacent contact devices in passing from one to the other and bring in circuit corresponding adjacent coil-sections on the field-magnet whereby an intermediate position of the object whose position is to be indicated will be shown.

708,479. CROSS-INDEX. ROBERT L. HUNTER, Cleveland, Ohio. Filed Jan. 10, 1901. Serial No. 42,749. (No model.)



Claim.—1. In a device of the class described, the combination of a plurality of index-cards and means for holding or retaining said cards in various transverse positions relatively to each other, substantially as described.

2. In a device of the class described, the combination of a guide or guides and a plurality of index-cards, each of said cards being provided with a plurality of means for engaging said guide or guides whereby said cards may be held in various transverse positions, substantially as described.

3. In a device of the class described, the combination of a guide or guides and a plurality of index-cards each card being provided with a plurality of means for loosely engaging said guide or guides whereby said cards may be held in various transverse positions, while free to move in a longitudinal direction, substantially as described.

4. In a device of the class described, the combination of a plurality of index-cards provided with slots upon their edges, means for holding or retaining said cards in various transverse positions relatively to each other, comprising a guide or guides for engaging the slots of said cards, substantially as described.

5. In a device of the class described, the combination of a plurality of index-cards provided with slots, means for engaging said slots and holding or retaining said cards from transverse movement relatively to each other while permitting the free longitudinal movement of the same, substantially as described.

6. In a device of the class described, the combination with the box or tray of a runner 28 provided in the bottom thereof and cards provided with a plurality of slots 40 and held in desired transverse relations by said runner, substantially as described.

7. In a device of the class described, the combination with the box or tray of the parallel runners 28 provided in the bottom thereof and a plurality of cards each having two sets of vertical slots 40 to fit said runners, substantially as described.

8. In a device of the class described, the combination with the box

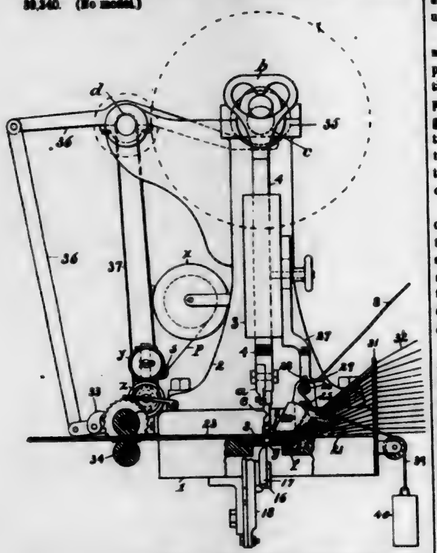
or tray of the parallel runners 28 provided in the bottom thereof and a plurality of cards each having two sets of vertical slots 40 to fit said runners, said cards also having slots 43 and a locking-rod extending through said slots, substantially as described.

9. In a device of the class described, the combination with the box or tray of the runners 28 in the bottom thereof, cards adapted to be held in various transverse positions by said runners and locking means common to said cards, substantially as described.

10. A cross-index card provided with a plurality of vertical slots 40, with substantially parallel sides, as and for the purpose specified.

11. A cross-index card provided with a plurality of slots 40 with substantially parallel sides and having a middle locking-bar aperture, as and for the purpose specified.

708,480. **FABRIC-SEWING MACHINE.** JOHN W. HYATT, Newark, N. J. Filed Jan. 23, 1901. Renewed Jan. 11, 1902. Serial No. 89,340. (No model.)



Claim.—1. In a multiplex sewing-machine having a reciprocating needle-bar, a row of eye-pointed needles carried thereby, and a needle-bed having an open slot for the passage of the needles, the combination, with such bed and needles, of a thread-carrying looper movable longitudinally next the needles and having an eye in the point and a longitudinal notch at the side in the rear of the eye, a guide A at the base of the looper with a guide *v* and means for supplying a lock-thread to the guide *v* and the eye of the looper, means for reciprocating the looper and carrying the eye and the notch beyond the end of the row of needles, a shuttle-guide mounted vertically at the end of the row of needles, and a shuttle with means for reciprocating it vertically through the notch of the looper to engage the loop of the lock-thread, substantially as herein set forth.

2. A multiplex sewing-machine having a needle-bar with means for reciprocating it vertically, a needle-holder with means for reciprocating it horizontally upon the needle-bar, and a row of eye-pointed needles carried by such holder, a needle-bed with longitudinal slot and a thread-carrying looper with means for reciprocating it next the needles, the looper having an eye in the point with a lock-thread carried thereby, and a shuttle with means for reciprocating it through the loop of such lock-thread.

3. In a multiplex sewing-machine, the combination, with the needle-bar and a row of flat eye-pointed needles of much greater breadth than thickness transversely to the row, and having each an eye extended transversely to the row and an open notch open its front side above the eye, of a needle-bed having an open slot for the passage of the needles, means for reciprocating the needle-bar to carry the notches beneath the fabric and maintain the tension upon the needle-threads before the said notches, and a looper supplied with an independent lock-thread reciprocated in the series of notches between the needles and the needle-threads under tension, to engage the loops formed by the said needles, substantially as herein set forth.

4. In a multiplex sewing-machine, the combination, with the needle-bar, and the row of flat eye-pointed needles of much greater breadth than thickness and having each an eye extended transversely to the row, and an open notch open its front side above the eye, of a needle-bed having an open slot for the passage of the needles, means for reciprocating the needle-bar to carry the notches beneath the fabric and maintain the tension of the needle-threads, and a looper having an eye in the point and a lock-thread carried thereby, with means for reciprocating such looper in the series of notches, between the needles and the needle-threads under tension and carrying the loop of the lock-thread beyond the end of the row, and means for securing the successive loops of the lock-threads together.

5. In a multiplex sewing-machine having a reciprocating needle-bar, a row of eye-pointed needles, and a needle-bed beneath the needle-bar, the combination, with such bed and needles, of a thread-carrying looper having an eye in the point, means for reciprocating the same next the needles, means for engaging the loop formed by such looper, means for continuously feeding the lock-thread to such looper, and a spring take-up between the feeding device and the looper for maintaining the tension upon the lock-thread.

6. In a multiplex sewing-machine having a rotary driving-shaft, a needle-bar reciprocated by the same, a needle-carrier with row of eye-pointed needles, and a needle-bed beneath the needle-bar, the combination, with such parts, of a thread-carrying looper having an eye in the point, means for reciprocating the same next the needles, means for engaging the loop formed by such looper, lock-thread rolls rotated continuously by the driving-shaft, a guide for directing the lock-thread through the same, and a spring having eye applied to the lock-thread between the feed-rolls and the looper, for maintaining the tension upon such thread during the reciprocation of the looper.

7. In a multiplex sewing-machine, the combination, with means for operating a row of eye-pointed needles and locking the loops of the threads carried thereby, of a needle-bed having an open slot for the passage of the row of needles, the perforated guide 31 at one side of the needle-bed, and the feed-rolls 34 at the opposite side, and a presser-foot for pressing the warp-threads into a layer adjacent to the slot in the needle-bed, whereby a series of warp-threads may be drawn across the needle-bed under tension transversely to the row of eye-pointed needles.

8. In a multiplex sewing-machine, the combination, with means for operating a row of eye-pointed needles and locking the loops of the threads carried thereby, of a needle-bed, means for guiding a series of warp-threads in a flat layer across the surface of the needle-bed and means for vibrating the needle-carrier, to form zigzag stitches and connect such warp-threads together laterally.

9. In a multiplex sewing-machine, the combination, with a reciprocating needle-bar and a row of eye-pointed needles carried thereby, and a needle-bed and means for locking the loops formed by the needles, of means for guiding a series of warp-threads in a flat layer across the surface of the needle-bed, and means for vibrating the needle-carrier to form zigzag stitches to lock such warp-threads together laterally.

10. In a multiplex sewing-machine, the combination, with a needle-bed and a transverse slot across the same, and means for locking the loops formed by the needles, of means for guiding a series of warp-threads in a flat layer across such slot, and a needle-bar with carrier having a series of broad flat needles adapted to pass between the warp-threads and having eyes extended fore and aft through the same, and means for vibrating the carrier to form zigzag stitches and connect the warp-threads together laterally.

11. In a multiplex sewing-machine, the combination, with a reciprocating needle-bar and a row of eye-pointed needles carried thereby, of a needle-bed with means for guiding a series of warp-threads in a flat layer along the needle-bed across the path of the needles, means for vibrating the needle-carrier to form zigzag stitches to connect the warp-threads into a fabric, a lock-thread-carrying looper having an eye in the point, means for reciprocating the looper and carrying the loop of the lock-thread beyond the edge of the fabric, and means for securing the loops of the lock-threads together upon the edge of the fabric to form a selvage thereon.

12. In a multiplex sewing-machine, the combination, with means for operating a row of eye-pointed needles and locking the loops of the threads carried thereby, of a needle-bed, a guide and a presser-foot at one side of the needle-bed for guiding a series of warp-threads in a flat layer across the surface of the needle-bed, means for vibrating the needle-carrier to form zigzag stitches and connect such warp-threads laterally, feed-rolls at the opposite side of the needle-bed adapted to draw the sewed fabric from the needles, a ratchet-wheel upon the feed-rolls, and a pawl reciprocated a fraction more than the space of an integral number of teeth upon the ratchet-wheel, whereby the elasticity of the fabric operates to reverse the movement of the feed-rolls while the needles are in the fabric, and the last row of stitches is pressed against the forward side of the needles to beat the rows of stitches together.

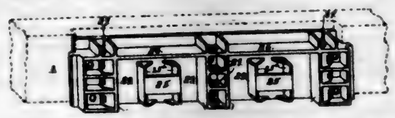
13. In a multiplex sewing-machine having a reciprocating needle-bar, a row of eye-pointed needles and a needle-bed beneath the needle-bar, the combination, with such bed and needles, of a thread-carrying looper having an eye in the point, means for reciprocating the same next the needles, means for engaging the loop formed by such looper, rolls for continuously but insufficiently feeding the thread to such looper, a spring take-up between the feeding-rolls and the looper, and means for pressing the feeding-rolls together adapted to yield under the tension of the take-up to permit the slipping of the thread in the rolls to supply the deficiency.

14. In a multiplex sewing-machine having a reciprocating needle-bar, a row of eye-pointed needles and a needle-bed beneath the needle-bar, the combination, with such bed and needles, of a thread-carrying looper movable longitudinally next the needles with an eye extended horizontally through the point, a vertical notch at the side of the rear of the eye, and a groove in the side of the looper extended backwardly from such notch, means for reciprocating the looper and carrying the eye and the notch beyond the end of the row of needles, and a shuttle with means for reciprocating it vertically through the notch of the looper to engage the loop of the lock-thread.

15. In a multiplex sewing-machine, the combination, with the needle-bed and means for guiding a series of warp-threads in a flat layer across the surface of the same, of a needle-carrier having a row of eye-pointed needles flattened in the direction of the warp-threads, and having each an eye extended through the breadth of the same, and a looper, with means for operating the same, for locking the loops of the needle-threads, substantially as herein set forth.

16. In a multiplex sewing-machine having a reciprocating needle-bar, a needle-bed and means for locking the loops of the needle-threads underneath such bed, of a series of needles flattened transversely to the length of the needle-carrier and having each an eye extended through the breadth of the same, and the body of each needle formed in longitudinal sections one at each side of the eye, and one each above and below the eye, as and for the purpose set forth.

708,481. **CAR-RIGGING OR DRAFT APPLIANCE FOR RAILWAY-CARS.** SYLVESTER H. JANSEN, Buffalo, N. Y.; Emily J. Jansen executrix of said Sylvester H. Jansen, deceased. Filed Nov. 10, 1899. Serial No. 736,556. (No model.)



Claim.—1. In combination with the draft-timbers of a car, draft-plates secured to the inner sides of the draft-timbers, vertically-disposed abutments formed on the inner faces of the draft-plates, bosses formed with the inner faces of the draft-plates intermediately the central and end abutments, said bosses comprising end plates connected by face-plates, follower-plates adapted to travel between the abutments and the ends of the bosses, springs between the follower-plates, bearing against the faces of the bosses whereby said springs are guided, a yoke slidable between the draft-plates and having an intermediate cross-piece for confining the springs and followers and a draw-bar to which the yoke is attached as and for the purpose described.

2. In combination with the draft-timbers of a car, draft plates secured to the inner sides of the draft-timbers, vertically-disposed abutments formed on the inner faces of the draft-plates intermediately the central and end abutments, said bosses comprising end plates connected by face-plates, follower-plates adapted to travel between the abutments and the ends of the bosses, springs between the follower-plates, bearing against the faces of the bosses whereby said springs are guided, a yoke slidable between the draft-plates and having an intermediate cross-piece for confining the springs and followers, a draw-bar to which the yoke is attached, bars bolted to the under edge of the draw-plates, cross-bars connecting the longitudinal bars whereby the draft-timbers are connected, as and for the purpose described.

708,482. **PNEUMATIC TIRE.** THOMAS B. JEFFERY, Kenosha, Wis. Filed July 24, 1901. Serial No. 69,471. (No model.)

Claim.—1. A pneumatic tire comprising concentric flexible bands adapted when secured together at their lateral edges to constitute an inclosure, in combination with rigid annular elements which lap and unite such flexible bands at their corresponding lateral edges, such rigid annular elements being exterior to the edges which they unite, and forming rigid lateral armor for the tire.

2. A pneumatic tire comprising a casing consisting of two flexible elements each annular and adapted to be joined at their corresponding lateral edges to inclose the tire-chamber; two rigid annular elements lapping the adjacent edges of the flexible elements at the opposite sides respectively of the tire and connected thereto and constituting the means of uniting said two flexible elements.

3. A pneumatic tire consisting of two concentric flexible bands having their corresponding lateral edges in the same planes respectively transverse to the axis, in combination with two rigid annular elements which lap and engage the corresponding edges of the flexible bands at opposite sides respectively.

4. A pneumatic tire consisting of two concentric flexible bands which are normally approximately semicylindrical in form in transverse section, in combination with two rigid annular elements which lap and engage the corresponding edges of the flexible bands at opposite sides respectively.

5. A pneumatic tire, consisting of two concentric flexible bands, of which the inner is adapted to be seated at the middle part of its width on the rim, and means securing it thereto; said bands being united throughout their circumference at their corresponding lateral edges; interior annular elements lapping the two bands across their said lateral junctions, and engaged with the bands at opposite sides of the junctions respectively.

6. A pneumatic tire, consisting of two concentric bands; rigid annular elements which exteriorly clasp their corresponding lateral edges, and rigid annular elements which interiorly lap the edges of said bands at each of said lateral junctions, and engage the bands at opposite sides of said junctions respectively.

7. A pneumatic tire, consisting of two concentric annular bands, each provided with exterior and interior beads, B^2, B^3, parallel with their lateral edges respectively, the interior beads being nearer the edge than the exterior; in combination with the rigid annular elements adapted to clasp the corresponding edges of said bands and engage the exterior beads thereof; and interior rigid annular elements lapping the junctions of said bands at the opposite sides, and engaging their interior beads.

708,483. **PLAYING-BALL.** ELEAZER KENDRALL, Boston, Mass. Filed Dec. 18, 1901. Serial No. 86,347. (No model.)

Claim.—1. A playing-ball comprising a highly-compacted substantial gutta-percha shell and a soft-rubber sphere or ball powerfully gripped by said shell, so that the shell constantly tends to compress the core and the latter to expand the shell.

2. A playing-ball comprising a highly-compacted substantial gutta-percha shell and a sphere of solid soft rubber held under permanent compression by said shell.

3. A playing-ball comprising a gutta-percha shell consisting of welded segments, and a solid sphere consisting entirely of well-vulcanized soft rubber filling said shell and held under compression thereby.

4. A playing-ball consisting of a highly-compacted shell built up from gutta-percha segments, said segments being welded edge to edge, and a filling consisting largely or wholly of soft rubber powerfully gripped by said shell.

5. A playing-ball comprising a shell built up of highly solidified or compacted hemispherical sections of well-cemented gutta-percha, and a sphere of highly-vulcanized, solid soft rubber held under compression by said shell.

6. A playing-ball comprising a highly-compacted substantial gutta-percha shell and a sphere of solid soft rubber cemented to and powerfully gripped by said shell.

7. A playing-ball comprising a gutta-percha shell consisting of welded segments, and a sphere of well-vulcanized soft rubber filling said shell and cemented thereto and held under compression thereby.

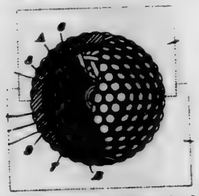
8. In a playing-ball, the combination with a soft filling of a shell of plastic material cemented and powerfully compressed thereon, and holding said filling under permanent compression.

9. In a playing-ball, the combination with a soft springy filling, of a shell consisting of segments of plastic material welded together and both cemented to and compressed upon said core, and holding said core under permanent compression.

10. A golf-ball having a core of molded elastic material compressed within a hard or rigid but elastic outer covering, substantially as set forth.

11. A golf-ball having a core of homogeneous rubber under pressure and an outer covering of gutta-percha, substantially as set forth.

708,484. PLAYING-BALL. ELEAZER KEMPSHALL, Boston, Mass. Filed June 16, 1902. Serial No. 111,839. (No model.)



Claim.—1. A playing-ball comprising a hard core, a layer of soft rubber thereon, twine wound tightly upon said soft rubber, a layer of rubber upon said twine, windings of twine upon the last-mentioned layer of rubber, and a shell of plastic material.

2. A playing-ball comprising a hard-rubber shell, a layer of soft rubber thereon, tense windings of twine upon said soft rubber, tense windings of rubber upon said twine, tense windings of twine upon said rubber windings, and a gutta-percha shell.

3. A playing-ball comprising a perforated hard-rubber shell, a layer of soft rubber thereon, tense windings of twine upon said soft rubber, tense windings of rubber upon said twine, tense windings of twine upon said rubber windings and a gutta-percha shell, said windings of twine being impregnated with celluloid.

4. A playing-ball comprising a hard shell, a plurality of rubber layers thereon, each layer being wound with twine, and a shell of gutta-percha.

5. A playing-ball comprising a perforated hard-rubber shell, a plurality of rubber layers thereon, each layer being wound with twine; and a shell of gutta-percha.

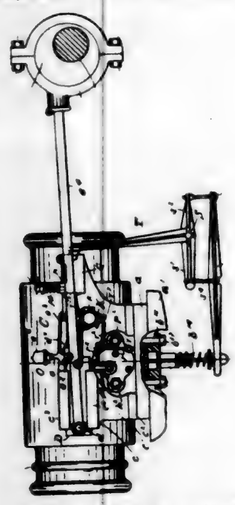
6. A playing-ball comprising a perforated center piece of hard material, a plurality of rubber layers thereon, each layer being wound with twine; and a shell of gutta-percha.

708,485. GOVERNING AND VALVE-OPERATING MECHANISM FOR GAS OR VAPOR ENGINES. ERNST H. KOSMINTER, Kansas City, Mo., assignor to the Kansas City Hay Press Company, a Corporation of Missouri. Filed Apr. 29, 1901. Serial No. 57,971. (No model.)

Claim.—1. In valve-operating mechanism, the combination with the exhaust-valve, of a spring-retracted, slidable bar, a valve-actuating reciprocating plate, a plunger pivotally connected with said plate and coacting with and actuating intermittently the slidable bar, a rotatable cam supporting the outer end of said plunger and adapted to remove said plunger from contact with said slidable bar, and coacting devices upon said reciprocating plate and said slidable bar imparting motion alternately to said cam, in the reciprocal movements of the said plate and sliding bar.

2. In valve-operating mechanism, the combination with the exhaust-valve, of a spring-retracted, slidable bar, a valve-actuating reciprocating plate a plunger pivotally connected with said plate, coacting with and actuating intermittently the slidable bar, a rotatable cam supporting the outer end of said plunger, and adapted to move the outer end of said plunger from contact with the slidable bar, a self-engaging barbed stem pivotally connected with the said reciprocating plate, and a pawl upon the slidable bar, and devices upon each side of said cam actuated alternately by said barbed stem and said pawl.

3. In valve-operating mechanism, the combination with the exhaust-valve, of a spring-retracted, slidable bar actuating said valve, a reciprocating plate, a plunger pivotally connected with said plate and actuating the slidable bar, a rotatable cam supporting the outer end of said plunger pins upon one side of said cam, and teeth upon the other side in alternate, transverse positions to said pins, a stem pivotally connected with said reciprocating plate and a barb at the outer end engaging automatically with said pins, and a pawl upon the slidable bar engaging with said teeth in the reciprocal movements of said plate and sliding bar.



4. In valve-operating mechanism, the combination with a suitable supporting bracket or stand and with the exhaust-valve, of a spring-retracted, slidable bar actuating said valve, suitable guides upon said stand therefor, a reciprocating plate, and guides upon said bracket therefor, a spring-actuated plunger coacting with and actuating the slidable bar, and pivotally connected with said plate, a stud-shaft upon said bracket, and a rotatable cam upon said stud-shaft supporting the outer end of said plunger, and adapted to move said plunger from contact with the slidable bar, pins extending from one side of said cam, and teeth upon the other side in alternate, transverse position to the pins, a spring-actuated stem pivotally connected with the reciprocating plate, and self-engaging devices upon said stem adapted to engage with the pins on said cam, and a spring-actuated pawl pivotally connected with the slidable valve-operating bar and arranged to engage with the teeth on said cam, and a spring on the stud-shaft bearing against said cam.

5. In valve-operating mechanism, the combination with the exhaust-valve and with a suitable supporting bracket or stand of a guide-box at one end thereof, a spring-retracted slidable bar in said box, guide-bearings at the other end of said bracket, and a reciprocating plate on said bearings and a plunger pivotally connected with said plate and coacting to actuate said slidable bar, a spring-actuated pawl pivotally connected with said sliding bar, a stud-shaft upon said bracket, and a rotatable cam upon the stud-shaft supporting the outer end of said plunger and adapted to move the outer end of said plunger in and out of contact with the slidable bar, pins extending outwardly from one side of said cam, and a ring upon the other side, and teeth upon said ring in alternate, transverse positions to the said pins, adapted to be engaged by the pawl on the sliding bar, and a stem pivotally connected with the reciprocating plate, and a hook upon said stem having a rearwardly-inclined forward end.

6. In a vapor-engine, the combination with the main power-shaft and the exhaust-valve, of a valve governing and operating mechanism comprising a reciprocating plate, and a supporting-bracket therefor, and guide-bearings upon said bracket, a vibrating governor, upon said reciprocating plate, and vibrating arms upon said governor, an eccentric upon the power-shaft and an eccentric-rod connected with the eccentric and also connected with the reciprocating plate, a spring-retracted, slidable bar operating the exhaust-valve and a spring-actuated locking-plate arranged above said slidable bar and engaging intermittently therewith, and also actuated intermittently by one of the arms of the governor, a spring-actuated plunger-bar pivotally connected with said reciprocating plate and coacting intermittently with the slidable bar, a cam supporting the outer end of said plunger and pins upon and extending outwardly from one side of said cam and teeth upon the other side in alternate, transverse position to said pins, and adapted to be engaged alternately by said pawl, and a spring-actuated stem pivotally connected with said reciprocating plate, and a barb upon said stem engaging alternately with said pins.

7. In a valve operating and governing mechanism for vapor-engines, the combination with the exhaust-valve and a spring-retracted valve-operating slidable bar, and with a guide-box therefor of a reciprocating plate, a spring-actuated plunger-bar pivotally connected with said plate and coacting intermittently with said slidable bar, a vibrating plate pivotally connected at its forward end with the forward end of said box, and a hook thereon, and a lip upon said hook, said slidable bar having a transverse groove adapted to receive said lip, lugs upon the rear end of said guide-box for said sliding bar, and a transverse plate upon said lugs, a rod connected with the rear end of the vibrating plate having its upper end screw-threaded and extending through the said transverse plate on said lugs, an adjusting-nut upon said rod, a spiral spring upon said rod between said nut and said transverse plate, and means for moving said hooked end of said vibrating plate into engagement with said slidable bar

8. In vapor-engines, the combination with the cylinder of the engine, having an air and gas mixing chamber, of an exhaust-valve, a cylinder for the gas-igniting devices connected with the cylinders of the engine, and a cylinder-plate, a crank-shaft and an insulated pin within said igniter-cylinder, and contacts on the inner ends of said shaft and pin, a spring holding said contacts normally apart, a plate pivotally connected at one end with the cylinder-plate for the gas-igniting devices, a spring retracting said pivoted plate, a rod extending through said plate and the crank in the crank-shaft of the igniting devices, nuts upon the ends of said rod, a reciprocating plate, a plunger pivotally connected with said plate, devices actuated by said plunger and opening said exhaust-valve intermittently, and a tripper upon the said plunger actuating said pivoted plate on the cylinder-plate intermittently.

9. In vapor-engines, the combination with the cylinder of the engine having an air and gas mixing chamber, of an exhaust-valve, a cylinder for the gas-igniting devices connected with the cylinder of the engine and a cylinder-plate, a crank-shaft and a stationary, insulated pin extending through said igniter-cylinder, contacts upon the inner ends of said shaft and pin and a spring holding said contacts normally apart, a spring-retracted plate pivotally connected with the cylinder-plate, a rod extending through said plate and the crank-arm on the crank-shaft, adjusting-nuts on the ends of said rod, a bracket upon the engine and suitable guides at one end of said bracket, a plate in said guides, a plunger pivotally connected with said plate, means for reciprocating said plate, a box at the other end of said bracket, a slidable valve-actuating bar in said box actuated intermittently by said plunger, a rotatable cam upon said bracket supporting the outer end of said plunger, devices upon said reciprocating plate and said slidable bar actuating said cam alternately, and a tripping-plate on said plunger actuating said pivoted plate on the cylinder-plate for the igniting devices intermittently.

10. In valve-operating devices for gas-engines the combination with a spring-actuated exhaust-valve, of a rock-shaft, arms upon said shaft, an adjustable balanced beam upon said arms actuating said valve and means for operating said rock-shaft.

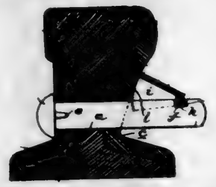
11. The combination with a spring-actuated exhaust-valve, of a rock-shaft, arms upon said shaft, a beam having its rear end extending to and actuating said valve, a link connecting said beam intermediate its ends with one of said arms on the rock-shaft, a rod connected adjustably with the other arm and bearing upon the outer end of said beam, a lever on the rock-shaft and means for actuating said lever, substantially as described.

12. The combination in a vapor-engine with the cylinder and its base and with the side supports for said base of a rock-shaft, a spring-actuated exhaust-valve, slidable valve-operating mechanism upon said base of the engine-cylinder, and a lever on the rock-shaft connecting therewith, arms upon said rock-shaft, a beam having one end extending to and operating the exhaust-valve, a link connected with one arm of the lever and with the said beam intermediate its ends and a screw-threaded adjusting-rod connected with the other arm having one end of said rod bearing upon the outer end of said beam, and an adjusting-nut on said rod beneath said arm.

13. In vapor-engines, the combination with the cylinder of the engine and its main driving-shaft, of an eccentric upon said shaft, and an eccentric-rod, a spring actuated exhaust-valve on said cylinder, a bracket upon said engine, a reciprocating plate upon said bracket, and suitable guides upon said bracket therefor, a stud shaft upon said plate with which said eccentric-rod is connected, a plunger pivotally connected with said plate, a triangular-faced cam on said bracket supporting the outer end of said plunger, pins upon the outer side and near the angles of said cam, and teeth upon the other side of said cam in alternate, transverse position to the said pins, a stem pivotally connected with said reciprocating plate, and a hook on said stem having a rearwardly-inclined forward end, a slidable bar in said bracket, actuated intermittently by said plunger, a box on said bracket therefor and a spring-actuated pawl pivotally connected with the inner side of said slidable bar, engaging with the teeth on the inner side of said cam, and gas-igniting devices upon the said engine actuated intermittently by said plunger.

14. In vapor-engines, the combination with the cylinder of the engine and its main driving-shaft, of an eccentric upon said shaft and an eccentric-rod, a spring-actuated exhaust-valve in said cylinder, a bracket upon said engine, a reciprocating plate upon said bracket, and suitable guides therefor, and a stud-shaft on said plate, with which said eccentric-rod is connected, a spring-actuated plunger pivotally connected with said plate, a stud-shaft on said bracket, and a rotatable, triangular-faced cam on said stud-shaft supporting the outer end of said plunger, a spring bearing on said cam, pins upon the outer side of and near the angles of said cam, teeth upon the other side of said cam in alternate, transverse position to said pins, a stem pivotally connected with said reciprocating plate, and a hook having a rearwardly-inclined, forward end engaging alternately with said pins, a guide-box upon the other end of said bracket, a slidable valve-actuating bar in said box, intermittently acted upon by said plunger, a spring-actuated pawl engaging alternately with the teeth on said cam, a rock-shaft upon said engine, and arms upon said shaft, a beam having its inner end engaging with the exhaust-valve, a link connecting one of said arms on the rock-shaft with said beam, intermediate the ends thereof, a rod adjustably connected with the other arm and bearing on the forward end of said beam, and a lever on the rock-shaft, having its free end contacting with the forward end of the sliding bar, substantially as described.

708,486. BOLT AND FASTENER THEREFOR. ALBERT H. LEWIS, Uhrichsville, Ohio, assignor of three-fourths to Albert G. Quimby, James C. Shields, and Peter C. Stevenson, Uhrichsville, Ohio. Filed May 20, 1902. Serial No. 106,227. (No model.)



Claim.—1. A bolt having a crosswise abutment thereon adjacent to one end, in combination with a fastener adapted to bear at one end against the crosswise abutment of the bolt, and having an opposite convex and serrated or roughened end to engage a device through which the bolt is passed.

2. A bolt having a crosswise groove adjacent to one end, the outer wall of which is undercut and constitutes an abutment, in combination with a fastener having a toe at its outer end and adapted to bear in the groove, and also having a convex and serrated or roughened inner end adapted to be pressed into engagement with a device through which the bolt is passed.

3. A bolt having a crosswise abutment thereon, undercut at its inner side, in combination with a separate fastener having a pointed toe at its outer end adapted to bear in the undercut of the abutment, and an inner end adapted to engage a device through which the bolt is passed.

4. The combination of a bolt having a crosswise groove, the outer wall of which is undercut, and a fastener having the side and top walls, and also having the toe at its outer end disposed in the crosswise groove of the bolt, and its inner end rounded and roughened or serrated.

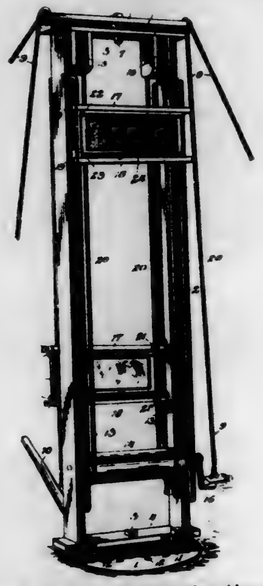
708,487. SIGNALING APPARATUS. JAMES R. MEAD, Lewes, Del., assignor of one-half to William R. Veasey, Lewes, Del. Filed Nov. 5, 1901. Serial No. 81,242. (No model.)

Claim.—1. In a signaling apparatus, the combination with a support which is rotatable upon its vertical axis, of vertically-movable signal-holders carried by opposite sides of the support, a plurality of signals for interchangeable engagement with the holders, and means for elevating and maintaining the signal-holder at one side of the support in an elevated and displayed position while the signal-holder at the opposite side of the support is held in a depressed position for receiving a signal.

2. In a signaling apparatus, the combination with a support which is rotatable upon its vertical axis, of vertically-slidable signal-holders carried by opposite sides of the support and movable from the bottom to the top thereof and vice versa, a plurality of signals for interchangeable engagement with the holders, and means for raising and lowering the signal-holders and to maintain the holder at one side of the support in an elevated and displayed position while the signal-holder at the opposite side of the support is in a depressed position for receiving a signal preparatory to being elevated.

3. In a signaling apparatus, the combination with a support which is rotatable upon its vertical axis, of vertically-movable signal-holders carried by opposite sides of the support and provided with guideways, a plurality of signal-slides for interchangeable engagement with the hold-

ers, and means for maintaining the signal-holder at one side of the support in an elevated and displayed position, while the signal-holder at the opposite side of the support is in a depressed position for receiving a signal-slide.



4. In a signaling apparatus, the combination with an upright rotatable support, of signal-holding means at opposite sides of the support, and means for simultaneously raising the signal-holding means at one side of the support and lowering the same upon the opposite side thereof, whereby signals may be displayed in an elevated position at one side of the support while other signals are being set at the lower portion of the opposite side of the support, the support being rotatable to display the latter set of signals when elevated.

5. In a signaling apparatus, the combination with an upright support which is rotatably adjustable upon a vertical axis, of an upstanding endless halyard carried by the support and working in opposite directions on opposite sides thereof, and signal-holders carried by the halyard and located at opposite sides of the support, whereby signals may be simultaneously elevated at one side of the support and hauled down at the opposite side thereof, and signals may be set at one side while other signals may be displayed at the opposite side of the support.

6. In a signaling apparatus, the combination of an upstanding rotatable support, means for adjustably rotating the same, a pair of upstanding endless halyards having corresponding portions at opposite sides of the support, and signals having their opposite ends connected to corresponding portions of the respective halyards, whereby signals may be set upon one side of the support while other signals are being displayed at the opposite side thereof.

7. In a signaling apparatus, the combination with an upstanding support, of a pair of upright rigid guides carried by the support, opposite upstanding halyards carried by the support, a signal-holder having substantially horizontal top and bottom cross-bars connected respectively to the opposite halyards with their opposite ends slidably mounted upon the respective guides and provided in their inner faces with corresponding open-ended grooves, and a signal-slide removably fitted in the grooves.

8. A signaling apparatus, comprising a mast or tower, a rigid vertical guide carried by the tower, a vertically-adjustable signal-holder slidably mounted upon the guide and provided with a substantially horizontal open-ended guideway, and a removable signal-slide carried by the guideway and removable horizontally outward through the open end thereof.

9. A signaling apparatus comprising a mast or tower, a vertical rigid guide carried thereby, a vertically-adjustable signal-holder having corresponding substantially horizontal open-ended grooves, and a signal-slide removably fitted in the grooves.

10. A signaling apparatus, comprising a mast or tower, a pair of vertical rigid guides carried thereby, a signal-holder having top and bottom cross-bars having their opposite ends slidably mounted upon the guides, and also provided with substantially horizontal corresponding open-ended grooves, a signal-slide removably fitted in the grooves, and means for raising and lowering the holder.

11. A signaling apparatus, comprising a mast or tower, opposite upstanding guide-rods carried thereby, a signal-holder slidably mounted upon the guide-rods and provided with a guideway, a signal-slide removably carried by the guideway, and means for raising and lowering the holder.

12. A signaling apparatus, comprising a mast or tower, opposite upright guide-rods carried thereby, a signal-holder having substantially horizontal top and bottom cross-bars, which are provided with terminal openings receiving the guide-rods, and also having corresponding open-ended grooves in their inner faces, a signal-slide removably fitted in the grooves, and means for raising and lowering the holder.

13. A signaling apparatus, comprising a mast or tower, opposite upright guide-rods carried by the tower, a drum carried by the tower, guides mounted near the opposite end of the tower, endless halyards running over the guides and the drum, means for rotating the drum, signal-holders carried by the halyards, and slidably mounted upon the guide-rods and removable signal-slides for the holder.

14. A signaling apparatus, comprising a mast or tower which is adjustably rotatable upon a vertical axis, a pair of halyards carried by and movable with the tower, and a signal connected at opposite ends to the halyards to prevent flattering of the signal.

15. In a signaling apparatus, a tower comprising a substantially rectangular frame which is adjustably rotatable upon a vertical axis, opposite upright guides carried by the frame, a signal-holder having its opposite ends slidably mounted upon the guides, and a pair of halyards for raising and lowering the signal-holder, said halyards being connected to opposite ends of the signal.

16. In a signaling apparatus, a tower comprising a substantially rectangular frame which is rotatably adjustable upon a vertical axis, upright guide-rods carried by the opposite sides of the frame, a signal-holder slidably mounted at opposite ends upon the guides, a drum mounted within the lower part of the frame, means for rotating the drum, a pair of pulley-blocks mounted upon the upper portion of the frame, and endless halyards reeved through the pulley-blocks and around the drum, the signal-holder being connected to the halyards.

17. In a signaling apparatus, a tower comprising a substantially rectangular frame which is adjustably rotatable upon a vertical axis, upright guide-rods carried by and offset from the opposite sides of the upright side members of the frame, signal-holders located at opposite sides of the frame and slidably connected to the respective guide-rods, and means for raising and lowering the signal-holders.

18. In a signaling apparatus, a tower comprising a substantially rectangular frame which is adjustably rotatable on a vertical axis, a drum mounted within one end portion of the frame, means for operating the drum, guide-pulleys at the opposite end of the frame, halyards reeved through the guide-pulleys and around the drum, and signal-holders carried by the halyards and located at opposite sides of the frame.

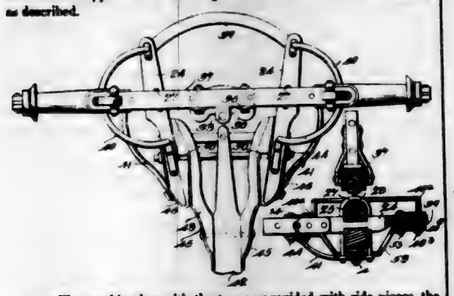
19. A signaling apparatus, comprising a base, a rotatable mast or tower mounted thereon, means carried by and adjustable upon the tower into and out of engagement with the base to form an adjustable interlocking engagement between the mast or tower and the base, and a signal-holder carried by the mast or tower.

20. A signaling apparatus, comprising a base having a circular series of sockets in its upper face, a rotatable mast or tower mounted upon the base and concentrically with respect to the circular series of sockets, a locking-bolt carried by the mast or tower and in operative relation to the series of sockets, and a signal-holder carried by the mast or tower.

21. In a signaling apparatus, the combination with a base, of an upright substantially rectangular frame mounted to rotate upon the base on a central vertical axis, an adjustable interlocking connection between the frame and the base, a drum mounted within the lower end of the frame, means for operating the drum, guide-pulleys mounted within the upper end of the frame, halyards reeved through the guide-pulleys and over the drum, guide-rods carried by the opposite edges of both side pieces of the frame, pairs of signal-holding cross-bars having terminal perforations receiving the respective guide-rods, and also provided in their inner faces with corresponding open-ended grooves, signal-slides removably fitted in the grooves of the cross-bars, each cross-bar being connected to the halyards, a cross-head swiveled to the upper end of the frame, and guys connected to the opposite ends of the cross-head.

708,488. RUNNING-GEAR FOR VEHICLES. WALTER H. MARKLAM, Olean, N. Y., assignor to the Meeklan Wagon Company, New York, N. Y. Filed Nov. 7, 1901. Serial No. 81,456. (No model.)

Claim.—1. The combination of an axle, a bolster, front bounds, a tongue pivoted between the front bounds, metal straps or bars secured to the front bounds and to the tongue and detachably interlocked and permitting the tongue to swing upward and downward on its pivot, the curved braces supported by the bolster and extending in advance and in rear of the same and secured at their front ends to the bounds, adjacent to the pivot of the tongue, the rear ends of the braces terminating in vertical bolts extending through the bounds, the transverse connecting-bars secured to the bounds by the bolts of the curved braces, the bottom braces also secured to the bounds by the said bolts, and the side braces extending from the axle to the front ends of the bounds and secured to the latter a considerable distance in advance of the pivot of the tongue, whereby the latter is supported and held against lateral movement, substantially as described.

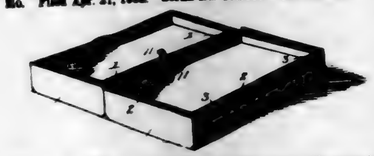


2. The combination with the tongue provided with side pieces, the front bounds and the transverse pivot-rod, of the straps or bars secured to the side pieces of the tongue and to the bounds, and having perforations to receive the rod and provided with enlargements, one of the enlargements at each side of the tongue being recessed to receive the other enlargement and the latter being rounded, substantially as and for the purpose described.

3. The combination with a tongue having side pieces, bounds, and a transverse pivot-rod, of the straps or bars secured to the side pieces and provided at their rear portions with enlargements having rounded front ends, and the straps or bars secured to the bounds and provided in advance of the pivot-rods with enlargements having rounded bearing-recesses receiving the adjacent ends of the said enlargements, substantially as described.

4. The combination with a tongue having side pieces, bounds, and a transverse pivot-rod, of the straps or bars 45, secured to and conforming to the configuration of the side pieces of the tongues and provided at their rear portions with enlargements having rounded front ends and straps or bars 46 arranged on the inner and outer edges of the bounds and provided in advance of the pivot-rods with enlargements having bearing-recesses receiving the rounded ends of the enlargements of the straps or bars 45, substantially as described.

708,489. FOLDING SAMPLE-CASE. CALVIN S. MORRIS, St. Louis, Mo. Filed Apr. 21, 1902. Serial No. 104,089. (No model.)



Claim.—A folding sample-case, comprising two main trays hinged together and adapted to close together on their free edges, and two additional trays hinged respectively to the outer sides of the main trays to stand in horizontal position when turned outward, and bottoms in the additional trays fixed intermediate of the heights of their side and end walls, whereby when the additional trays are brought together they constitute covers for the main trays and form a central compartment between the folded main trays

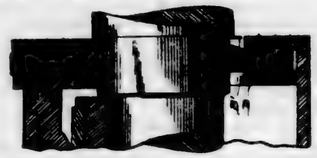
---

708,490. FOLDING DISPLAY BOX OR TRAY. CALVIN S. MORRIS, St. Louis, Mo. Filed Apr. 21, 1902. Serial No. 104,090. (No model.)

Claim.—1. A shipping and display device comprising a plurality of trays hinged together to fold one upon the other in vertical succession and whereby they can be extended and stand on parallel planes of decreasing heights, plates hinged to the sides and ends of the bottom tray adapted to turn into vertical position against the trays, and fastening means to hold the plates against the trays.

2. A shipping and display device, comprising a tray A, plates hinged to the sides and ends thereof, a tray B secured to the inner face of one of the side plates to turn outward with said plate, a plate C secured to the outer side piece of tray B and extending below the bottom thereof, a tray C hinged to the plate C, and a tray D formed with a vertical side extension hinged to the tray C, said trays being adapted to fold one upon the other with the hinged plates of tray A turned against their sides and ends, and fastenings to bind the plates and trays together.

708,491. DUST-GUARD. JAMES S. PATTEN, Baltimore, Md., assignor to Metal Dust Guard Company of Baltimore City, a Corporation. Filed June 3, 1901. Serial No. 62,967. (No model.)



Claim.—1. The improved dust-guard herein described comprising the annular packing-section, and the frame-section secured to the packing-section between the inner and outer edges thereof whereby the portion of the packing-section within the frame-section may operate as a packing and the portion of the packing-section outside the frame section may operate to hold the guard from turning in the car-axle box, and the said frame-section being composed of the face-plate, the inwardly projecting flanges at the outer edge of the face-plate and the spurs projecting from the edge of said flanges and penetrating through the packing-section and clinched on the side thereof opposite the face-plate substantially as set forth.

2. A dust-guard composed of a ring-like packing-section, and a ring-like frame-section secured to one face of the packing-section between the inner and outer edges thereof and lying wholly between said inner and outer edges.

3. A dust-guard comprising the annular packing-section, and an annular brace or frame section secured to the packing-section between the inner and outer edges thereof, the inner edge of the packing-section being arranged to operate as a packing and its outer edge being formed to hold the guard from turning in the car-axle box substantially as set forth.

4. A dust-guard composed of a continuous unbroken ring-like packing-section, and a continuous ring-like frame-section secured to the side face of said packing-section and lying between the inner and outer edges thereof.

5. A dust-guard comprising an annular yielding packing-section, a frame to brace said section and fastening means for said frame which fastening means project through the packing-section and operate to brace the same on the opposite side thereof from the frame substantially as set forth.

6. A dust-guard composed of a ring-like packing-section, a ring-like frame-section fitted against one face of the packing-section between the inner and outer edges thereof, and securing devices extending from the frame-section through the packing-section.

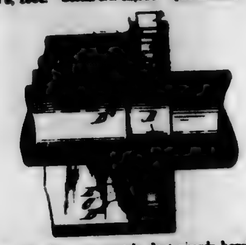
7. A dust-guard comprising an annular packing-section and an annular brace secured positively in connection with the packing-section, said brace occupying, throughout its full length, a position between the inner and outer edges of the packing-section whereby portions of the packing-section within and without the brace will be unobstructed by the latter substantially as set forth.

8. A dust-guard composed of a continuous unbroken ring-like packing-section, and a continuous unbroken ring-like brace secured to and against one face of the packing-section between the inner and outer edges of said packing.

9. A dust-guard composed of a ring-like packing-section having its outer edge entirely exposed and unobstructed and a frame or brace secured to one face of said packing-section and occupying a position entirely within the outer edge of the packing-section, substantially as set forth.

10. A dust-guard composed of a ring-like packing-section and a ring-like brass-frame secured to and against one face of the packing-section and lying wholly between the inner and outer edges thereof, substantially as set forth.

708,492. DUST-GUARD. JAMES S. PAYNE, Baltimore, Md., assignor to Metal Dust Guard Company of Baltimore City, a Corporation. Filed June 3, 1901. Serial No. 62,926. (No model.)



Claim.—1. The improvement in dust-guards herein described consisting of the annular packing-section, the carrier therefor formed with a face-plate, a pocket having a peripheral wall or outer plate, and a side plate, and the cover-sheet fitted over the face-plate and having a portion fitting within the pocket, the rim-flange extending from the outer edge of the face-plate in the same direction as the pocket, and means for securing the annular packing-section within the pocket of the carrier substantially as set forth.

2. A dust-guard comprising a carrier having a face-plate and a pocket for holding the packing-section, the packing-section, and the cover-sheet extending within the pocket and thence over the face-plate outside the packing-section substantially as set forth.

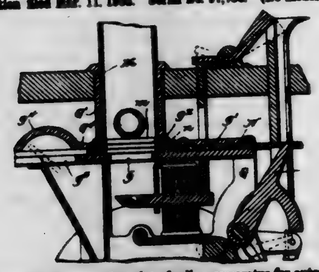
3. A dust-guard comprising the carrier having a face-plate and a pocket and provided with a side plate, the cover-sheet extending over the face-plate and fitting within the pocket and having a slitted portion lying against the side plate of the pocket, the packing-ring fitting in said pocket, and the rivets securing the packing-ring and the slitted portions of the cover-sheet to the side plate of the pocket substantially as set forth.

4. A dust-guard comprising an annular packing-ring, and a carrier therefor composed of a sheet-metal plate having a pocket for the packing-ring, and a bracing-flange at its outer edge, and fastening means for securing the packing to the side plate of said pocket substantially as set forth.

5. In a dust-guard a carrier for a packing-ring composed of a sheet-metal plate provided with a pocket having a side plate P' for the packing-ring and having at its outer edge a bracing-flange projecting in the same direction as the said pocket substantially as set forth.

6. In a dust-guard a packing-ring carrier comprising a plate having a laterally-projecting pocket provided with a side plate P' to receive a packing-ring and provided at its outer edge with a lateral flange projecting in the same direction as the pocket and the springs secured to the plate and housed within the space between the pocket and the outer flange substantially as set forth.

708,493. MAGAZINE PLATE-FEEDING APPARATUS. GEORGE H. PUTER, Cleveland, Ohio, assignor to American Automatic Photographic Company, Cleveland, Ohio, a Corporation of Ohio. Original application filed Dec. 13, 1901, Serial No. 86,720. Divided and this application filed Mar. 11, 1902. Serial No. 97,726. (No model.)



Claim.—1. In magazine plate-feeding apparatus for automatic photographic apparatus, the combination with a plate-slideway, of a slide operating in said way, the latter being provided with a semicircular opening through which a plate may be caused to drop.

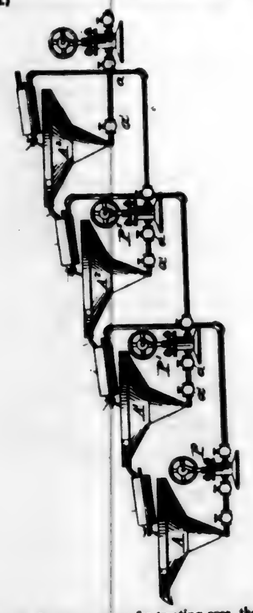
2. In magazine plate-feeding apparatus for automatic photographic apparatus, the combination of a plate-magazine, a plate-slideway provided with a semicircular opening, a slide operating in said way intermediately of said magazine and semicircular opening, the curved side of said opening being on the side farthest toward and the straight side being on the side farthest away from said magazine.

3. In magazine plate-feeding apparatus for automatic photographic apparatus, the combination of a plate-magazine, a plate-feeding slide having a plate-receiving aperture formed therein, and a support for such slide, such support provided with an aperture below such magazine, such plate-feeding opening located intermediately of such magazine and aperture in such support, the latter being of such a form as to prevent the passage of a plate therethrough.

4. In magazine plate-feeding apparatus for automatic photographic apparatus, the combination of a magazine-seat, a tubular plate-magazine secured in said seat, a slideway located beneath and transversely of said magazine and provided with an aperture beneath the magazine of dimensions such as to prevent plates from the latter from passing therethrough, and a slide operating in such way and provided with an opening for receiving a plate from the magazine, such opening being located so as to permit it to establish communication between said magazine and said slideway-opening.

5. In a magazine plate-feeding apparatus for automatic photographic apparatus, the combination with a plate-magazine provided with a movable closure at its bottom, of a support provided with a seat for such magazine, such support formed with an aperture below said seat, whereby said closure may be removed from the magazine through such aperture.

708,494. APPARATUS FOR EXTRACTING METALS FROM ORES. JOHN RANDALL, Deadwood, S. D. Filed May 23, 1902. Serial No. 108,722. (No model.)



Claim.—1. In an apparatus for treating ores, the combination of a series of tanks with a series of agitators above said tanks and discharging into the same, so arranged that the overflow of the solvent fluid from each tank discharges into the agitator over the next adjacent tank and from thence into the latter, and means for conveying the ore from the bottom of each of said tanks into the agitator directly above the adjacent tank for discharge into the latter, substantially as described.

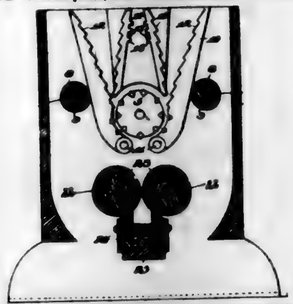
2. In an apparatus for treating ores, a series of tanks with outlets at the bottoms thereof and provided with lips at the upper edges having discharge-outlets, a series of agitators above said tanks adapted to discharge their contents into the tops thereof, and means for conveying the ore from each said tanks into the agitator directly above the adjacent tank for discharge into the latter, said parts being combined substantially as described.

3. In an apparatus for treating ores, a series of tanks with outlets at the bottom thereof, a series of agitators adapted to discharge their contents into the tops of said tanks and means for conveying the contents of each of said tanks into the agitator directly above the adjacent tank for discharge into the latter, each of said tanks having a lip with discharge leading into the ore-receiving end of the agitator whereby the ore and fluid pass through the agitator in the same direction, said parts being combined substantially as described.

4. In an apparatus for treating ores, a series of tanks, each having an outlet in its bottom, a series of agitators adapted to discharge into said tanks and pipes with pumps for conveying ore from the outlets in the bottoms of each of said tanks to the agitators discharging into the adjacent tank, each of said tanks having solvent-liquid-overflow outlets discharging into the ore-receiving ends of said agitators, said parts being combined substantially as described.

5. In an apparatus for treating ores, a series of tanks, a series of agitators above said tanks, and means for forcing ore from the bottom of each of said tanks except the last one thereof to the agitator discharging into the adjacent tank, each of said tanks having a solvent-outlet discharging into an agitator at the ore-receiving end thereof, said parts being combined substantially as described.

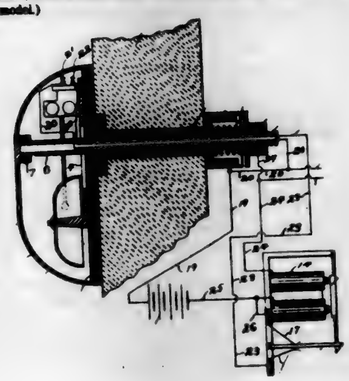
708,495. STONE OR ORE CRUSHER. DANIEL C. ROBINSON, McKeesport, Pa. Filed Sept. 27, 1901. Serial No. 76,772. (No model.)



Claim.—1. In a crusher, a casing, a pair of suitably-pivoted sides forming a hopper in said casing, shafts mounted in said casing carrying eccentrics for engagement with said sides, means for operating said shafts in unison, a breaking-down roll secured between said sides of the hopper, and a pair of inclined stationary jaws above said breaking-down roll, said jaws carrying projections on their rear faces, and pins carried by the casing whereby said jaws may be adjusted, substantially as described.

2. In a crusher, the combination of a casing, a hopper secured in said casing, movable sides forming jaws of said hopper, means to operate said jaws inwardly and outwardly, a breaking-down roll between the lower part of said jaws, crusher-rolls secured under said breaking-down roll, and means whereby said jaws and rolls are driven in unison, substantially as described.

708,496. BURGLAR-ALARM. FREEMAN C. ROBINSON and JAMES B. GREEN, Council Bluffs, Iowa. Filed Nov. 26, 1901. Serial No. 83,711. (No model.)



Claim.—1. The combination, in a burglar-alarm, with a suitable gong located outside of the vault, safe or other receptacle or apartment to be protected, of a shield inclosing said gong and means for closing an electric circuit that causes said gong to be sounded upon the moving of said shield, substantially as described.

2. The combination, in a burglar-alarm, with a suitable gong, of a shield inclosing said gong, a tube supporting said shield and means connected with said tube for closing an electric circuit upon the moving of said shield, substantially as described.

3. The combination, with the wall of the vault, safe or other receptacle, of an alarm-gong located on the outside thereof, a shield inclosing said gong, a tube supporting said shield and extending through said wall and means connected with said tube for closing an electric circuit upon the movement of said shield and tube, substantially as described.

4. The combination, with the wall of a vault, safe or other receptacle, of a gong located on the outside thereof, a shield inclosing said gong, a tube extending through said wall and supporting said shield and means arranged upon the outside of the wall and in connection with said tube for closing an electric circuit upon the movement of said gong and tube, substantially as described.

5. The combination, with the wall of a vault, safe or other receptacle, of a suitable gong located on the outside of said wall, a shield inclosing said gong, a support for said shield extending through said wall, and means connected with said support inside of said wall for closing an electric circuit upon the movement of said shield, substantially as described.

6. The combination, with the wall of a vault, safe or other receptacle, of a gong located upon the outside thereof, a shield inclosing said gong, a tube supporting said shield and extending through said wall and forming a conduit for the conductors by which said gong is operated, a spring engaging said tube and tending to draw said shield against said wall, a washer arranged upon said tube and engaged by said spring and a collar surrounding said tube and insulated therefrom, a suitable battery and electrical connections to said collar and said sleeve, substantially as described.

7. The combination, in a burglar-alarm, with a suitable gong located outside of the vault, safe or other receptacle or apartment to be protected, of a shield inclosing said gong, an electric circuit in which said gong is located and means for causing said gong to be operated through said circuit upon the moving of said shield, substantially as described.

8. The combination, with the wall of a vault, safe or other receptacle, of a suitable gong or alarm located on the outside of said wall, an electric circuit in which said gong is located, a shield inclosing said gong and means for closing said electric circuit, and thereby operating the said gong or alarm, upon the moving of said shield, substantially as described.

9. The combination, with the wall of a vault, safe or other receptacle, of a suitable gong or alarm located on the outside of said wall, a perforated metallic shield inclosing said gong or alarm, the base of said alarm or gong and said shield being arranged in an electric circuit adapted to be closed when an electrical connection is made between said shield and the base or frame of said alarm.

10. The combination, with a vault, safe or other receptacle of a suitable gong or alarm located outside of said receptacle, a shield inclosing said gong and means located within said vault, safe or receptacle for operating said gong upon the moving of said shield.

11. The combination, with a vault, safe or other receptacle, of a suitable gong or alarm located on the outside of said wall, with the base or frame of said gong or alarm arranged in an electric circuit, a perforated metallic shield inclosing said gong or alarm, said shield being arranged in the same circuit with the base or frame of said alarm or gong, and said shield and said base being insulated from each other, whereby upon the insertion of a metallic instrument through one of the perforations of said shield into contact with said base or frame, the alarm or gong will be sounded, substantially as described.

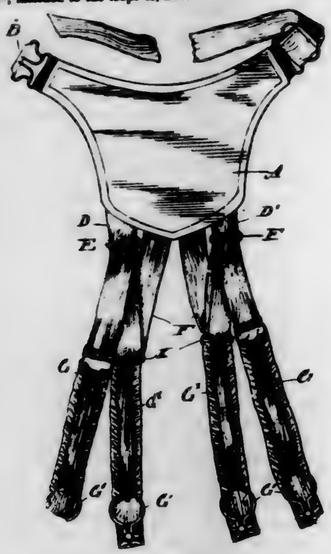
12. The combination, with the wall of a vault, safe or other receptacle of an alarm located on the outside thereof and electrically connected through said wall with a circuit-closer arranged within said vault, safe or receptacle, a shield arranged on the outside of said wall and inclosing said gong or alarm and electrical connections between said shield and said circuit-closer for the purpose set forth.

13. The combination, with the wall of a vault, safe or other receptacle, of a gong located on the outside thereof, an automatic circuit-closer arranged within said wall and adapted to close the circuit operating said gong, a shield arranged on the outside of said wall and inclosing said gong, and an electric circuit connected with said shield and also connected with and adapted to operate said automatic circuit-closer, substantially as described.

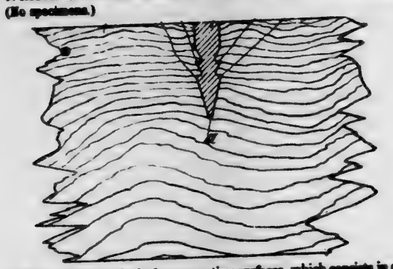
708,497. GARMENT-SUPPORTING DEVICE. LOUIS ROSER, Jr., Chicago, Ill. Filed Apr. 23, 1902. Serial No. 104,362. (No model.)

Claim.—A hose-supporter comprising a shield or pad with a body-strap secured thereto, straps D and D' secured to said shield, loops E, E

attached to said straps D and D', straps F, F, secured to the shield intermediate straps D and D', and passing through said loops, elastic straps fastened to the ends of straps F, loops K hung on straps F, and elastic straps G[x], fastened to the loops K, as set forth.

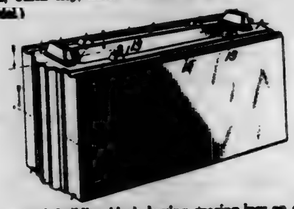


708,498. METHOD OF ORNAMENTING SURFACES. JOHANNES P. RUDOLPH, Görlitz, Germany. Filed Feb. 14, 1901. Serial No. 47,091. (No specimens.)



Claim.—The method of ornamenting surfaces, which consists in subdividing the surface into separate areas by inlaid metal strips, and then applying liquid colors to the separated areas, substantially as specified.

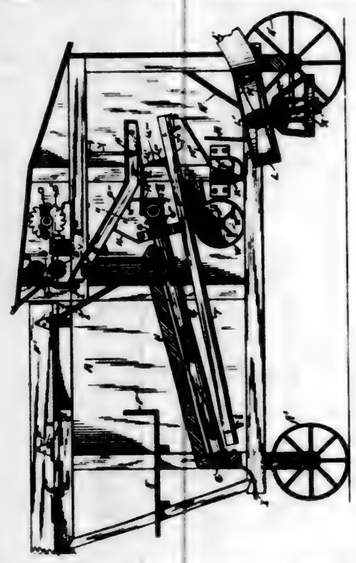
708,499. BUILDING-BLOCK. FRANK A. SEARSHIT and GEORGE J. STEVENS, Union City, Mich. Filed Feb. 27, 1902. Serial No. 95,905. (No model.)



Claim.—1. A building-block having spacing-lugs on one face and grooves on the same face exterior to the lugs, the opposite face of the block having also grooves corresponding in position to the first-named grooves to register with the first-named grooves of an adjacent block.

2. A building-block having ribs on opposite faces provided with mutually-converse corrugations the bottoms of which terminate in planes spaced from the said faces of the block and said walls having fingers for engagement within an adjacent block, the remaining walls of the block having spacing-lugs adjacent to the inner faces thereof and having grooves spaced outwardly from the lugs, the opposite face of the block having also grooves corresponding in location to the first-named grooves.

708,500. CORN-HUSKING MACHINE. JOHN K. SMITH, Hartford City, Ind. Filed June 18, 1900. Serial No. 20,671. (No model.)



Claim.—1. In combination substantially as described, a pair of snapping-rolls bearing a fixed relation relative to each other, means for operating said rolls, and correspondingly-located ribs and grooves on the rollers each comprising longitudinally-disposed portions arranged out of alinement and inclined intermediate portions connecting said longitudinal portions.

2. In combination substantially as described, a series of husking-rolls located side by side, means for operating said rolls, and each alternate roll being provided with a series of separated grooves of a length substantially that of an ear of corn all grooves of the series being arranged in alinement longitudinally of the roll, and each intermediate roll being provided with a plurality of separated series of projecting pins also arranged in alinement longitudinally of the roll and adapted as the roll revolves to engage the corn seated in the grooves of the adjacent roll, and guides H arranged to feed the corn to a point between each pair of rolls.

708,501. METHOD OF FILLING METAL TUBES WITH WOODEN CORES. OTTOMAR STRESER, Frankenberg, Germany. Filed Aug. 3, 1900. Serial No. 25,796. (No specimens.)

Claim.—1. A process for constructing metal tubes for use in the manufacture of furniture, consisting of inserting into a seamless tube one or more sheet-metal blanks with overlapping edges, expanding the blanks to permit the overlapping edges to be withdrawn so that the entire outer surface of the blanks contact with the inner periphery of the seamless tube.

2. A process for constructing metal tubes for use in the manufacture of furniture, consisting of inserting into a seamless tube one or more cylindrically-bent sheet-metal blanks with their edges overlapping, and inserting wedges within the blanks to spread them apart, to permit the overlapping edges to be withdrawn until the entire outer periphery of the blank contacts with the inner periphery of the seamless tube.

708,502. HYDROCARBON-MOTOR. WILLIAM J. STILL, Wimbledon, England. Filed Aug. 31, 1901. Serial No. 73,823. (No model.)

Claim.—1. A hydrocarbon-motor comprising a rotary carrier, a support therefor, motor-cylinders fixed tangentially to the axis of said carrier and each provided with a piston, a normally stationary crank shaft or body provided with a crank-pin and around which said carrier and cylinders are mounted to rotate, a rock-shaft mounted at the outer end of each cylinder and provided with an inner crank-arm connected to the piston of the corresponding cylinder and with an outer crank-arm, and link mechanism connecting the outer crank-arms to said crank-pin, substantially as described for the purposes set forth.

2. A hydrocarbon-motor comprising a rotary carrier, a support therefor, motor-cylinders fixed tangentially to the axis of said carrier and each provided with a piston, a crank shaft or body provided with a crank-pin and around which said carrier and cylinders are mounted to rotate, means whereby said crank shaft or body can be held stationary and released, a rock-shaft mounted at the outer end of each cylinder and provided with an inner crank-arm connected to the piston of the corresponding cylinder and with an outer crank-arm, and link mechanism connecting the outer crank-arms to said crank-pin and to a rotary part of said motor, substantially as described for the purposes set forth.

3. A hydrocarbon-motor comprising a rotary carrier, a support therefor, motor-cylinders fixed tangentially to the axis of said carrier and each provided with a piston, a normally stationary crank shaft or body provided with a crank-pin and around which said carrier and cylinders are mounted to rotate, a rock-shaft mounted at the outer end of each cylinder and provided with an inner crank-arm connected to the piston of the corresponding cylinder, and with an outer crank-arm, a link connecting the outer crank-arms together, a second link jointed at one end to one of said outer crank-arms, a pair of additional links jointed to the other end of said second link and one of which is jointed to said crank-pin and the other to a rotary part of the motor, means for admitting explosive charges to said cylinders alternately, means for firing said charges, and means for causing the exhaust of the spent gases.

4. A hydrocarbon-motor comprising a rotary carrier, a support therefor, motor-cylinders fixed tangentially to the axis of said carrier and each provided with a piston, a normally stationary crank shaft or body provided with a crank-pin and around which said carrier and cylinders are mounted to rotate, a rock-shaft mounted at the outer end of each cylinder and provided with an inner crank-arm connected to the piston of the corresponding cylinder and with an outer crank-arm, one of said outer crank-arms having its outer end bent at an angle to the remaining portion, a link connecting the bent end of said crank-arm to the other outer crank-arm, a second link jointed at one end to the said bent end of one of the outer links, a pair of shorter links jointed to the other end of said second link at opposite sides thereof, one of said links being also jointed to said crank-pin and the other to a rotary part of said motor, means for admitting explosive charges to said cylinders alternately, means for firing said charges, and means for causing the exhaust of the spent gases.

5. A hydrocarbon-motor comprising two cylinders arranged with their axes parallel to one another and a central tubular extension projecting laterally from one side thereof, a crank-shaft extending through said tubular extension and provided at one end with a crank and crank-pin and at the other end with a clutch device whereby it can be held stationary or released, a support for said tubular extension and crank-shaft, two rock-shafts carried by said casting near the outer open ends of said cylinders and each provided with two crank-arms one of which is arranged to enter the open end of the corresponding cylinder and is connected by a link to the piston therein, and the other is located outside said cylinder, and link mechanism substantially as described connecting the outer crank-arms of the rock-shafts to the crank-pin and to the combined cylinder and carrier, substantially as described.

6. In a hydrocarbon-motor, the combination with a rotary carrier and two parallel motor-cylinders fixed thereto and each fitted with a piston, of a central crank-shaft about which the carrier and cylinders are mounted to turn, a crank arm and pin fixed to one end of said shaft, a clutch device at the other end of said shaft whereby the same can be held stationary or released, two rock-shafts *x* each mounted in a bearing near the outer end of one of said cylinders and provided with inner and outer crank-arms *u* and *l* respectively, one of the outer crank-arms having a bent end 2, a link connecting the inner arm of each rock-shaft to the piston of the corresponding cylinder, a link 3 connecting the bent end 2 of one of the outer crank-arms to the other outer crank-arm, a link 4 jointed at one end to the said bent ends 2 of one of the outer crank-arms, and a pair of short links 6 and 7 jointed by a common pin 5 to the other end of said link 4, said link 6 being jointed by a pin to the cylinders, and said link 7 being jointed to said crank-pin 9, substantially as described for the purposes specified.

7. In a hydrocarbon-motor, motor-cylinders mounted to rotate and each having a normally closed combustion-chamber with separate inlet and exhaust valves and valve-chambers at one end, a tubular extension connected to said cylinders and formed with a gas-passage leading to the inlet-valve chamber of each cylinder, and a stationary body surrounding said tubular extension and formed with a gas passage and port in communication with the gas-passage in said tubular extension.

8. In a hydrocarbon-motor, the combination of a rotary casting comprising motor-cylinders each provided at one end with a normally closed combustion-chamber and a gas-inlet valve and valve-chamber, and a tubular extension formed with gas-passages communicating at one end with the inlet-valve chambers of the respective cylinders and at the other end with ports in the periphery of said extension, and a stationary body surrounding said tubular extension and formed with a gas-passage therethrough terminating in a port in communication with the gas-passages in said tubular extension.

9. In a hydrocarbon-motor, a casting comprising a pair of cylinders *a* and a tubular extension *b* extending from one side thereof and formed with gas-passages *e* leading to the inlet-valve chamber at the closed end of each cylinder and terminating in ports *f* in the periphery of said extension, and a stationary gas-supply chamber *g* surrounding said tubular extension and in communication with the ports *f* therein, substantially as described.

10. In a hydrocarbon-motor, the combination of a pair of motor-cylinders, a tubular extension integral with said cylinders and formed with gas-passages communicating at one end with the gas-inlet valve-chambers of the cylinders and at the other ends with ports in the periphery of said extension, and a stationary support provided with bearing wherein said tubular extension is mounted to rotate, the ports in said tubular extension being between said bearings, and said support being made hollow to serve as a gas-supply device and provided with a port also located between said bearings, substantially as described.

11. In a hydrocarbon-motor, the combination of the two rotary cylinders *a* and lateral extension *b* made integral with one another and formed with the gas-supply passages *e e* and ports *f*, the normally stationary shaft 11 extending through said tubular extension, and the hollow support *g* formed with the gas-outlet port *f* and provided with bearings *c c* for said extension, substantially as described.

12. In a hydrocarbon-motor, the combination of motor-cylinders each provided at one end with a combustion-chamber and separate inlet and exhaust valves and valve-chambers, a rotary tubular carrier connected to said cylinders and formed with gas-supply passages leading to the respective inlet-valve chambers, a support for said carrier, an annular silencing-chamber connected to said cylinders, and surrounding said tubular carrier, and exhaust-passages connecting the exhaust-valve chambers to said silencing-chamber, substantially as described.

13. In a hydrocarbon-motor of the kind herein referred to, the combination with a rotary carrier, motor-cylinders connected thereto, and inlet and exhaust valves for controlling the supply of explosive charges to and the exhaust of spent gases from the motor-cylinders, of valve-operating mechanism for each cylinder, a cam for actuating each set of said valve-operating mechanism, and epicyclic gearing for actuating the cams, said gearing comprising a normally stationary centrally-arranged toothed wheel, and other toothed wheels journaled to the rotary part of the motor, gearing with said central toothed wheel and connected to said cams.

14. In a hydrocarbon-motor of the kind herein referred to, the combination with a rotary carrier, motor-cylinders connected thereto, and inlet and exhaust valves for controlling the supply of explosive charges to

and the exhaust of spent gases from the motor-cylinders, of valve-operating mechanism for each cylinder, a cam for actuating each set of said valve-operating mechanism, and epicyclic gearing for actuating the cams, said gearing comprising a centrally-arranged toothed wheel, means whereby the same can be held stationary or allowed to rotate with said motor, and other toothed wheels journaled to the rotary part of the motor, gearing with said central toothed wheel and connected to said cams.

15. In a hydrocarbon-motor, the combination with a rotary carrier, motor-cylinders fixed thereto and each provided at one end with separate gas inlet and exhaust valves provided with springs that tend to close them, of two-armed levers each adapted to control a pair of inlet and exhaust valves, a second lever adapted to operate and control the position of each of the first-mentioned levers, a cam for operating each of said second levers, and epicyclic gearing carried by said motor and worked by the rotation thereof for rotating said cams.

16. In a hydrocarbon-motor, the combination with a rotary carrier, motor-cylinders connected thereto and each provided at one end with a closed combustion-chamber having a pair of inlet and exhaust valves provided with springs that tend to close them, of valve-operating mechanism for each pair of valves, said mechanism comprising a two-arm lever mounted in a bearing at the outer side of the valve-chambers and provided with a lever-arm, a spring tending to cause said lever to open the inlet-valve and allow the exhaust-valve to close, a second lever pivoted to the rotary motor and adapted to act upon and move said lever-arm in a direction to cause said two-arm lever to open the exhaust-valve and allow the inlet-valve to close, a cam for operating said second lever, a toothed wheel journaled to said motor and connected to said cam, and a centrally-arranged normally stationary toothed wheel gearing with the first-mentioned toothed wheel and around which the latter wheel normally travels, substantially as described.

17. In a hydrocarbon-motor, the combination with a rotary carrier, motor-cylinders connected thereto and each provided with separate inlet and exhaust valves provided with springs tending to close them, a two-armed lever pivoted to the outer side of the valve-chambers of each cylinder, a lever-arm connected to each of said two-arm levers, and a spring tending to move said lever in a direction to open the corresponding inlet-valve and allow the exhaust-valve to close, of a centrally-arranged shaft or body, a toothed wheel fixed thereon, means for holding and releasing said shaft or body, and sets of valve-controlling mechanism for each pair of inlet and outlet valves, each set of valve mechanism comprising a two-armed lever pivoted to a rotary part of the motor and having one arm adapted to move the first-mentioned lever and lever-arm in opposition to their spring, a rotary cam having three cam-paths of different radii arranged to act successively upon the other arm of the second two-arm lever, and a toothed wheel carrying said cam, journaled to a rotary part of said motor, and gearing with the centrally-arranged toothed wheel, substantially as described.

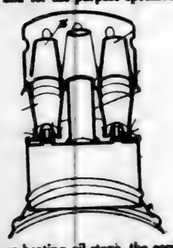
18. A hydrocarbon-motor comprising a rotary carrier, two cylinders fixed thereto and each provided at one end with separate inlet and exhaust valves, a crank-shaft extending through said carrier and provided at one end with a crank-pin and at the other end with a clutch device whereby it can be held stationary or released, mechanism substantially as described connecting the pistons of each cylinder to said crank-pin and to a rotary part of the motor, a central toothed wheel fixed to and concentric with said shaft, two outer toothed wheels journaled to a rotary part of said motor, gearing with said central toothed wheel and of half the diameter thereof, a cam fixed to each of said outer toothed wheels and formed with three cam-surfaces of different radii, and spring-actuated lever mechanism substantially as described for controlling each pair of valves, said lever mechanism being pivoted to a rotary part of said motor and arranged to be operated in one direction by one of said cams and in the opposite direction by its spring, as set forth.

19. In a hydrocarbon-motor, the combination with a crank-shaft and crank, and the piston of said motor, of two links that are jointed together at one end and one of which is jointed at its other end to the crank-pin and the other is jointed to a relatively fixed part of the motor at a point outside the circular path of the crank-pin, and means connecting the jointed ends of said links to said piston.

708,503. COOKING OR HEATING OIL-STOVE. MARIE I. STONE, Toronto, Canada. Filed Apr. 28, 1902. Serial No. 104,360. (No model.)

Claim.—1. In a cooking and heating oil-stove, the combination with the oil-bowl and the burners extending upwardly from the same, of the disk provided with double truncated-cone-shape flues, the lower one being reversely set to the upper one and at the bottom fitting the burner as and for the purpose specified.

2. In a cooking or heating oil-stove, the combination with the oil-bowl and the burners extending upwardly from the same, of the disk provided with double truncated-cone-shape flues, the lower one being reversely set to the upper one and at the bottom fitting the burner, a central opening in the disk and a central guide affixed to the center of the top of the bowl and designed to extend up through the central opening or hole in the disk as and for the purpose specified.

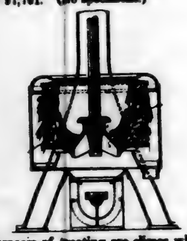


3. In a cooking or heating oil-stove, the combination with the oil-bowl and the burners extending upwardly from the same, of the disk provided with double truncated-cone-shape flues, the lower one being reversely set to the upper one and at the bottom fitting the burner, and a radiator-wall suitably secured at the lower edge to and above the edge of the disk as and for the purpose specified.

4. In a cooking and heating oil-stove, the combination with the bowl, the burners located in the top of the same, the disk provided with upwardly-extending rim, and the radiator fitting each rim, of the thimbles suitably secured and extending through the disk and the reversely-set truncated cone fitting at the bottom on the burner and at the top around the lower half of the thimble, so as to support the same and the truncated cone fitting the upper half of the thimbles above the disk and forming with the lower truncated cone a plurality of flues as and for the purpose specified.

5. In a cooking and heating oil-stove, the combination with the bowl, the burners located in the top of the same, the disk provided with an upwardly-extending rim and perforated as shown, and the radiator-wall fitting each rim, of the thimbles suitably secured and extending through the disk and the reversely-set truncated cones fitting at the bottom on the burners and at the top around the lower half of the thimbles, so as to support the same and the truncated cones fitting the upper half of the thimbles above the disk and forming with the lower truncated cones a plurality of flues as and for the purpose specified.

708,504. TREATMENT OF ORE-SLIMES. HENRY I. SOLMAS and HUGH F. KIRKPATRICK-PIGARD, London, England. Filed Mar. 11, 1902. Serial No. 97,761. (No specimens.)

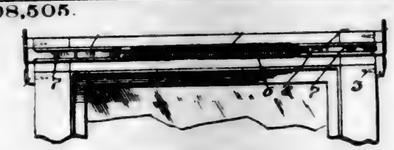


Claim.—The process of treating ore-slimes which consists in separating by means of a centrifugal machine the ore-slimes from the residual water with which they are mixed by adding a little lime to the charge, removing the bulk of the water, thereafter introducing into the machine an amount of leaching solution of a volume equal to that of the remaining quantity of adhering moisture and introduced into the slimes by centrifugal action, and replacing the moisture by the added leaching solution.

708,505. WINDOW-SHADE AND CURTAIN-POLE BRACKET. JAMES P. SWEENEY and THOMAS W. SWEENEY, Tarentum, Pa., assignors of one-third to William H. Wylie, Tarentum, Pa. Filed Apr. 26, 1902. Serial No. 104,682. (No model.)

Claim.—In a fixture of the character described, the combination with the supports provided with pins spaced apart on their inner faces, of horizontal guide-plates secured to the front side of each support, said guide-plates having their inner ends apertured, shade-brackets slidably mounted in said guide-plates, springs disposed between the adjacent ends of the said guide-plates and having their ends secured in the apertured ends thereof, vertically-arranged guides detachably secured to the sides of the said supports, and curtain-brackets removably secured in said guides, substantially as described.

708,505.



708,506. DRESS-CUTTING INSTRUMENT FOR DRAFTING GARMENTS. GUSTAF V. VALENTIER, Chicago, Ill. Filed July 5, 1901. Renewed Aug. 11, 1902. Serial No. 119,322. (No model.)

Claim.—1. A chart or instrument for drafting garments, cut out of thin material, having one long straight edge one end of which is tangential to a large convex curved end which is practically semicircular and which merges into a convex curve of larger radius, said convex curve approaching said straight edge and extending about one-half its length and terminating in a tangential straight line which continues to approach said first-mentioned edge, so that the instrument practically ends in a point, together with the scales on opposite sides of the chart arranged in respect to the edges of the chart in the manner shown and described.

2. A chart or instrument for drafting garments, of a somewhat fish-shaped outline as described, provided with a large curved end, practically semicircular, which merges into a convex curve of larger radius on one edge and into a straight line on the opposite edge, said convex curve of larger radius ending in a tangential straight line which approaches the opposite edge of the instrument, said curved edge and end being adapted, when the instrument is placed in predetermined positions to indicate the curves of the various patterns comprising a lady's dress, together with the scales on opposite sides of the instrument, arranged on said instrument in the manner and for the purposes set forth.

3. A chart or instrument for drafting patterns for ladies' garments comprising a thin flat instrument of a somewhat fish-shaped outline, having one long straight edge terminating tangentially to a large convex curved end, which is practically semicircular and which merges into a convex curve of larger radius terminating in a tangential straight line which approaches said first-mentioned line, and provided with certain scales on its edges representing certain measurements and also with other scales on the body of the instrument removed from the edges, representing various other measurements ordinarily taken, said scales varying between the usual limits of the corresponding measurements and being placed on the instrument in such relation to the outlines of same that when said instrument is placed in certain predetermined positions the various points in the scales will indicate various points on the diagram agreeing with the corresponding measures.

4. In a chart or instrument for drafting patterns for ladies' garments, comprising a thin flat fish-shaped instrument having one long straight edge terminating tangential to a large convex curved end practically semicircular, which merges into a convex curve of larger radius, which approaches said straight edge extending about half the length of same and which ends in a tangential straight line which continues to approach said straight edge, the end of the instrument opposite to said large curved end being quite narrow, scales on said instrument corresponding with the usual measurements, said scales being graduated between the ordinary limits of the corresponding measurements and provided with perforations at the principal points in same adapted to admit the point of a pencil for the purpose of marking on the pattern.

5. A chart or instrument for drafting patterns for ladies' garments, of a somewhat fish-shaped outline as described, provided with one long straight edge ending in a large curved end of constantly-increasing radius though nearly semicircular, said large curved end merging into a convex curve of large radius which extends nearly parallel with said long straight edge and about one-half its length, said large curve ending in a tangential straight line which approaches said long straight edge, said instrument being provided with a number of diagonal lines which are so placed on the instrument that when the long straight edge of said instrument is placed on one vertical edge of a skirt-gore pattern one of said diagonal lines will determine the direction of the other vertical edge of said gore, substantially as described.

6. A chart or instrument for drafting patterns for ladies' garments, of a somewhat fish-shaped outline as described, provided with one long straight edge ending in a large curved end of constantly-increasing radius though nearly semicircular, said large curved end merging into a convex curve of large radius which extends nearly parallel with said long straight edge and about one-half its length, said large curve ending in a tangential straight line which approaches said long straight edge, said instrument being provided with a scale divided into inches and quarters extending at a right angle to said long straight edge, and beginning at the junction of said long straight edge with said large curved end, the second inch division from the starting-point of said scale being marked "0" and numbers running right and left from said "0" point, forming what might be called a right-and-left scale, substantially as described.

708,507. ADJUSTABLE CURTAIN-BRACKET. LOUIS A. WATTS, Cincinnati, Ohio, assignor of one-half to George Schott, Cincinnati, Ohio. Filed Sept. 26, 1901. Serial No. 76,706. (No model.)

Claim.—1. An adjustable curtain-bracket comprising a rigid arm adapted to be secured to a window frame or support, a slide adjustable thereon having an arm extending at right angles to the former, and a roller-supporting member adjustable lengthwise on said latter arm and having slidable connection with the first-mentioned arm; substantially as described.

2. An adjustable curtain-bracket comprising a rigid arm adapted to be secured to a window frame or support, a slide adjustable thereon having an arm extending at right angles to the former, and a roller-supporting member longitudinally slotted and embracing the first-mentioned arm and adjustable lengthwise on the arm carried by the slide; substantially as described.

3. An adjustable curtain-bracket comprising a rigid arm adapted to be secured to a window frame or support, a slide adapted to be adjustably secured on said arm in either of two positions which are at right angles to each other, said slide having an arm extending therefrom at right angles to the first-mentioned arm, and a roller-supporting member adjustable lengthwise on said latter arm; substantially as described.

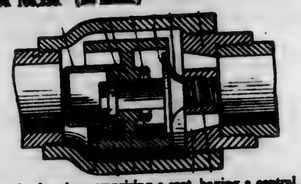
4. An adjustable curtain-bracket comprising a rigid arm adapted for attachment to a support, a sleeve member having transverse ways therethrough whereby said member may be slidably secured on said arm in either of two positions which are at right angles to each other, means for locking said sleeve in place thereon, an arm extending from said sleeve at right angles to the former arm, a curtain-roller-supporting member slidable lengthwise on said latter arm, and means for locking said member in position; substantially as described.

5. An adjustable curtain-bracket comprising a rigid arm adapted for attachment to a support, a sleeve member having transverse ways therethrough whereby said member may be slidably secured on said arm in either of two positions which are at right angles to each other, a set-

screw located at the intersection of said ways for locking said sleeve on the arm, an arm extending from said sleeve at right angles to the former, a curtain-roller-supporting member slidably secured on said second arm, and a set-screw for locking the same in position; substantially as described.

6. An adjustable curtain-bracket comprising a base-plate adapted for attachment to a support, an arm extending therefrom, a sleeve on said arm having an extension at right angles to the former, means for locking said sleeve in place, a curtain-roller-supporting plate slidable lengthwise on said extension, and a set-screw locking said plate in position, said set-screw being insertible at either side of the device to adapt the same for use at either end of the curtain-roller; substantially as described.

708,508. PUMP-VALVE. DAVID C. WOOD, St. Louis, Mo., assignor of one-fourth to E. Huff, St. Louis, Mo. Filed May 6, 1902. Serial No. 106,230. (No model.)



Claim.—1. A valve comprising a seat having a central upwardly-directed spindle, and a movable cylindrical member having flat ends, and having a central hub and a continuous web connecting the body and the hub, said hub being slidably and removably mounted upon the spindle to permit of reversal of the body to bring its ends alternately into coöperative relation with the seat.

2. A valve comprising a seat having a central stem and openings surrounding the stem, a hollow cylindrical body mounted slidably upon the stem for movement with its end into and out of contact with the seat, and a deflecting-plate at the base of the stem, said plate extending upwardly and outwardly over the openings in the seat.

3. A valve comprising a seat having a central stem, a body having a central hub slidably mounted upon the stem and adapted for engagement with the seat, and a cap removably engaged with the hub and inclosing the upper end of the stem.

708,509. LISTER-CULTIVATOR. WILLIAM S. GRAHAM, Canton, Ill., assignor to Parlin & Orendorff Company, Canton, Ill., a Corporation of Illinois. Filed May 3, 1902. Serial No. 105,462. (No model.)

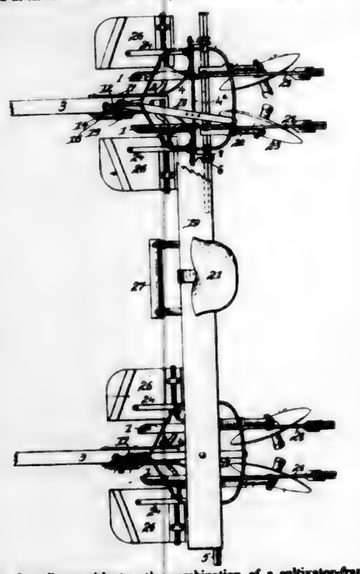
Claim.—1. In a lister-cultivator, the combination of a pair of cultivators adapted to follow furrows, horizontal frames carried by the cultivators, a spreader-board laid across the horizontal frames and link-bars pivoted at their front ends to the frames, connected pivotally between their ends to the spreader-board and having their rear ends extended below cross-bars of the frames.

2. In a lister-cultivator, the combination of a pair of cultivators adapted to follow furrows, horizontal frames on the cultivators having each an arc-formed rear cross-bar and a pair of side bars, a spreader-board laid on the side bars of the cultivator-frames and link-bars beneath the frames pivoted at their front ends to the frames, connected pivotally with the spreader-board and having their rear ends extended beneath the arc-formed cross-bars of the frames.

3. In a lister-cultivator, the combination of a cultivator-frame adapted to run in a furrow, a lever, a rock-shaft, cultivating appliances attached to the rock-shaft and extended rearward therefrom, arms extending upward from the rock-shaft, and a seat-supporting frame sustained by the arms and by the lever, whereby the seat-supporting frame is rocked forward and back as the cultivating appliances are raised and lowered.

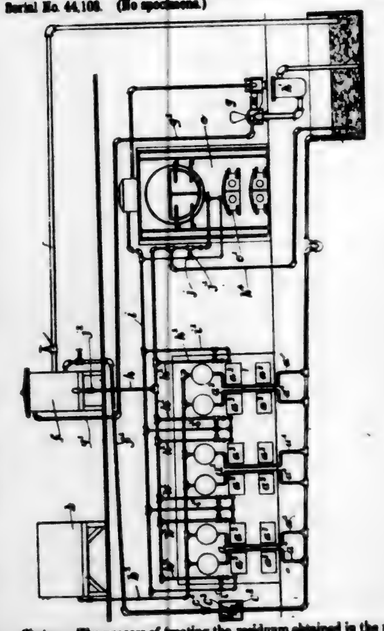
4. In a lister-cultivator, the combination of a cultivator-frame adapted to run in a furrow, a lever fulcrumed in the front of the cultivator-frame, an upward-extended arm on the lever, a rock-shaft journaled crosswise of the rear part of the cultivator-frame, cultivating appliances attached to the rock-shaft and extended rearward therefrom, arms extending upward from the rock-shaft, and a seat-supporting frame sustained at its rear end by the rock-arms and at its front end by the extension of the lever.

5. In a lister-cultivator, the combination of a cultivator-frame adapted to run in a furrow, a lever fulcrumed in the front of the cultivator-frame, a rock-shaft journaled in the rear part of the cultivator-frame crosswise thereof, cultivating appliances attached to the rock-shaft and extended rearward therefrom, arms extending upward from the rock-shaft, other arms pivoted on the arms of the rock-shaft, means for adjusting the pivoted arms on the arms of the rock-shaft, and a seat-supporting frame sustained at its rear end on the two-part arms and at its front end on the lever.



6. In a lister-cultivator, the combination of a cultivator-frame, an arched axle, supporting-wheels on the axle, crusher-boards carried by extensions of the axle and braced from the frame, and cultivating appliances in the rear of the spreader-boards.

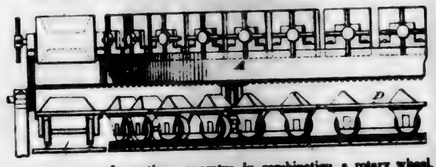
708,510. PROCESS OF TREATING GAS-TAR RESIDUUM. JOHN T. LOVEJ, Boston, Mass., assignor of two-thirds to Milton P. McLaughlin, Somerville, and Joseph H. Smith, Wollaston, Mass. Filed Jan. 21, 1901. Serial No. 44,103. (No specimens.)



Claim.—The process of treating the residuum obtained in the manufacture of gas, which consists in agitating said residuum together with water to reduce it to a liquid mass of uniform consistency, and then separating from said mass the free water to produce a liquid product having a uniform and predetermined consistency.

REISSUES.

12,027. CASTING APPARATUS. DAVID T. CROXTON, Canal Dover, Ohio. Filed May 5, 1902. Serial No. 106,097. Original No. 660,373, dated May 29, 1900.



Claim.—1. In casting apparatus, in combination, a rotary wheel, molds rotatably mounted thereon, a track located beneath the casting-molds, cars or trucks coupled in a continuous endless chain, and connected to the rim of the mold-supporting wheel, a water-tank located in the car-track, and having the car-track depressed and attached to the bottom of said tank, whereby the cars will be drawn through the water for cooling the pigs, substantially as described.

2. In casting apparatus, in combination, a rotary wheel, molds rotatably mounted thereon, a track located beneath the casting-molds, cars or trucks coupled in a continuous endless chain, and connected to the rim of the mold-supporting wheel, a water-tank located in the car-track, and having the car-track depressed and attached to the bottom of said tank, and a portion of the rail on inside of the track elevated in a curved line, the arrangement being such that as the cars are drawn to travel on said track, they will pass through the tank for cooling the iron and also be tilted in passing over the elevated rail for unloading the cars, substantially as described.

3. In casting apparatus, in combination, a horizontally-arranged rotary carrier, molds mounted thereon and traveling in a circular path around the axis of the carrier, a cooling-chamber below the carrier for the pigs, and means supplemental to the mold-carrier traveling through the cooling-chamber in paths parallel to the path of the molds for advancing the pigs, substantially as set forth.

4. In casting apparatus, in combination, a horizontally-arranged rotary carrier, molds mounted thereon and traveling in a horizontal circular path around the axis of the carrier, a cooling-chamber formed on a curve around the axis of the carrier and adapted to hold a body of water and to receive the pigs from the mold, a conveyer moving through the water in said cooling-chamber in paths parallel to the path of the molds, means for imparting motion to the carrier and means for imparting motion to the conveyer in the cooling-chamber, substantially as set forth.

5. In casting apparatus, in combination, a horizontally-arranged rotary carrier, molds mounted thereon and traveling in a circular path around the axis of the carrier, a water-chamber below the carrier and means for moving the pigs through the water-chamber in paths curved around the axis of the carrier, substantially as described.

6. In casting apparatus, in combination a horizontally-arranged rotary carrier, molds mounted thereon and moving around the axis of the carrier; a cooling-chamber below the carrier, means for moving the pigs through the cooling-chamber in a path curved around the axis of the carrier, and means for causing the pigs to move away from the cooling-chamber on lines radial of the carrier, substantially as set forth.

7. In casting apparatus, in combination, a horizontally-arranged rotary carrier moving around a vertical axis, molds mounted thereon traveling around the axis of the carrier, a tank constituting more or less of an annular chamber arranged beneath the carrier substantially parallel to and directly under the path of the molds, a pig-receiving conveyer in the said tank and adapted to carry the pigs through the water in the said tank in a path around the axis of the carrier and means for causing the pigs to move from said carrier on lines radial of the said carrier, substantially as set forth.

8. In casting apparatus, in combination a horizontally-arranged rotary carrier moving around a vertical axis, molds mounted thereon traveling around said axis, a cooling-chamber beneath the carrier and arranged inside of the vertical lines of the carrier, and means for advancing the pigs through the cooling-chamber rotating around the axis of the carrier and means for causing the pigs to move in directions radial to the carrier substantially as set forth.

9. In casting apparatus, in combination a horizontally-arranged rotary mold-carrier, molds mounted thereon, a carrier for the castings below the molds supported independently of the mold-carrier and arranged to move around the vertical axis of the mold-carrier, substantially as set forth.

10. In casting apparatus, in combination, a horizontally-arranged rotary mold-carrier, molds mounted thereon, a horizontally-moving carrier for the castings below the mold-carrier consisting of a series of sections arranged in a circular series and arranged to travel around the vertical axis of the mold-carrier, and said sections being capable of movement relatively to the mold-carrier, substantially as set forth.

11. In casting apparatus, in combination a horizontally-arranged rotary mold-carrier, molds mounted thereon, a horizontally-moving carrier for the castings below the mold-carrier consisting of a series of sections arranged in a circular series and arranged to travel around the vertical axis of the mold-carrier and a support for the castings-carrier having a section in a relatively lower horizontal plane, a section in a relatively higher horizontal plane, and sections connecting the higher to the lower sections, whereby the castings-carrier when moving around the said axis is caused to travel in different horizontal planes, substantially as set forth.

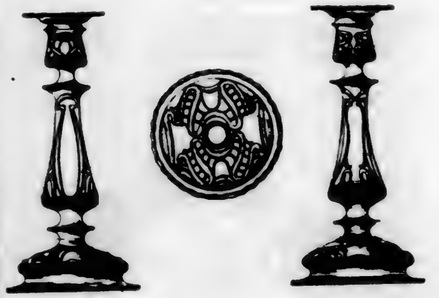
12. In casting apparatus, in combination, a horizontally-arranged rotary mold-carrier, molds mounted thereon, a horizontally-moving carrier for the castings below the molds and arranged to move around the vertical axis of the mold-carrier and a support for the castings-carrier having a lower section, a higher section, and intermediate connecting-sections, and means for causing the castings-carrier to move around the vertical axis of the mold-carrier, substantially as set forth.

DESIGNS.

36,034. HANDLE FOR SPOONS, FORKS, OR SIMILAR ARTICLES. JOHN CUBLEE, Wallingford, Conn., assignor to International Silver Co., Meriden, Conn., a Corporation of New Jersey. Filed July 25, 1902. Serial No. 117,060. Term of patent 7 years.

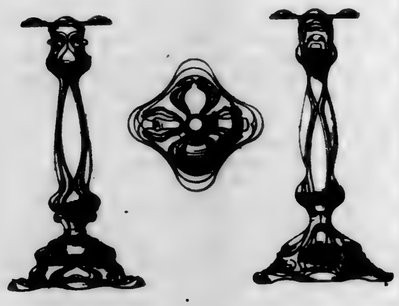
Claim.—The ornamental design for a handle for a spoon, fork or similar article as herein shown and described.

36,035. CANDLESTICK. LOUIS C. HILLER, Wallingford, Conn., assignor to International Silver Co., Meriden, Conn., a Corporation of New Jersey. Filed July 25, 1902. Serial No. 117,047. Term of patent 7 years.



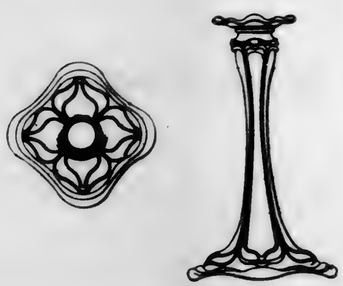
Claim.—The ornamental design for a candlestick as herein shown and described.

36,086. CANDLESTICK. LOUIS C. HELLER, Wallingford, Conn., assignor to International Silver Co., Meriden, Conn., a Corporation of New Jersey. Filed July 26, 1902. Serial No. 117,043. Term of patent 7 years.



Claim.—The ornamental design for a candlestick as herein shown and described.

36,087. CANDLESTICK. LOUIS C. HELLER, Wallingford, Conn., assignor to International Silver Co., Meriden, Conn., a Corporation of New Jersey. Filed July 26, 1902. Serial No. 117,049. Term of patent 7 years.



Claim.—The ornamental design for a candlestick as herein shown and described.

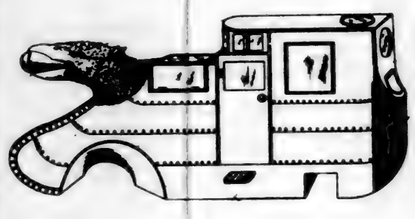
36,088. BAG-FRAME. SIDNEY A. KELLER, New York, N. Y., assignor to Marcus T. Goldsmith, New York, N. Y. Filed Sept. 21, 1901. Serial No. 76,078. Term of patent 3½ years.

Claim.—The ornamental design for a bag or purse frame, or similar article, as shown and described.

36,089. PAPER OR DRAPING WEIGHT. AARON LEVANS, Philadelphia, Pa. Filed July 11, 1902. Serial No. 115,947. Term of patent 14 years.

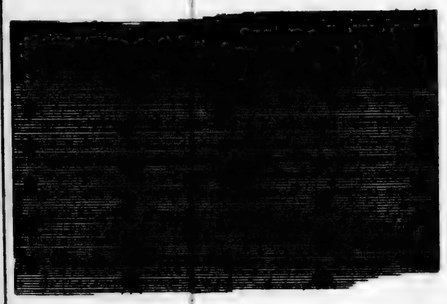
Claim.—The ornamental design for a paper or draping weight, as herein shown and described.

36,040. AUTOMOBILE-BODY. JOHN C. REUTER, St. Louis, Mo. Filed July 3, 1902. Serial No. 114,322. Term of patent 3½ years.



Claim.—The ornamental design for an automobile-body, as herein shown and described.

36,041. FABRIC. WILLIAM FREDERIC STIFEL, Wheeling, W. Va. Filed Aug. 6, 1902. Serial No. 118,634. Term of patent 7 years.



Claim.—The ornamental design for a fabric as herein shown and described.

TRADE-MARKS

REGISTERED SEPTEMBER 2, 1902.

38,860. MEN'S GLOVES. SHWARTZ, SCHLOSS & COMPANY, New York, N. Y. Filed July 11, 1902.

HERCULES

The word "HERCULES." Used since July 1, 1902.

38,861. SHIRT-WAISTS. UNITED SHIRT WAIST Co., Chicago, Ill. Filed July 7, 1902.

KEEP-KOOL

The hyphenated word "KEEP-KOOL." Used since May 1, 1902.

38,862. SILKS. CONSUMERS SILK MILLS AND COUPON EXCHANGE Co., Newark, N. J. Filed July 14, 1902.

Relda

The word "RELDA." Used since June, 1902.

38,863. REMEDY FOR RHEUMATISM. ADOLF H. WISSOWATY, Chicago, Ill. Filed Aug. 12, 1902.

A portrait of the registrant. Used since June 1, 1902.

38,864. SWEETENED AND UNSWEETENED COCOA AND CHOCOLATE. JOSEPH J. O'DONOGHUE'S Sons, New York, N. Y. Filed May 8, 1902.

Gold Seal

The representation of a seal having thereon a monogram comprising the letters and abbreviation "G S C Co" and the words "GOLD SEAL." Used since March 22, 1897.

38,865. BUTTER. R. O. WHITFORD & Co., Washington, D. C. Filed Apr. 15, 1902.

The words "RED CLOVER" and the representation of leaves and a bloom of red clover and a circular cable-like border. Used since March 15, 1902.

38,866. CLEANSING PREPARATIONS IN TABLET FORM. Geo. W. KIRK, Swansboro, Va. Filed July 22, 1902.

KI-SOP

The hyphenated word "KI-SOP." Used since July, 1900.

88,867. COMPOSITIONS FOR COATING WOOD AND METAL. AMERICAN STANDARD COMPOSITION CO., Washington, D. C. Filed Apr. 17, 1902.

A symbol consisting of the representation of an anchor in an inclined position resting at one end of the stock on a rock and having a chain attached to the eye, an eagle having upraised and partially-spread wings and grasping in its talons the shank of the anchor, and a marine or water view partially around the rock. Used since April 1, 1902.

88,868. BLACKBOARD-CRAYONS. AMERICAN SCHOOL FURNITURE COMPANY, New York, N. Y. Filed May 24, 1902.

The representation of a five-pointed star having the word "STAR" in plain block letters across the face and the representation of a bar immediately below the word "Star." Used since September 27, 1901.

88,869. ICE-CREAM FREEZERS. DASH & CO., Cincinnati, Ohio. Filed June 2, 1902.

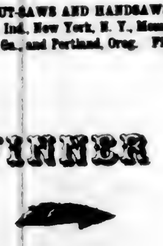
PEARL

The word "PEARL." Used since 1899.

88,870. CROSSCUT-SAWS. E. C. ATKINS & COMPANY, Indianapolis, Ind., New York, N. Y., Memphis, Tenn., Minneapolis, Minn., Atlanta, Ga., and Portland, Oreg. Filed Nov. 5, 1901.

The word "POINTER" and the representation of a dog of the pointer type. Used since April 29, 1901.

88,871. CROSSCUT-SAWS AND HANDSAWS. E. C. ATKINS & COMPANY, Indianapolis, Ind., New York, N. Y., Memphis, Tenn., Minneapolis, Minn., Atlanta, Ga., and Portland, Oreg. Filed Nov. 5, 1901.



The word "WINNER" and the representation of the heads and necks of two racing-horses, one slightly in advance of the other. Used since March 22, 1901.

THE NORRIS PETERS CO.

LABELS

REGISTERED SEPTEMBER 2, 1902.

9,410.—*Title:* "A POCKET HAT LUER." (For Hat-Luers.) CHARLES E. SACKETT, Danbury, Conn. Filed July 31, 1902.

9,411.—*Title:* "BOSTON LIGHT GELATINE." (For Gelatin.) A. L. STARK, Boston, Mass. Filed July 28, 1902.

9,412.—*Title:* "KNICKERBOCKER CHOP." (For Tea.) FIRM OF W. J. BUTTFIELD, New York, N. Y. Filed August 11, 1902.

9,413.—*Title:* "HOP TEA." (For a Non-Intoxicating Beverage.) N. THOMAS BREWING CO., Dayton, Ohio. Filed August 11, 1902.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

EX PARTE GROSSMITH.

Decided December 9, 1901.

TRADE-MARKS—ANTICIPATION—"FLORODORA" AND "FLORIDENA."

The word "Florodora" refused registration in view of the prior registered mark "Floridena."

ON appeal.

TRADE-MARK FOR PERFUMES, PERFUMED SOAP, TOILET ARTICLES, ETC.

Application of John L. Grossmith for registration filed July 20, 1901, No. 63,814.

Messrs. J. E. Evans-Jackson & Co. and *Messrs. Richards & Co.* for the applicant.

ALLEN, *Commissioner:*

This is an appeal from the decision of the Examiner of Trade-Marks refusing to register the word "Florodora" as a trade-mark for perfumes.

Registration was refused on reference to the prior registered mark "Floridena" for the same class of goods. The similarity between the words is so close that it is believed that the ordinary purchaser would be deceived and induced to purchase the goods of one party supposing them to be the goods of the other. There is certainly a likelihood of confusion in the minds of the purchasing public between the marks.

The decision of the Examiner of Trade-Marks is affirmed.

FELBEL v. OLIVER.

Decided January 6, 1902.

1. INTERFERENCE—PRIORITY OF INVENTION—CONCEALMENT OF INVENTION.

Where F. reduced the invention to practice and for one year and five months thereafter made no other machines and made no substantial advance toward placing the invention on the market, during which time O. made the invention and put it into use, *Held* that F. is the first inventor in the absence of a showing that he intentionally concealed the invention from the public or abandoned the idea of obtaining a patent and using the invention.

2. SAME—REDUCTION TO PRACTICE—DILIGENCE IN USING INVENTION.

By a reduction to practice a party's rights are protected, and it is not necessary thereafter to use the same amount of diligence in putting the invention upon the market as is necessary in a reduction to practice by one first to conceive but the last to reduce to practice.

APPEAL from Examiners-in-Chief.

TYPE-WRITING MACHINE.

Application of Jacob Felbel filed December 18, 1899, No. 740,703. Application of Thomas Oliver filed July 17, 1899, No. 724,049.

Mr. William W. Dodge for Felbel.

Messrs. Poole & Brown for Oliver.

ALLEN, *Commissioner:*

This is an appeal by Oliver from the decision of the Examiners-in-Chief affirming the decision of the Examiner of Interferences awarding priority of invention to Felbel upon the following issue:

In a type-writing machine, the combination with type-operating mechanism and a power-driven carriage, of a tabulating mechanism including a series of denomination-keys and a series of independently-movable stops connected thereto and also including an independent release-key for the carriage, the construction and arrangement being such that any key may be operated to set its corresponding stop, and such that said release-key may then be operated to enable the carriage to move rapidly to the point determined by the setting of said stop.

The testimony establishes and Oliver admits that the device in evidence as Felbel exhibit machine was made by Felbel in July, 1898. It is a full-sized operative machine and was successfully used at that time. This was prior to any date of invention proved by Oliver, and his claim to priority rests upon the contention that Felbel lost his rights after making the machine by a course of conduct similar to that of Mason in the case of *Mason* v. *Hepburn*, (84 O. G., 147.) This is stated in the reason of appeal as follows:

That the Examiners-in-Chief were in error in failing to hold that the contestant Felbel has lost all rights as against Oliver by putting aside the model made in July, 1898, and in failing to introduce into public use the improvements embodied in said model or to apply for a patent thereon, until after Oliver had invented, reduced to practice, filed his application for, and put into general public use the improvements set forth in his application.

Felbel's application was filed on December 18, 1899, and therefore there was a delay of one year and five months on his part after his machine was made. It does not appear that during this time Felbel made any other machines of the same character or made any substantial advance toward placing the machine upon the market. It is this failure to manufacture the machine during the time when Oliver made his invention and placed it upon the market which is alleged as a forfeiture of his rights.

The conduct of Felbel, as shown by the testimony, is not analogous to that of the parties who were adjudged to have lost their rights by intentional delay and concealment in the cases cited by the appellant. When his machine was made, Felbel took it to Seamans, an officer of a large manufacturing concern engaged in the manufacture of type-writers, with the expectation that the com-

pany would manufacture it. After waiting some time to see if this would be done he states that he took possession of the machine and had drawings for an application for a patent prepared in January, 1899. It is said that the draftsman was working on these drawings one hundred and four hours. Felbel states that he then intended to prepare the specification and claims himself, but was busy on other matters, and in the fall of that year turned the preparation of the case over to one Barkley. There is nothing in the admissions of Felbel or the testimony of the witnesses to show that he intentionally concealed the invention from the public or abandoned the idea of obtaining a patent and making use of the invention.

After the completion of an invention it is not necessary that the inventor use the same amount of diligence in putting it upon the market as is necessary in a reduction to practice by one first to conceive but the last to reduce to practice. By a reduction to practice a party's rights are protected and are not lost by what might be considered a lack of diligence if it had reference to a completion of the invention, but only by some such course of conduct as indicated in *Mason* v. *Hepburn*, cited above. (*Estey* v. *Newton*, 86 O. G., 799.)

Oliver argues that there is no interference in fact and that if the issue is construed as broad enough to apply to both parties' devices it is not patentable in view of the prior art. For the purposes of this case the issue must be construed as broad enough to apply to both devices. It is not limited beyond that in terms and was apparently intended to have that scope when the claims were drawn. The question whether a claim of that breadth is patentable is a matter to be considered by the Examiner when the cases come before him for *ex parte* consideration. The Examiners-in-Chief have called attention to this matter under Rule 126 and stated that in their opinion the issue is not patentable. The Examiner will consider this question when the applications come before him.

The decision of the Examiners-in-Chief is affirmed.

EX PARTE DOWNING.

Decided March 10, 1902.

1. FINAL REJECTION—FORMAL AMENDMENTS.

Where an applicant makes merely formal amendments to the claims and requests reconsideration, *Held* that a final rejection is in order.

2. AMENDMENT AFTER FINAL REJECTION—ADDITIONAL CLAIM—FORMAL AMENDMENT.

A party cannot demand the admission of an additional claim after final rejection as placing the case in better form for appeal, since if it differs from other claims it affects the merits.

3. SAME—DUPLICATION OF CLAIMS.

Where after final rejection the applicant presents by amendment an additional claim which is substantially the same as one of those rejected, *Held* that the amendment should not be entered, either with or without the showing referred to in Rule 68, since duplicate claims are not permissible.

ON petition.

CLOTHES-RACK.

Application of James M. Downing filed April 3, 1900, No. 11,826.

Mr. R. G. Dyrenforth for the applicant.

ALLEN, *Commissioner:*

This is a petition from the action of the Examiner finally rejecting the claims in the above-entitled application and refusing the admission of a new claim filed after said final rejection.

The records show that after four actions by the Office an amendment was filed canceling all the claims and inserting in lieu thereof two new claims.

The Examiner suggested that certain formal amendments be made to these claims in order to correct their phraseology. The claims were also rejected on references.

The petitioner filed an amendment adopting the suggestions of the Examiner as to the formal matters and requested a reconsideration of the previous action on the merits, giving reasons for this request.

On reconsideration the Examiner finally rejected the claims. The applicant thereupon filed a new claim in addition to those already in the case and asked that it be entered and considered on its merits. The Examiner refused to enter and consider this claim on the ground that the claims were under final rejection, and the application was therefore in condition for appeal, citing Rule 68. The petitioner argued that the amendment was in order, as the final rejection was premature.

The amendments made to the claims after the first rejection thereof are clearly mere formal amendments. They were suggested by the Examiner in order to place the claims in better form. They did not in any way change or affect the merits of the claims.

The mere fact that an applicant amends rejected claims does not prevent the claims from being finally rejected upon a reconsideration thereof. The claims must be amended in matters of substance to avoid a final rejection. When the amendments are mere formal changes in the claims, a final rejection is proper. It follows, therefore, that the Examiner was not premature in his final rejection of the claims. (*Ex parte Rider*, 85 O. G., 1078.)

Upon the refusal of the Examiner to enter and consider the new claim on its merits the petitioner requested that the same be entered for the purpose of appeal under Rule 68. The Examiner properly refused to enter the new claim on the ground that Rule 68 does not provide for the entry of a new claim in addition to those under final rejection for the purpose of appeal. Rule 68 provides that—

> * * * amendments canceling claims or presenting those rejected in better form for consideration on appeal may be admitted.

The phrase "presenting those rejected in better form" is clear in its meaning. The intent of this provision of Rule 68 is to permit an applicant to change the form of the rejected claims for consideration on appeal. This change in form of the rejected claims can only take place by amendment. If a new claim is submitted which is merely one of the rejected claims in better form, the rejected claim should be canceled and the new claim substituted in lieu thereof; otherwise two claims which are the same in substance will be presented in the same application, which is not permissible.

If the new claim differs from the rejected claim in substance, it clearly cannot be entered in an application which is in condition for appeal under the first provision of the second paragraph of Rule 68, which provides only for the entry of amendments *not* affecting the merits. (*Ex parte White*, 98 O. G., 1969.)

The petitionor then filed a verified statement setting forth reasons why the new claim was not earlier presented and requested that in view of this statement the said claim be entered and considered.

The Examiner held that the new claim did not affect the merits, that it was the same claim in substance as those in the case under final rejection, and refused to enter the claim for that reason, as to do so would only present for consideration the same question already passed upon.

If the new claim did not affect the merits of the case, the Examiner's action was correct. In order to warrant the entry of an amendment after final rejection upon a verified showing of good and sufficient reasons why it was not earlier presented, the amendment must affect the merits. (*Ex parte White*, *supra*.)

A comparison of the new claim with the claims under final rejection makes it clear that the new claim does not affect the merits of the application. It is the same in substance as the claims under final rejection. The entry of the claim would only present for consideration the matter already passed upon.

The Examiner's action is correct, and the petition is denied.

EX PARTE HOYT.

Decided March 27, 1902.

DIVISION—SPRING-MOTOR AND COMBINATION OF MOTOR WITH A FAN.

Held that division was properly required between claims to a spring-motor and claims to that motor in combination with a fan.

ON petition.

SPRING-MOTOR.

Application of Charles H. Hoyt filed June 29, 1901, No. 66,504.

Mr. Thomas D. Stetson for the applicant.

ALLEN, *Commissioner:*

This is a petition from the action of the Examiner requiring division between the claims of the above-entitled application.

Claims 1, 2, and 3 cover a spring-motor which is obviously of general application. Claim 4 covers this motor in combination with a fan.

Spring-motors and automatic fans, comprising a fan and its motor, are recognized in the art and manufacture as separate subjects of invention. They are separately classified in this Office.

Under these circumstances division was properly required, following the well-settled practice of the Office. (See *ex parte Johnston*, 92 O. G., 1235; *ex parte Smith*, 98 O. G., 1971.)

The petition is denied.

EX PARTE TYLER.

Decided July 8, 1902.

1. DIVISION—GAS-ENGINE—SPECIFIC DEVICE—CAPABLE OF GENERAL USE.

Held that division should be required between claims to the general gas-engine structure and specific claims covering, respectively, a self-lubricating journal-box, a lubricator for a crank-pin, a crank-pin, a speed-regulating device, a valve capable of use in any engine structure.

2. SAME—SAME.

Held that claims for a valve mechanism which covers a structure which is peculiarly adapted for use in the general gas-engine structure disclosed and claimed should not be divided from the claims covering the general gas-engine structure.

ON petition.

GAS-ENGINE.

Application of Aaron J. Tyler filed May 2, 1900, No. 15,261.

Messrs. Davis & Davis for the applicant.

ALLEN, *Commissioner:*

This is a petition from an action of the Examiner requiring division between certain groups of claims in the above-entitled application on the ground that the several groups of claims cover, respectively, independent inventions capable of separate use.

The invention relates to a gas-engine of special type. A majority of the claims are drawn to cover, in general, a gas-engine structure. Some of the claims, however, cover specific devices which are used in a gas-engine construction; but these devices are recognized by inventors and manufacturers as separate and independent inventions from each other and from the general engine structure in which they are used.

Claims 1 and 2 cover a specific form of self-lubricating journal-box. Such a structure is capable of general use and is not confined to use in the special engine construction described and claimed by the petitioner. Not only is such a device recognized by inventors and manufacturers as a separate and independent invention from the general engine structure in which it is used, but it is so recognized by this Office in its scheme of classification. The Examiner is right in his opinion that these two claims should be presented in a separate application from that containing the claims drawn upon the general engine structure.

Claims 3 and 4 should also be divided from the remaining claims in this application for the same reasons, in that they cover a specific form of lubricator for a crank-pin which is capable of separate use from the other inventions claimed in this application. Claim 5 covers a crank-pin of specific form which is capable of use in any engine. It is an independent subject-matter of invention from the general engine structure in which it is used.

The same is to be said of claims 13 and 14, for the reason that these claims cover a specific form of speed-regulating device, which is an independent subject-matter of invention from the inventions covered in the remaining claims and is capable of separate use.

The Examiner has required that the group comprising claims numbered 11, 12, 33, 34, 35, 36, and 37 be divided from the other claims on the ground

that they are drawn to cover a specific form of valve-operating device. An examination of these claims shows that claims 11 and 12 cover a specific valve capable of use in any engine structure, and the requirement of division by the Examiner as to these claims is right. Claims 33 to 37, inclusive, however, are drawn to cover the general engine structure specifically disclosed in this application, and division of these claims from the other claims covering the engine structure should not be insisted upon.

Claims 15 and 16, which were required by the Examiner to be divided from the remaining claims, also cover the general engine structure, and the requirement of division as to these two claims should not be insisted upon.

The petition is granted to the extent indicated.

DECISIONS OF THE U. S. COURTS.

Court of Appeals of the District of Columbia.

IN RE MCNEIL.

Decided June 23, 1902.

1. PATENTABILITY—MCNEIL—SEWING-MACHINE—CLAIMS NOT PATENTABLE.

The claims in the application of Chester McNeil for a sewing-machine, Serial No. 665,193, filed December 31, 1897, examined and *Held* to be not patentable in view of the prior art. (Decision of Assistant Commissioner, 100 O. G., 1976, affirmed.)

2. COMBINATION UNPATENTABLE—ELEMENT NEW—DOUBLE USE.

Where the combination in a sewing-machine of a trimmer in advance of one form of stitch-forming mechanism is old, *Held* that the combination of that trimmer with another stitch-forming mechanism is not patentable, whether that stitch-forming mechanism is new or old.

Mr. Charles L. Sturtevant for the appellant.

Mr. John M. Coit for the Commissioner of Patents.

SHEPARD, *J.*:

This is an appeal from the decision of the Commissioner of Patents denying an application for a patent for an improved combination in sewing-machines.

The application contains seventeen claims, sixteen of which are substantially represented by claim 1, as follows:

1. In a sewing-machine, in combination with stitch-forming mechanism, including devices for forming two rows of irregular stitches, the adjacent loops of which are interlocked, of a trimmer arranged in advance in the stitch-forming mechanism and in the line of the same, substantially as described.

Claim 5 was separately considered and reads as follows:

5. The combination, in a sewing-machine, of a suitable trimmer stitch-forming mechanism in rear of said trimmer including a plurality of eye-pointed thread-carrying devices forming parallel rows of stitches upon opposite sides of the line of feed and eye-pointed thread-carrying devices reciprocating back and forth between said opposite rows of stitches and forming intermediate interlocking rows of stitches, substantially as described.

The Primary Examiner, in his decision denying patentability, quotes the appellant's statement of his improvement as follows:

The invention therefore consists primarily of a sewing-machine including stitch-forming devices for making two rows of irregular stitches, the adjacent loops of which are interlocked, and a trimmer arranged in advance of the stitch-forming mechanism and in the line of the same. Secondly, the invention consists of a trimmer for severing the edges of overlapped pieces of fabric, stitch-forming mechanism in rear of said trimmer including devices for depositing along the edge of each of the abutting pieces of fabric a row of binding-stitches, and means for interlocking the adjacent loops of said binding-stitches, whereby, in one operation, an artificial selvage is formed on the edges of the fabric, and the same are united. Thirdly, the invention consists of a plurality of obliquely-set vertically-reciprocating and laterally-vibrating needles, and means for imparting an amount of lateral movement to said needles sufficient to carry each past the working position of another in every vibration, and a trimmer located in advance of said needles and between the extremities of throw thereof.

He then adds:

Inspection of the Woodward machine shows that every feature of each of the claims, save claim 5, in so far as the same call for stitch-forming mechanism, is found therein. The applicant has added to the said Woodward machine the ordinary trimmer in common use upon sewing-machines does not involve invention, the combination of stitch-forming mechanism and a trimmer, coöperating therewith to trim the edges of the material being stitched, being admittedly at least thirty years old.

From another point of view, the claims call for the bare substitution in the Borton and Willcox machine for the stitch-forming mechanism shown therein of the stitch-forming mechanism shown in the Woodward machine.

The decision of the Primary Examiner was affirmed successively on appeal to the Examiners-in-Chief and the Commissioner.

Agreeing with the conclusions of the Assistant Commissioner, we shall content ourselves with quoting from his opinion, to which nothing need be added beyond the citation of some additional authorities. He said, after reciting the patents of Nicholas (No. 168,521), Woodward (No. 466,264), Woodward & Timm (No. 480,377), and Borton & Willcox (No. 498,616):

It is old in a sewing-machine to combine a trimmer with a stitch-forming mechanism. This combination is shown in the patent to Borton and Willcox. In this patent the trimmer is arranged in advance of the stitch-forming mechanism in the line of the seam, and said stitch-forming mechanism includes devices for forming two rows of stitches.

The particular stitch-forming mechanism shown by appellant, and which constitutes an element in the combination of his claims, is not separately claimed by the appellant. Such a stitch-forming mechanism is shown, described, and claimed in the patent to Woodward.

The appellant has filed affidavits, under the provisions of Rule 75, to establish a date of invention of the matter claimed prior to the date of filing of Woodward's application, which resulted in the grant of his patent, No. 466,264, on December 29, 1891. The Examiner has held that these affidavits are not sufficient for the purpose. Whether they are sufficient or not is immaterial, from the view I take of this case.

Borton and Willcox having invented the combination of a trimmer with a stitch-forming mechanism, it is not invention to combine a trimmer with another stitch-forming mechanism, whether the stitch-forming mechanism be new or old. No new result is accomplished by appellant which differs in kind from the result accomplished by Borton and Willcox. There is no special coaction between the particular stitch-forming mechanism and the trimmer. Each sets in its own way and is not affected by the other, and performs its function in the combination irrespective of the other. I think that what the appellant has done is within the province of the mechanic and does not amount to invention.

As stated by the Supreme Court of the United States in *Hill* v. *Wooster*, (50 O. G., 560; 132 U. S., 695, 701,) * * * it is not enough that a thing shall be new, in the sense that in the shape or form in which it is produced it shall not have been before known, and that it shall be useful, but it must, under the Constitution and the statute, amount to an invention or discovery.

See also, *Durham* v. *Seymour* (71 O. G., 601; 6 App. D. C., 78, 103), and cases cited and reviewed therein.

There being no error in the decision of the Commissioner of Patents, it will be affirmed; and this decision will be certified to the Commissioner as required by law.

Patents Nos. 708,511 to 708,979.

Attorneys.

(ORDER No. 1,497.)

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., August 30, 1902.

Pursuant to the provisions of section 487 of the Revised Statutes, and with the approval of the Secretary of the Interior, Charles O. Erbaugh, of Denver, Colo., registry number 2305, is hereby disbarred from practice before the United States Patent Office for gross misconduct.

E. B. MOORE,
Acting Commissioner.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., September 2, 1902.

This Office has been advised by the Secretary of the Interior of the disbarment of the following attorneys from practice before the Department or any Bureau thereof:

Edward O. Jones, Booneville, Ind., August 8, 1902; William Jones, Booneville, Ind., August 8, 1902; Clayban M. Perkins, Elkton, Ky., August 22, 1902; Turner Bartley, Tompkinsville, Ky., August 27, 1902; Benjamin F. Morse, East Elmore, Vt., August 28, 1902; William A. Emery, formerly of Norway, now of East Waterford, Me., August 29, 1902.

C. M. IRELAN,
Chief Clerk.

Money by Mail.

Money sent by mail to the Patent Office will be at the risk of the sender. Letters containing money should be registered.

Punctuation and Amendments.

Attention is called to Order 789, dated November 26, 1892, which is as follows:

It is hereby directed that in the printing of claims of applications for patents the punctuation of the claims as made by applicants be strictly followed, and that the punctuation of the specification made by applicants be not departed from except to cure a manifest absurdity.

This order is still in force.

Examiners are prohibited from making any change in the claims or specification of an application without the consent of applicants or their attorneys; but when amendment becomes necessary the Office will duly advise, by letter, the applicant or his representative before passing a case to issue.

Women Inventors.

The Patent Office has published and has for sale a volume containing a list of women inventors to whom patents have been granted by the United States from 1790 to July 1, 1888. 44 pages. Paper covers, 50 cents.

An Appendix to the above, covering the period from July 1, 1888, to October 1, 1892. One volume, 18 pages. Paper covers, 25 cents.

Appendix No. 2, October 1, 1892, to March 1, 1895. One volume, 28 pages. Paper covers, 25 cents.

PATENTS

GRANTED SEPTEMBER 9, 1902.

708,511. PARAMETHYL-AMIDOPHENYL-GLYOXYLIC ACID AND PROCESS OF MAKING SAME. Fritz Ach, Mannheim, Germany, assignor to The Firm of C. F. Boehringer & Soehne, Mannheim-Waldhof, Baden, Germany. Filed May 20, 1900. Serial No. 16,635. (No specimens.)

Claim.—1. The process of preparing para-amidophenyl-glyoxylic acid which consists in treating amidophenyltartronyl-ureids with an oxidizing agent in the presence of alkali.

2. The process of preparing para-amidophenyl-glyoxylic acid which consists in dissolving an amidophenyltartronyl-ureid in an alkali and acting on the solution with an oxidizing agent.

3. The process which consists in dissolving an amidophenyltartronyl-ureid in an alkali solution, adding an oxidizing reagent thereto and boiling until the generated ammonia is driven off.

4. The process which consists in dissolving an amidophenyltartronyl-ureid in an alkali solution, adding an oxidizing reagent thereto and boiling in a reflux apparatus until the generated ammonia is driven off.

5. The process which consists in dissolving an amidophenyltartronyl-ureid in an alkali solution, adding an oxidizing reagent thereto and boiling in a reflux apparatus until the generated ammonia is driven off, then filtering and evaporating the filtrate, whereby the alkali salt of the new acid is obtained.

6. The process which consists in dissolving an amidophenyltartronyl-ureid in an alkali solution, adding an oxidizing reagent thereto, and boiling until the generated ammonia is driven off, then filtering and evaporating the filtrate, whereby the alkali salt of the new acid is obtained, then dissolving in water and acidulating the filtrate.

7. The process which consists in dissolving methyl-anil-alloxan in potash lye and adding mercuric oxid all in the proportions specified, and boiling in a reflux apparatus until all the ammonia has been liberated until generated ammonia has disappeared.

8. The process which consists in dissolving methyl-anil-alloxan in potash lye and adding mercuric oxid, all in the proportions specified, and boiling in a reflux apparatus until generated ammonia has disappeared, then filtering and evaporating the filtrate to dryness, digesting with alcohol and again evaporating.

9. The process which consists in dissolving methyl-anil-alloxan in potash lye and adding mercuric oxid all in the proportions specified, and boiling in a reflux apparatus until generated ammonia has disappeared, then filtering and evaporating the filtrate to dryness, digesting with alcohol and again evaporating, then dissolving the residue in water and acidulating with a mineral acid, whereby the new amido-phenylglyoxylic acid is precipitated.

10. As a new chemical compound, para-methyl-amido-phenylglyoxylic acid having the formula $CH_3.NH.C_6H_4.CO.COOH$ which is readily soluble in boiling water, cold alcohol, acetone, acetic ether, but soluble with difficulty in cold chloroform, ether and benzene, which softens on heating to 140°, centigrade, and is decomposed with frothing at 155°, to 157°, centigrade, and which forms short well-developed prisms of an orange color.

708,512. DIACETYL-DIAMIN AND PROCESS OF MAKING SAME. Fritz Ach, Mannheim, Germany, assignor to The Firm of C. F. Boehringer & Soehne, Mannheim-Waldhof, Baden, Germany. Filed May 1, 1901. Serial No. 58,256. (Specimens.)

Claim.—1. The process of preparing the herein-described uracyl derivatives which consists in heating a uric acid together with an organic acid anhydrid until the product of the reaction will not reduce an ammoniacal silver solution except by prolonged boiling.

2. The process of preparing the herein-described uracyl derivatives which consists in heating a uric acid together with an organic acid anhydrid under pressure until the product of the reaction will not reduce an ammoniacal silver solution except by prolonged boiling.

3. The process of preparing the herein-described uracyl derivatives which consists in heating a uric acid together with an organic acid anhydrid and a condensing agent until the product of the reaction will not reduce an ammoniacal silver solution except by prolonged boiling.

4. The process of preparing the herein-described uracyl derivatives which consists in heating a uric acid together with an organic acid anhydrid and a condensing agent under pressure until the product of the reaction will not reduce an ammoniacal silver solution except by prolonged boiling.

5. The process of preparing diacyl-diamins which consists in heating uric acid proper together with an organic acid anhydrid until the product of the reaction will not reduce an ammoniacal silver solution except by prolonged boiling.

6. The process of preparing diacyl-diamins which consists in heating under pressure uric acid proper together with an organic acid anhydrid until the product of the reaction will not reduce an ammoniacal silver solution except by prolonged boiling.

7. The process of preparing diacyl-diamins which consists in heating uric acid proper together with an organic acid anhydrid and a condensing agent until the product of the reaction will not reduce an ammoniacal silver solution except by prolonged boiling.

8. The process of preparing diacyl-diamins which consists in heating under pressure uric acid proper together with an organic acid anhydrid and a condensing agent until the product of the reaction will not reduce an ammoniacal silver solution except by prolonged boiling.

9. The process of preparing 4-5-diacetyl-diamido-uracyl which consists in heating uric acid proper together with acetic anhydrid until the product of the reaction will not reduce an ammoniacal silver solution except by prolonged boiling.

10. The process of preparing 4-5-diacetyl-diamido-uracyl which consists in heating uric acid proper together with acetic anhydrid and a condensing agent until the product of the reaction will not reduce an ammoniacal silver solution except by prolonged boiling.

11. The process of producing 4-5-diacetyl-diamido-uracyl which consists in heating uric acid proper together with acetic anhydrid and pyridin, until the product of the reaction will not reduce an ammoniacal silver solution except by prolonged boiling.

12. The process of producing 4-5-diacetyl-diamido-uracyl which consists in heating uric acid proper together with acetic anhydrid and pyridin under pressure until the product of the reaction will not reduce an ammoniacal silver solution except by prolonged boiling.

13. The process of producing 4-5-diacetyl-diamido-uracyl which consists in heating uric acid proper together with acetic anhydrid and pyridin under pressure until the product of the reaction will not reduce an ammoniacal silver solution except by prolonged boiling and then separating the diacetyl compound by boiling with water.

14. As a new chemical compound, a uric-acid derivative in which an acid radical and hydrogen are separately bound to the nitrogen atoms in the positions 7 and 9 of a uric acid, the CO group of the position 8 having been removed, the said compound being a diacetyl-diamin of a uric acid, giving a strong murexid reaction when evaporating with hydrochloric acid and reducing an ammoniacal silver solution only after prolonged boiling.

15. As a new chemical compound, 4-5-diacetyl-diamido-uracyl having the formula hereinabove given, which is readily soluble in alkalies including ammonia, which gives a strong murexid reaction on boiling with concentrated hydrochloric acid, without adding an oxidizing agent, which reduces ammoniacal silver solution only after boiling for a long time, which has no melting-point but sinters and turns brown at about 300°, centigrade, gradually decomposing on still further raising the temperature, and which may be crystallized in fine felted needles.

708,518. THIOXANTHIN AND PROCESS OF MAKING SAME. Fritz Ach, Mannheim, Germany, assignor to The Firm of C. F. Boehringer & Soehne, Mannheim-Waldhof, Baden, Germany. Filed July 27, 1901. Serial No. 69,267. (No specimens.)

Claim.—1. In the art of preparing thioxanthins, the process which consists in reacting upon an uric acid with carbon bisulfid.

2. The process which consists in reacting upon an alkali salt of an uric acid with carbon bisulfid.

3. The process which consists in reacting upon an acid alkali salt of an uric acid with carbon bisulfid.

4. The process which consists in heating an acid alkali salt of an uric acid with carbon bisulfid.

5. The process which consists in heating an acid alkali salt of an uric acid with carbon bisulfid in the presence of water.

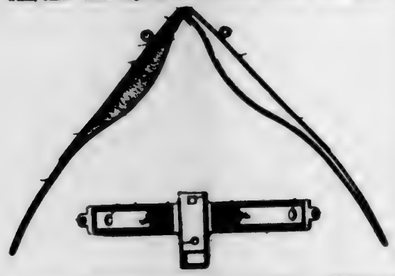
6. The process which consists in heating an acid alkali salt of an uric acid with carbon bisulfid and water under pressure in a closed vessel.

7. The process which consists in heating the mono-potassium salt of an uric acid with carbon bisulfid and water under pressure in a closed vessel.

8. The process which consists in heating the mono-potassium salt of 3-methyl-uric acid with carbon bisulfid and water in a closed vessel to a temperature of about 150° centigrade.

9. As a new chemical compound, 3-methyl-6-thiouranthin whose formula is $C_6H_6N_4SO_2$, which decomposes on heating at about 340° centigrade, dissolves in about four hundred parts of boiling water, crystallizes from the same in the form of bright-yellow lustres and has all the properties characteristic to the thiouranthins.

708,514. HARNESS TRACK-SADDLE. LE ROY R. ALLEN, Berwick, Ohio. Filed July 30, 1901. Serial No. 70,054. (No model.)



Claim.—1. In a harness-saddle, in combination, a saddletree, pad-plates secured thereto, and two disconnected pads attached to the pad-plates, the ends of the pad-coverings abutting together at the top, the tree and plates being contained within the pads and removable through the abutting ends.

2. In a harness-saddle, in combination, a saddletree, flanges thereon, a terret-bar between the flanges, a pad-plate resting upon the flanges and secured to the tree, a pad the skirting of which is without and upon the pad-plate, screws securing the skirting to the plate, a tug-hanger upon the skirting, a perforation through the tug-hanger, the housing and the plate, and a terret extending through the perforation and engaging the bar.

3. In a harness-saddle, in combination, two disconnected pads the coverings of which abut together at the top, a saddletree extending within the pads and removable through the abutting ends of the coverings, and means to secure the pads to the tree.

4. In a harness-saddle, the combination with a saddletree and pad-plates, of disconnected pad-coverings inclosing the tree and plates, said coverings having open upper ends abutting at the head of the saddle, and screws which pass through the coverings and attach the plates to the tree, whereby the tree may be detached from the plates and removed in the manner specified.

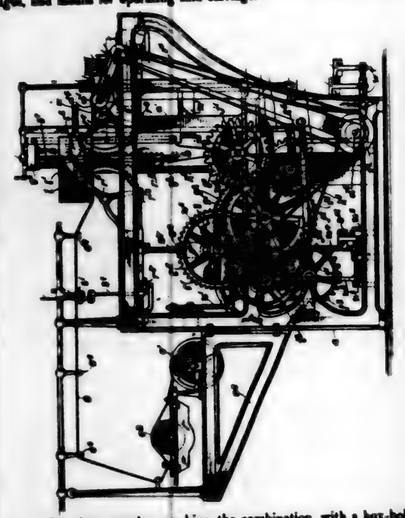
708,515. BOX-COVERING MACHINE. CHARLES R. RALPHYE, Brooklyn, N. Y. Filed June 27, 1898. Serial No. 684,541. (No model.)

Claim.—1. In a box-covering machine, the combination, with a box-holder, of a reciprocating carriage operating in a path parallel with one side of a box and having means carried thereby for engaging with and applying a covering-strip to a box on said holder, and means for operating the carriage.

2. In a box-covering machine, the combination, with a box-holder, of a reciprocating carriage operating in a path parallel with one side of a box and having a brush supported thereby for applying a covering-strip to the box, means for operating said carriage, and means for communicating a rotary movement to the brush.

3. In a box-covering machine, the combination, with a box-holder, of means reciprocating in a given path for engaging with a covering-strip and applying the same to a box, and means for engaging with the covering-strip in advance of said applying means and supporting its edges, for the purpose set forth.

4. In a box-covering machine, the combination, with a box-holder, of a reciprocating carriage provided with a brush or device supported thereby for applying a covering-strip to a box, and having means supported in advance of said brush for engaging with the strip to support its edges, and means for operating said carriage.



5. In a box-covering machine, the combination, with a box-holder, of means reciprocating in a given path for engaging with a covering-strip and applying the same to a box, and devices for engaging with the covering-strip in advance of said applying means and supporting its edges, one of said devices being laterally adjustable relative to the other.

6. In a box-covering machine, the combination, with a box-holder, of means reciprocating in a given path for engaging with the projecting edge of a covering-strip and acting upon the same in a longitudinal direction to bend and press the same against the bottom or adjacent side of a box carried by said holder.

7. In a box-covering machine, the combination, with an intermittently-rotating box-holder, of means for applying a covering-strip to the outer wall of a box, and means operating in a fixed path parallel with one side of a supported box for engaging with the loose edge of the covering-strip and bending and pressing the same against the inner wall of the box.

8. In a box-covering machine, the combination, with an intermittently-rotating box-holder, of a reciprocating carriage operating in a path parallel with one side of a supported box, provided with a series of arms arranged at varying angles relative to each other for successively engaging with the projecting edge of a covering-strip and operating to gradually bend and press the same against the bottom or adjacent side of the box.

9. In a box-covering machine, the combination with an intermittently-rotating box-holder, of a reciprocating carriage operating in a path parallel with one side of a supported box, provided with a series of spring-arms arranged at varying angles relative to each other for successively engaging with the projecting edge of a covering-strip and operating to gradually bend and press the same against the bottom or adjacent side of the box.

10. In a box-covering machine, the combination, with an intermittently-rotating box-holder, of a reciprocating carriage, operating in a path parallel with one side of a supported box, and provided with means carried thereby for engaging with the projecting edge of a covering-strip and acting upon the same to bend and press it against the bottom or adjacent side of the box.

11. In a box-covering machine, the combination, with an intermittently-rotating box-holder, of a reciprocating carriage operating in a path parallel with one side of a supported box, provided with means for engaging with the projecting edge of a covering-strip to bend and press the same against the bottom or adjacent side of the box, and with means in advance of said strip bending and pressing means for engaging with and supporting the projecting edge of the strip.

12. In a box-covering machine, the combination, with a box-holder, of a reciprocating carriage operating in a path parallel with one side of a box, a series of levers supported by said carriage, means for operating said levers to move the same into engagement with the covering-strip when opposite the box, and away from engagement therewith when in a position at the end of the box.

13. In a box-covering machine, the combination, with a box-holder, of a movable carriage, a lever supported by said carriage, and means operating said lever to move the same forward into engagement with the covering-strip when opposite the box, and backward from engagement therewith when in a position at the end of the box.

14. In a box-covering machine, the combination, with a box-holder, of a movable carriage, a strip-engaging device supported upon said carriage, and means for automatically moving said device forward into engagement with the covering-strip when opposite the box, and backward from engagement therewith when in a position at the end of the box, each automatic movement of the strip-engaging device being substantially at right angles to the movement of its carriage.

15. In a box-covering machine, the combination, with a box-holder, of a movable carriage operating in a path parallel with the edge of a supported box, a device carried by said carriage for engaging with a covering-strip upon the box, and means acting upon said device during the movement of the carriage to successively hold the same back from the edge of the box to permit it to pass one end of the latter, then enter it into the box to act upon the covering-strip, and then withdraw the same from within the box prior to reaching the opposite end of the latter, for the purpose set forth.

16. In a box-covering machine, the combination, with a box-holder, of a movable carriage operating in a path parallel with the edge of a box on said holder and provided with a roller thereon for passing beneath the box and supporting the same, and a device supported upon said carriage for engaging with a covering-strip and pressing the same upon the box.

17. In a box-covering machine, the combination, with a box-holder, of a movable carriage operating in a path parallel with the side of a box on said holder, a lever pivotally supported by said carriage to be moved therewith, and cam-plates located at opposite ends of the box to engage with said lever and control its movement in a direction toward and away from the box for the purpose set forth.

18. In a box-covering machine, the combination, with a box-holder, of a movable carriage operating in a path adjacent to one side of a box in said holder, a lever pivotally supported by said carriage to be movable therewith, and adjustable cam-plates located at opposite ends of the box to engage with said lever and control its movement in a direction toward and away from the box for the purpose set forth.

19. In a box-covering machine, a box-holder, a reciprocating carriage having means for applying a covering-strip to a box on said holder, means for operating said holder to successively present the several sides of a box thereon in the path of said strip-applying means, and means for automatically adjusting the position of the box-holder according to the form of the supported box whereby the several sides of the latter will be presented to the strip-applying means in the same plane.

20. In a box-covering machine, a box-holder, means for giving said holder a partial revolution at certain predetermined times and adjusting the vertical position of the same whereby the several sides of a box on said holder will be successively presented in the same predetermined plane, and means for applying a covering-strip upon the box on said holder.

21. In a box-covering machine, a box-holder, means for operating said holder to simultaneously give the same a partial turn and adjust its vertical position whereby the several sides of a box on said holder will be successively presented in the same plane, and means for applying a covering-strip upon the box on said holder.

22. In a box-covering machine, a box-holder, means for giving said holder a partial turn at certain predetermined times, means, embodying a cam, for automatically adjusting the vertical position of said holder whereby the several sides of a box thereon will be presented in the same predetermined plane, and means for applying a covering-strip upon the box on said holder.

23. In a box-covering machine, a box-holder, a shaft carrying said holder, a vertically-adjustable block in which said shaft is journaled and carried, means for operating said shaft to give the holder a partial turn at certain predetermined times, means for automatically moving said block to regulate the position of the holder, and means for applying a covering-strip upon the box in said holder.

24. In a box-covering machine, a box-holder, means for giving said holder a partial revolution at certain predetermined times and adjusting the vertical position of the same whereby the several sides of a box on said holder will be successively presented in the same predetermined plane, and means for automatically locking said holder in certain predetermined positions.

25. In a box-covering machine, a box-holder, means for revolving said holder, means for automatically locking said holder in certain predetermined positions, and means for automatically releasing said holder at certain predetermined times.

26. In a box-covering machine, a box-holder, a shaft carrying said holder and having a notched disk thereon, a spring-pressed pin normally engaging said disk to enter the notches therein and hold the box-holder from rotary movement, and means for automatically withdrawing said pin from engagement with the notched disk.

27. In a box-covering machine, a box-holder, a reciprocating carriage having means for applying a covering-strip to a box on said holder, a device carried by said carriage for acting upon the edge of said covering-strip, adjustable cam-plates located at opposite ends of the box for engaging with said device and controlling its movement in lateral direction toward and away from the box, and means for adjusting the box-holder and the said cam-plates relative to each other whereby the position of the cam-plates will correspond to the length of the box side presented for the application of the covering-strip.

28. In a box-covering machine, a box-holder, a reciprocating carriage having means for applying a covering-strip to a box on said holder, a device carried by said carriage for acting upon the edge of said covering-strip, adjustable cam-plates for engaging with said device to control its movement in a direction toward and away from the box, means for turning said box-holder at certain predetermined times to present its several sides to the strip-applying means, means for automatically adjusting the position of the box-holder whereby the several sides of an oblong or other irregular-shaped box may be presented in a certain predetermined plane, and means automatically adjusting the position of said cam-plates according to the length of the box side presented for the application of the covering-strip.

29. In a box-covering machine, a box-holder, a movable carriage having means for applying a covering-strip to a box on said holder, a device carried by said carriage for acting upon the edge of said covering-strip, adjustable cam-plates for engaging with said device to control its movement in a direction toward and away from the box, means for turning said box-holder at certain predetermined times to present its several sides to the strip-applying means, means for adjusting the position of the box-holder whereby the several sides of an oblong or other irregular-shaped box may be presented in a certain predetermined plane, and means operatively connecting said cam-plates with the box-holder whereby their position will be regulated by the movement of the latter.

30. In a box-covering machine, a box-holder, a movable carriage having means for applying a covering-strip to a box on said holder, a device carried by said carriage for acting upon the edge of said covering-strip, an adjustable cam or cam-plate for engaging with said device to control its movement in a lateral direction toward and away from the box, means for turning said box-holder whereby the several sides of an oblong or other irregular-shaped box may be presented in a certain predetermined plane, and means operatively connecting said cam-plate with the box-holder whereby its position will be regulated by the movement of the latter.

31. In a box-covering machine, a box-holder, means for engaging with the loose edge of a covering-strip to bend and press the same against the inner wall of a box, and means for entering the box and pressing the edge of the covering-strip against the inner corner of the same.

32. In a box-covering machine, a box-holder, means for applying a covering-strip to the outer wall of a box, means moving in a direction substantially parallel with the box and engaging with the loose edge of the covering-strip to bend and press the same against the inner wall of the box, and means having a movement to and from a position within the latter for pressing the edge of the covering-strip against the inner corner of the same.

33. In a box-covering machine, a box-holder, means for applying a covering-strip to the outer wall of the box, means engaging with the loose edge of the covering-strip and bending and pressing the same against the inner wall of the box, and a block supported to be movable to and from a position within the box, having a portion of its surface conforming to the inner corner of the latter for pressing the edge of the covering-strip therein.

34. In a box-covering machine, a box-holder, consisting of a rotatable head having box-supporting arms, means for applying a covering-strip to the outer wall of the box, means engaging with the loose edge of the covering-strip and bending and pressing the same against the inner wall of the box, blocks supported to slide upon said arms of the box-holder, and means connecting said blocks whereby the same may be moved to and from a position within the box to press the edge of the covering-strip against the corner of the same.

35. In a box-covering machine, a box-holder, a reciprocating carriage having means for applying a covering-strip to the outer wall of a box, and means automatically moving the said box-holder from its normal position during the return movement of the carriage, and returning the same to its proper position preparatory to the forward movement of the carriage.

36. In a box-covering machine, a box-holder, a vertically-adjustable block carrying said holder, a reciprocating carriage having means for applying a covering-strip to a box on said holder, and a rotating cam engaging said adjustable block and operating the same to raise the box-

holder from its normal position relative to the path of the carriage during the return movement of the latter.

27. A box-holder consisting of a cross-head, two pistons supported to slide on said head, blocks having box-supporting arms, supported to slide on said pistons in a direction at right angles to the movement of the latter on the cross-head, and means holding the parts in an adjusted position.

28. In a box-covering machine, the combination, with a box-holder, of means operating in a given path for engaging with a covering-strip and applying the same to a box on said holder, and means for rotating the box-holder with an intermittent movement to successively present the several sides of a supported box in the path of the strip-applying means and holding the same stationary while being acted upon by the latter, for the purpose set forth.

708,516. DRYING APPARATUS. HENRY C. BAUSEMAN, Baltimore, Md., assignor to Ella H. Baughman, Baltimore, Md. Filed Jan. 9, 1902. Serial No. 88,624. (No model.)

Claim.—1. In a drying apparatus, the combination with a rotary drum comprising a series of alternating drying-pockets and hot-air spaces, said pockets opening to the outside air and said hot-air spaces communicating with the interior of the drum, of means arranged for supplying said pockets with material to be dried, substantially as set forth.

2. A drying apparatus comprising a drum formed on its outer side with pockets and on its inner side with hot-air spaces communicating with the interior of the drum and arranged alternately with the pockets in combination with means arranged for supplying said pockets with material to be dried, substantially as set forth.

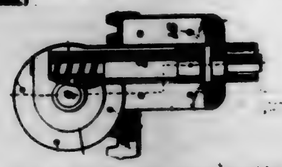
3. A drying apparatus comprising a corrugated drum formed with alternating drying-pockets and hot-air spaces, the pockets being accessible from without and the hot-air spaces communicating with the interior of the drum, of means arranged for supplying said pockets with material to be dried substantially as set forth.

4. A drum consisting of a cylindrical corrugated body to form alternating drying-pockets and hot-air spaces, the said pockets being accessible from without and the hot-air spaces communicating with the interior of the drum, heads secured to the ends of the drum and of greater diameter than the drum, roller-bearings upon which said heads are supported and means arranged for supplying said pockets with material to be dried, and means for rotating the drum, substantially as set forth.

5. A drier comprising a cylindrical drum formed with alternating drying-pockets and hot-air spaces and provided at its ends with heads, said hot-air spaces communicating with the interior of the drum and said pockets being accessible from without, substantially as set forth.

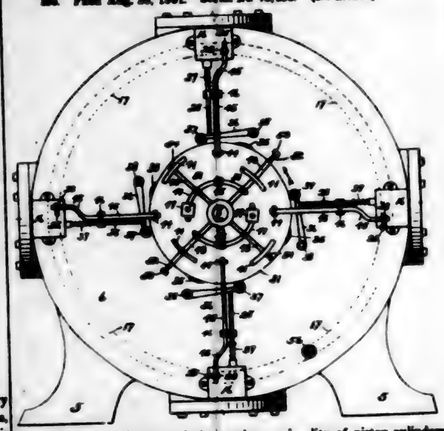
6. In a drying apparatus, a hollow rotary drum having a corrugated peripheral wall forming a series of alternating drying-pockets and hot-air spaces, said pockets opening to the atmosphere and said hot-air spaces communicating with the interior of the drum, substantially as set forth.

708,517. SASH ADJUSTER AND LOCK. FREDERICK W. & REMINGTON, Detroit, Mich. Filed May 24, 1901. Serial No. 61,757. (No model.)



Claim.—A window-sash adjuster and lock, comprising a casing adapted to be countersunk in the frame of a window so as to lie flush therewith, a gear-wheel of comparatively large diameter projecting outside the casing and adapted to engage a rack either to the rear or the front thereof upon the upper or lower sash of a window, a comparatively small pinion or worm-wheel extending inwardly from the said gear-wheel into the casing, a worm engaging said pinion or worm-wheel, a shaft carrying the said worm and finding bearings in the casing, the upper end of said shaft being reached through the opening in the front of a window-casing and formed with a squared end by which it may be turned, substantially as described.

708,518. EXPLOSIVE-ENGINE. ALBERT T. BURNETT, Kansas City, Mo. Filed Aug. 20, 1901. Serial No. 73,402. (No model.)



Claim.—1. In an explosive-engine, a plurality of piston-cylinders, a crank-shaft, a gear-wheel secured on said shaft, a stationary pinion driven by said gear-wheel, a cam-wheel mounted rotatably on said shaft, an internal gear in said cam-wheel, driven by said pinion, a plurality of cams, corresponding in number to the number of cylinders, mounted on the face of said cam-wheel so as to be movable radially, governor-levers pivotally secured to said cam-wheel and connected to said cams in such a manner that oscillation of said governor-levers will shift said cams radially, weights on said governor-levers, springs opposing the centrifugal pull of said weights, and admission-valves operated by the revolution of said cams, substantially as described.

2. In an explosive-engine, four piston-cylinders arranged ninety degrees apart, a crank-shaft, a gear-wheel secured on said shaft, a stationary pinion driven by said gear-wheel, a cam-wheel mounted rotatably on said shaft, an internal gear in said cam-wheel, driven by said pinion, the pitch diameter of said internal gear being double that of said gear-wheel, four cams on the periphery of said cam-wheel, set ninety degrees apart, and four exhaust-valves operated respectively by said cams, substantially as described.

3. In an explosive-engine, four piston-cylinders arranged ninety degrees apart, a crank-shaft, a gear-wheel secured on said crank-shaft, a stationary pinion driven by said gear-wheel, a cam-wheel mounted rotatably on said shaft, an internal gear in said cam-wheel, driven by said pinion, the pitch diameter of said internal gear being double that of said gear-wheel, four cams mounted on the face of said cam-wheel so as to be movable radially, said cams being ninety degrees apart, two governor-levers pivotally secured to said cam-wheel and connected to said cams in such manner that oscillation of said governor-arms will move said cams radially, weights on said governor-levers, springs opposing the centrifugal pull of said weights, and four admission-valves operated by the revolution of said cams, substantially as described.

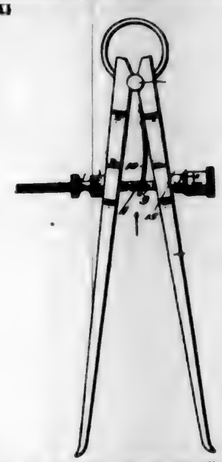
708,519. QUOIT. CHARLES T. BRADSHAW, Philadelphia, Pa. Filed Oct. 17, 1898. Serial No. 693,827. (No model.)

Claim.—1. A quoit consisting of a dished shell having a central opening in its top and having a deflecting-flange at the edge of the opening and projecting downwardly into the inclosure of the shell beyond the edge of the opening, said flange lying in the path of air-currents passing upwardly against the inner face of the shell, to deflect said currents against air-currents passing upwardly through the opening of the quoit, to steady the quoit in its flight.

2. A quoit consisting of a shell having a central opening, a flange

surrounding the opening, within the shell and extending parallel with the axis of the opening, and additional openings having rods adapted to be vibrated by air passing through their respective openings.

708,520. MEASURING INSTRUMENT. CHARLES A. BROWN and ROBERT C. KIMM, Reading, Mich. Filed Jan. 20, 1902. Serial No. 91,259. (No model.)



Claim.—1. In adjusting mechanism for calipers and like measuring instruments, the combination with the legs of the instrument provided with openings; of a draw-rod passing therethrough and provided with opposite threaded portions, an adjusting-nut working on one of said threaded portions for setting the calipers to the approximate adjustment, and a differential micrometer-nut upon the other threaded portion of the rod for setting the calipers to exact adjustment, the said differential nut comprising an outer nut, an inner nut having an exteriorly-threaded portion to engage said outer nut, and an interiorly-threaded portion to engage the threads on the draw-rod, and means for holding the outer nut against rotation, substantially as described.

2. In adjusting means for calipers and like measuring instruments, the combination with the legs of the instrument provided with openings; of a draw-rod extending through said openings and provided with opposite threaded portions, a nut engaging one of the threaded portions for setting the calipers to approximate adjustment, and a differential micrometer-nut engaging the other threaded portion of the rod for setting the instrument to the exact adjustment, the said micrometer-nut comprising an outer nut provided with legs to engage seats in the adjacent leg of the instrument and formed with interior screw-threads, and an inner nut having a stem formed with interior screw-threads to engage the rod and with exterior finer threads to engage the threaded surface of the outer nut and having a sleeve inclosing said stem and outer nut, substantially as described.

3. In adjusting means for calipers and other like measuring instruments, the combination with the legs of the instrument; of a draw-rod passing therethrough, said rod being provided with opposite threaded portions, a nut working upon one of the threaded portions of the rod for setting the instrument to the approximate adjustment, a differential micrometer-nut working upon the other threaded portion of the rod for setting the instrument to the exact adjustment, one of the members of said micrometer-nut being provided with legs for engaging the adjacent leg of the instrument for holding it against rotation, and means engaging the rod for normally drawing the same in one direction for maintaining said legs in engagement, substantially as and for the purposes set forth.

4. In adjusting means for calipers and other like measuring instruments, the combination with the legs of the instrument; of a draw-rod extending therethrough, said rod being provided with opposite threaded portions and an intermediate shoulder, a nut working upon one of the threaded portions of the rod for setting the instrument to the approximate adjustment, a differential micrometer-nut working upon the other threaded portion of the rod for setting the instrument to exact adjustment, one of the members of said micrometer-nut being provided with legs to engage notches in the adjacent leg of the instrument to look it against rotation, and a plate-spring secured to said leg and bearing against said shoulder to draw the rod in one direction to hold said legs in locking engagement, substantially as described.

708,521. RAILROAD-TIE. EARL M. BUNCH, Collinwood, Ohio. Filed Dec. 2, 1901. Serial No. 84,261. (No model.)

Claim.—1. In combination, a railroad-tie comprising a metal beam embedded in a body of molded material, said beam having lateral flanges forming seats for the rail, and rail-retaining bolts engaging said flanges.

2. A railroad-tie comprising a metal beam embedded in a solid block of molded material, said beam having lateral flanges forming seats for the rail.

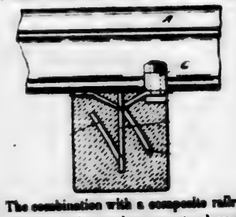
3. In combination, a railroad-tie comprising a flanged metallic beam embedded in a solid block of molded material, and rail-retaining bolts engaging the flanges.

4. In combination, a railroad-tie comprising a flanged metallic beam embedded in a block of molded material, the clips G, and the bolts D engaging the clips and the flanges.

5. In combination, a railroad-tie comprising a trough-shaped metallic beam embedded in a block of molded material, and rail-retaining means engaging the beam.

6. In combination, a railroad-tie comprising a trough-shaped metallic beam embedded in a block of molded material, and rail-retaining bolts engaging the beam.

708,522. RAILROAD-TIE. EARL M. BUNCH, Collinwood, Ohio. Filed Dec. 12, 1901. Serial No. 86,567. (No model.)



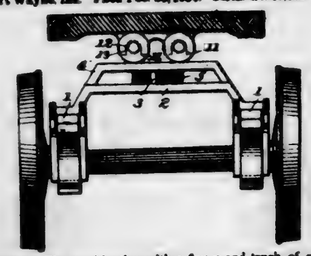
Claim.—1. The combination with a composite railroad-tie comprising a flanged metal beam having anchor-arms struck up therefrom, forming openings therethrough, and an inclosing body of molded material extending through said openings, of rail-retaining bolts engaging the flanges.

2. A railroad-tie comprising a metallic beam embedded in a block of molded material, said beam having flanges forming seats for the rails and arms projecting from the frame into the molded material, said arms presenting their broader sides in a horizontal plane.

3. A railroad-tie comprising a metallic beam embedded in a block of molded material and having integral flanges forming seats for the rails and anchor-arms projecting laterally into the molded material, said flanges and arms being struck up from the body of the beam producing openings therein through which the molded material extends.

4. A composite railroad-tie comprising a single metal plate having rail-supporting flanges and anchor-arms struck up therefrom, the wider sides of which are faced upwardly, forming openings therethrough, and a body of molded material inclosing said plate and arms and extending through the openings.

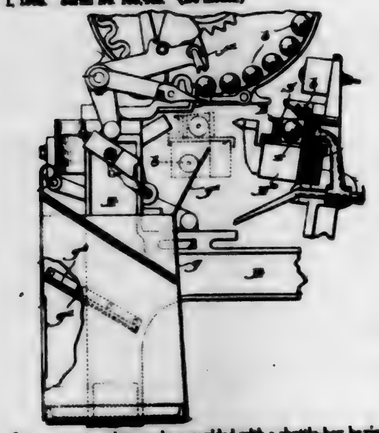
708,528. SWIVEL-TRUCK FOR VEHICLES. FRANK BURGER, Fort Wayne, Ind., assignor of three-fourths to Henry H. Williams, Fort Wayne, Ind. Filed Feb. 20, 1901. Serial No. 48,168. (No model.)



Claim.—The combination with a frame and truck, of a bolster supported on the truck, a bolt on the bolster, a girder supported above the

bolt, a connecting-bar between the bolt and frame, a cross-bar connected to the frame, and friction-rollers between the cross-bar and girder, substantially as described.

708,524. FILLING-CARRIER RECEPTACLE FOR WEFT-REPLENISHING LOOMS. JOHN I. DUNCAN, Hopedale, Mass., assignor to Draper Company, Hopedale, Mass., a Corporation of Maine. Filed May 1, 1902. Serial No. 105,468. (No model.)



Claim.—1. In a loom, a lay provided with a shuttle-box having an opening in its bottom for the discharge of a filling-carrier, a stationary receptacle having an upturned and rearwardly-inclined guide-lip to extend beneath said opening when the lay beats up, and an oppositely-inclined deflector below the lip within the receptacle, the latter having an opening in its wall below the deflector to permit withdrawal of filling-carriers directed from the deflector to the bottom of the receptacle.

2. In a loom, a lay provided with a shuttle-box having an opening in its bottom for the discharge of a filling-carrier, a stationary receptacle having an upturned and rearwardly-inclined guide-lip to extend beneath said opening when the lay beats up, and an oppositely-inclined guard or deflector below the guide-lip and within the receptacle and cushioned on its upper face, a filling-carrier passing from the guide-lip onto the deflector and being conducted thence to the bottom of the receptacle, the latter having an opening in its front wall below the deflector, for withdrawal of filling-carriers.

3. In a loom, a lay provided with a shuttle-box having an opening in its bottom for the discharge of a filling-carrier, the lay being cut away in front beneath the opening, a stationary receptacle having an upturned and rearwardly-inclined guide-lip to enter the cut-away portion of the lay and extend beneath the opening in the shuttle-box when the lay beats up, and an oppositely-inclined deflector extended across the receptacle below the lip, with a clearance between the lower edge of the deflector and the back of receptacle, the latter having an opening in its front wall below the deflector, through which may be removed filling-carriers directed from the lip to the deflector and thence to the bottom of the receptacle.

4. In a loom, a lay provided with a shuttle-box having an opening in its bottom for the discharge of a filling-carrier, a stationary receptacle having an open top and positioned to receive a discharged filling-carrier when the lay beats up, said receptacle having an opening in one of its walls, and an inclined deflector within the receptacle above the said opening to guard or shield from an incoming filling-carrier the hand of the attendant when inserted in the wall-opening.

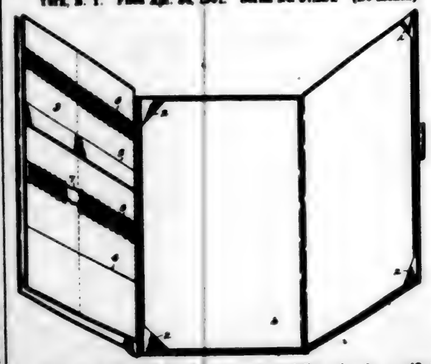
5. In a loom, a lay provided with a shuttle-box having an opening in its bottom for the discharge of a filling-carrier, a stationary receptacle having an open top and positioned to receive a discharged filling-carrier when the lay beats up, and an inclined deflector within the receptacle below its top, said deflector being cushioned on its upper face, a discharged filling-carrier falling onto the deflector and being conducted thence to the bottom of the receptacle, the latter having an opening in one of its walls below and guarded or shielded by the deflector, to permit withdrawal of filling-carriers.

6. A receptacle for discharged filling-carriers, consisting of a box having an open top, and an inclined guard or deflector within the box below its top and extended from one wall part way toward the opposite wall, the box having an opening in the wall of the box below and shielded by the guard or deflector.

7. A receptacle for discharged filling-carriers, consisting of a box having an open top, and an inclined guard or deflector fixedly mounted within the box below its top and extended from the front wall thereof part way toward its back wall, and a cushion on the upper face of the deflector, the box having an opening in its front wall below the guard or deflector.

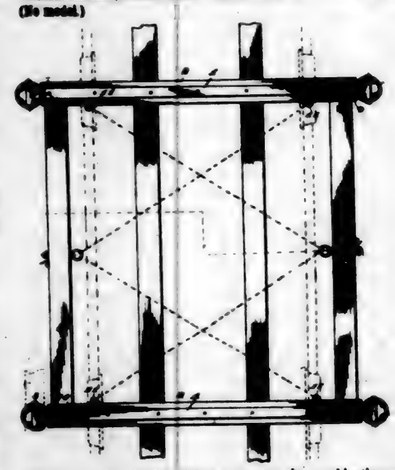
8. A receptacle for discharged filling-carriers, consisting of a box having an open top and an upturned, rearwardly-inclined guide-lip at its back, an oppositely-inclined guard or deflector within the box below the guard-lip, extended from the front wall of the box part way toward its back wall, and a cushion on the upper face of the guard or deflector, the box having an opening in its front wall below the said guard or deflector.

708,525. BLOTTER OR DESK-PAD. GEORGE W. BURKIRK, New York, N. Y. Filed Apr. 24, 1901. Serial No. 57,294. (No model.)



Claim.—A pad of the character substantially as herein specified; comprising a body-section and two flexibly-attached foldable sections, said body-section and one of said foldable sections being provided at the corners thereof most remote from each other with triangular pockets adapted to receive the corners of blotters and similar sheets, a pocket attached at one of its longer edges to the inner edge of the other foldable section, said pocket being practically of equal dimensions with said section, and the two being united at the shorter edges thereof by an extensible connection, the pocket being also provided with transverse bands or strips attached thereto at widely-separated points, and with suitably-attached transverse corrugated bands or strips.

708,526. LOAD-RETAINING APPARATUS FOR VEHICLES. WILLIAM H. CASE, Carlton, Minn. Filed Dec. 3, 1901. Serial No. 84,607. (No model.)



Claim.—1. In a load-retaining apparatus, the combination with a suitable car, of sockets pivotally supported thereon, flexible means secured to said sockets and passed transversely of the car to the opposite side thereof to that of the respective socket, and flexible means at each side of said car for simultaneously controlling the socket-operating means for affecting all of the sockets of the opposite side of the car, substantially as described.

2. In a load-retaining apparatus, the combination with a suitable car, of stake-carrying sockets pivoted at either side thereof, cables secured to each of said sockets and passed to the side of the car opposite that of the respective socket, and flexible means carrying the free ends of said cables, whereby operation of said flexible means is designed to simultaneously affect all of the sockets of one side of the car, substantially as described.

3. In a load-retaining apparatus, the combination with a suitable car, of stake-carrying sockets pivotally supported near either side thereof, flexible means engaging each of said sockets and designed to control the pivotal position of the same, the said means being passed to the opposite side of the car to that of the sockets, and means for controlling the movement of said flexible means of all of the sockets on one side of the car simultaneously, from the opposite side thereof, substantially as described.

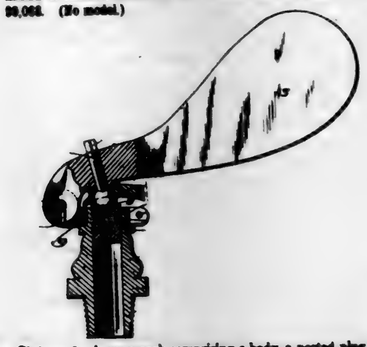
4. In a load-retaining apparatus, the combination with a suitable car, of straps passed transversely thereof, sockets pivoted to the ends of said straps, means carried by said sockets and passed transversely across the car to the opposite side thereof to that of the respective sockets for controlling the pivotal movement thereof, flexible means upon said opposite side connecting the controlling means of one set of sockets whereby the same may be operated simultaneously, means for locking said connecting means against movement, substantially as described.

5. In a load-retaining apparatus, the combination with a suitable car, of straps arranged transversely thereof and secured on top of the same, stake-carrying sockets pivoted to said straps to swing laterally outward and downward, a cable secured to each of said sockets and passed to the opposite side of said car to that of its respective socket, a chain carrying the free ends of all the cables of one side of the car, and means for locking said chain against movement, substantially as described.

6. In a load-retaining apparatus, the combination with a suitable car, of stake-carrying sockets pivoted upon the same, each of said sockets being provided with an annular groove, a ring fitting within said groove and surrounding said socket, an eye formed on said ring, a cable secured to said eye and passed to the opposite side of said car, and means for locking the free end of said cable in a given position, substantially as described.

7. In a load-retaining apparatus, the combination with a suitable car, of stake-supporting sockets pivotally mounted thereon near each side thereof, a cable secured to each of said sockets, a ring carried by the framework of said car near each of said sockets, the cable of each of the respective sockets being passed through its contiguous ring, and thence to the opposite side of the car to that of its socket, and a chain at each side of the said car engaging the free ends of all of the cables of its respective side of the car, and designed to be operated for simultaneously affecting all of said cables, substantially as described.

708,527. COMBINED GAGE-COCK AND SAFETY-VALVE. ALEXANDER C. GALGER, Richmond, Va. Filed Mar. 20, 1902. Serial No. 99,068. (No model.)



Claim.—1. A gage-cock comprising a body, a ported plug inserted therein and having a concaved seat, a convex valve, and a gravity-lever for closing the valve against its seat, substantially as set forth.

2. A gage-cock comprising a body, a ported plug inserted therein and having a concaved seat, a gravity-lever, a convex valve carried by the lever, and a shield about the valve-stem and guarding the valve, substantially as set forth.

3. A gage-cock comprising a body, a ported plug inserted therein and having a concaved seat, a gravity-lever, and a convex valve having a stem journaled in the lever and having a projecting end by which it may be turned, substantially as set forth.

708,528. METAL CAP FOR BOTTLES OR JARS. CHRISTIAN A. CALLESEN, New York, N. Y., assignor to ANNA Callesen, Brooklyn, N. Y. Filed Nov. 13, 1901. Serial No. 82,093. (No model.)

Claim.—1. A metal cap for bottles or jars having a tongue, the base of the tongue being formed by slits terminating in the side wall or flange of the cap, and an additional slit in the side wall or flange of the cap extended to a point intermediate the slits which form the base of the tongue whereby the body of metal at the base of the tongue may be broken as the tongue is bent away from the cap, for releasing the side wall or flange from its engagement with the neck of the bottle or jar, substantially as set forth.

2. A metal cap for bottles or jars having a tongue projecting from its side wall or flange, with its base located within the said side wall or flange, and a slit in the side wall or flange leading to a point at the base of the tongue whereby the body of metal at the base of the tongue may be broken as the tongue is bent away from the cap for completely severing the side wall or flange for releasing it from the neck of the bottle or jar, substantially as set forth.

3. A metal cap having a side wall or flange fitted to be clamped to the neck of a bottle or jar and a tongue projecting from the side wall or flange, and a slit through the side wall or flange leading to a point within the base of the tongue whereby the body of metal at the base of the tongue may be broken as the tongue is bent away from the cap for releasing the side wall or flange from its looking engagement with the neck of the bottle or jar, substantially as set forth.

4. A metal cap for bottles or jars having a tongue, the base of the tongue being formed by slits terminating in the side wall or flange of the cap, and a plurality of additional slits in the side wall or flange of the cap extended to points intermediate the slits which form the base of the tongue whereby the body of metal at the base of the tongue may be broken as the tongue is bent away from the cap for releasing the side wall or flange from its engagement with the neck of the bottle or jar, substantially as set forth.

5. A metal cap for bottles or jars having a tongue projecting from its side wall or flange, with its base located within the said side wall or flange, and a plurality of slits in the side wall or flange leading to points within the base of the tongue whereby the body of metal at the base of the tongue may be broken as the tongue is bent away from the cap for completely severing the side wall or flange for releasing it from the neck of the bottle or jar, substantially as set forth.

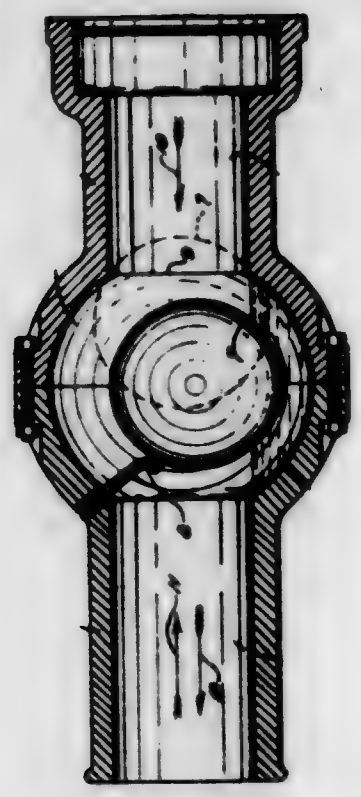
708,529. WATER-TRAP. FRITZ GARBUTT, Jr., Chicago, Ill. Filed Feb. 3, 1902. Serial No. 92,317. (No model.)

Claim.—1. A device of the type set forth, comprising two horizontal sections of pipe having their ends flared and in abutting engagement forming an interior globular pocket, the lower portion of the pocket adapted to receive a liquid extending in alinement with the lower portions of the pipe-sections, a float adapted to be supported by the liquid, with a means extending through one of said pipe-sections and into said globular pocket for engagement with the float, said means being adjustable from the exterior of the pipe.

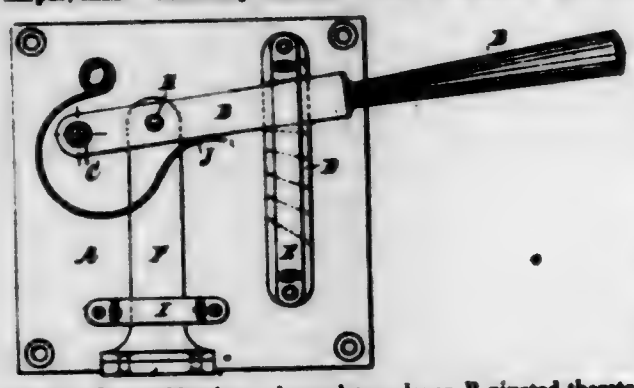
2. A device of the type set forth, comprising horizontal sections of pipe having their ends flared and bolted together, forming an interior globular pocket between the openings of the pipes, said pocket adapted to receive a liquid extending in alinement with the lower portions of the pipe-sections, a float supported by the liquid, and a wire screwed into one of the pipe-sections and extending within said globular pocket.

3. A device of the type set forth, comprising horizontal sections of pipe having their ends flared and secured together forming an interior globular pocket, the lower portion of which is adapted to receive a liquid extending flush with the lower portions of the pipe, a float supported by the liquid, and a means extending within the globular pocket and to the front of the opening of one of the pipe-sections for engagement with said float.

708,529.

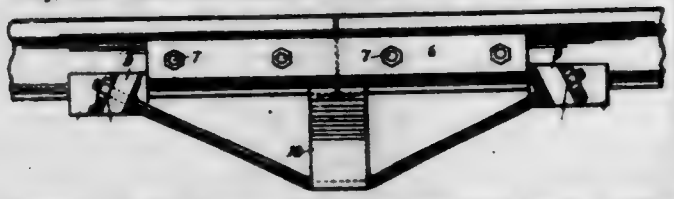


708,530. DOOR HOLDER OR BOLT. WILLIAM J. CRAFFEE, Manharper, Indiana. Filed May 13, 1902. Serial No. 106,942. (No model.)



Claim.—In combination, a base-plate, a lever B pivoted thereto, a holder pivotally connected to the lever at a point between the pivot of the lever and its free end, a rack located upon the base-plate for engaging and holding the lever and a spring for pressing the lever against the rack-teeth, substantially as described.

708,531. RAIL-JOINT. WILLIAM COLLETON, Mukwonago township, Wis. Filed Mar. 26, 1902. Serial No. 100,010. (No model.)

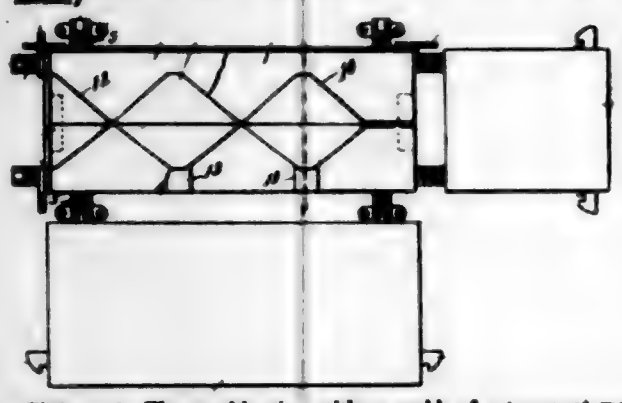


Claim.—1. In combination, the abutting ends of two rails, joint-plates on and secured to the rails, straining-blocks loose and slidable on the flanges of the rails bearing against the joint-plates, a strut between the straining-blocks under the ends of the rails, and tension-rods bearing medially on the strut and anchored by tension-nuts to the straining-blocks.

2. Supporting means for a rail-joint, comprising joint-plates secured to the webs of the rails, straining-blocks slidable on the base of the rails and bearing against the ends of the joint-plates, a strut between the straining-blocks under the ends of the rails, and tension-rods bearing medially on the strut and secured adjustably to the straining-blocks.

3. Supporting means for a rail-joint, comprising straining-blocks adapted to fit on the base of the rails and against joint-plates thereon, and provided with laterally-projecting wings, a strut between the straining-blocks under the ends of the rails, tension-rods bearing medially on the outer end of the strut and extending to and passing through the wings on the straining-blocks, and nuts turning by a screw-thread on the ends of the tension-rods and against the wings on the blocks.

708,532. MOLD FOR MAKING CEMENT STONE. ROBERT R. COLPITTS, Jacksonville, Mich. Filed Apr. 12, 1902. Serial No. 102,582. (No model.)



Claim.—1. The combination with a mold, of a two-part member forming a series of cores, the core at one end of the series being closed and the core at the opposite end thereof being open.

2. A series of cores for molding-machines constructed and arranged in sections and adapted when placed together to form the series of cores, the core at one end of the series having a closed end and the core at the opposite end of the series having an open end.

3. A series of cores for molding-machines constructed and arranged in sections and adapted when placed together to form the series of cores, the core at one end of the series being open.

4. In a mold, a base having sides and ends hinged thereto, said sides and ends being locked together, an auxiliary sectional bottom arranged above said base, sectional cores arranged upon said bottom, a top plate, and means for pressing said top plate downward with relation to said sides and ends.

5. In a mold, a base having sides and ends detachably secured thereto, means connected with the sides and the ends for fastening them in a vertical position, an auxiliary bottom, said bottom being split throughout its entire length, sectional cores disposed upon said bottom, a top plate, and means for pressing the top plate downward with relation to said sides and ends.

6. In a cement-mold, a base having ears thereon; detachable sides and ends having tongues for engagement with said ears; a sectional auxiliary bottom, and sectional cores mounted thereon.

7. A series of cores for molding-machines constructed and arranged in sections and adapted when placed together to form the series of cores one core of the series having an open portion.

8. In a cement-mold, a base; detachably-hinged sides and ends; a top plate; a roller having ears at either end eccentric to said roller; a chain about said mold and its ends in engagement with said ears; and an arm for turning said roller to tighten said chain and compress said mold.

9. In a cement-mold for plastic material, a base; a removable auxiliary bottom superimposed thereupon consisting of two or more sections; sectional cores mounted upon the auxiliary bottom and removable therewith and detachably-hinged sides and ends.

10. In a mold, a base, sides and ends detachably secured to said base, a top plate, a lever having a roller provided with ears at its ends, and a chain having connection with the ears of said roller whereby the top plate may be pressed downward with relation to the sides and ends when the lever is raised.

11. A mold for plastic material, consisting of a base having ears thereon; each of said ears having a rectangularly-shaped opening therein; curved portions upon said ears adjacent to said openings; sides and ends having downwardly-directed projections conforming in cross-section to said rectangularly-shaped openings in said ears, with curved surfaces upon said projections adjacent to said rectangular-shaped portion, and straight portions to roll upon the curved portions of the ears in raising and lowering the said sides and ends in their operation.

12. The combination with a mold having detachably-hinged sides and ends, of an auxiliary bottom consisting of two sections, and sectional cores mounted thereon dividing the mold into two separate and distinct molds.

13. The combination with a mold, of a two-part member forming a series of cores.

14. In a mold, a base, sides and ends detachably secured to said base, an auxiliary bottom having raised portions, cores arranged upon said bottom, a top plate, and means for pressing the top plate downward with relation to the sides and ends.

15. In a mold, a base, sides and ends detachably secured to the base, an auxiliary sectional bottom having raised portions in its upper surface, sectional cores arranged upon said bottom, a top plate, and means for pressing the top plate downward with relation to the said sides and ends.

16. In a mold, a base, sides and ends detachably secured to the base, an auxiliary bottom split throughout its entire length, the split members

of said bottom having raised portions in their upper faces, sectional cores arranged upon the said bottom, a top plate, and means for pressing the top plate downward with relation to the said sides and ends.

17. In a mold, a base, sides and ends detachably secured to the base, an auxiliary bottom split throughout its entire length, and a core formed of two parts whereby part of the core may be removed from the mold simultaneously with one split portion of the auxiliary bottom.

18. In a mold, a base, sides and ends detachably secured to the base, an auxiliary bottom split throughout its entire length, a core formed of two parts whereby one part of the core may be removed independently of its companion part, and a top plate adapted to be pressed downward upon the said sides and ends.

19. In a mold, the combination with a sectional auxiliary bottom of a sectional core, the said bottom and the core being constructed and arranged whereby a section of the bottom may be removed with a section of the core independently of the other sections of the bottom and the core.

20. A series of cores for molding-machines constructed and arranged in sections and adapted when placed together to form the series of cores.

21. A series of cores for molding-machines constructed and arranged in sections and adapted when placed together to form a series of compartments independent one of the other.

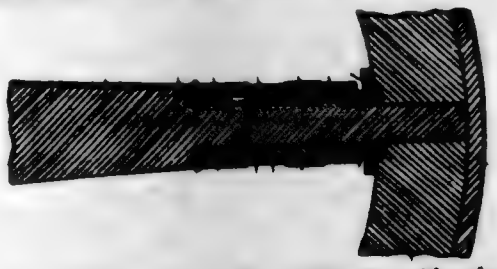
708,533. BEVEL AND SQUARE. ALBERT C. CHILMARK, La Crosse, Wis. Filed Mar. 3, 1902. Serial No. 96,495. (No model.)

Claim.—The combination with a handle having a longitudinal slot; of a blade pivoted in said slot and having a central segmental extension projecting from one edge, said extension being provided on one side with lines forming a polygon-miter scale *a* and designating angle-indices, and on its opposite side with the companion bevel and plumb cut scales *c*, *c'* and *d*, *d'*, formed by angle-lines and corresponding indices, said scales *c* and *d* being disposed at the ends of the segmental portion at their intersection with the inner edge of the blade, and the scales *c' d'* between the same and the center of the segmental portion, the blade also having a table *b* explanatory of the index-angles of scales *a*, and a table *e* explanatory of the indices and pitch-measures of the scales *c c'* and *d d'*, together with means for securing the blade in adjusted position, substantially as and for the purpose specified.

708,534. GARMENT-FASTENING. CHARLES R. DE LANCEY, Newport, Pa. Filed Aug. 8, 1901. Serial No. 71,280. (No model.)

Claim.—A socket fastening member comprising a head or flange, a socket upon one side thereof, said socket having a top opening and a side passage, and a rim formed integral with and guarding the top opening of the socket, said rim having its ends converging to form a contracted throat to said opening and thence continued or extended laterally beyond the socket to form diverging spring guard-fingers, said fingers adapted to open and close under pressure to admit of the passage of the shank of a stud into the socket and top opening, the head of which stud passes into and out of the socket through the passage in the side of said socket, substantially as set forth.

708,585. TIRE-TIGHTENER. HOWELL P. DICKINSON, Hurtsboro, Ala. Filed Mar. 18, 1902. Serial No. 98,702. (No model.)

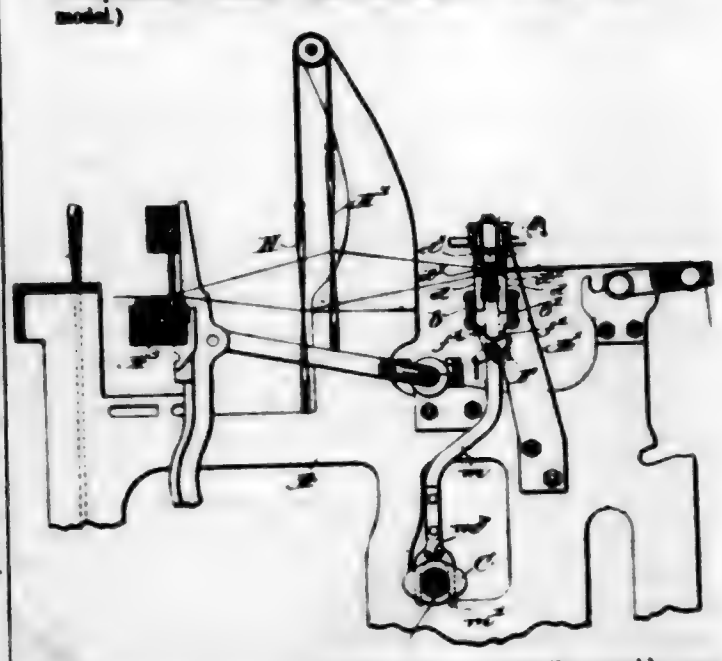


Claim.—1. In a tire-tightener, the combination with a tire, felly and spoke, the latter being provided with a tenon entering the felly; of a thimble slidable on said tenon, and engaging the felly and provided with right and left threaded portions of different diameters, an adjusting-nut engaging one of said threaded portions, and a lock-nut engaging the other threaded portion and adapted to hold the adjusting-nut against rotation, said nuts being provided with sleeves for covering the threads of said surfaces exposed by the adjustment of the nuts, substantially as specified.

2. In a tire-tightener, the combination with a tire, felly and spoke, the latter being provided with a tenon entering the felly; of a thimble slidable on said tenon and provided with right and left threaded surfaces, a clip carried by the thimble and embracing the felly, an adjusting-nut engaging one of said threaded portions, and a lock-nut engaging the other threaded portion and adapted to hold the adjusting-nut against rotation, substantially as set forth.

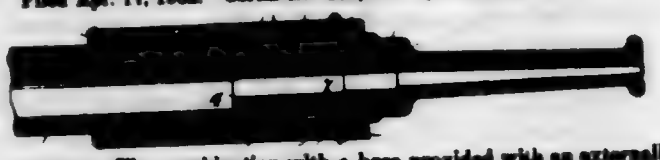
3. In a tire-tightener, the combination with a tire, felly and spoke, the latter being provided with a tenon entering the felly; of a thimble slidable on said tenon and provided with right and left threaded surfaces, a clip carried by the thimble and embracing the felly, an adjusting-nut engaging one of said threaded portions, and a lock-nut engaging the other threaded portion and adapted to hold the adjusting-nut against rotation, said nuts being provided with sleeves for covering the threads of said surfaces exposed by the adjustment of the nuts, substantially as specified.

708,586. WARP STOP-MOTION FOR LOOMS. CLARE H. DRAPER, Hopedale, Mass., assignor to Draper Company, Hopedale, Mass., a Corporation of Maine. Filed Jan. 6, 1902. Serial No. 88,822. (No model.)



Claim.—In a loom, two parallel series of vertically-movable warp-stop-motion controlling-detectors maintained inoperative by intact warp-threads, a normally vibrating feeler for each series, stopping means for the loom actuated by or through the arrest of a feeler by a released detector of the series with which it coöperates, a single vertically-movable warp-support between the two series of detectors to lift the warp-threads simultaneously with the detecting movement of each feeler, to take up warp slack and thereby prevent improper action of a detector, and means to positively lift the warp-support.

708,587. HOSE-COUPLING. WILLIAM G. HEIM, Manitowoc, Wis. Filed Apr. 17, 1902. Serial No. 103,427. (No model.)

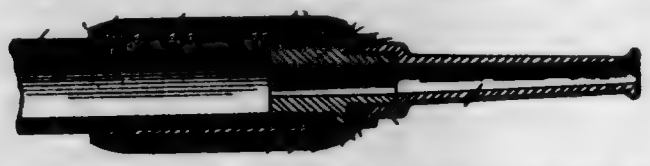


Claim.—The combination with a hose provided with an externally-screw-threaded nipple, of an internally-screw-threaded nozzle, a coupling provided at each end with exterior screw-threads, one of which affords connection to the nozzle, and provided at its inner end with screw-threads which engage the threads of the nipple, and a handle or grip placed around the end of the hose and having internal screw-threads to engage the external screw-threads at the inner end of the coupling, substantially as set forth.

708,588. HOSE-COUPLING. WILLIAM G. HEIM, Manitowoc, Wis. Filed Apr. 17, 1902. Serial No. 103,428. (No model.)

Claim.—1. The combination with a hose, its nipple provided with an annular shoulder, and a hose-nozzle, of a grip or handle located upon

the end of the hose and having a portion clamped between the shoulder of the nipple and the inner end of the nozzle, substantially as set forth.



2. The combination with a hose, its nipple having an annular shoulder, and its nozzle having an annular shoulder, of a grip or handle located upon the outer end of said hose and provided at each end with stop-shoulders, and a non-conducting covering which is confined between said shoulders, the outermost stop-shoulder being formed with an annular inwardly-projecting flange which is clamped between the annular collar of the nipple and the annular collar of the nozzle, substantially as set forth.

708,589. VIBRATORY-CURRENT RELAY. JOHN M. PELL, Arlington, N. J., assignor to American Telephone and Telegraph Company, a Corporation of New York. Filed Sept. 16, 1901. Serial No. 75,491 (No model.)

Claim.—1. A vibratory-current relay adapted to produce steady makes and breaks in a local circuit, consisting of a permanent magnet with coil-surrounded poles; two insulated spring-bars of diverse weight and rate of vibration mounted by one end in a common support, and together extending over the poles of said magnet to a point beyond them, the lighter of said springs being outermost and weighted at its free end; an armature attached to the heavier spring-bar and supported thereby in front of said magnet-poles; a stop for said heavier bar; and coöperating local-circuit relay-points carried at the free ends of the said spring-bars respectively; the said stop being adapted to maintain the said armature out of contact with said magnet-poles and to establish a nodal point in the said heavier spring-bar, and the said local-circuit points being normally in contact but adapted to separate when the said springs are vibrated by said magnet, substantially as described.

2. In a vibratory-current relay, the combination of a permanent magnet M having electromagnetic coils C surrounding its poles; the vibratory armature-spring E secured at one end to the supporting-block S; the armature D carried thereby; and the node-establishing and armature-regulating front stop R for said armature-spring; with the lighter associate spring N also secured at one end in said supporting-block and weighted at the other; relay-points s s' carried by the springs E and N respectively and held normally in contact with each other by the pressure of said lighter spring; and an adjustable mounting for the common fixed support of said springs E and N; the said two springs being constructed and adjusted to have different rates of vibration, whereby the said normally united points are enabled to separate, or increase their contact resistance during the passage of appropriate alternating currents through the said electromagnetic coils, substantially as specified.

3. In a vibratory-current relay, the combination of the permanent U-magnet having pole-pieces surrounded by electromagnetic main-circuit helices; an armature therefor; a contact-spring carrying said armature supported at one end in an insulating-block adjustably mounted on said magnet near the heel thereof, and extending beyond the point of armature attachment; a stop adjustably secured to said magnet and impinging upon the face of said spring at a point substantially midway between the armature and the end thereof; a lighter contact-spring also supported at one end in said insulating-block and extending parallel with the armature-carrying spring; the said two springs having different rates of vibration, and carrying the separable relay-points of a local circuit, and the said lighter spring being weighted at its free end, and adjusted to exercise a normal pressure upon the armature-carrying spring at the free ends of both, thereby holding the said relay-points normally in contact, substantially as described.

708,540. ROUNDABOUT. HORRORS F. FELTON, Grand Forks, N. D. Filed Jan. 18, 1902. Serial No. 90,281. (No model.)

Claim.—1. The combination of a revolvable standard, a radial arm carried thereby, a wheeled forward figure portion rigidly secured to the radial arm, a wheeled rear figure portion hinged to the forward figure portion and trailing circumferentially around the standard.

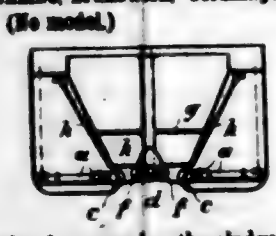
2. In a roundabout, the combination of a revolvable standard, a radial arm, a hinged two-part figure carried by the arm one section of which is rigidly connected with the radial arm and eccentric wheels mounted upon both parts of the figure.

3. In a roundabout, the combination of a revolvable standard, a radial arm carried thereby, a two-part hinged figure mounted thereon, one section of which is rigidly connected with the radial arm, and eccentrically-mounted wheels upon the figure, the wheel upon one part being of a different diameter from that of the other figure.

4. In a roundabout, the combination of a revolvable standard, a radial arm carried thereby, a two-part hinged wheeled figure mounted thereon one section of which is rigidly connected with the radial arm and a head hinged to the fore part of the figure.

5. The combination of a revolvable standard, a radial arm carried thereby, a two-part figure, a supporting-wheel carried by each part, a hinge between said parts, and a rigid connection between the forward section and the radial arm, whereby the forward section traverses and constitutes a guide for the after-trailing section.

708,541. HYDRAULIC DEVICE FOR EMPTYING DREDGING-SCOWS. OTTO PREHLING, Brunswick, Germany. Filed Nov. 5, 1900. Serial No. 35,475. (No model.)



Claim.—1. A device for removing the sludge by suction from the sludge-rooms of ships and dredge-boats, comprising the combination of two systems of pipe-conduits a, d, parallel to each other and longitudinally arranged within the ship, one of the said pipe-conduits having connection with the dredge-pump, while the other pipe-conduit is open to the outside, both pipe-conduits being provided at the bottom of the storage-rooms with a great number of short pipes c, f, which are so arranged that two of them are situated in the same axis and which open out opposite to each other and which may be opened or closed separately, in order to be able to take up the sludge from all points of the boat, substantially as specified.

2. A device for emptying and dumping sludge from dredge-boats, comprising the combination with the dredge-pump, of two systems of piping in communication with the sea-water and with the dredge-pump respectively, side outlets in the said pipes, opening into the hold of the ship or vessel, and webs and high-pressure conduits arranged between said outlets to prevent the stopping up of said outlets and to keep the sludge in a loose condition and open the way for the currents of water sucked through the said sludge, substantially as described.

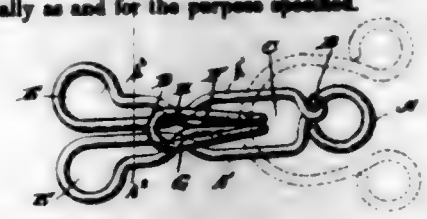
3. In a device for emptying dredge-boats, the combination of a pipe that communicates with the water and has lateral outlet-openings, with a second pipe that is adapted to be connected to a dredge-pump and has lateral inlet-openings, arranged opposite the lateral outlet-openings, substantially as specified.

4. In a device for emptying dredge-boats, the combination of a pipe that communicates with the water and has lateral outlet-openings, with a second pipe that is adapted to be connected to a dredge-pump and has lateral inlet-openings, and with webs arranged between the openings, substantially as specified.

708,542. HOOK AND EYE. NOAH D. GARIS, Garisville, Pa. Filed Sept. 24, 1901. Serial No. 76,367. (No model.)

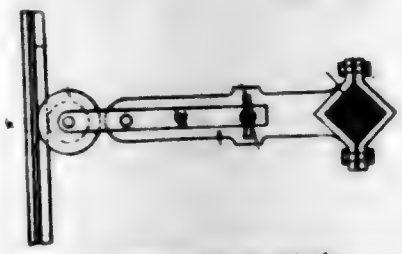
Claim.—1. In a hook and eye, a hook consisting of a single piece of wire bent so as to form an eyelet A at one end and the eyelets E at the other end, an elongated opening formed by intermediate wires between eyelet A and eyelets E, the outer wires passing underneath the interme-

diate wires and upward through the elongated opening and bent forward so as to form a hook, a raised portion or hump formed in the intermediate wires underneath the hook and coming within a slight distance of the hook, substantially as and for the purpose specified.



2. In a hook and eye, a hook consisting of a single piece of wire bent so as to form the eyelet A at one end and the eyelets E at the other end, an elongated opening formed by intermediate wires between eyelet A and eyelets E, said intermediate wires bent so as to approach one another and running parallel with one another at D, then bent outward at the eyelets E, these outer wires then passing underneath the intermediate wires and upward through the elongated opening and bent forward so as to form a hook, a raised portion or hump formed in the intermediate wires underneath the hook, substantially as and for the purpose specified.

708,543. ADJUSTABLE SHEAVE-ARM FOR LEERS. JOSEPH GOODMAN, Pittsburg, Pa. Filed July 5, 1901. Serial No. 67,067. (No model.)



Claim.—1. In an operating mechanism for leers, a rockably-mounted arm and a member pivoted to the arm and adapted to swing in the arc of a circle, and means for securing the pivoted member at different points in relation to the arm, after adjustment of the member.

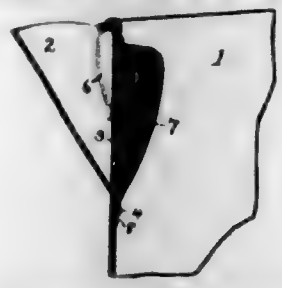
2. In an operating mechanism for leers, a rockably-mounted arm having an arc-shaped slot, a member pivotally connected to the arm, and a bolt passing through the member and through the slot, whereby the member can be adjusted in the arc of a circle and secured where positioned.

3. In an operating mechanism for leers, the combination with a plurality of bed-bars, and a plurality of pulling-out bars, of a plurality of rockably-mounted arms adapted for supporting the bed-bars and for raising them up and down in relation to the pulling-out bars, and means for rocking the said arms.

4. In an operating mechanism for leers, the combination with a plurality of bed-bars and a plurality of pulling-out bars, of a plurality of rockably-mounted arms, means for rocking said arms, and members carrying sheaves which support the bed-bars, said members being adjustably mounted on the arms so that the relative elevation of the bed-bars to the arms may be varied.

5. In an operating mechanism for leers, the combination with a plurality of bed-bars and a plurality of pulling-out bars, of a plurality of rockably-mounted arms having arc-shaped slots, members pivoted to the arms, sheaves on the members which support the bed-bars, and bolts passing through the members and through the slots, whereby the members and sheaves can be swung in the arc of a circle and the bed-bars raised or lowered relative to the arms and means for rocking the arms.

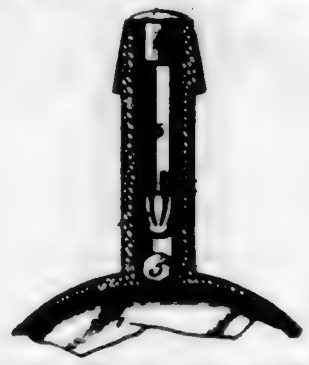
708,544. STRAINER FOR COFFEE-POTS. ERNST J. GUERTEL, Milwaukee, Wis., assignor of one-half to Frank P. Dittmar, Milwaukee, Wis. Filed Aug. 26, 1901. Serial No. 73,256. (No model.)



Claim.—1. In a coffee-pot or similar receptacle, a suitable frame adapted to fit the interior surface of the receptacle around the pouring-spout; a screen secured to the frame in a position to cover the inlet of the spout; one or more suspensory spring-hooks secured to the frame and extending over the rim of the receptacle and downwardly to engage its exterior surface, said frame and hooks serving as a clamp to bind the screen firmly in position against the interior surface of the receptacle.

2. In a coffee-pot, or similar receptacle, a suitable frame, adapted to fit the interior surface of the receptacle around the pouring-spout; a screen secured to said frame in a position to cover the inlet of the spout; and one or more suspensory spring-hooks secured to the frame and extending over the rim of the receptacle and downwardly to a point opposite the central portion of the screen; said hooks and screen-frame being arranged to serve as a clamp to bind the screen in position.

708,545. NON-REFILLABLE BOTTLE. CHARLES C. GUERRIST, Nashville, Tenn., assignor of one-half to H. B. Shyer, Nashville, Tenn. Filed Jan. 22, 1902. Serial No. 90,831. (No model.)



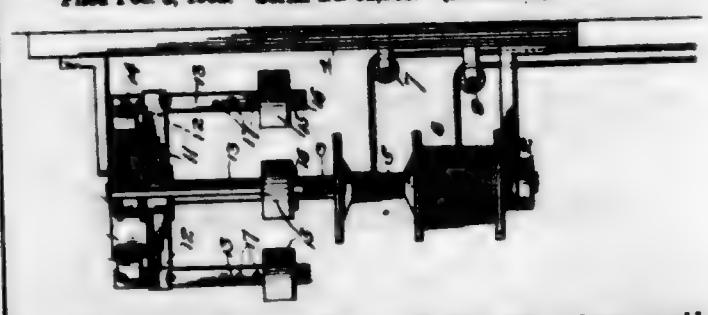
Claim.—1. In combination with a bottle or receptacle having a neck provided with a valve-seat and an inner shoulder a short distance from said valve-seat, a valve coöperating with the valve-seat to close the passage through the said neck, and a guard for preventing displacement of the valve, the same consisting of a tubular body fitted within the neck of the bottle and having an enlargement at its inner end provided at its base with an outer shoulder to snap under the inner shoulder of the neck, said enlargement comprising spring elements, substantially as set forth.

2. In combination with a bottle or receptacle having a neck provided with a valve-seat and an inner shoulder a short distance from the said seat, a valve coöperating with the valve-seat for closing the passage through the neck of the bottle, and a guard of tubular form having an enlargement at its inner end of approximately conoidal form and having an outer shoulder at the base of the said enlargement to snap under the inner shoulder of the neck of the bottle, said enlargement and the adjacent portion of the tubular body being slotted to admit of compression of the said enlargement when passing by the inner shoulder of the bottle-neck when pressing the guard therein, substantially as set forth.

3. In combination, a bottle or receptacle having a valve-seat, and an inner shoulder spaced therefrom, a valve coöperating with the valve-seat, and a guard having an enlargement at its inner end to snap under the inner shoulder of the neck, said enlargement being closed at its lower end to prevent interference with the valve by means of a wire or instrument inserted into the neck of the bottle, substantially as set forth.

4. In combination, a bottle or receptacle having a valve-seat and an inner shoulder within its neck, a valve coöperating with the valve-seat, and a guard consisting of a tubular body having a conoidal-shaped enlargement at its lower end and having an outer shoulder at the base of the enlargement to snap under the inner shoulder of the bottle-neck, the sides of the enlargement being slotted and the lower end of the enlargement being closed, the upper portion of the guard having a packing-sleeve fitted thereto, substantially as set forth.

708,546. FIRE-ESCAPE. CHARLES J. HAGENBUCH, Warren, Pa. Filed Feb. 3, 1902. Serial No. 92,263. (No model.)



Claim.—In a fire-escape, the combination with a frame provided with bearings; of a shaft journaled in said bearings and carrying at its lower end two drums, guide-pulleys secured to said frame, ropes reversely wound around said drums and having their ends pendent from said pulleys, a spider fixed to the upper end of said shaft to turn therewith, a relatively stationary friction-disk, levers pivoted intermediate their ends to

said spider, brake-shoes carried at the upper ends of said levers for frictional contact with said disk, and weights vertically adjustably connected to the lower ends of said levers, substantially as and for the purpose described.

708,547. OVERSHOE. HENRY A. HAMILTON and FRANK H. CRAWFORD, Emleuton, Pa. Filed June 20, 1901. Serial No. 65,370. (No model.)

Claim.—An overshoe having a reversible upper with a slit extending the entire length of the central portion of the front of the upper and approximating to the sole of the shoe, a folded vamp or gusset of rubber formed integral with the under meeting edges of the slit whereby the upper is adapted to be wholly turned inside out and over the sole of the shoe and then re-turned to its normal position by means of the expansible and contractible action of said vamp or gusset, substantially as specified.

708,548. CONSTRUCTION OF METALLIC-FRAME BUILDINGS. CHARLES R. HENDERD, Brooklyn, N. Y. Filed Apr. 11, 1902. Serial No. 102,337. (No model.)

Claim.—1. A building, the frame of which is composed of metallic pipe the ends of which are united by cross-bolts and suitable turnbuckles to apply the requisite strain.

2. A building, the frame of which is composed of metallic pipe, the ends of which are united by cross-bolts and suitable turnbuckles to apply the requisite strain, the walls and partitions being made of metallic rods or wires embedded in cement.

3. A building, the frame of which is composed of metallic pipe with suitable connections, the window and door openings being made of sections of pipe coupled together, the door and window casings being attached to the metallic framing with threaded bolts which engage with the tubing adjacent to the door and window openings.

4. A building the frame of which is composed of metallic pipe, the ends of which are united by cross-bolts and certain turnbuckles, and a sleeve adapted to inclose the turnbuckles and lap on the ends of the adjacent sections of pipe, for the purpose set forth.

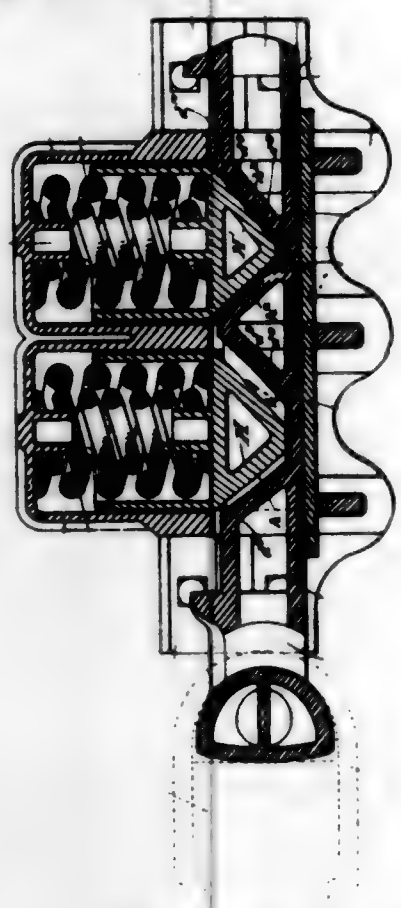
5. In a metallic-frame building a turnbuckle interposed between the adjacent ends of the metal elements composing the frame whereby the requisite strain may be applied to draw the parts to position and a sleeve adapted to inclose the turnbuckle and to lap onto the metal elements at each side of the turnbuckle, for the purpose set forth.

708,549. THERMOPHORE. FRITZ HELLIESEN, Andernach, Germany. Filed July 2, 1902. Serial No. 114,532. (No model.)

Claim.—1. A holder adapted to contain a crystallizable substance, and opposed contact-surfaces arranged within the holder and movable toward and away from each other, whereby crystallization of the substance contained within the holder may be started by the friction obtained by the rubbing of the frictional surfaces together, substantially as described.

2. A flexible holder adapted to contain a crystallizable substance, and opposed contact-bodies arranged within the holder and movable toward and away from each other, whereby crystallization of the substance contained within the holder may be started by the friction obtained by the rubbing of the frictional bodies together, substantially as and for the purpose set forth.

708,550. FRICTION DRAFT-RIGGING FOR RAILWAY-CARS. JOHN J. HENNESSY, Milwaukee, Wis. Filed June 16, 1902. Serial No. 111,874. (No model.)



Claim.—1. In a railway draft-rigging, the combination of a draw-bar with a draft-iron in line therewith, a stationary friction-plate in line with the draw-bar and in sliding frictional engagement with one of the sides of the draft-iron, double-incline friction-faces on the opposite side of the draft-iron from said stationary friction-plate, a transversely-movable friction-block having corresponding double-incline friction-faces, a transversely-arranged spring acting against said friction-block and centrally pressing said draft-iron against said stationary friction-plate, the incline friction-faces on the draft-iron and friction-block for resisting buffing strains being at a greater angle than those for resisting pulling strains, to cause the draft-rigging to exert a greater resistance in buffing than in pulling, substantially as specified.

2. In a railway draft-rigging, the combination with a draw-bar of a draft-iron in line therewith, a stationary friction-plate in line with the draw-bar and in sliding frictional engagement with one of the sides of the draft-iron, a plurality of double-incline friction-faces on the opposite side of the draft-iron from said stationary friction-plate, a plurality of transversely-movable friction-blocks each having corresponding double-incline friction-faces and a plurality of transversely-arranged springs acting against said transversely-movable friction-blocks and centrally pressing said draft-iron against said stationary friction-plate, the incline friction-faces for buffing on the draft-iron and friction-blocks being at a greater angle than those for pulling, substantially as specified.

3. In a railway draft-rigging, the combination with a draw-bar of a draft-iron in line therewith, a stationary friction-plate in line with the draw-bar and in sliding frictional engagement with one of the sides of the draft-iron, a plurality of double-incline friction-faces on the opposite side of the draft-iron from said stationary friction-plate, a plurality of transversely-movable friction-blocks each having corresponding double-incline friction-faces and a plurality of transversely-arranged springs acting against said transversely-movable friction-blocks and centrally pressing said draft-iron against said stationary friction-plate, the incline friction-faces for buffing on the draft-iron and friction-blocks being at a greater angle than those for pulling, the double inclines on one of said friction-blocks having a snug fit and on the other a loose fit with the corresponding double inclines on the draft-iron so that one of the springs may be partially compressed before the other comes into action, substantially as specified.

4. In a railway draft-rigging, the combination of a draw-bar with a draft-iron in line therewith, a stationary friction surface or plate in line with the draw-bar and in frictional sliding engagement with one of the sides of the draft-iron, double-incline friction-faces on the opposite side

of the draft-iron from said stationary friction-plate, a transversely-movable friction-block having corresponding double-incline friction-faces, and a transversely-arranged spring acting against said friction-block and centrally pressing said draft-iron against said stationary friction surface or plate, said draft-iron and friction-block being of malleable iron, steel or other suitable metal and having an interposed supplemental wearing-plate of different metal, substantially as specified.

5. In a railway draft-rigging, the combination of a draw-bar with a draft-iron in line therewith, a stationary friction surface or plate in line with the draw-bar and in frictional sliding engagement with one of the sides of the draft-iron, double-incline friction-faces on the opposite side of the draft-iron from said stationary friction-plate, a transversely-movable friction-block having corresponding double-incline friction-faces, and a transversely-arranged spring acting against said friction-block and centrally pressing it against said stationary friction surface or plate, said draft-iron being of malleable iron and the stationary friction-plate, of wrought-iron and having an interposed supplemental cast-iron wearing-plate, substantially as specified.

6. In a railway draft-rigging, the combination of a draw-bar with a draft-iron in line therewith, a stationary friction surface or plate in line with the draw-bar and in frictional sliding engagement with one of the sides of the draft-iron, double-incline friction-faces on the opposite side of the draft iron from said stationary friction-plate, a transversely-movable friction-block having corresponding double-incline friction-faces, and a transversely-arranged spring acting against said friction-block and centrally pressing it against said stationary friction surface or plate, said draft-iron and stationary friction-plate having interengaging friction wearing-faces of different metals, substantially as specified.

7. In a railway draft-rigging, the combination of a draw-bar with a draft-iron in line therewith, a stationary friction-plate in line with the draw-bar and in sliding frictional engagement with one of the sides of the draft-iron, double-incline friction-faces on the opposite side of the draft-iron from said stationary friction-plate, a transversely-movable friction-block having corresponding double-incline friction-faces and a transversely-arranged spring acting against said friction-block and centrally pressing said draft-iron against said stationary friction-plate, said draft-iron having a pair of side webs d' bridging said double-incline friction-faces thereon, substantially as specified.

8. In a railway draft-rigging, the combination of a draw-bar with a draft-iron in line therewith, a stationary friction-plate in line with the draw-bar and in sliding frictional engagement with one of the sides of the draft-iron, double-incline friction-faces on the opposite side of the draft-iron from said stationary friction-plate, a transversely-movable friction-block having corresponding double-incline friction-faces and a transversely-arranged spring acting against said friction-block and centrally pressing said draft-iron against said stationary friction-plate, said draft-iron having a pair of side webs d' bridging said double-incline friction-faces thereon, said draft-iron being of malleable iron and having supplemental wearing-plates on its incline faces between said webs, substantially as specified.

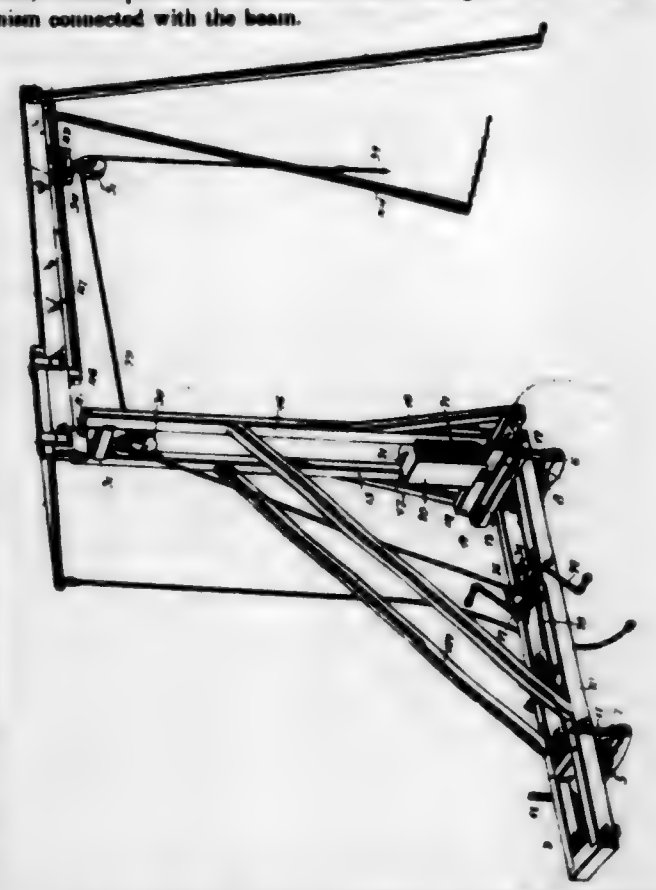
708,551. **FENCE-BUILDER AND HAY-DERRICK.** WESLEY W. G. HILL, Martinsville, Ill. Filed June 5, 1901. Serial No. 63,264. (No model.)

Claim.—1. In a machine of the class described the combination with the sills of a mast hinged thereto and comprising spaced uprights having a pulley at their upper ends, a beam pivoted between the upper ends of the uprights, a pulley upon the beam, a lifting-line passed over the pulley on the mast and beam, a line attached to one end of the beam for moving the latter pivotally and a winding-drum mounted upon the sills and adapted for attachment of the lines thereto interchangeably.

2. In a machine of the class described the combination with the sills of a mast hinged thereto and comprising spaced uprights having a pulley at their upper ends, a beam pivoted between the upper ends of the uprights, a pulley upon the beam, a lifting-line passed over the pulley on the mast and beam, a line attached to one end of the beam for moving the latter pivotally, a winding-drum mounted upon the sills and adapted for attachment of the lines thereto interchangeably, the uprights of the mast being adapted to receive a driving-block therebetween below the pulley.

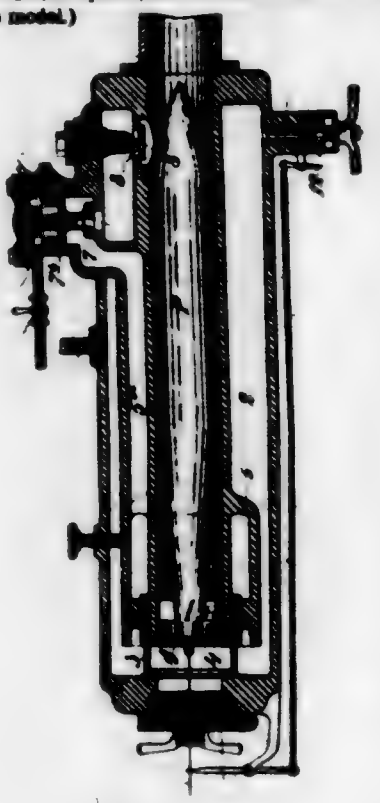
3. A machine of the class described comprising a body portion having a mast at one end thereof, a beam provided with a track, said mast being adapted for pivotal connection of the beam therewith at different elevations, supporting-legs adapted for interchangeable connection with the outer end of the beam to support it at different elevations, a carriage slidably engaged with the track and having a pulley, hooks slidably connected with the track, and a winding-drum on the body to receive a line engaged with the pulley.

4. In a machine of the class described, the combination with the body portion, of a mast hinged thereto for movement to recline thereon or stand erect, a beam pivoted to the mast to fold thereagainst and lifting mechanism connected with the beam.



5. In a machine of the class described the combination with the body portion, of a mast hinged thereto for movement to recline thereon or stand erect, a beam pivoted to the mast to fold thereagainst, lifting mechanism connected with the beam and braces removably connected with the mast and with the body.

708,552. **SUBMARINE OR OTHER GUN.** JOHN P. HOLLAND, Newark, N. J., assignor to Electric Boat Company, a Corporation of New Jersey. Filed Sept. 13, 1898. Renewed Feb. 10, 1902. Serial No. 93,451. (No model.)



Claim.—1. A gun for discharging a torpedo or other projectile, having means for first setting the projectile in motion with compressed air, having regulable, mechanical connecting means between the projectile and an igniter for afterward igniting an explosive charge when the projectile shall have traveled far enough to act forcibly on the igniter through said connecting means, and having a special, stationary chamber for the explosive charge independent of the projectile, substantially as set forth.

2. A gun for discharging a torpedo or other projectile, having a bar-

rel to guide the projectile, a breech-chamber behind the projectile-chamber, means for admitting a charge of compressed air to said breech-chamber for setting the projectile in motion, a cartridge-chamber independent of the projectile and open to said breech-chamber and adapted to receive a cartridge containing an explosive charge, an igniting device for said cartridge, and regulable connecting means between said igniting device and the projectile whereby the latter, when it shall have moved a predetermined distance, will effect the ignition of the cartridge, substantially as set forth.

3. A gun having an air-reservoir about its barrel in the form of a jacket, a breech-chamber behind the projectile-chamber, a valve controlling communication between said reservoir and breech-chamber, a cartridge-chamber communicating with the breech-chamber and adapted to receive a cartridge containing an explosive, said cartridge-chamber being independent of the projectile and forming a part of the gun, and means for igniting said explosive when the projectile shall have moved a predetermined distance, substantially as set forth.

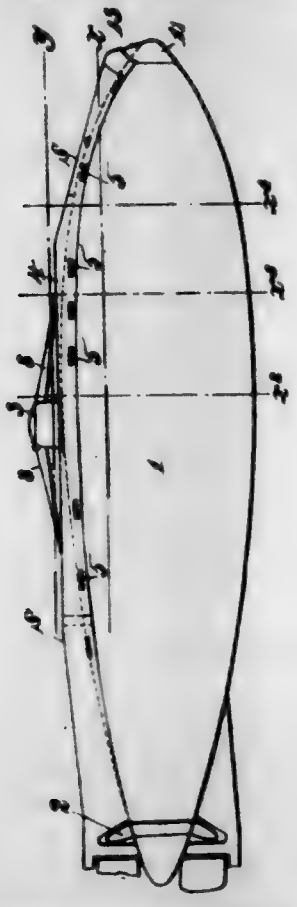
4. A gun having an air-reservoir about its barrel in the form of a jacket, a breech-chamber behind the projectile-chamber, a valve controlling communication between said reservoir and breech-chamber, a cartridge-chamber communicating with the breech-chamber and adapted to receive a cartridge containing an explosive, said cartridge-chamber forming a part of the gun, and means for igniting the said explosive while the charge of compressed air is between the said cartridge-chamber and the projectile, whereby the force of the explosive acts on the projectile through the intermediate cushion of air, substantially as set forth.

5. A gun for submarine use, having a valve-controlled inlet for admitting gas under tension to the bore of the gun in front of the projectile, whereby the water may be forced out of the said bore in advance of the projectile, substantially as set forth.

6. A gun for submarine use, having a valve to admit compressed air behind the projectile, a chamber to contain compressed air behind the said valve to hold said valve down to its seat, a port opening into the bore of the gun in front of the projectile, a passage connecting said port with the chamber behind said valve, and a firing-valve, controlling said passage whereby when said firing-valve is opened the air from said chamber expels the water from the bore of the gun, substantially as set forth.

7. A gun for submarine use having a firing-valve for admitting a gas under tension behind the projectile, and a valve, automatically controlled by said firing-valve, which admits a gas under tension in front of the projectile substantially at the same time as the firing, whereby the water is expelled from the bore ahead of the advancing projectile.

708,553. SUBMARINE BOAT. JOHN P. HOLLAND, Newark, N. J. Filed Aug. 7, 1901. Serial No. 71,120. (No model.)



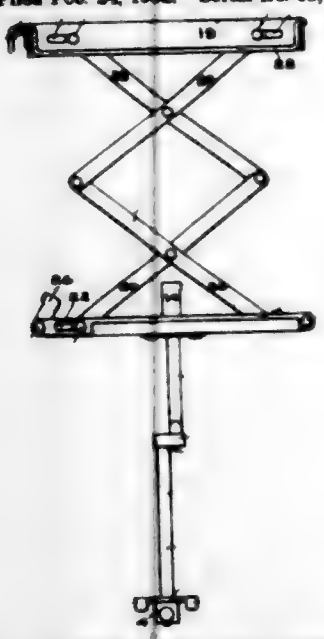
Claim.—1. A submarine boat provided on its top or rounded back with a hollow superstructure having a flat, level promenade both forward and aft of the conning-tower, and having sloping portions extending from said level promenade down to the stem and stern of the boat, said hollow superstructure having at its sides always-open scuppers for the flow of water in and out, and having in its top always-open gratings for the flow of air in and out, substantially as set forth.

2. A submarine boat having on its top or rounded back a hollow superstructure with apertures for the free flow of water into and out of same, a conning-tower which extends up through said superstructure, the inclined structures, and the sloping fins 8 on the superstructure and abutting against the said tower to prevent the fouling of lines, substantially as set forth.

3. The combination with a submarine boat of spindle form and having an expulsion-tube, a muzzle-casting, and a cap 11 hinged to said casting and provided with a shield-plate 11', of the hollow superstructure on the boat, provided with a hood 13 which houses the operative mechanism of the cap and the shield thereof, substantially as set forth.

4. A submarine boat having on its rounded top or back a hollow superstructure extending the entire length of the boat and open at all times for the outflow and inflow of air or water, said superstructure having at its middle part a flat, level, promenade-deck, and at its forward end an inverted-V form so as to reduce resistance in moving through the water, as set forth.

708,554. COPY-HOLDER FOR TYPE-WRITERS. EDWARD A. HOLBITE, St. Paul, Minn., assignor of one-half to James C. Bramwell, St. Paul, Minn. Filed Feb. 24, 1902. Serial No. 96,181. (No model.)



Claim.—1. In a copy-holder of the class described, the combination of a vertical standard, a collar slidable upon said standard, an interlocking connection between said collar and the upper end of said standard, an upwardly-projecting arm carried by said collar said arm being bent to bring its upper end toward said standard, a copy-holding frame having rotatable support upon the upper end of said bent arm, means for holding said copy-holding frame and said bent arm in parallel planes, and means for holding said frame at an angle with said arm.

2. In a copy-holder of the class described, the combination of a vertical standard provided with means for attachment to a support, a collar slidable upon said standard, an upwardly-projecting arm carried by said collar, said arm being bent to bring its upper end toward the standard, means for supporting said collar at the upper end of said standard, a collapsible copy-holding frame rotatably supported upon the upper end of said arm, means for securing said frame in a plane at right angles with the plane of said bent arm, and means for securing said frame parallel to said bent arm.

3. In a copy-holder of the class described, the combination of a vertical standard and a supporting-clamp therefor, a collar slidable upon said standard, an arm carried by said collar, means for holding said collar supported at the upper end of said standard, a post carried by the upper end of said arm, a sleeve inclosing said post, and a collapsible copy-holding frame carried by said sleeve.

4. In a copy-holder of the class described, the combination of a standard, a supporting-clamp therefor, a collar slidable upon said standard and provided with a downwardly and horizontally disposed slot in its side, an outwardly-projecting pin carried by the upper end of said standard and adapted to fit into said slot to support said collar, an arm carried by said collar, and a collapsible copy-holding frame rotatably mounted upon the upper end of said arm.

5. In a copy-holder of the class described, the combination of a standard and supporting-base therefor, a collar slidable upon said standard, an

interlocking connection between said collar and base, an interlocking connection between said collar and the upper end of said standard, a bent arm supported by said collar, and a collapsible copy-holding frame carried by the upper end of said arm.

6. In a holder of the class described, the combination of a standard, a supporting-base therefor, a collar slidable upon said standard, an interlocking connection between said collar and the upper end of said standard, a bent arm supported by said collar, a post carried by the upper end of said arm, a sleeve inclosing said post and provided with a slot to receive said arm and to hold said sleeve in adjusted positions upon said post, and a collapsible copy-holding frame carried by said sleeve.

708,555. **SAFETY ENVELOP-FILLER.** GEORGE E. HUNDT, Omaha, Nebr. Filed Feb. 12, 1902. Serial No. 93,736. (No model.)

Claim.—1. The combination with an envelop of a filler held therein, said filler comprising a frame provided with V-shaped terminations held apart under spring tension.

2. As a new article of manufacture, a safety-filler for envelops, comprising a spring-wire frame in combination with two V-shaped end portions secured thereto, said end portions being held apart under spring tension all arranged substantially as and for the purpose set forth.

708,556. **GRASS OR GRAIN CUTTING MACHINE.** RAY W. HUSSEY, Pendleton, Ind. Filed Jan. 6, 1902. Serial No. 88,948. (No model.)

Claim.—1. In a machine of the class described, a crank-wheel with a pin for driving the knife, a knife-head with a vertical slot, and a bearing-block vertically slidable in said slot to receive the crank-pin, said block having an oil-chamber in its upper side with outlet-orifices therefrom to each side of the bearing-block and to the pin, substantially as and for the purpose shown and described.

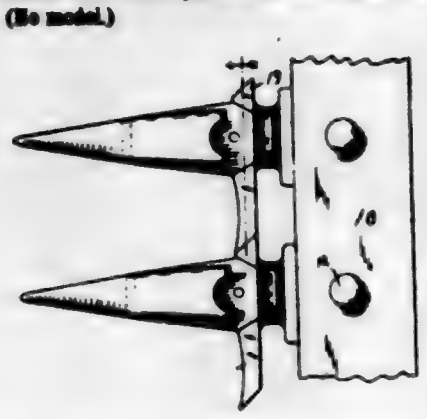
2. In a machine of the class described, a crank-wheel with a pin for driving the knife, a knife-head with a pair of oppositely-placed rigid vertical arms, a bar adjustably mounted in one arm and opposite the other to form a vertical slot, and a bearing-block slidable in said slot to receive said crank-pin.

3. In a machine of the class described, a crank-wheel with a pin to drive the knife, a bearing-block in which said pin fits and a knife-head having a vertical slot for the bearing-block which is formed by a rigid vertical arm turned at its upper end, a rigid oppositely-placed shorter arm, a supplementary plate connected at one end to the short arm and at the other end with the turned upper end of the long arm, and a bar held in a vertical position opposite said long arm by a lag-screw near one end extending through said short arm and by a lag-screw at the other end extending through the supplementary plate.

4. In a machine of the class described, an axle, a frame pivotally mounted thereon, means for supporting the knife and finger-bar at the forward end of said frame, a tongue, a lever mechanism fulcrumed above its lower end beside the tongue with an arm extending therefrom, a link connecting said arm and the frame to be elevated, a spring adjustably connected with the tongue and the lower end of the lever, a block slidably mounted on the tongue, doubletrees mounted in said block, and a spring connected to said sliding block and the forward end of said frame.

5. In a machine of the class described, an axle, a frame pivotally mounted thereon, means for supporting the knife and finger-bar at the forward end of the frame, a tongue, a guide-bar on the tongue, a block slidably mounted on said guide-bar, doubletrees mounted in said block, a spring connecting the sliding block to the forward end of said frame, and a spring-stop secured to the guide-bar that permits the insertion of the sliding block thereon and limits its rearward movement.

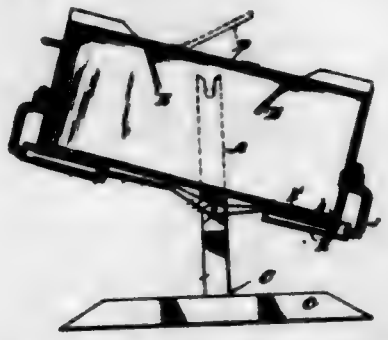
708,557. **HARVESTER.** RAY W. HUSSEY, Dublin, Ind., assignor to the Hussey Mower and Implement Company, Dublin, Ind., a Corporation of Indiana. Original application filed Jan. 6, 1902, Serial No. 88,948. Divided and this application filed Apr. 3, 1902. Serial No. 101,993. (No model.)



Claim.—1. In a machine of the class described, a guard-finger with a guard-bar extending from only one side of the finger and beveled at its outer end forwardly and away from the finger, and a reversely-beveled surface on the opposite side of the finger against which the guard-bar of the adjacent finger will abut.

2. In a machine of the class described, a series of guard-fingers secured thereto, each finger being provided with a guard-bar that extends laterally to the adjacent finger and at its outer end is beveled forwardly and away from the finger to which the guard-bar is attached, and a reversely-beveled shoulder on the opposite finger against which the guard-bar of the adjacent finger abuts.

708,558. **WASHING-MACHINE.** FREDERICK G. HYATT, St. James, Minn. Filed Mar. 7, 1902. Serial No. 97,169. (No model.)



Claim.—1. In a washing-machine, the combination of a supporting-frame, a receptacle mounted to rock therein, air-pump, a pipe connecting the pump with the lower portion of one end of the receptacle through a restricted opening, and connections between the rocking receptacle, the pump and the supporting-frame whereby the pump is operated as the receptacle is rocked.

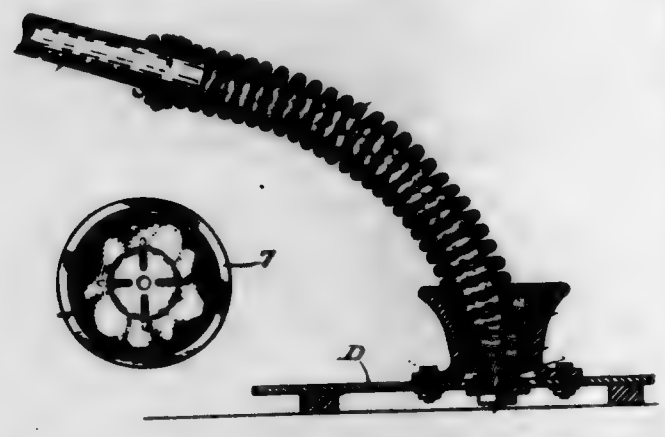
2. In a washing-machine, the combination of a supporting-frame, a receptacle mounted to rock therein, an air-pump, the cylinder of which is attached to the rocking receptacle and which communicates with the lower portion of one end of the receptacle, and connections between the piston of the pump and the supporting-frame whereby the pump is operated as the receptacle is rocked.

3. A washing-machine comprising a supporting-frame, a receptacle mounted to rock therein, an air-pump, the cylinder of which is secured to the receptacle, a pipe connecting the cylinder of the pump with the receptacle, a check-valve in said pipe, a valve in the piston of the pump and connections between the piston and the supporting-frame whereby the pump is operated as the receptacle is rocked.

4. A washing-machine comprising a supporting-frame, a receptacle mounted to rock therein, air-pumps carried by and rocking with the receptacle and communicating with opposite ends thereof, and connections between the piston of the pumps and the supporting-frame whereby the pumps are operated as the receptacle is rocked.

5. A washing-machine, comprising a supporting-frame, a receptacle mounted to rock therein, air-pumps, the cylinders of which are secured to the opposite ends of the receptacle, communications between the interior of the receptacle and the cylinders of the air-pumps, and connections between the piston-rods of the air-pumps and the supporting-frame, the organization being such that the air-pumps are alternately operated to inject air into the receptacle, as the latter is rocked.

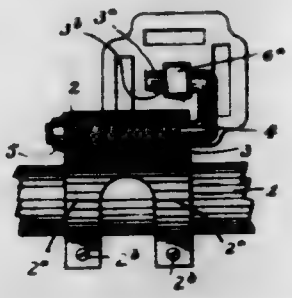
708,559. TROLLEY-POLE. CHARLES D. JENNEY, Indianapolis, Ind. Filed Dec. 5, 1900. Serial No. 39,215. (No model.)



Claim.—1. The combination of an electric car, an overhead conductor, a pole extending from said car to said conductor and embodying in its structure a spring whereby it may yield in any direction, and a bowl-like socket formed with outwardly-curved sides within which the spring-like lower end of said pole may be secured.

2. The combination of an electric car, an overhead conductor, a pole carried by said car and extending to said conductor, the lower end whereof is in itself a spring, a bowl-like socket having outwardly-curved sides secured to the car into which said spring-like lower end of the pole enters, and a clamp washer and bolt whereby said spring-like lower end of the pole is secured within said socket.

708,560. DEVICE FOR HITCHING HORSES TO SHAFTS. CHAS. B. JOHNSON, Columbus, Ohio. Filed Jan. 10, 1902. Serial No. 89,215. (No model.)



Claim.—1. In a shaft-hitching device, a tube fixed to the shaft, a hook having two parallelly-extending legs one leg rockably secured in said tube, a spring on said leg, a projection on the other of said legs, a plate on the harness having an eye into which the latter leg can be inserted to be secured thereto only when the hook is turned out of normal position relatively to said plate, substantially as described.

2. In a shaft-hitching device, a tube 2 having securing skirts or clips 2^a for embracing the shaft formed integrally therewith, a hook having two parallelly and rearwardly extending legs, one leg extending into said tube and rockable therein, a spring on said leg, and means on the harness with which the other leg can be connected only when the legs are turned out of normal position, substantially as described.

708,561. PROCESS OF SEPARATING ALUMINA FROM SILICA. ADOLF KAYSER, Buffalo, N. Y. Filed Sept. 5, 1901. Serial No. 74,450. (No specimens.)

Claim.—1. The process of separating alumina from silica, which consists in heating a mixture, containing alumina, silica, lime and soda in the proportion of two molecules of soda to one molecule of alumina and two molecules of lime to one molecule of silica, to a cindering temperature and leaching out the aluminate of soda thus formed; substantially as described.

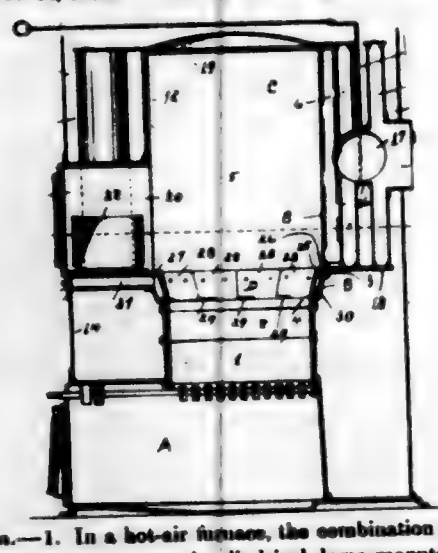
2. The process of separating alumina from silica, which consists in heating a mixture, containing alumina, silica, lime and soda in the proportion of two molecules of soda to one molecule of alumina and two molecules of lime to one molecule of silica, to a cindering temperature, leaching out the aluminate of soda thus formed and recovering the alumina from the solution; substantially as described.

3. The process of recovering alumina from marl containing approximately, alumina eighteen per cent., silica twenty-eight per cent., calcium oxid fifty-four per cent., which consists in mixing it with carbonate of soda in the proportion of about one hundred pounds of marl to thirty-four pounds of carbonate of soda, heating to the cindering temperature, leaching and recovering the alumina from the resulting solution; substantially as described.

708,562. EMERGENCY SAFETY-PLUG. FRANK KOSTLAN, Traer, Iowa. Filed May 16, 1902. Serial No. 107,582. (No model.)

Claim.—The combination with a steam-boiler provided with a safety-plug, substantially as described, of an emergency safety-plug, comprising a gland adapted to be screwed into the boiler-shell, a tubular stem screwing into said gland, and provided with a suitable hand-wheel, and auxiliary stem screwing into said tubular stem, and provided with a suitable set-nut, and a terminal, conical tip of soft metal secured in the end of said auxiliary stem.

708,568. HOT-AIR FURNACE. JOHN F. KRAUTER, Toledo, Ohio. Filed Feb. 14, 1901. Serial No. 47,205. (No model.)



Claim.—1. In a hot-air furnace, the combination with a fire-pot, of a radiator comprising a central cylindrical dome mounted on the fire-pot and having a fuel-duct for the fire-pot extending from one side and a flue opening opposite therefrom into an inner drum extending concentrically around the dome to opposite sides of the fuel-duct; an outer drum concentrically disposed around the inner drum and connected at opposite sides of the fuel-duct by elbows with the inner drum; narrow vertical air-passages between the outer and inner drums and between the inner drum and the dome; an exit-flue for the outer drum set horizontally opposite the flue of the dome, and an intermediate flue connecting the outer and inner drums in alinement with the exit-flue and having a damper adapted, when open, to admit direct draft from the flue of the dome through the intermediate flue to the exit-flue, and, when closed, to force the draft circuitously through the drums.

2. In a hot-air furnace, the combination with a fire-pot having an outwardly-flared detachable top section provided with an inner shoulder around the base of the section, and with an incut at one side in its rim, of an annular base-plate for the dome mounted horizontally on the fire-pot, with its inner rim on the rim of the top section, a dome for the fire-pot, provided with a side opening and mounted on the base-plate concentric with its inner rim, a perforated lining for the top section of the fire-pot, formed of detachable sections, having the lower ends of the sections supported on the inner shoulder of the top section, and the upper ends curved outward and supported by the inner rim of the horizontal plate, forming, with the top section of the fire-pot and the rim of the plate, an annular air-space around and within the top of the fire-pot, plates secured to the annular horizontal plate, and to the dome around its side opening, forming a fuel-duct for the fire-pot, a plate angled at the sides and secured to the base-plate beneath the fuel-duct, and to the top

section of the fire-pot around the opening formed by the side incut in its rim, forming an air-duct for the annular air-space and a frame including the outer ends of both ducts, provided with independent closures for the ducts.

708,564. WAGON-BRAKE. PHELPS LEWIS, Yocum, Ky. Filed Apr. 26, 1902. Serial No. 104,848. (No model.)

Claim.—In a wagon-brake, the combination with a wheeled truck, of a brake-beam provided with brake-shoes, a brake-lever connected with said beam, a second brake-lever mounted on the truck and provided with a curved and slotted arm, a slidable tongue having a downwardly-deflected and slotted rear end portion carrying a pin which works in the curved and slotted arm of the second brake-lever, a brake-rod extending between the two brake-levers and pivotally connected therewith, and a universal coupling associated with the brake-rod between its points of connection with the brake-levers, substantially as and for the purpose described.

708,565. BELT STUD OR FASTENER. FRANK M. LINDERMAN and CHARLES A. BIRD, Chicago, Ill. Filed Jan. 6, 1902. Serial No. 88,667. (Model.)

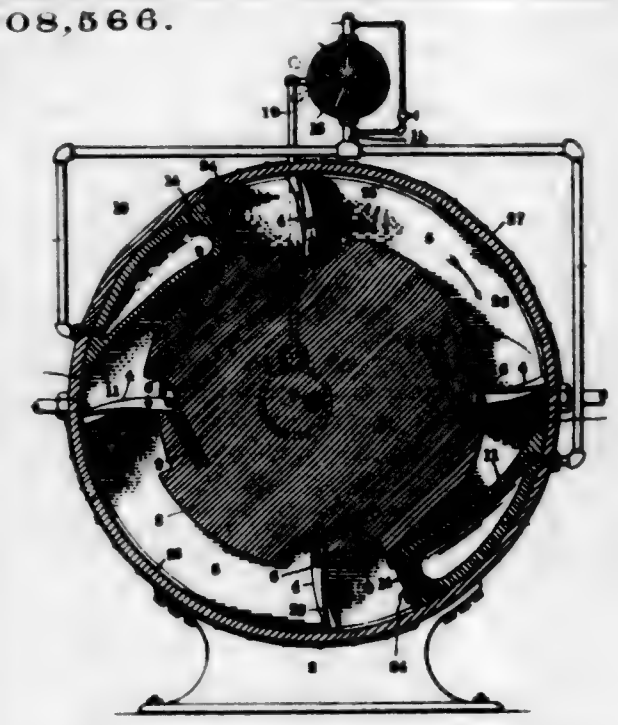
Claim.—A belt-stud comprising a curved bar 1 provided at its end with T-heads 2 whose lower bearing-surfaces lie substantially in line with the top of the bar, said heads being formed with the rounded under edges 3 and intermediate strengthening-ribs 4 and having their upper surfaces convexly curved between their upper and lower edges 5 and 6 and from their central portions 7 to their end edges 8, substantially as and for the purpose specified.

708,566. ROTARY ENGINE. MITCHELL M. LOCKERBY, Grand Forks, N. D. Filed Apr. 28, 1902. Serial No. 104,999. (No model.)

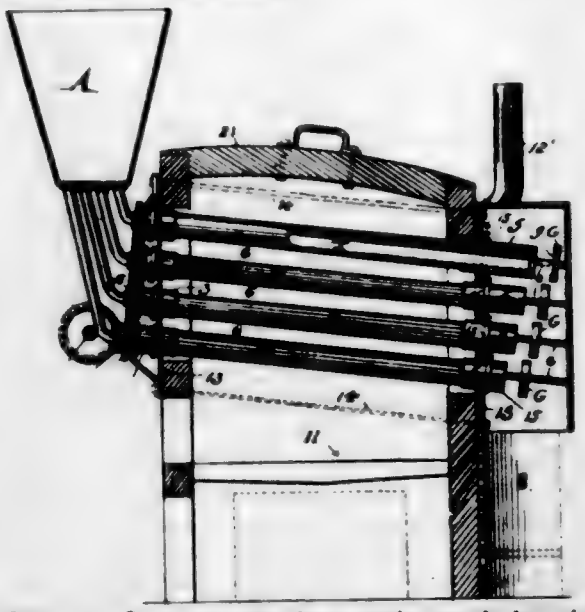
Claim.—1. The combination of a rotary wheel, a casing, swinging pistons secured to the wheel, eccentric-blocks secured to the casing having steam-chambers formed therein, live-steam pipes entering the eccentric-blocks, steam-ports in the eccentric-blocks, an oscillating valve, eccentric-rod connections between the wheel and the valve, and exhaust-ports in the casing, substantially as set forth.

2. The combination of a rotary wheel, a casing, swinging pistons secured to the wheel, eccentric-blocks secured to the casing having steam-chambers formed therein, live-steam pipes entering the eccentric-blocks, steam-ports in the eccentric-blocks, an oscillating valve, eccentric-rod connections between the wheel and the valve, exhaust-ports in the casing, and packing for the eccentric blocks, pistons and casing, substantially as set forth.

708,566.



708,567. APPARATUS FOR SEPARATING METALS FROM THEIR ORES. WARREN A. R. LOOSE, Provo, Utah. Filed Sept. 9, 1901. Serial No. 74,826. (No model.)



Claim.—1. In an apparatus for separating metals from their ores, the combination with a muffle, of a shield adjustable toward and from the discharge end of the muffle and having a sight-opening to afford inspection of the interior of the muffle while the ore is being reduced, and means inclosing the end of the muffle and the shield.

2. In an apparatus for separating metals from their ores, the combination with a revoluble muffle, of a shield separated from the end of, and movable in line with, the discharge end of the muffle and having a transparent portion to permit inspection of the interior of the muffle during the reducing operation, and an inclosure for the end of the muffle and the shield.

3. In an apparatus for separating metals from their ores, the combination with an inclined muffle through which the ore passes, of a shield separated from the end of, and movable in line with, the discharge end of the muffle, and having a transparent portion, means whereby the shield may be adjusted toward and from the end of the muffle, and a housing inclosing the discharge end of the muffle and the shield.

4. In an apparatus for separating metals from their ores, the combination with a muffle, of a shield in line with, and separated from, the end of the muffle and including a ring or band and a transparent sheet held thereto, and means whereby the shield may be adjusted to and from the discharge end of the muffle.

5. In an apparatus for separating metals from their ores, the combination with the muffles, of an inclosure or housing for the discharge ends of said muffles, said housing or inclosure being closed on all sides, except the bottom, and having openings containing transparent material, and a shield interposed between the housing and the discharge end of the muffle, and having a transparent portion in line with the openings in said housing.

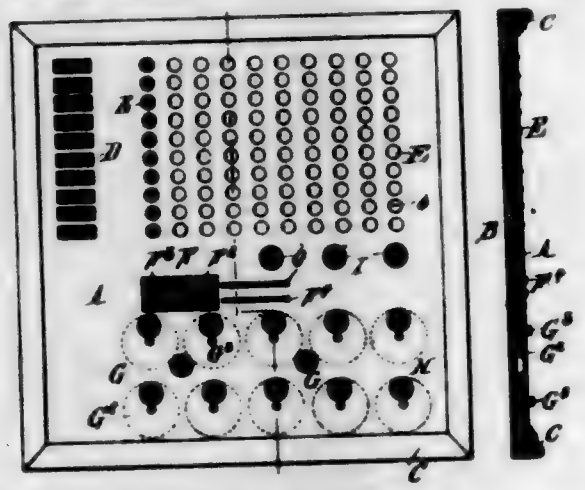
6. In an apparatus for separating metals from their ores, the combination with a vertical row of muffles, of an inclosure or housing covering the discharge ends of all of the muffles said inclosure having closed sides and top, an open bottom and a hinged door, said door having glazed sight-openings, one in line with each of the muffles.

7. In an apparatus for separating metals from their ores, the combination with a vertical row of muffles, of an inclosure or housing for the discharge ends thereof and having internal guides, and a shield fitting said guides in line with the muffles and adjustable with relation to the discharge ends of the muffles.

8. In an apparatus for separating metals from their ores the combination with a muffle, of a burner-tube entering directly therein and composed of graphite said tube having inclined sides converging upwardly.

9. In an apparatus for separating metals from their ores the combination with the muffle, of a burner-tube entering the muffle and having substantially a triangular form in cross-section.

708,568. APPARATUS FOR TEACHING PRIMARY ARITHMETIC. ARTHUR F. LOEHNERT, Detroit, Mich. Filed Apr. 12, 1901. Serial No. 55,532. (No model.)



Claim.—1. In an arithmetical apparatus in which numbers are represented by color-dots formed by means of colored apertures in a face-plate, of apertures provided with disks rotatively secured behind the face-plate and provided with means for turning each disk upon its center, each disk carrying upon its face different colors and arranged in such relation to one of the apertures that by turning the disk the color of the aperture may be changed.

2. In an arithmetical apparatus in which numbers are represented by color-dots formed by means of colored apertures in a face-plate, of color-dots arranged in groups to form number-pictures composed of ten or any lesser number of color-dots each color-dot being provided with a slide whereby any color-dot may be covered over independently of any other one, and color-disks affixed behind the apertures forming some of the color-dots and adapted to vary the colors of said dots by turning the disk, those not provided with the disks having a fixed and uniform color, whereby in forming a number-picture by suitably opening or closing certain slides, the colors of some of the color-dots composing said number-picture may be varied for the synthetic or analytic consideration of the number represented by the number-picture.

3. In an arithmetical apparatus composed of a face-plate provided with apertures having slides and arranged to form color-dots upon the face-plate adapted to represent numbers by opening the slides, of one or more groups of color-dots as G, each composed of five, grouped to form the number-picture five, four of each group provided with means for changing the color of the dot whereby each dot of the group may be made to appear of a different color from the others.

4. In an arithmetical apparatus, the combination with the face-plate A, and its group or groups of colored apertures G arranged to represent the number-picture "five," each aperture provided with a slide, of color-disks rotatably secured upon the back of the face-plate behind four of the apertures, each color-disk bearing five different colors each adapted to appear in the aperture by rotating the disk.

5. In an arithmetical apparatus, composed of a face-plate provided with apertures having slides and arranged to form color-dots, the combination of the group E of circular color-dots arranged in ten rows of ten each, each row having a different color from the adjacent row, a group D of ten rectangular color-dots, a rectangular color-dot F having ten circular color-dots of a different color placed within its color-field and provided with separate slides, and groups of circular color-dots G, G, H, I, adapted to collectively form number-pictures of ten or less color-dots and having means to vary the color of some of the color-dots.

6. In an arithmetical apparatus, in which numbers are represented by color-dots formed by means of colored apertures in the face-plate having slides for opening and closing the apertures, the combination of one or more groups of circular color-dots for representing numbers numerically, one group as D of rectangular color-dots, and the rectangular color-dot F having in its color-field ten circular color-dots of a different color and controlled by separate slides.

708,569. INDICATOR FOR BALL GAMES. EDWARD MANLEY, Chicago, Ill. Filed Oct. 9, 1901. Serial No. 78,143. (No model.)

Claim.—1. A device for use in ball games, comprising an indicator interposed between the pitcher's and catcher's positions and defining or bounding the usual or determined trajectory of the ball, substantially as described.

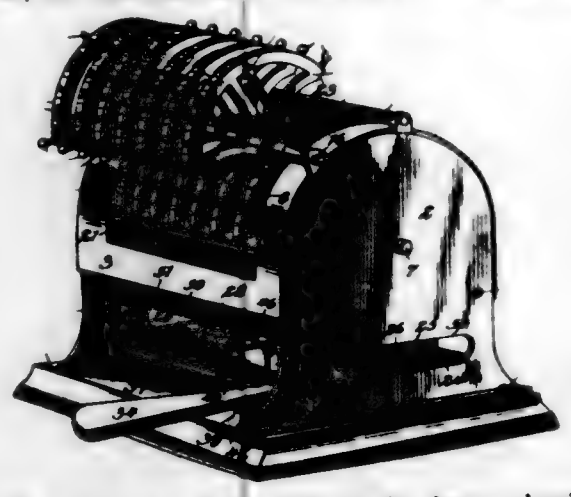
2. An indicator for ball games, comprising a light non-resisting vertical device interposed between the pitcher's and catcher's positions to determine the correct trajectory of a pitched ball, substantially as described.

3. An indicator for ball games, comprising a slight frame interposed between the pitcher's and catcher's positions, by which the ball is to be pitched, for the purpose and substantially as described.

4. In an indicator for ball games, the combination of two vertical members anchored between the pitcher's and catcher's positions, said members being of slight proportions and arranged to determine the correct trajectory of the pitched ball, substantially as described.

5. In an indicator for ball games, the combination of an overhead support, a pair of vertically-arranged members suspended therefrom at a point between the pitcher's and catcher's positions, and transverse members attached to the vertical members to form therewith a frame through which the ball must be pitched, substantially as and for the purpose set forth.

708,570. PRINTING-MACHINE. FLORIAN J. MARTIN, Milwaukee, Wis. Filed Apr. 18, 1901. Serial No. 56,450. (No model.)



Claim.—1. In a printing-machine of the character described, the combination of shiftable printing mechanism, which is normally fixed in printing position, a shiftable inking device normally out of engagement therewith, a shiftable platen, and common manually-operated means for inserting and withdrawing the platen from between the inking device and the printing mechanism and into operative relation with respect to said printing mechanism, and also for moving the inking device into and out of engagement with the printing mechanism.

2. In a printing-machine, the combination with relatively fixed oscillatory shiftable printing mechanism, of a vertically-movable inking de-

vice normally out of engagement therewith, a shiftable platen, and common hand-operated means for raising the inking device into engagement with the printing mechanism, and also for moving the platen over and away from the inking device and for raising the same into operative relation with respect to the printing mechanism.

3. In a printing-machine of the character described, the combination with shiftable but normally fixed printing mechanism, of a vertically-movable inking device therefor, a platen movable substantially horizontal in a plane lying between the inking device and the printing mechanism to cover and uncover the inking device, and also movable vertically into operative relation with respect to the printing mechanism, and a vertically and horizontally swinging lever having operative connections with the inking device and the platen.

4. In a printing-machine of the character specified, a casing-housing printing mechanism, substantially as described, the ends of the casing being provided with slots through which the material to be printed upon may be inserted, in combination with an inking means for the printing mechanism, a platen, and means operating to remove the platen from over the inking means to permit inking of the printing characters and to project the platen over the inking means when printing is to be effected.

5. In a printing-machine of the character specified, the combination with printing mechanism, of a bed-block arranged below the printing mechanism, an inking-pad mounted on the bed-block, a platen, and a lever adapted when shifted, in one direction in a horizontal plane, to move the platen from over the inking-pad, and when depressed to bring the inking-pad into contact with the characters of the printing mechanism, and when shifted in the opposite direction in a horizontal plane, to bring the platen over the inking-pad and when depressed to lift the bed-block and with it the platen toward the characters of the printing mechanism.

6. In a printing-machine of the character specified, a plurality of printing-wheels each bearing a gear-wheel and a ratchet-wheel, and type-wheel actuators and indicators each comprising two oppositely-disposed sectors having their arcs of rotation concentric, one of the sectors being provided with teeth to mesh with the said gear-wheel and the other bearing characters corresponding to those on the type-wheel, locking means for engaging the ratchet-wheel, pointers coacting with the character-bearing sector, and stops also coacting with the extremities of the character-bearing sector to limit its arc of rotation.

7. In a printing-machine of the character specified, a plurality of printing-wheels each bearing a gear-wheel and a ratchet-wheel, type-wheel actuators each comprising two oppositely-disposed sectors having their arcs of rotation concentric, one of the sectors being provided with teeth to mesh with the said gear-wheel, and the other bearing characters corresponding to those on the type-wheel, a bed-block arranged below the type-wheels, an inking-pad mounted on the bed-block, a platen, and a lever adapted when shifted in one direction in a horizontal plane to move the platen from over the inking-pad, and when depressed to bring the inking-pad into contact with the characters of the type, and when shifted in the opposite direction in a horizontal plane to bring the platen over the inking-pad and when depressed to lift the bed-block and with it the platen toward the characters on the type-wheel.

8. In a printing-machine having printing-wheels, and actuating mechanism therefor, a movable bed-block normally held out of engagement with the printing mechanism, an inking-pad carried by the bed-block, a platen, and a lever to perform the triple functions of moving the platen over and away from the inking-pad and of raising the bed-block.

9. In a printing-machine having printing-wheels and actuating mechanism therefor, substantially as described, of a movable bed-block normally held out of engagement with the printing mechanism, an inking-pad carried by the bed-block, a platen, and a lever for moving the platen over and away from the inking-pad and for raising the bed-block.

10. In a printing-machine having printing-wheels, and actuating mechanism therefor, substantially as described, a movable bed-block normally held out of engagement with the printing mechanism, an inking-pad carried by the bed-block, a platen, means for moving the platen over and away from the inking-pad and for raising the bed-block, and means for automatically returning the bed-block to its normal position upon the release of its actuating means.

11. In a printing-machine of the character specified, the combination with a plurality of printing-wheels, and actuating and indicating mechanism therefor, substantially as described, of a bed-block carrying an inking-pad and a platen, means operating automatically to hold the bed-block normally depressed, a rock-shaft bearing two arms extending beneath the bed-block, one of the arms being provided with a flattened head and with an overhanging lug, a lever pivotally connected with the latter arm and having a flattened head engaging the said lug, and an arm carried by the lever and having a pivotal connection with the platen.

12. In a printing-machine of the character specified, the combination with a plurality of printing-wheels, and actuating and indicating mechanism therefor, of a bed-block bearing an inking-pad and a platen, and a lever adapted, when moved in a horizontal plane, to move the platen either to expose or cover the inking-pad and when depressed through interposed mechanism, to raise the bed-plate either to cause inking of the character of the type-wheel or to effect printing.

13. In a printing-machine of the character specified, a plurality of printing-wheels and actuating and inking mechanism therefor, a bed-block having spring means operating normally to cause the bed to be depressed and thus out of the path of movement of the type-wheels, a rock-shaft carrying two arms extending beneath the ends of the bed-block, one of the arms being provided at its outer extremity with an enlarged flattened head carrying a depending pin working in an orifice in the base-plate of the machine, the pin carrying a spring operating normally to hold the arm raised, and the inner portion of the arm being provided with an overhanging lug, a lever pivoted upon the latter arm and having an enlarged flattened head to engage with the lug, an arm carrying a pin engaging a slot formed in a projection on the platen, and guide-pins carried by the rock-shaft and coacting with the tongue.

14. In a printing-machine of the character specified, the combination with a plurality of printing-wheels and actuating and inking mechanism therefor, of a bed-block provided with two sets of guideways, the lower set of guideways being engaged by an inking-pad carrier, and the upper guideways by a platen, and means for moving the platen to cause it to cover or expose the inking-pad and to raise the bed-block.

15. In a printing-machine of the character specified, a casing comprising a base-plate, end plates secured thereto and a shell or cover secured to the end plates, a shaft journaled in suitable bearings in the end plates and supporting a plurality of type-wheels each bearing a ratchet-wheel and a gear-wheel, a shaft supported in bearings near the front of the machine and carrying a plurality of type-wheel actuators and indicators, corresponding in number to the type-wheels, each comprising two oppositely-disposed sectors having their arcs of rotation concentric, one of the sectors having teeth engaging the said gear-wheels and the other sector bearing characters corresponding with those on the type-wheels, locking means engaging the ratchet-wheels, a bed-block arranged below the type-wheels, an inking-pad and a platen supported by the bed-block, a rock-shaft journaled in the end plates and carrying two arms projecting under the bed-block, one of the arms being provided on its outer extremity with an enlarged flattened head and near its inner extremity with an overhanging lug, a lever pivoted on its latter arm and having an enlarged flattened head engaging the said lug, the lever carrying an arm provided with a pin engaging a slot formed in a tongue projecting from the platen, guide-pins carried by the rock-shaft and coacting with the tongue to cause the platen to move in a right line, guides arranged in the casing and operating to direct insertion to the slip of paper under the type-wheels, the end plates of the casing being provided with openings to permit insertion of a strip of paper therethrough and under the type-wheels.

16. In a printing-machine of the character specified, the combination with a plurality of type-wheels and actuating mechanism therefor, of a vertically-movable bed-block, carrying an inking-pad and a platen, a lever adapted for horizontal movement and rocking movement in the two extremities of the arc of a circle, horizontal movement in one direction with rocking movement effecting projection of the platen over the inking-pad and then lifting of the bed-block to effect printing, and horizontal movment in the other direction and depression effecting uncovering of the inking-pad and lifting of the bed-block to effect inking of the pad.

17. In a printing-machine of the character specified, a plurality of printing-wheels each having its periphery provided with printing characters of any suitable material, each type-wheel carrying a gear-wheel and a ratchet-wheel, locking means engaging the gear-wheels, type-wheel actuators and indicators corresponding in number to the type-wheels, and comprising each two oppositely-disposed sectors having their arcs of rotation concentric, one of the sectors being provided with teeth engaging the gear-wheels, and the other bearing characters corresponding to those on the type-wheels, pointers coacting with the character-bearing sectors, knobs carried by latter sectors by which they may be moved, stops for limiting the arc of rotation of the sectors, a movable bed-block carrying an inking-pad and a platen, and a lever adapted through interposed mechanism to move the platen over or away from the inking-pad and to lift the bed-block.

18. In a printing-machine of the character described, the combination with a base, of a casing comprising opposite ends rising from the base, a top shell extending between and supported by the end pieces and having a longitudinal opening extending through the front and top thereof, the lower front and rear edges of the casing being terminated short of the base and provided with inwardly and downwardly inclined guide-plates, the lower ends of which terminate above the base, the opposite end pieces having corresponding transverse openings lying at the lower ends of the guide-plates, printing mechanism mounted between the end pieces and having adjusting means projected through the opening in the shell or casing, a vertically-movable inking device carried by the base

and below the printing mechanism, a platen located between the base and the printing mechanism, and means for moving the inking device to ink the printing mechanism and also to move the platen into operative relation with respect to said printing mechanism, the end openings forming an entrance and an exit for the element to be printed upon, and the spaces formed between the base and the opposite inclined guide-plates forming similar openings disposed in alinement transversely to the first-mentioned openings.

19. In a printing-machine of the character described, a rotatable printing-wheel having type characters, and carrying a gear-wheel, a type-wheel actuator and indicator pivoted at one side of the printing-wheel and embodying two oppositely-disposed sectors having their arcs of rotation concentric, one of the sectors being provided with teeth to mesh with the gear-wheel, and the other sector having characters corresponding to those on the type-wheel, a relatively fixed pointer coöperating with the characters on the indicating-sector, and means for locking the type-wheel against accidental movement.

20. In a printing-machine of the character described, the combination of a plurality of independently-rotatable printing-wheels mounted upon a common axis and having type characters upon their peripheries, gears carried by the type-wheels, type-wheel actuators and indicators each of which embodies oppositely-disposed sectors having their arcs of rotation concentric and pivoted at one side of the printing-wheels, one of the sectors being provided with teeth in mesh with the adjacent gear and the other sector having its periphery provided with characters corresponding to the type characters of the adjacent type-wheel, and a fixed pointer coöperating with the characters on all of the indicating-sectors, whereby, when a plurality of sectors are set at a predetermined relation, the disposition of the type characters which are in printing position is clearly indicated by the indicator characters alined with the pointer.

708,571. CAR-COUPLING. THOMAS F. MELARSON, Upper Charlo, Canada. Filed June 2, 1902. Serial No. 109,883. (No model.)

Claim.—1. A car-coupler comprising a draw-head having a recess in its forward end adapted to receive a link, a pin slidable in a transverse aperture across said recess to engage the link, and link-supporting means comprising a normally projecting bolt longitudinally slidable in said draw-head beneath said recess, said bolt being adapted to directly sustain the link and to be pushed back flush with the end of said draw-head, and a spring adapted to hold said link-supporting bolt resiliently pressed into its projecting position.

2. A car-coupler comprising a draw-head having a recess in its forward end adapted to receive a link, a pin mounted in a transverse aperture in said draw-head and adapted to be shot across the said recess to engage the link, a bolt slidable in a longitudinal passage-way in said draw-head coaxial with said recess, a spring mounted at the rear end of said bolt and adapted to hold the same pressed into its forward position with its front end across said aperture for the pin, a link-supporting bolt mounted to reciprocate in a longitudinal passage-way in said draw-head beneath said recess, a second spring mounted on the rear end of said link-supporting bolt to retain the same in forward or projecting position, and a latch-bolt adapted to be projected across the path of said link-supporting bolt to engage the same when retracted and hold it in retracted position.

3. A car-coupler comprising a draw-head having a recess in its forward end adapted to receive a link, a pin mounted in a transverse aperture in said draw-head and adapted to be shot across the said recess to engage the link, a bolt slidable in a longitudinal passage-way in said draw-head coaxial with said recess, a spring mounted at the rear end of said bolt and adapted to hold the same pressed into its forward position with its front end across said aperture for the pin, a link-supporting bolt mounted to reciprocate in a longitudinal passage-way in said draw-head beneath said recess, a second spring mounted on the rear end of said link-supporting bolt to retain the same in forward or projecting position, a latch-bolt adapted to be projected across the path of said link-supporting bolt to engage the same when retracted and hold it in retracted position, a rock-shaft mounted transversely of the car at the end thereof, a rock-arm keyed centrally to said rock-shaft, a bolt connecting the end of said rock-arm with the link-pin, and lever-handles formed on the extremities of said rock-shaft, whereby said pin may be raised from the side of the car, substantially as described.

4. In a car-coupler, a supporting means for the free end of a link held in the same draw-head comprising a bolt adapted to reciprocate in a longitudinal passage-way formed in the draw-head, a bracket-lug formed on the forward end of said bolt and rising to a level with the under side of the link when in horizontal position, and vertically-upstanding side lugs formed on said bracket-lug to confine said link against horizontal movement.

5. In a car-coupler, a supporting means for the free end of a draw-link adapted to hold the same in horizontal position comprising a longitudinal bolt adapted to reciprocate in a passage-way formed in the draw-head beneath said link, a bracket-lug formed on the front end of said bolt and adapted to support the pin, and a spring mounted on the rear end of said bolt and adapted to keep the same resiliently pressed into projecting position.

6. In a car-coupler, a supporting means for the free end of a draw-link adapted to hold the same in horizontal position comprising a longitudinal bolt adapted to reciprocate in a passage-way formed in the draw-head beneath said link, a bracket-lug formed on the front end of said bolt and adapted to support the pin, a spring mounted on the rear end of said bolt and adapted to keep the same resiliently pressed into projecting position, a latch-bolt adapted to be projected across the path of said supporting-bolt to engage and hold the same when retracted, a spring acting on said latch-bolt to project it into engagement with said supporting-bolt, and a pair of handle-bars projecting to opposite sides of the car and connected with said latch-bolt, whereby to enable the same to be released and projected forward by said first-named spring.

7. A car-coupler comprising a draw-head having a recess in its forward end adapted to receive a link, a pin adapted to slide in a transverse aperture in said draw-head and to be projected across said recess to engage the link, a rock-shaft mounted transversely of the car above said draw-head, a rock-arm centrally keyed on said rock-shaft and connected with said pin, cranked handles formed on the extremities of said rock-shaft to enable said pin to be raised from the side of the car, a bolt slidable in a longitudinal passage-way formed in said draw-head in line with the link, a spring connected with the rear end of said bolt and adapted to hold the same pressed resiliently forward across the path of said pin to hold the same in raised position, a link-supporting bolt slidable in a longitudinal passage-way parallel with said first-named bolt and directly beneath the same, a supporting-lug formed on the front end of said link-supporting bolt adapted to receive and hold said link, and a spring connected with the rear end of said link-supporting bolt to hold the same resiliently pressed into forward position.

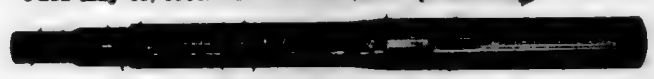
8. A car-coupler comprising a draw-head having a recess in its forward end adapted to receive a link, a pin adapted to slide in a transverse aperture in said draw-head and to be projected across said recess to engage the link, a rock-shaft mounted transversely of the car above said draw-head, a rock-arm centrally keyed on said rock-shaft and connected with said pin, cranked handles formed on the extremities of said rock-shaft to enable said pin to be raised from the side of the car, a bolt slidable in a longitudinal passage-way formed in said draw-head in line with the link, a spring connected with the rear end of said bolt and adapted to hold the same pressed resiliently forward across the path of said pin to hold the same in raised position, a link-supporting bolt slidable in a longitudinal passage-way parallel with said first-named bolt and directly beneath the same, a supporting-lug formed on the front end of said link-supporting bolt adapted to receive and hold said link, a spring connected with the rear end of said link-supporting bolt to hold the same resiliently pressed into forward position, a latch-bolt adapted to project across the path of said link-supporting bolt and to retain the same in retracted position, a spring acting on said latch-bolt to project it into engagement with said link-supporting bolt, and a bar sliding transversely of the car

and connected with said latch-bolt, whereby to enable the latter to be operated to release said link-supporting bolt from either side of the car, substantially as described.

9. In a car-coupler, the combination of a link-and-pin connection, a rock-shaft mounted transversely of the car and connected with said pin to raise the same, a pair of crank-handles formed on the respective ends of said rock-shaft, and means arranged to be inserted under said handles when the pin is raised to hold it in raised position.

10. In a car-coupler, the combination of a link-and-pin connection, a rock-shaft mounted transversely of the car and connected with said pin to raise the same, a pair of crank-handles formed on the respective ends of said rock-shaft, and an oblique swinging bar pivoted on a vertical axis to the car-body and having a socket formed in its upper end adapted to receive and support said crank-handle to hold the pin in raised position, substantially as described.

708,572. FOUNTAIN-PEN. CARL F. MILLER, Janesville, Wis. Filed May 13, 1901. Serial No. 59,956. (No model.)



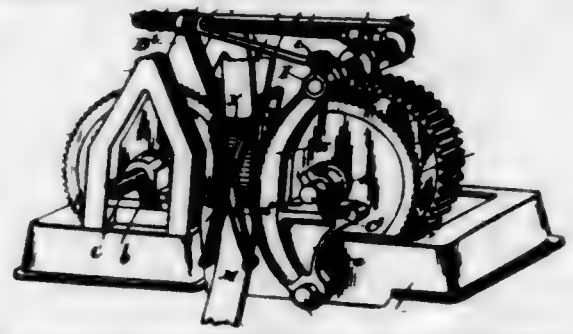
Claim.—In a fountain-pen, a reservoir having a nipple, a cap threaded on the nipple, a pen and feeder in the opposite end of the reservoir and a stem connected to the feeder in combination with a valve-casing on the opposite end of the stem, a piston having a hole in its end formed with the valve-casing, ports through the wall of the valve-casing leading into the reservoir, a valve for controlling the hole in the piston and the ports, a spring in the valve-casing for retaining the valve normally seated and a buffer-screw depending into the reservoir for regulating the draw of the piston, as and for the purpose described.

708,573. CAPTIVE-BALL APPARATUS. EUSTACE H. MILES, Cambridge, England. Filed Mar. 26, 1900. Serial No. 10,260. (No model.)

Claim.—A combination consisting of an open-work net bag adapted to hold an ordinary playing-ball movable therein, two elastic suspension-cords secured to opposite ends of the network bag and rows of hooks adapted to secure the outward ends of the suspension-cords in such a way that the ball may be placed at any desired height from the ground and the suspension-cords inclined at any desired angle.

708,574. PEAT-PRESS. WILLIAM A. MILNE, Brown's Corners, Canada. Filed Sept. 30, 1901. Serial No. 77,099. (No model.)

Claim.—1. In a peat-press two forming-wheels both having their peripheries divided into arc-shaped and angular recesses, the arc-shaped recess of one wheel being designed to come substantially opposite the angular recess of the opposite wheel when they are on a level with the shafts as they rotate as and for the purpose specified.



2. The combination with the wheels supported and driven and approaching each other opposite their centers, of the endless bands suitably driven and having plain surfaces substantially abutting the faces of the wheels whereby the hopper thus formed is of the same width throughout and thereby form ends for the cavities or recesses, and backing-supports for the bands as specified.

3. The combination with the forming-wheels supported and driven and approaching each other opposite their centers, of the endless bands suitably driven and substantially abutting the faces of the wheels, so as to form ends for the cavities or recesses and roller-chains forming a bearing to the outside of the bands and suitable supports for such roller-chains as and for the purpose specified.

708,575. GOLF-CLUB. WILLIAM MILNE, Penarth, England. Filed Jan. 21, 1901. Serial No. 44,183. (No model.)

Claim.—1. In the heads of clubs for playing the game of golf, the combination of a hard and rigid face-plate and a pad of resilient material at the back of the same, the pad being thicker at one edge than at the other.

2. In the heads of clubs for playing the game of golf, the combination of a hard and rigid face-plate and a pad of resilient material at the back of same, the pad being thicker at the upper edge than at the lower.

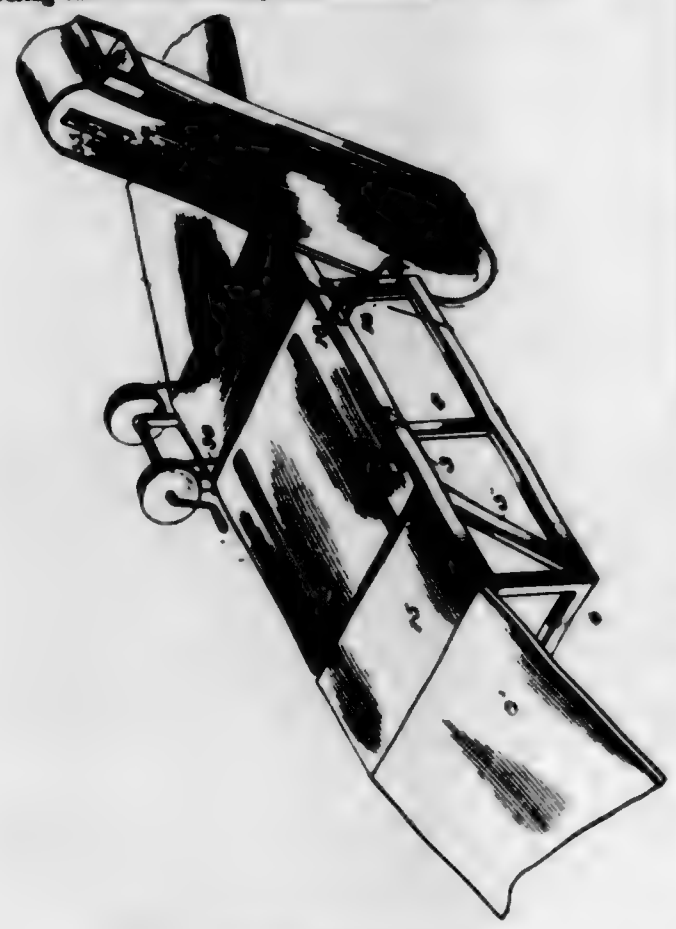
708,576. GRAIN-ELEVATOR. WILLIAM H. MCCANNON and CHARLES A. LEE, Formoso, Kans. Filed Apr. 15, 1902. Serial No. 103,089. (No model.)

Claim.—1. In a grain-elevator, the combination with the elevator proper, and a raised platform to which the elevator is connected, of a bin-holding chamber arranged beneath the top of the platform, a hinged cover for the bin, a tilting bin located within said chamber and means for elevating one end of the bin through the top of the bin-chamber so as to discharge into the elevator, substantially as described.

2. In a grain-elevator, the combination with the elevator proper, and a raised platform to which the elevator is connected, of a tilting bin arranged beneath the top of the platform, means for raising and lowering one end of the bin, and a cut-off at the discharge end of the bin for regulating the flow of grain from the bin to the elevator, substantially as described.

3. In a grain-elevator, the combination with a raised platform and the elevator proper connected therewith, of a tilting bin located below the top of the platform and in line with the elevator, a cut-off at the dis-

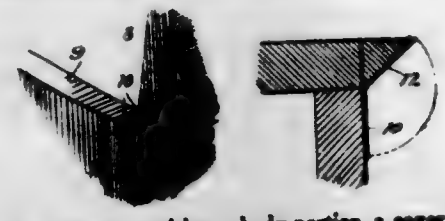
charge end of the bin, and a windlass and connection for raising and lowering one end of the tilting bin, substantially as described.



708,577. EYELET. GEORGE R. MCCORMACK, East Bridgewater, Mass., assignor to Precision Eyelet Company, East Bridgewater, Mass., a Copartnership. Filed Feb. 8, 1902. Serial No. 93,185. (No model.)

Claim.—The herein-described improved sheet-metal eyelet, comprising the barrel A, and the circular flange consisting of two thicknesses or layers of metal B, B', concentric in cross-section and in physical contact with each other throughout their entire width and circumference or length, the peripheral portion B' of the metal constituting the flange being folded under the portion B, and corresponding in shape thereto, and the flange being formed to produce an annular groove on its under surface, substantially as set forth.

708,578. BOX. EDWARD T. HOSAK, Chicago, Ill. Filed Mar. 8, 1901. Serial No. 50,404. (No model.)



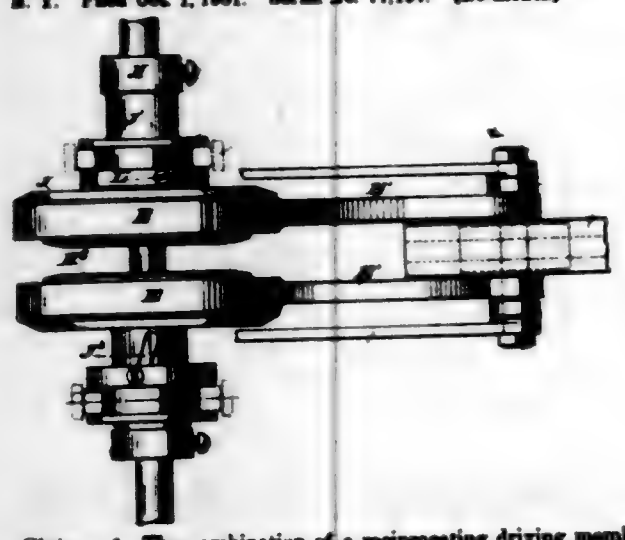
Claim.—1. A box comprising a body portion, a cover, a hinge, and a stop-strip attached in position to hold said cover in inclined open position, said stop-strip affording a plane against which the edge of the cover abuts when in such inclined open position, substantially as described.

2. A box comprising a body portion, a cover, a cloth hinge, attached to said box and cover, a stop-strip attached outside said hinge, in position to hold said cover in inclined open position, said stop-strip affording a plane against which the edge of said cover abuts when it is in inclined open position, substantially as described.

3. A box comprising a body portion, a cover, a flexible hinge, and a stop-strip attached by cementation outside said hinge in position to hold said cover in inclined open position, substantially as described.

4. A box comprising a body portion, a cover, a cloth hinge, secured to said body portion and said cover by cementation, and a stop-strip cemented to said hinge upon the outside of the box, in position to hold said cover in partly open position, substantially as described.

708,579. DRIVING-GEAR. JOHN HUTEY, Midlandpark, N. J., assignor of two-thirds to Carl P. Lenk and Rudolph Lenk New York, N. Y. Filed Oct. 1, 1901. Serial No. 77,197. (No model.)



Claim.—1. The combination of a reciprocating driving member, a driven part mounted to turn, a driving part mounted to oscillate about the axis of the driven part and provided with an outwardly-extending guideway, an intermittent grip device forming a driving connection between said oscillating driving part and the driven part, connecting mechanism from the driving member to the driving part, said connecting mechanism comprising an adjustable member arranged to slide along the guideway of the driving part, a link pivotally connected with said connecting mechanism at the adjustable member thereof, and an adjustable carrier on which said link is fulcrumed.

2. The combination of a reciprocating driving member, a driven part mounted to turn, a driving part mounted to oscillate about the axis of the driven part, and provided with an outwardly-extending guideway, an intermittent grip device forming a driving connection between said oscillating driving part and the driven part, connecting mechanism comprising an adjustable member arranged to slide along the guideway of the driving part, a link pivotally connected with said connecting mechanism at the adjustable member thereof, a normally stationary carrier on which said link is fulcrumed, said carrier being pivoted to a stationary part, and a speed-controlling lever for adjusting the carrier on the pivot.

3. The combination of a reciprocating driving member, a driven part mounted to turn, a connecting mechanism from the driving member to the said part, the latter being provided with a guideway on which said connecting mechanism is adjustable, the said guideway being arranged substantially radially with respect to the axis of the driven part, and having at its outer portion a lateral extension on which said connecting mechanism may move when in its outer position, said mechanism being adjustable on the driven part from its outer position at which the driving member moves without affecting the driven part, to a maximum of rotary speed of the driven part, and means for adjusting said connecting mechanism.

4. The combination of a reciprocating driving member, a driven part mounted to turn, a driving part mounted to oscillate about the axis of the driven part and provided with an outwardly-extending guideway terminating in a lateral extension, an intermittent grip device forming a driving connection between said oscillating driving part and the driven part, connecting mechanism from the reciprocating driving member to the oscillating driving part, said connecting mechanism comprising an adjustable member arranged to slide along the guideway of the oscillating driving part and the lateral extension thereof and to reciprocate longitudinally along said lateral extension, a link pivotally connected with said connecting mechanism at the adjustable member thereof, a normally stationary carrier on which said link is fulcrumed, said carrier being pivoted to a stationary part, and a speed-controlling lever for adjusting the carrier on the pivot, and adapted to move the adjustable member of the connecting mechanism along the guideway of the driving part and into engagement with the lateral extension of said guideway.

5. The combination of a reciprocating driving member, a driven part mounted to turn, a driving part mounted to oscillate about the axis of the driven part and provided with an outwardly-extending guideway terminating in a lateral extension, extending at an angle to the main portion of said guideway an intermittent grip device forming a driving connection between said oscillating part and the driven part, connecting mechanism from the reciprocating driving member to the oscillating driving part, said connecting mechanism comprising an adjustable member arranged to slide along the guideway of the oscillating driving part and the lateral extension thereof and to reciprocate longitudinally along said lateral extension, and an adjustable support for said adjustable member.

6. An intermittent grip device comprising a driving-ring, a clutch member, having a hub projected therefrom, a plurality of rollers between

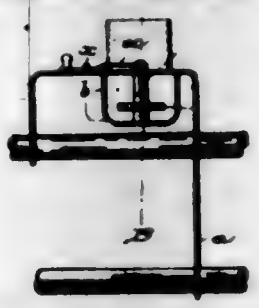
the driving-ring and the clutch member, pins projecting on each side of said rollers so as to limit the motion of said rollers, a plate-disk from which said pins project, a sleeve upon which said disk is mounted and capable of a partial movement of rotation about the axis of said grip device, but incapable of longitudinal movement along the same, said sleeve being provided with an oblique slot, a pin adapted to move longitudinally in a groove in the hub of said clutch member and to engage the walls of said oblique slot in said sleeve, and means to move said pin longitudinally along said hub and thereby to rotate said sleeve and the disk thereon and to vary the position of the pins within said recesses and the movement of the said rollers.

7. An intermittent grip device comprising a driving-ring, a clutch member provided with a plurality of arms which contact with the driving-ring and between which are recesses, the inner walls of which consist of inclined planes, a plurality of rollers within said recesses and adapted to engage the inner surface of the driving-ring, and means for preventing the engagement of the rollers with the driving-ring during movement of the latter in one direction.

708,580. ANTIFRICTION METAL ALLOY. HARRY PEARSE and BYRE F. IEVERS, Buenos Ayres, Argentina. Filed July 18, 1902. Serial No. 116,018. (No specimens.)

Claim.—An antifriction metallic alloy composed of lead, antimony, tin, copper, wrought-iron, and cast-iron, substantially as set forth.

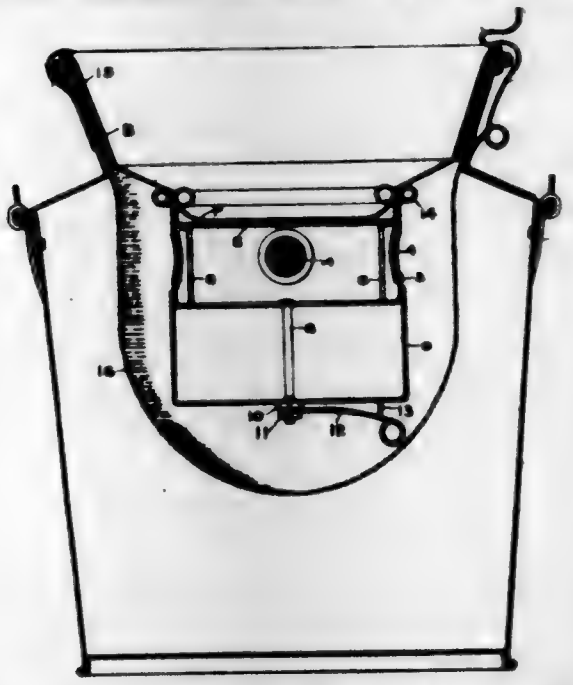
708,581. PHONOGRAPH. WILHELM PETSCHE, Berlin, Germany. Filed Jan. 9, 1901. Serial No. 42,699. (No model.)



Claim.—1. In combination, a pivoted arm for supporting the diaphragm, having a slot, and a revolvable locking-rod passing through said slot and flattened on its side, said rod being arranged to limit the lateral movement of the pivoted arm, substantially as described.

2. A holding device for recording and speaking apparatus in phonographs comprising an arm *g*, and a locking-rod *m* on which the arm is guided, said rod being flattened laterally, substantially as described.

708,582. MILK-PAIL ATTACHMENT. MILLARD F. POTTER, St. Paul, Minn. Filed Apr. 28, 1902. Serial No. 104,793. (No model.)



Claim.—1. The combination with a milk-pail, of a funnel, means for securing said funnel in the mouth of said pail, a closed bottom for said funnel, a horizontal strainer arranged in said funnel, the bottom of said funnel being formed with screened openings in its side wall below said horizontal strainer, and a slidable cap fitted over the bottom of said funnel.

2. The combination with a milk-pail, of a funnel, means for holding said funnel in the mouth of said pail, a downwardly-projecting closed bottom carried by said funnel, a horizontal strainer detachably supported in said funnel, the bottom of said funnel being formed with screened openings below said strainer, and a slidable cap arranged in connection with the bottom of said funnel.

3. The combination with a milk-pail, of a funnel, means for detachably supporting said funnel in the mouth of said pail, a downwardly-projecting closed bottom for said funnel, a horizontal strainer detachably supported therein, the bottom of said funnel being provided with screened openings in its side wall below said strainer, a slidable cap fitted over the bottom of said funnel, and means for securing said cap in open position.

4. The combination with a milk-pail, of a funnel, means for supporting said funnel in the mouth of said pail, a downwardly-projecting closed bottom for said funnel, a horizontal strainer detachably supported therein, said funnel being formed with screened openings in its side wall below said strainer, a rubber ring surrounding said funnel, a rod projecting downwardly from the bottom of said funnel, a cap slidably supported on said rod and fitting over the bottom of the funnel, a catch secured to the bottom of said cap, a spring carried by said rod and projecting outward adjacent to said catch, and a fabric bag surrounding said funnel and connected parts.

5. An attachment of the class described, consisting of a funnel provided with a closed end, said funnel being formed with screened openings in its side wall, a cap slidably supported upon the end of said funnel, and means for holding said cap in open position.

6. An attachment of the class described, consisting of a funnel provided with a closed end formed with screened openings in its side wall, a rubber ring surrounding said funnel above said openings, and a cap slidably supported upon the closed end of said funnel.

708,588. DREDGING APPARATUS. GEORGE G. POWELL, New York, N. Y. Filed Dec. 11, 1901. Serial No. 85,445. (No model.)

Claim.—1. In a dredge, the combination of a buoyant body or float and a series of buckets mounted to travel around said float in a common path.

2. In a dredge, the combination of a buoyant body or float, a circular chain of buckets mounted to travel vertically around the float, an adjacent boat, driving mechanism thereon, and driving connections from said mechanism to the buckets.

3. A buoyant cylindrical body, a boat to which it is adjustably connected, a circular chain of buckets arranged to travel vertically around the cylinder, mechanism for imparting motion to the buckets, and a conveyer moving transversely to the travel of the buckets to carry away the spoil.

4. In a dredge a buoyant cylindrical drum, a circular series of buckets sustained by and traveling vertically around the drum, and each having a hinged side to discharge the contents, and means for automatically opening and closing the same.

5. In a dredge, a boat, an adjacent float, and vertically-adjustable connections between them, in combination with a circular series of dredging-buckets mounted to revolve around the float, mechanism for driving the buckets, and means for flooding and draining the float.

6. In a dredge, in combination with the boat adjustably connected thereto, the cylindrical drum, tracks encircling the same, an endless chain of buckets traveling on the tracks, driving mechanism mounted in the boat and connected with the buckets, and means for conveying away the spoil discharged from the buckets.

7. The float, the chain of buckets provided with opening sides and arranged to travel around the float, in combination with means for automatically opening and closing the buckets.

8. In a dredge, the combination of a buoyant body, parallel endless series of buckets revolving around the same, and means for driving the different series independently, whereby they may be actuated at different speeds for one series while another is at rest, as the character of the soil or other conditions may demand.

9. In a dredge, the combination of a scow and a connected buoyant body, an endless series of buckets arranged to travel vertically around the buoyant body, said buckets extending laterally beyond the sides of the scow, whereby they are adapted to open a channel wider than the scow, substantially as described and shown.

10. In a dredge, the combination of a hull or scow with driving mechanism thereon, a drum or float located in advance of the hull and connected thereto by means for vertical adjustment, parallel series or chains of buckets arranged to travel vertically around the float, driving-cables extended from the respective series of buckets to the independent driving mechanism on the scow, and means for controlling the tension of the respective cables independently.

11. In a dredge, a hull or scow and bucket-driving mechanism mounted thereon, in combination with parallel chains of buckets, located directly in front of the scow and extending beyond the sides of the latter, the arrangement being substantially such as described and shown, to open in advance of the scow a channel for its passage.

708,584. PIGMENT. ALEXANDER S. RAMAGE, Cleveland, Ohio. Filed Feb. 17, 1902. Serial No. 94,471. (No specimens.)

Claim.—A pigment consisting of the light, yellow, hydrated basic, ferric oxid, having the formula $Fe_2O_3Fe_2(OH)_6$, impregnated with an independent coloring agent, as set forth.

708,585. PROCESS OF TREATING FERROUS LIQUORS. ALEXANDER S. RAMAGE, Cleveland, Ohio. Filed Feb. 17, 1902. Serial No. 94,472. (No specimens.)

Claim.—1. The process of treating ferrous liquors, which consists in precipitating therefrom a yellow, hydrated, basic, ferric oxid, containing occluded oxygen, and calcining said oxid by heating it to a temperature sufficient to cause the occluded oxygen to react on the oxid with evolution of heat, as set forth.

2. The process of treating ferrous liquors, which consists in precipitating therefrom a yellow, hydrated, basic, ferric oxid, containing occluded oxygen, and calcining said oxid by heating it, with exclusion of air, to a temperature sufficient to cause the occluded oxygen to react on the oxid with evolution of heat, as set forth.

3. The process of treating ferrous liquors, which consists in precipitating therefrom a yellow, hydrated, basic, ferric oxid, containing occluded oxygen, calcining said oxid by heating it to a temperature sufficient to cause the occluded oxygen to react on the oxid with evolution of heat, and stirring the oxid during calcination, as set forth.

4. The process of treating ferrous liquors, which consists in precipitating therefrom a yellow, hydrated, basic, ferric oxid, containing occluded oxygen, calcining said oxid by heating it, with exclusion of air, to a temperature sufficient to cause the occluded oxygen to react on the oxid with evolution of heat, and stirring the oxid during calcination, as set forth.

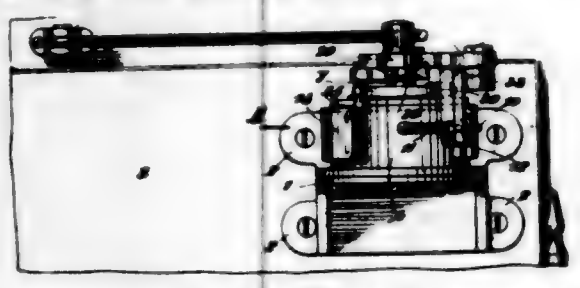
5. The process of treating ferrous liquors, which consists in precipitating therefrom a yellow, hydrated, basic, ferric oxid, recovering the acid radical as a solution of a salt of an alkali or alkaline-earth metal, placing said oxid and solution in proximity, and heating said oxid to a temperature sufficient to cause the occluded oxygen to react on the oxid with evolution of heat, thereby simultaneously calcining the oxid and supplying heat to evaporate the solution, as set forth.

6. The process of treating ferrous liquors, which consists in precipitating therefrom a yellow, hydrated, basic, ferric oxid, recovering the acid radical as a solution of a salt of an alkali or alkaline-earth metal, placing said oxid and solution in proximity, and heating said oxid, with exclusion of air, to a temperature sufficient to cause the occluded oxygen to react on the oxid with evolution of heat, thereby simultaneously calcining the acid and supplying heat to evaporate the solution, as set forth.

7. The process of treating ferrous liquors, which consists in precipitating therefrom a yellow, hydrated, basic, ferric oxid, recovering the acid radical as a solution of a salt of an alkali or alkaline-earth metal, placing said oxid and solution in proximity, heating said oxid to a temperature sufficient to cause the occluded oxygen to react on the oxid with evolution of heat, thereby simultaneously calcining the oxid and supplying heat to evaporate the solution, and stirring the oxid during calcination, as set forth.

8. The process of treating ferrous liquors, which consists in precipitating therefrom a yellow, hydrated, basic, ferric oxid, recovering the acid radical as a solution of a salt of an alkali or alkaline-earth metal, placing said oxid and solution in proximity, heating said oxid, with exclusion of air, to a temperature sufficient to cause the occluded oxygen to react on the oxid with evolution of heat, thereby simultaneously calcining the acid and supplying heat to evaporate the solution, and stirring the oxid during calcination, as set forth.

708,586. DOOR CHECK AND CLOSER. XAVER REICHLIN, Horgen, Switzerland, assignor to Antony Schorno, Irvington, N. J. Filed May 6, 1902. Serial No. 106,143. (No model.)



Claim.—1. In door checks and springs, the combination of the main spiral spring mechanism, a brake-band surrounding the drum of the said mainspring mechanism, a brake-lever connected to one end of the said brake-band, and a wedge-piece to actuate the said brake-lever, for the purpose of at first braking the closing door and then releasing it again, substantially as described.

2. In door checks and springs, the combination of the mainspring mechanism, a brake-band surrounding the spring-drum, a brake-lever connected to one end of the said brake-band, a wedge-piece coöperating with the said brake-lever, a screw-bolt connecting the said brake-band with the said brake-lever, and an interposed spring, for the purpose of altering the tension of the said brake-band, substantially as set forth.

3. In door checks and springs, the combination of the mainspring mechanism, a brake-band surrounding the spring-drum, a brake-lever connected to one end of the said brake-band, a wedge-piece coöperating with the said brake-lever, a plate carrying the said wedge-piece and turning about the mainspring-pin, and means for adjustably securing the said plate, for the purpose of varying the relative position of the said wedge-piece to the said brake-lever, substantially as and for the purpose set forth.

4. In door checks and springs, the combination of the mainspring mechanism, a brake-band surrounding the spring-drum, a brake-lever connected to one end of the said brake-band, a wedge-piece coöperating with the said brake-lever, and an arm pivotally secured upon the mainspring-drum and carrying the said wedge-piece, and means for adjusting the said wedge-piece upon the said pivoted arm, substantially as and for the purpose specified.

5. In door checks and springs, the combination of the mainspring mechanism, a brake-band surrounding the spring-drum, a brake-lever connected to one end of the said brake-band, a wedge-piece coöperating with the said brake-lever, an arm pivotally secured upon the mainspring-drum and carrying the said wedge-piece, means for adjusting the said wedge-piece upon the said pivoted arm, and means for altering the starting po-

sition of the said pivoted arm, for the purpose of reducing or enhancing the braking action, substantially as set forth.

6. In door checks and springs, the combination of the mainspring mechanism, a brake-band surrounding the spring-drum, a brake-lever adjustably connected to one end of the said brake-band, an adjustable wedge-piece codperating with the said brake-lever, and a tension-lever, adapted to actuate the said brake-band upon the door being violently slammed, substantially as described.

7. In a door-check, the combination with a drum, a spring therein, a lever, a roller on the lever and a cam-surface on which said roller acts to check the closing of the door, substantially as set forth.

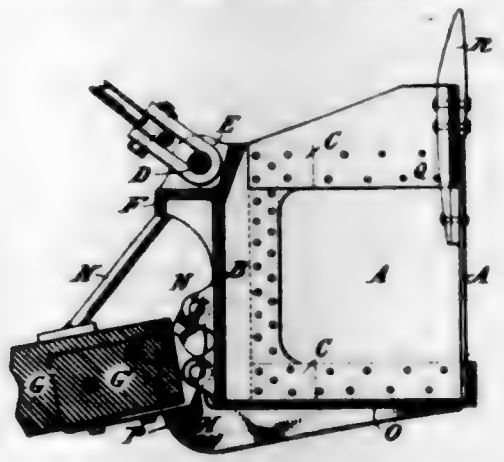
8. In a door-check, the combination with a drum, a spring therein, a lever, a roller on the lever and a pivoted cam-surface on which the roller acts to check the closing of the door, substantially as set forth.

9. In a door-check, the combination with a drum, a spring therein, a lever, a roller on the lever and a pivoted adjustable cam-surface on which the roller acts to check the closing of the door, substantially as set forth.

10. In a door-check, the combination with a drum, a spring therein, a lever, a roller on the lever and a pivoted adjustable cam-surface on which the roller acts to check the closing of the door, and means to alter the point at which the door is checked, substantially as set forth.

11. In a door-check, the combination with a drum, a lever, a roller on the lever, and a cam pivoted on the drum and having a long and a short arm, said roller adapted to engage the long arm to check the closing of the door, and a spring to hold the cam in operative position and allow it to move out of the path of the roller when the door is opened, substantially as set forth.

708,587. **DREDGE-BUCKET.** ARTHUR W. ROBINSON, Montreal, Canada. Filed May 20, 1902. Serial No. 108,269. (No model.)



Claim.—1. A bucket the back of which is composed of a single continuous casting having a horizontal stiffening-flange near its upper edge and means for the direct attachment of the hoisting-tackle to said casting.

2. A bucket the back of which is composed of a single continuous casting having a horizontal stiffening-flange near its upper edge, lugs for the attachment of the hoisting-tackle and for engagement with the arm and back braces cast integral with said casting.

3. A bucket the back of which is composed of a single continuous casting having lugs for the attachment of the hoisting-tackle and for engagement with the arm and the braces thereof and for hinging the bottom, all cast integral therewith.

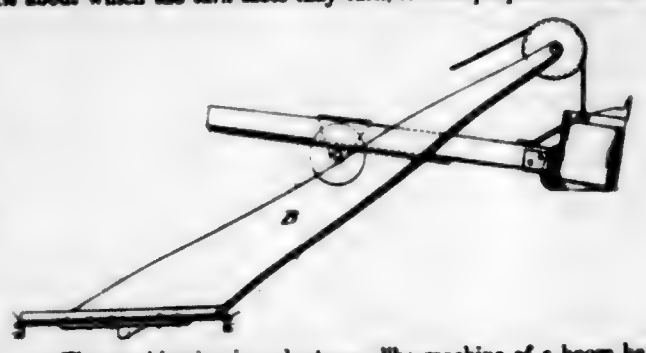
4. A bucket the back of which is composed of a single continuous casting having lugs cast integral therewith for the direct attachment of the hoisting-tackle to said casting.

5. A bucket the back of which is composed of a single continuous casting and having a horizontal stiffening-flange and projecting parts C, C, to which the shell-plate of the bucket may be bolted, means whereby the hoisting-tackle may make direct attachment with said casting and a reinforcing band or plate at the upper edge of the mouth of the bucket shell-plate upon which the teeth are supported.

708,588. **BOOM FOR DREDGES, EXCAVATORS, &c.** ARTHUR W. ROBINSON, Montreal, Canada. Filed May 20, 1902. Serial No. 108,270. (No model.)

Claim.—1. The combination in a dredge or like machine of a boom having a tapering form and rigidly attached at its larger end to a turn-table, the turn-table itself, feet on the under side of the turn-table and a rotatable collar supported about a fixed center and provided with sockets adapted to receive said feet, for the purpose set forth.

2. The combination in a dredge or like machine of a boom having lateral flanges thereon whereby it is stiffened against lateral strains, said flanges tapering from the base of the boom toward its free end, and a turn-table to which the larger end of the boom is rigidly attached and an axis about which the turn-table may turn, for the purpose set forth.

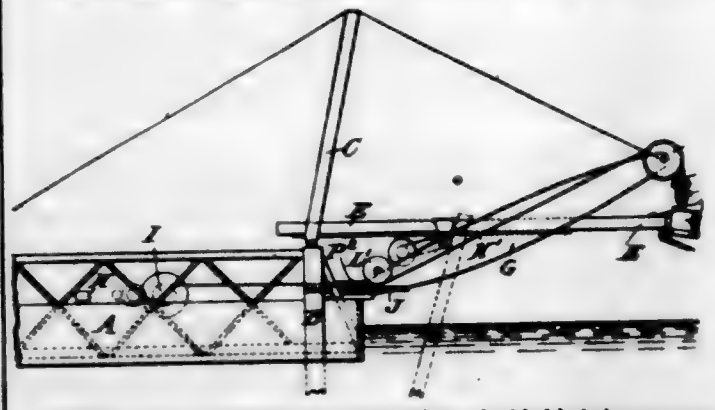


3. The combination in a dredge or like machine of a boom having a tapering form from a turn-table toward its free end and provided with lateral flanges likewise tapering in form from the turn-table toward the free end of the boom, for the purpose set forth.

4. The combination in a dredge or like machine of a boom composed of two similar parts, each having an outwardly-extending horizontal flange, the boom as a whole being rigidly attached at its larger end to a turn-table, the turn-table itself and means whereby the boom and turn-table may be rotated as a unit, for the purpose set forth.

5. The combination in a dredge or like machine of a boom having a tapering form and provided with lateral flanges, the larger end of the boom being rigidly attached to a turn-table, the turn-table itself, feet beneath the turn-table integral with or rigidly attached to the base of the boom, a rotatable collar provided with a suitable fixed center and sockets located upon the collar adapted to receive said feet, for the purpose set forth.

708,589. **HOISTING-GEAR FOR DIPPER-BUCKETS FOR USE UPON DREDGES, STEAM-SHOVELS, &c.** ARTHUR W. ROBINSON, Montreal, Canada. Filed May 20, 1902. Serial No. 108,272. (No model.)



Claim.—1. A hoisting-gear embodying a doubled hoisting-rope and five guiding-sheaves over the turn-table, three of them equally spaced and horizontally arranged, the central one lying between the hoisting-ropes, and two vertically arranged, and a turn-table which directly or indirectly supports all of said sheaves, for the purpose set forth.

2. A hoisting-gear embodying a doubled hoisting-rope, a turn-table, three horizontally-disposed and equally-spaced sheaves carried by the turn-table, the central one lying between the hoisting-ropes, two vertically-disposed guiding and supporting sheaves so arranged relative to the first-named sheaves as to guide the ropes to and from them and means for winding up and unwinding said ropes, for the purpose set forth.

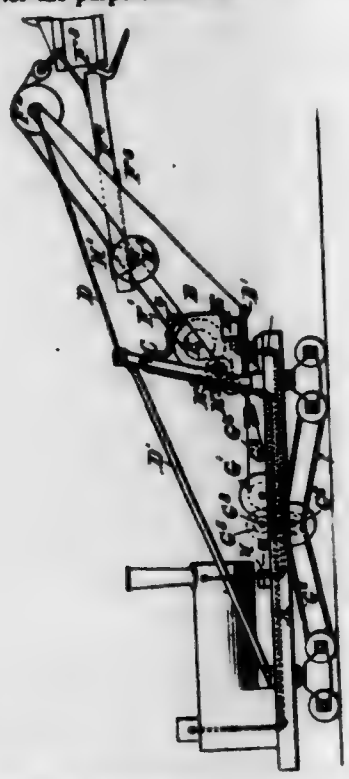
3. A hoisting-gear embodying a doubled hoisting-rope and vertically-arranged and horizontally-arranged sheaves for guiding and controlling the direction of the hoisting-ropes, said sheaves being all of them directly or indirectly supported by a turn-table and moving with it, and the horizontal sheaves being equally spaced relative to each other, the central one lying between the hoisting-ropes, a turn-table itself and a sheave at the bucket around which the doubled hoisting-rope passes, for the purpose set forth.

708,590. **STEAM-SHOVEL, &c.** ARTHUR W. ROBINSON, Montreal, Canada. Filed May 20, 1902. Serial No. 108,273. (No model.)

Claim.—1. In a dredge or like machine the combination of a boom rigidly attached to a turn-table the turn-table itself and a hoisting-engine and drum located upon the boom and centered about the axis of revolution thereof, for the purpose set forth.

2. In a dredge or like machine the combination of a boom rigidly attached to a turn-table, the turn-table itself feet rigidly connected to the boom beneath the turn-table which enters steps therefor in a rotatable collar supported upon the axis of revolution, said collar itself, and a hoisting-engine and drum located upon the boom and centered about the axis of revolution thereof, for the purpose set forth.

3. In a dredge or like machine the combination of a boom rigidly attached to a turn-table, the turn-table itself fast rigidly connected to the boom beneath the turn-table which enters steps therefor in a rotatable collar supported upon the axis of revolution, said collar itself, and a hoisting-engine and drum located upon the boom and centered about the axis of revolution thereof, and steam supply and exhaust pipes leading to and from the cylinders of the engine and provided with swivels located on the axis of revolution, for the purpose set forth.



4. In a dredge or like machine the combination of a boom mounted upon and turning with a turn-table the turn-table itself and a hoisting-engine and drum located upon the boom and turning therewith, for the purpose set forth.

5. In a dredge or like machine the combination of a boom provided with feet at its lower ends which enter steps therefor in a rotatable collar and said collar itself supported upon the axis of revolution of the boom, for the purpose set forth.

6. In a dredge or like machine the combination of a boom provided with feet at its lower ends which enter steps therefor in a rotatable collar and said collar itself supported upon the axis of revolution of the boom, and a hoisting-engine and drum located upon the boom and turning with it, for the purpose set forth.

7. In a dredge or like machine the combination of a boom supported upon and turning with a turn-table, the turn-table itself a hoisting-engine and drum located upon the boom, feet at the lower end of the boom which enter steps therefor in a rotatable collar said collar itself supported upon the axis of revolution and steam supply and exhaust pipes leading to and from the hoisting-engine each comprising stationary and movable sections suitably connected together, for the purpose set forth.

8. In a dredge or steam-shovel or like machine the combination of a two-part dipper-arm, a saddle-block adapted to engage with the arm, a hoisting-rope which passes between the two parts of the dipper-arm and means for controlling the thrust of the dipper-arm, for the purpose set forth.

9. In a dredge or like machine the combination of a drum, spur-gears for actuating the drum, pinions loosely mounted on a shaft which engage with the spur-gears and a friction-clutch located between said spur-gears and which engages with suitable surfaces on said pinions, for the purpose set forth.

10. In a dredge or like machine the combination of a drum, spur-gears for actuating the drum, pinions loosely mounted on a shaft which engage with the spur-gears and a friction-clutch located between said spur-gears and which engages with suitable surfaces on said pinions, and a brake adapted to engage with said spur-gears and control the running of the drum, for the purpose set forth.

11. In a dredge or like machine the combination of a boom, hoisting-engines and a drum located upon the boom surrounding the axis of rotation thereof and duplex gearing connecting the hoisting engine or engines with the boom, for the purpose set forth.

12. In a dredge or like machine the combination of a boom, hoisting-engines and a drum located upon the boom surrounding the axis of rotation thereof, gearing connecting the hoisting engine or engines with the boom, and steam supply and exhaust pipes having a swivel connection located in the axis of rotation of the boom, for the purpose set forth.

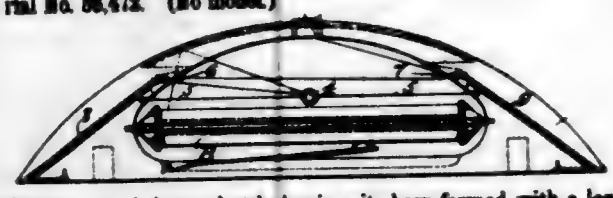
13. In a dredge, steam-shovel, or like machine the combination of a two-part dipper-arm and a centrally-recessed saddle-block adapted to engage with the arm and a hoisting rope or ropes adapted to pass through said recessed saddle-block, for the purpose set forth.

14. In a dredge or like machine the combination of a drum having holes in its sides through which the draft-ropes may pass and a clamp adapted to engage with the two ends of the hoisting-ropes and confine the same, for the purpose set forth.

708,591. WALL-PLASTER. NELSON J. RUGGLES, Columbus, Ohio. Filed Feb. 26, 1902. Serial No. 96,715. (No specimens.)

Claim.—As an article of manufacture, prepared plaster consisting essentially of pulverized partially-slaked, dried and bolted lime, fire-clay and sand all mixed in substantially the proportions stated.

708,592. LOOM-SHUTTLE. ADOLF SCHAUB, Paterson, N. J., assignor to George A. Fletcher, Otto W. Schaum, and W. H. Rometsch, copartners trading as Schaum and Uhlinger. Filed Dec. 19, 1901. Serial No. 86,472. (No model.)



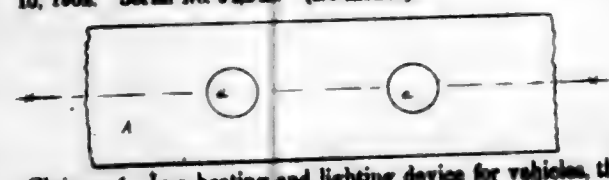
Claim.—1. A loom-shuttle having its bow formed with a longitudinal slot directly therein and provided with a central drawing-off eye, and an intermediate guiding means for the thread on its passage from said slot to said eye.

2. A loom-shuttle having a single bobbin-chamber, a bow formed with a continuous longitudinal slot directly therein and provided with a central drawing-off eye, and an intermediate guide-eye located approximately midway the length of the bobbin and between the latter and the drawing-off eye.

3. A loom-shuttle having its bow formed with a longitudinal slot constituting a guideway for the thread directly in said bow and said bow provided with a central drawing-off eye, a guide-eye located approximately midway the length of the bobbin and between the latter and the drawing-off eye, and intermediate right and left tension-eyes.

4. A loom-shuttle having a central eye in the bow, a longitudinal guideway to receive the thread on its passage from the bobbin to said bow-eye, and a guide-eye yieldingly supported midway of the length of the bobbin and below the bow-eye.

708,593. LIGHTING AND HEATING DEVICE FOR VEHICLES. PHILIPP F. SCHWENKE and JOHN W. CASE, Jackson, Mich. Filed Feb 15, 1902. Serial No. 94,245. (No model.)



Claim.—1. In a heating and lighting device for vehicles, the combination with a heater, adapted to be placed over an opening in the floor of a vehicle, of a lamp-chimney provided with a loose revoluble joint, the upper end of said chimney communicating with said opening, so that the heat derived from a lamp communicating with the lower end of said chimney shall pass through the said opening and into said heater, substantially as described.

2. In a lighting and heating device for vehicles, the combination with a heater provided with a radiator, and adapted to be placed over an opening in the floor of a vehicle, of a lamp-chimney provided with a loose revoluble joint, the upper end of said chimney adapted to be placed contiguous to said radiator while the lower end of said chimney is adapted to support a lamp, substantially as described.

3. In a lighting and heating device for vehicles, the combination with a heater provided with a radiator and adapted to be placed over an opening in the floor of a vehicle, a lamp-chimney provided with a loose revoluble joint, the upper end of said chimney adapted to be placed contiguous to said opening so that the heat derived from a lamp attached to the lower end of said chimney shall pass through said opening and into said heater, of a bull's-eye arranged in the lower half of said chimney and an adjustable slide, B, arranged in the interior of the chimney and adapted to shut off the light from the bull's-eye, substantially as described

4. In a lighting and heating device for vehicles, the combination with the floor of a vehicle provided with an opening through said floor, a heater provided with a radiator placed over said opening, a lamp-chim-

ney provided with a loose revoluble joint, the upper end of said chimney placed contiguous to said opening so that the heat from a lamp attached to the lower end of said chimney shall pass through said opening and into said heater, the lower part of said chimney provided with a bull's-eye, a slide arranged in the chimney to shut off the bull's-eye, and a reflector arranged in the chimney opposite the bull's-eye, substantially as described.

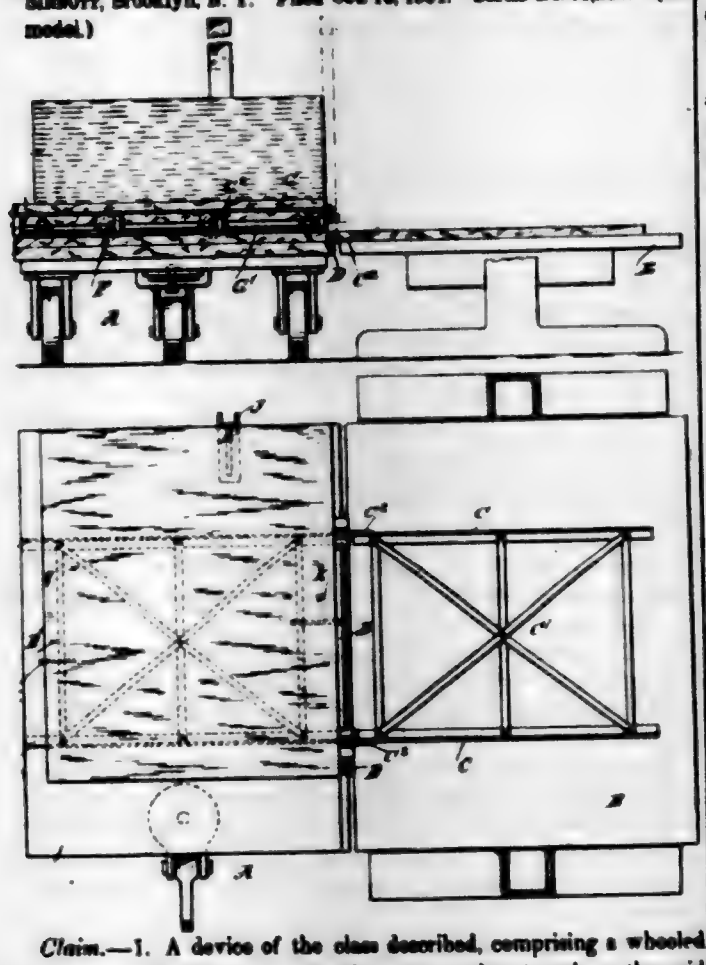
708,594. MESSAGE-BOX. HENRIETTA SHRIVER, Arbuckle, Cal., administratrix of Augustus F. Shriver, deceased, assignor to Morris Zobertier and Samuel R. Caldwell, San Francisco, Cal. Filed Jan. 23, 1902. Serial No. 91,647. (No model.)

Claim.—1. A message-box, comprising a casing having a receptacle for a paper roll and a receptacle for receiving the paper, feed-rollers arranged between said receptacles, the roll-holding receptacle being provided with an opening in one of its walls, a plate arranged below said opening and swinging arms on which the casing is mounted, substantially as specified.

2. A message-box, comprising a casing, arms mounted to swing on a support and having pivotal connection with the casing, the said casing having a roll-holding receptacle and a roll-receiving receptacle, feed-rollers arranged between said receptacles, one wall of the roll-holding receptacle being provided with an opening, and a plate arranged below said opening forming a bed over which the paper passes, substantially as specified.

3. A message-box, comprising a casing having a receptacle for a paper roll and a receptacle for receiving the paper, feed-rolls arranged between the receptacles, a stop device for one of the rollers, a supporting-plate, a shaft at the lower portion of the plate, a spring connection between the shaft and plate, and arms extended from the shaft to the box, substantially as specified.

708,595. CARRYING AND TRANSFERRING DEVICE. JOHN H. SIBBOTT, Brooklyn, N. Y. Filed Oct. 10, 1901. Serial No. 78,217. (No model.)



Claim.—1. A device of the class described, comprising a wheeled vehicle, a track fixed thereon, a carriage mounted to travel on the said track, and a track-section adapted to be supported on a receiving-table of a printing-press and forming an extension for the said fixed track, for wheeling the carriage from the wheeled vehicle onto the receiving-table, as set forth.

2. A device of the class described, comprising a wheeled vehicle, a track fixed thereon, a carriage mounted to travel on the said track, and a track-section adapted to form an extension for the said fixed track, for wheeling the carriage from the fixed track onto the track-section, the said track-section being also adapted to form a guide for piling the sheets of paper on the said carriage, as set forth.

3. A device of the class described, comprising a wheeled vehicle, a fixed track thereon, a carriage mounted to travel thereon, and a track-section removably connected with the said fixed track and adapted to be supported on a receiving-table of a printing-press and forming an extension therefor, to permit of wheeling the said carriage from the wheeled vehicle onto the receiving-table and leaving it thereon, as set forth.

4. A device of the class described, comprising a fixed track, a carriage mounted to travel thereon and adapted to receive a load, and a track-section pivoted on the said fixed track and adapted to form a guide for the sheets piled on the said carriage, as set forth.

5. A device of the class described, comprising a fixed track, a carriage mounted to travel thereon and adapted to receive a load, a track-section pivoted on the said fixed track and adapted to form a guide for the sheets piled on the said carriage, and means for locking the said track-section to the said carriage, as set forth.

6. In a device of the class described, a table or platform having longitudinally-extending guideways, wheels having one end of their axles working in said guideways, and guard-rails carried by the table or platform and engaging the other ends of the axles of the wheels, as set forth.

7. In a device of the class described, a table or platform having longitudinally-extending guideways, wheels having one end of their axles journaled in a support independent of the table or platform and their other ends working in the said guideways, and guard-rails carried by the table or platform and engaging the ends of the axles mounted in the said support, as set forth.

8. A device of the class described, comprising a track, a frame having wheels mounted to travel on the said track, a table, and guideways carried on the table and in which the axles of the said wheels work, as set forth.

9. A device of the class described, comprising a track, a frame having wheels mounted to travel on the said track, a table, guideways carried on the table and in which the axles of the said wheels work, and a locking device for locking the said table to the said frame, as set forth.

10. A device of the class described, comprising a track, a frame having wheels mounted to travel on the said track, a table, guideways carried on the table and in which the axles of the said wheels work, and means substantially as described, for limiting the ordinary motion of the guideways on the said axles, as set forth.

11. In a device of the class described, the combination with a frame, and wheels having one end of their axles mounted in said frame, of a platform having longitudinal guideways in which are mounted the other ends of the axles of the wheels and provided with guard-rails engaging axles adjacent to the frame, as set forth.

12. In a device of the class described, the combination with a frame, and wheels having one end of their axles mounted in said frame, of a platform having longitudinal guideways in which are mounted the other ends of the axles of the wheels and provided with guard-rails engaging axles adjacent to the frame, and means for locking the platform to the frame, as set forth.

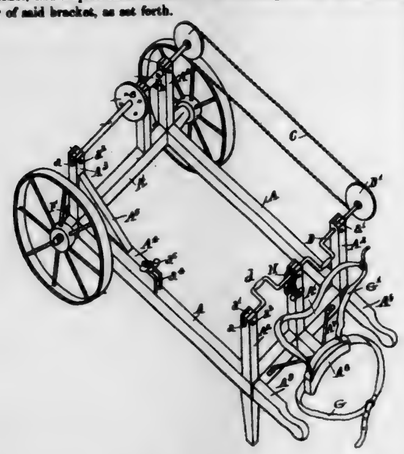
13. A device of the class described, comprising a wheeled vehicle, a fixed track on said vehicle, a track-section pivoted to the fixed track, means for locking the track-section in a vertical position, and a carriage comprising a frame having wheels mounted to travel on the fixed track and track-section, and a platform mounted to travel on the frame at a greater rate of speed than that of the frame on the track, as set forth.

14. A device of the class described, comprising a wheeled vehicle, a fixed track thereon, a track-section pivoted to the fixed track, means for locking the track-section in a vertical position, and a carriage comprising a frame, wheels having one end of their axles mounted in said frame, and a platform having longitudinal guideways in which are mounted the other ends of the axles and provided with guard rails engaging the axles of the wheels adjacent to the frame, as set forth.

708,596. REEL FOR BARBED WIRE. ZACHARY D. SMITH, Springfield, Ill. Filed Mar. 14, 1902. Serial No. 98,314. (No model.)

Claim.—In an apparatus of the class described, a bracket having a slotted horizontal member provided with a projecting pin, and a vertical member provided with a transverse bearing, in combination with a main frame a plate on said frame adapted to receive said pin, a bolt passing

through said frame and through the slot in a horizontal member of said bracket, and a spool-shaft turnable in the bearing on the vertical member of said bracket, as set forth.



708,597. CURRYCOMB. ANDREW TEPPER and OLE M. HELTNER, Rariville, Ill.; said Heltner assignor to said Tepfer. Filed Apr. 28, 1902. Serial No. 105,063. (No model.)

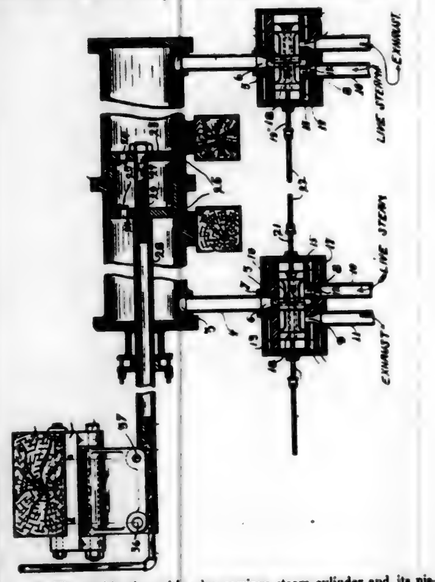
Claim.—The combination with a currycomb having spring-sockets at its corners; of a cleaner consisting of a top plate and cleaner-bars depending therefrom and adapted to engage the opposite sides of the comb-bars, braces located between said cleaner-bars and holding the same in contact with the comb-bars, springs arranged in the spring-sockets and confined between the bottoms of said sockets and the top plate of the cleaner, posts projecting from the currycomb, and a bail journaled in said posts to swing in either direction and provided with cranks to bear upon the cleaner, whereby the latter may be depressed against the tension of said springs, substantially as and for the purpose described.

708,598. STEAM-FEED FOR SAWMILL-CARRIAGES. EDWIN B. THOMAS, St. Paul, Minn., assignor of one-half to Union Iron Works, Minneapolis, Minn., a Corporation of Minnesota. Filed Aug. 31, 1901. Serial No. 73,914. (No model.)

Claim.—1. The combination, with a log-carriage steam-cylinder and piston having its rod connected with the carriage, of valve-casings having suitable pipe connections with the ends of the cylinder and with the steam-supply and normally admitting steam to both sides of the piston simultaneously, and suitable slide-valves provided in said casings and within control of the sawyer and when stationary allowing steam to enter both ends of the cylinder simultaneously and when operated alternately closing the steam-inlet passages and opening the cylinder to the exhausts, substantially as described.

2. The combination, with a log-carriage steam-cylinder and piston having its rod connected with the carriage, of valve-casings having suitable pipe connections with the cylinder on both sides of the piston and provided with steam inlet and exhaust ports and with annular grooves between said inlet and exhaust ports communicating with the cylinder, and slide-valves provided in said casings and within control of the sawyer for normally allowing the steam to flow into both ends of the cylinder simultaneously when the carriage is stationary and alternately exhausting the steam from each side of the piston when the carriage is in motion.

3. The combination, with a log-carriage steam-cylinder and its piston connected with the log-carriage, of valve-casings connected respectively with the cylinder on both sides of the piston, said casings being provided with steam inlet and exhaust ports and having annular grooves located between said ports and forming passages communicating with the cylinder, piston-valves provided in said casings and within the control of the sawyer, and bridges provided on said valves intermediate to their ends for closing the exhausts when the valves are stationary and opening the steam-inlet passages to the cylinder, and alternately opening and closing said exhausts and said inlet-ports when the valves are in motion.



4. The combination, with a log-carriage steam-cylinder and its piston connected with the log-carriage, of valve-casings having pipe connections with the cylinder on each side of the piston respectively, said casings having steam inlet and exhaust ports, annular grooves provided in the walls of said casings between said ports and communicating with the cylinder, piston-valves provided in said casings and within control of the sawyer, bridges provided on said valves intermediate to their ends and permitting steam to flow into the cylinder upon both sides of the piston when the valves are stationary and alternately exhausting the steam from the ends of the cylinder when the valves are in motion, the sides of the bridges being substantially flat, for the purpose specified.

5. The combination, with a valve-casing having inlet and exhaust ports and a suitable connection with a cylinder, of a piston-valve provided within said casing, ducts for the water of condensation provided in the wall of said casing near its ends, and passages connecting said ducts with the exhaust-port.

6. The combination, with a cylinder, of a valve-casing connected therewith and provided with inlet and exhaust ports and an annular duct between said ports, of a double-ended slide-valve provided within said casing and having a bridge intermediate to its ends for closing the passages from said ports to said duct and the cylinder, and ducts for the water of condensation provided near the ends of said casing and communicating with passages that lead to the exhaust, substantially as described and for the purpose specified.

7. The combination, with a log-carriage steam-cylinder and its piston connected with the carriage, of suitable means through which live steam is conducted from the cylinder to the carriage, and means for delivering steam simultaneously to both ends of the cylinder when the carriage is at rest, whereby the pressure on the carriage is always constant, and means within control of the sawyer for alternately closing the live-steam inlets and opening said cylinder ends to the exhausts, substantially as described.

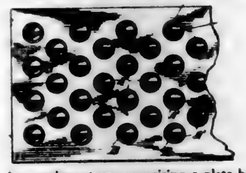
8. The combination, with a log-carriage steam-cylinder, of a hollow piston therein provided with check-valves, a hollow piston-rod provided with suitable ducts through which steam is conveyed to the log-carriage, suitable operative connections provided between said piston-rod and carriage, means through which steam is normally admitted to both sides of the piston simultaneously, whereby the pressure on the carriage is constant even when the carriage is stationary, and means within control of the sawyer for alternately shutting off the admission of steam to the ends of the cylinder and opening the same to the exhausts, substantially as described.

9. The combination, with a log-carriage steam-cylinder having a hollow piston provided with check-valves and a piston-rod connected with a log-carriage and provided with ducts through which steam is conveyed to the carriage, of valve-casings having pipe connections with the cylinder on both sides of the piston and provided with steam inlet and exhaust ports, and slide-valves provided within said casings and within control of the sawyer, and provided with means for normally allowing the steam to enter on both sides of the piston simultaneously when the valves are stationary and for alternately exhausting the steam from said sides when the valves are in motion, substantially as described.

10. The combination, with a log-carriage steam-cylinder, of a hollow piston therein provided with check-valves and ducts for the water of condensation, a plug provided in said piston, a second plug having suitable connections with the log-carriage, a hollow piston-rod connecting said plugs, suitable ducts provided in said plugs connecting said rod with the hollow piston and with pipe connections to the carriage, means through which steam is delivered simultaneously to both sides of the piston when the carriage is stationary, whereby pressure on the log-carriage will be constant, and means within control of the sawyer for alternately shutting off the passage of steam to each side of the piston and opening the same to the exhaust, substantially as described.

11. The combination, with a log-carriage steam-cylinder, of a piston having a hollow rod connected with the carriage and through which rod steam is conducted from both ends of the cylinder to the steam-operated mechanism on the carriage, means for delivering steam simultaneously to both ends of the cylinder when the carriage is at rest, whereby pressure on the carriage mechanism is always constant, and means within control of the sawyer for alternately shutting off the steam from the ends of the cylinder and opening them to the exhausts.

708,599. TRAP FOR AMALGAM. GEORGE R. TUTTLE, Grass Valley, Cal. Filed Aug. 7, 1901. Serial No. 71,157. (No model.)

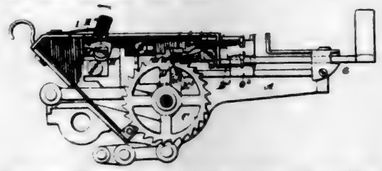


Claim.—1. An amalgam-trap comprising a plate having a recess therein, and a cell in said recess comprising a tubular body portion and a partition therein, said body portion and partition being composed of dissimilar metals, substantially as described.

2. An amalgam-trap comprising a plate having a recess therein, and a cell in said recess comprising a tubular body portion and a partition therein adapted to be inserted into or withdrawn from either end of the body portion, said body portion and the partition being composed of dissimilar metals, substantially as described.

3. An amalgam-trap comprising a plate having a recess therein, and a cell in said recess comprising a tubular body portion and a removable partition therein, said body portion and partition being composed of dissimilar metals, substantially as described.

708,600. LINE-SPACING MECHANISM FOR TYPE-WRITERS. FRANZ X. WAGNER, New York, N. Y., assignor to Wagner Typewriter Company, New York, N. Y., a Corporation of New York. Filed Dec. 27, 1901. Serial No. 87,473. (No model.)



Claim.—1. The combination in a type-writer or like machine of a rotary paper-roller having a ratchet-wheel, a driving-pawl for turning said ratchet-wheel and permanently in engagement therewith but normally free to slip over the ratchet-wheel teeth, a locking device for preventing an outward movement of the driving-pawl during its entire driving movement, and single means for operating the driving-pawl and for bringing the locking device into action at the beginning of the operative movement of the driving-pawl.

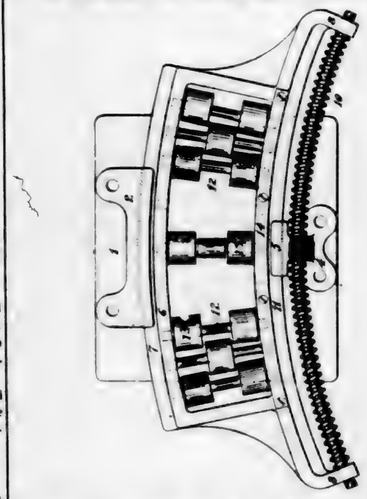
2. In a type-writer or like machine, the combination of a paper-roller having a ratchet-wheel, a main slide, a driving-pawl carried by said main slide and in permanent engagement with the ratchet-wheel, said driving-pawl being normally free to slip over the ratchet-wheel teeth, a locking-slide with a limited movement relatively to the main slide, and means for operating the locking-slide and the main slide successively.

3. The combination of the paper-roller having a ratchet-wheel, the main slide, the pivoted driving-pawl engaging the ratchet-wheel permanently and carried by the main slide, the auxiliary slide projecting beyond the main slide and having a spring connection therewith, said auxiliary slide being provided with a projection adapted in one of its positions to lock the driving-pawl against outward movement, and an operating device for engaging the projecting portion of the auxiliary slide and moving the said slide and the main slide successively.

4. The combination of a main slide carrying a driving-pawl, a paper-roller having a ratchet-wheel engaged by said pawl, a locking device movable on the main slide and adapted to prevent outward movement of the driving-pawl, an operating means adapted to engage said locking device and to move the same preparatory to moving the main slide and the driving-pawl.

5. The combination of a paper-roller having a ratchet-wheel, with a spring-pressed slide, a driving-pawl secured thereto, an adjustable stop for varying the initial position of said slide, a locking-slide movable relatively to the main slide and carried thereby, said locking-slide being adapted to prevent outward movement of the driving-pawl, and operating means for first moving the locking-slide alone and then both slides together.

708,601. ROLLER SIDE BEARING. JOHN C. WANDS, St. Louis, Mo. Filed Nov. 8, 1901. Serial No. 81,585. (No model.)



Claim.—1. In a side bearing for cars, the combination with an antifriction device, of a rod carried thereby, and a restoring-spring arranged on said rod; substantially as described.

2. In a side bearing for cars, the combination with an antifriction device, of a rod carried thereby, a fixed guide for said rod, and a restoring-spring arranged on said rod between said fixed guide and the antifriction device; substantially as described.

3. In a side bearing for cars, the combination with an antifriction device, of a rod carried thereby, a fixed guide for said rod, and springs arranged on said rod at each side of the fixed guide; substantially as described.

4. In a side bearing for cars, the combination of an antifriction device, a frame in which the same is mounted, and opposing springs arranged at the side, and in the horizontal plane of said frame for centering the same and its carried antifriction device; substantially as described.

5. In a side bearing for cars, the combination with an antifriction device, of a guide therefor, and opposing springs arranged at the side, and in the horizontal plane of said antifriction device, for coöperating with said guide at their outer ends and with the antifriction device at their inner ends; substantially as described.

6. In a side bearing for cars, the combination with an antifriction device provided with lateral guiding-fins, of guide-brackets coöperating with said fins, and restoring-springs arranged at one side of said antifriction device; substantially as described.

7. In a side bearing for cars, the combination with an antifriction device, of laterally-extending guiding-fins, guide-brackets coöperating with said fins, and opposing springs for restoring said antifriction device, said springs being seated against one of said guiding-brackets; substantially as described.

8. In a side bearing for cars, the combination with an antifriction device, of laterally-extending guiding-fins, guide-brackets coöperating with said fins, a rod carried by said antifriction device and passing through one of said guide-brackets, and springs arranged on each end of said rod and seated against said guide-bracket; substantially as described.

9. In a side bearing for cars, the combination with a track-plate, of an antifriction device and separable guide-brackets therefor, said guide-brackets having integral overhangs; substantially as described.

10. In a side bearing for cars, the combination with a shiftable frame, and separated groups of antifriction devices carried by said frame; substantially as described.

11. In a side bearing for cars, the combination with a shiftable frame, of separated groups of antifriction devices carried at the ends of said frame, whereby when one of said groups is in service the other is partially or entirely out of service, and resilient means for restoring said shiftable frame and its antifriction devices to a central position after operation; substantially as described.

12. In a side bearing for cars, the combination with a shiftable frame, of a track-plate, and separated groups of rollers in the end of the frame; substantially as described.

13. In a side bearing for cars, the combination with a track-plate, of a shiftable frame carrying separated groups of rollers at its ends, one of which groups is designed to be in service while the other is wholly or partially out of service, and a centering device for said frame; substantially as described.

14. In a side bearing for cars, the combination with a track-plate, of a shiftable frame, spindles arranged in separated groups at the ends of said frame, and rollers loosely mounted on said spindles; substantially as described.

15. In a side bearing for cars, the combination with a track-plate, of a shiftable frame, separated groups of rollers mounted in the ends of said frame, and sectional rollers overlapping each other and loosely arranged on said spindles; substantially as described.

16. In a side bearing for cars, the combination with a track-plate, of a shiftable frame, a plurality of spindles forming separated groups at each end of said frame, nested or grouped rollers mounted upon said spindles, said rollers overlapping each other, and a medial spindle provided with rollers; substantially as described.

17. In a side bearing for cars, the combination with an antifriction device, of springs exerting their energies in opposite directions for returning the antifriction device to a central position after operation; substantially as described.

18. In a side bearing for cars, the combination with a frame containing antifriction devices, of opposing springs for centering the same; substantially as described.

19. In a side bearing for cars, the combination with a reciprocatory antifriction device, and opposing springs acting to center said antifriction device; substantially as described.

20. In a side bearing for cars, the combination with a reciprocatory antifriction device, and opposing springs arranged to extend parallel with the direction of movement of said antifriction devices and acting to center the same; substantially as described.

21. In a side bearing for cars, the combination with a reciprocatory antifriction device comprising a roller-carriage and a plurality of antifriction-rollers caged therein, and opposing springs arranged to center said carriage; substantially as described.

22. In a side bearing for cars, the combination with a reciprocatory antifriction device comprising a carriage and a plurality of roller elements caged therein to maintain definite relation to the carriage, a base upon which said carriage travels, and opposing springs acting to center said carriage relatively to its length of travel across the base; substantially as described.

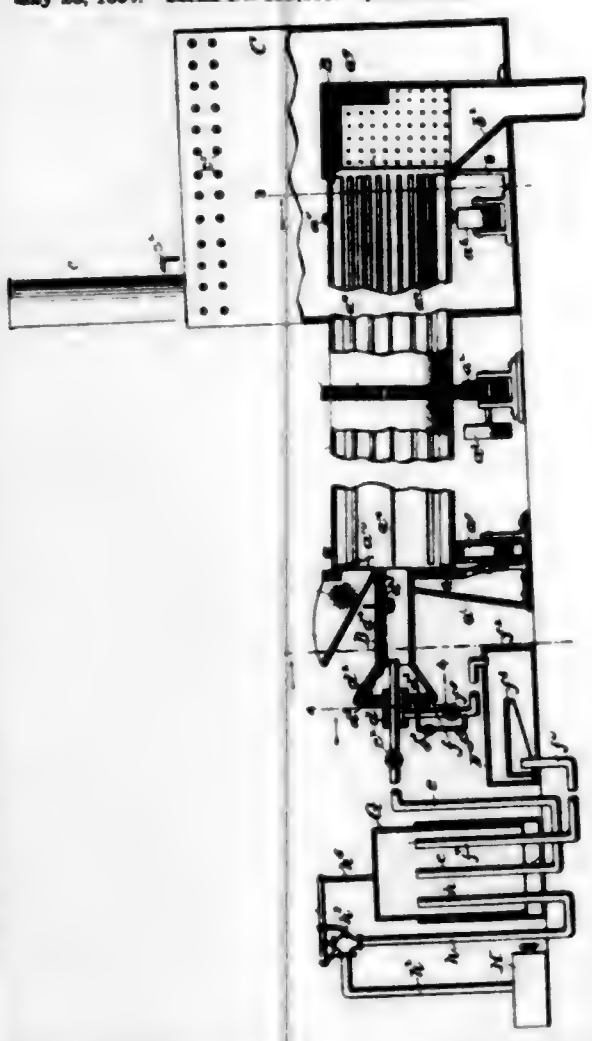
23. In a side bearing for cars, the combination with a frame containing antifriction devices, and opposing springs which bear at one of their ends against said frame and at their other ends against fixed abutments, whereby, the normal position of said frame is determined by the establishment of equilibrium between said springs; substantially as described.

24. In a side bearing for cars, the combination with a track-plate, of a frame containing antifriction devices, which frame is designed to traverse said track-plate, opposing springs, the ends of which are seated against said frame, and abutments against which the opposite ends of said springs are seated, whereby the frame is returned to a normal or central position by the establishment of equilibrium between said springs; substantially as described.

25. In a side bearing for cars, the combination with a frame containing antifriction devices, and coiled expansion-springs jointly engaging said frame in all of its positions and acting to restore said frame to a central position; substantially as described.

26. In a side bearing for cars, the combination with a frame containing antifriction devices in the form of rollers, and coiled expansion-springs under compression at all times and in all positions of said frame, said springs separately acting to restore the frame to a central position, or a position of equilibrium by the preponderating pressure of one spring over the other; substantially as described.

708,602. **DRIER.** ABRAHAM T. WELCH, Baltimore, Md. Filed May 28, 1897. Serial No. 638,659. (No model.)



Claim.—1. The combination in a drier of a chamber, means for blowing or injecting flame thereinto at one end through an opening of smaller diameter than that of the end of the chamber and located some distance above its base, means for supplying to said end of the chamber material to be treated and means operating to advance the material progressively toward the other end of the chamber, substantially as described.

2. The combination in a drier of a chamber, means for blowing or injecting flame thereinto at one end through an opening of smaller diameter than that of the end of the chamber, and located at substantially the center of said end, means for supplying to said end of the chamber material to be treated, and means operating to advance the material progressively toward the other end of the chamber, substantially as described.

3. The combination in a drier of a chamber, means for blowing or injecting flame thereinto at one end through an opening of smaller diameter than that of the end of the chamber and located above the material to be treated, means for supplying to said end of the chamber material to be treated, and means operating to advance the material progressively toward the other end of the chamber, substantially as described.

4. A drier comprising a shell or drum, having its interior provided with a series of shelves, the same increasing in number from the inlet to the exit end of the drum, in combination with means for supplying heat to the drum, substantially as described.

5. A drier comprising a shell or drum, having its interior provided with a series of shelves, the same increasing in number from the inlet to the exit end of the drum, substantially as described.

6. A drier comprising a shell or drum having its interior provided with a series of shelves, a dust-arrester arranged at the discharge end of the drum, comprising an open-work structure, and a brush carried by the drum for removing accumulations from the interior walls of the said arrester, substantially as described.

7. The combination with a chamber of a burner in communication with the inlet end thereof, an air-supply pipe in connection with the burner and projecting beyond the same, substantially as described.

8. The combination with a revoluble drum, of a burner in communication with the inlet end thereof, an air-supply pipe in connection with the burner, and projecting beyond the same, substantially as described.

9. A drier comprising a shell or drum having its interior provided with a series of shelves, a dust-arrester arranged at the discharge end of the drum, comprising an open-work structure, and a dust-room inclosing the dust-arrester, and provided with means for introducing cooler air whereby to chill fine particles of material escaping thereto, substantially as described.

10. The combination with a revoluble drum of a stationary head-plate carrying a combustion-chamber, means for supplying a blast to the said chamber, a burner arranged at the outer end of the said chamber, a fuel-supply pipe entering the combustion-chamber, and means for regulating the supply of fuel to the burner, substantially as described.

11. The combination in a drier of a chamber open at one end and closed at the other, means for blowing flame into the closed end under pressure, and means for supplying to the chamber at the closed end material to be dried.

12. The combination in a drier of a chamber open at one end and closed at the other, means for blowing flame into the closed end under pressure in a direction substantially parallel to the line of discharge, and means of supplying to the chamber at the closed end material to be dried.

13. The combination in a drier of a chamber having a discharge-outlet, means for blowing flame partially therethrough from a passage-way alined with the line of discharge, means for supplying to the said chamber material to be treated, and means operating to advance the material through the chamber without burning, at a varied speed dependent upon the weight of the pieces.

14. The combination in a drier of a chamber having a discharge-outlet, means for forcing flame partially therethrough, in a line substantially parallel to the line of discharge, means for supplying such chamber with material to be treated, and means operating to advance the material through the chamber without burning, toward the outlet, at a speed dependent upon the heat-absorbing capacity of the material.

15. The combination in a drier, of a chamber closed at one end and having a discharge-outlet at the other, an inlet through said closed end having substantially parallel walls, and an area in cross-section less than that of the chamber, means for blowing flame into said chamber through said inlet, means for relieving the pressure of the discharge-outlet and means for supplying to the chamber material to be dried.

16. The combination in a drier, of a chamber provided with a discharge-outlet, a contracted inlet, of an area in cross-section less than that of the chamber, means for blowing the flame through said inlet in a direction substantially parallel to the line of discharge, means for relieving the pressure at the discharge-outlet and means for supplying to the chamber at or near the flame-inlet material to be dried.

17. The combination in a drier of a chamber having a discharge-outlet, means for blowing flame thereinto, in a direction substantially parallel to the line of discharge, means for relieving the pressure at the discharge-outlet, and means for supplying to the chamber at, or near the fire-inlet, material to be dried, and means for agitating the material so as to bring it into the line of the blast.

18. The combination in a drier of a chamber having a discharge-outlet, means for blowing flame thereinto under pressure in a direction substantially parallel to the line of discharge, means for relieving the pressure at the discharge-outlet, and means for supplying to the chamber at, or near the fire-inlet, material to be dried, and means for subjecting the material intermittently to the action of the blast, first to the highest temperature, and subsequently to the constantly-declining temperature.

19. The combination in a drier of a chamber having a discharge-outlet means for forcing flame partially therethrough in a line substantially parallel to the line of discharge, means for regulating and controlling the temperature of the flame and force of the blast, means for supplying to the said chamber material to be treated, and means operating to advance the material through the chamber without burning.

20. In a drier the combination of a cylinder, means for revolving the cylinder, means for projecting a flame under pressure into one end at or about its center, and means for feeding to the cylinder material to be dried, at the same end as the blast.

21. In a drier the combination of a receiver and agitator for the goods, said receiver being provided with a discharge-outlet, of means for feeding material to be dried to the receiver always at substantially the same point, and means for projecting a flame under pressure directly over the goods in the direction of discharge, the point of maximum temperature in the receiver being substantially opposite the point of maximum bulk of the goods.

22. In a drier the combination of a receiver having a discharge-outlet, means for agitating the goods in the receiver, means for feeding material to be dried to the receiver, always at substantially the same point, and means for projecting a flame directly over the goods in the direction of discharge, the point of maximum temperature in the receiver being opposite the point of maximum bulk of the goods.

23. In a drier the combination of a receiver having a discharge-outlet, means for agitating the goods, means for feeding material to be dried to the receiver always at substantially the same point and means for projecting a flame directly over the goods in the direction of discharge, so located that the point of maximum temperature in the receiver will be opposite the maximum bulk of goods.

24. In a drier the combination of a receiver having a discharge-outlet, the means for feeding the material to be dried to the receiver at one end, always at substantially the same point, whereby a maximum bulk of goods is maintained at the feed end, which gradually declines to the discharge end, means for agitating all the goods to prevent burning, and means for projecting a blast over the goods, the point of inlet of blast being over and opposite the maximum bulk of goods, and above the level of the discharging goods at the discharge end.

25. In a drier the combination of a receiver having a discharge-outlet, embodying a receiving-bed, having a rear wall forming an abrupt angle with the bed, with means for feeding material to be dried to the bed, immediately in front of the abrupt wall, means for agitating all the goods on the receiving-bed, and means for blowing a blast over the goods, the point of inlet of blast being opposite to the point of maximum bulk of goods, and above the level of the discharging goods at the discharge end.

26. In a drier the combination of a receiver, means for projecting a blast thereinto, means for regulating and controlling the force, volume and temperature of the blast to produce a desired power, means for advancing the material to be dried through the chamber, and means for supplying to the receiver material to be dried, and acted upon by the blast so as substantially to balance the power and work at all points in the receiver.

27. In a drier the combination of a receiver, means for projecting a flame thereinto under pressure, means for regulating and controlling the force, volume and temperature of the blast, to produce the desired power, means for advancing the material to be dried through the chamber, and means for supplying to the receiver material to be dried, and regulating the volume of material fed to the receiver, and acted upon by the blast so as substantially to balance the power and work at all points in the receiver, substantially as described.

28. In a drier the combination of a receiver, means for projecting a blast thereinto, means for regulating and controlling the pressure, volume and temperature of the blast to produce a desired power, and means for supplying to the receiver material to be dried in regulated quantity, so as to present to the power at all points in the receiver an amount of work proportional thereto.

29. In a drier the combination of an inclined rotating drum, open at one end and closed at the other by a stationary wall, means for projecting a flame through said wall into said drum at a substantial distance above the base of said drum, means for feeding material to be dried into said drum through said wall, and means for rotating said drum.

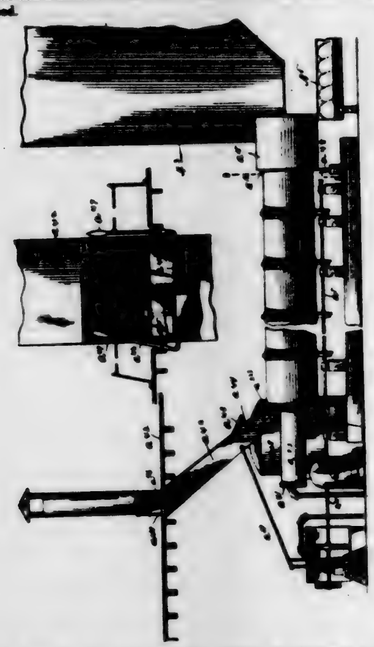
708,603. DRIER. ABRAHAM T. WELCH, Baltimore, Md. Filed Feb. 16, 1899. Renewed July 31, 1902. Serial No. 117,230. (No model.)

Claim.—1. In a drier the combination of a level-drum closed by a vertical wall at one end and open at the other with means for supplying material to be dried to the drum at the closed end, and delivering the same against the vertical wall, so that the material lies in a pile the depth of which decreases from the vertical wall toward the open end of the drum, means for projecting a flame into the drum from its closed end such a distance from the bottom of said drum that the flame upon entering will not impinge upon the goods piled on the bottom, means for rotating the drum and means whereby by the rotation of the drum the material is dropped through the flame and fed through the drum toward the open end thereof.

2. In a drier the combination of a level-drum closed by a vertical wall at one end and open at the other, of means for supplying material to be dried to the drum at the closed end and delivering the same against the vertical wall so that the material lies in a pile the depth of which decreases from the vertical wall toward the open end of the drum, means for projecting a flame through the vertical wall into the drum such a distance from the bottom of said drum that the flame upon entering will not impinge upon the goods piled on the bottom, and means for rotating the drum whereby by the rotation of the drum the material is dropped through the flame and progressed through the drum toward the open end thereof.

3. In a drier the combination of a drum closed at one end by a head substantially at right angles to the axis of the drum, and open at the other, the level of the discharge being the same as that of the base at feed end,

means for supplying to the drum at the closed end material to be dried, means for revolving the drum, and means for projecting into the drum at its closed end a flame at or about the center of the head substantially as described.



4. In a drier the combination of a receiver, the discharge end of which is at substantially the same level as the goods-receiving surface at the feed end, and having at its rear end an abrupt wall high enough to retain in the receiver an incline of goods of such an inclination that goods of any given moisture, while traveling down the incline from the feed to the discharge end of the receiver, will lose the desired quantity of moisture, means for agitating the material to be dried, means for feeding to the receiver measured quantities of material to be dried, means for projecting a flame through said wall such a distance from the bottom of said drum that the flame upon entering will not impinge upon the goods piled on the bottom.

5. In a drier the combination of a rotating drum open at one end, and closed at the other by a stationary vertical wall, means for projecting a flame through said wall into said drum at a substantial distance above the base of said drum, means for feeding material to be dried into said drum through said wall and means for rotating said drum.

6. In a drier the combination of a rotating drum open at one end and closed at the other by a stationary vertical wall, means for projecting a flame through said wall into said drum, means for feeding material to be dried into said drum through said wall, means for rotating said drum, and means whereby by the rotation of the drum the material is fed through the same and dropped through successive parts of the blast.

7. In a drier the combination of a rotating drum closed at one end by a stationary vertical plate, means for rotating said drum and means for adjusting said drum longitudinally, so that it will always bear tightly against said plate.

8. In a drier the combination of a drum composed of sections suitably secured together, flanges on the drum, of flanged friction-rollers for rotating the drum, a combined head-plate, feed-chute and combustion-chamber closing the feed end of the drum and means for shifting the shafts carrying the friction-rollers whereby to cause the drum to bear tightly against the head-plate.

9. The combination with the drying-receptacle provided with means for supplying heat at the feed end and having a cooler arranged at the discharge end, and a dust-collector inclosing the cooler.

10. The combination with the drying-cylinder provided with means for supplying heated products of combustion at the feed end and having a cooler arranged at the discharge end, of a dust-collector inclosing the cooler, substantially as described.

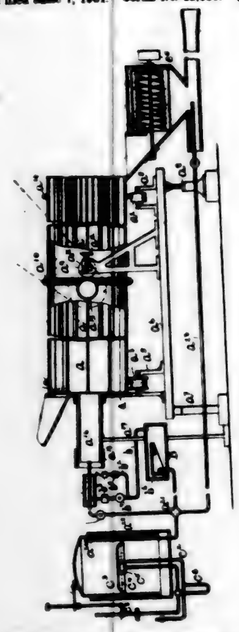
11. The combination with the drying-cylinder provided with means for supplying heated products of combustion at the feed end and having a cooler arranged at the discharge end, a dust-collector inclosing the cooler, said collector being provided with a spray to carry down the dust, substantially as described.

12. The combination with a drying-chamber, of a dust-collector located at the discharge end thereof in position to receive gases and floating particles therefrom but not the bulk of the dry material, consisting of a chamber open at the bottom and nearly closed at the top, the cubical contents of which progressively increases from the bottom toward the top, whereby the dust and floating particles are precipitated, the bulk of material being discharged without passing into the dust-collector.

13. The combination with a drying-chamber, of a dust-collector located at the discharge end thereof in position to receive gases and floating particles therefrom but not the bulk of the dry material, consisting of a chamber open at the bottom for the admission of cool air, the cubical contents of which progressively increase from the bottom to the top whereby the dust and floating particles are precipitated, the bulk of material being discharged without passing into the dust-collector.

14. The combination with a drying-chamber, of a dust-collector located at the discharge end thereof in position to receive gases and floating particles therefrom but not the bulk of the dry material, consisting of a chamber open at the bottom for the admission of cool air and nearly closed at the top, the cubical contents of which progressively increase from the bottom to the top, whereby the dust and floating particles are precipitated, the bulk of material being discharged without passing into the dust-collector.

708,604. DRIER. ABRAHAM T. WELCH, Baltimore, Md. Original application filed Oct. 22, 1897, Serial No. 656,062. Divided and this application filed June 7, 1901. Serial No. 63,859. (No model.)



Claim.—1. In a drier the combination with an inclined rotating drum, open at one end and closed at the other by a stationary wall, means for projecting a flame through said wall into said drum at a substantial distance above the base of said drum, means for feeding material to be dried into said drum through said wall, means for rotating said drum, and means for varying the inclination of said drum.

2. In a drier the combination with an inclined rotating drum, open at one end and closed at the other by a stationary wall, means for projecting a flame through said wall into said drum, means for feeding material to be dried into said drum through said wall, means for rotating said drum, means whereby by the rotation of said drum material is fed through the same and dropped through successive parts of the flame, and means for varying the rate of feed through said drum.

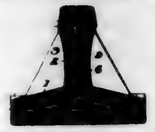
3. In a drier the combination with a drum of means for projecting a flame into said drum at a substantial distance above the base of said drum, means for feeding material to be dried into and through said drum, means for delivering the material from the drum, and means for agitating the material to be dried in cooler air after it has been discharged from the drum.

4. In a drier the combination with a drum of means for projecting a flame into the drum at a substantial distance above the base of said drum, means for feeding the material to be dried into and through said drum, means for agitating the material to be dried in cooler air after it has been discharged from the drum, and means for discharging the material from said agitating means.

5. In a drier the combination with a drum of means for projecting a flame into said drum at a substantial distance above the base of said drum, means for feeding material into and through said drum, means for agitating the material after it is discharged from the drum in cooler air, said agitating means consisting of a screen and a rotating brush.

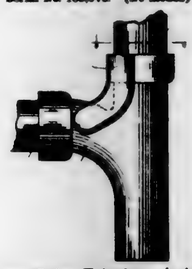
6. In a drier the combination with a drum of means for projecting a flame into said drum at a substantial distance above the base of said drum, means for feeding material into and through said drum, means for agitating the material after it is discharged from the drum in cooler air, said agitating means consisting of a screen and a rotating brush, and means for discharging material from said agitating means.

708,605. RAILROAD-RAIL JOINT. WILLIAM C. WESSEL and HENRY W. JACOB, Pittsburg, Pa. Filed Jan. 20, 1902. Serial No. 90,517. (No model.)



Claim.—In a rail-joint, the combination with the rails having the under faces of their treads grooved, of a chair carrying integral fish-plates, flanges and a base, and flanges on the upper ends of the fish-plates engaging in said grooved treads, vertical enlargements formed on the base of the chair and being apertured to receive the spikes, the said flanges of the base being recessed at their ends on the under side, and wedges adapted to be received within said recessed flanges and engage the upper face of the base, the wedges being located on each side of the rail-web and being engaged from the exterior of the ends of the chair-flanges, substantially as described.

708,606. VENTILATING-T. EDWARD F. WIETER, Chicago, Ill., assignor of one-half to Frederick H. Letourneau, Chicago, Ill. Filed Apr. 18, 1902. Serial No. 103,573. (No model.)



Claim.—1. A ventilating-T having a horizontal and a vertical branch, and a vent open at the top and joining with the said horizontal branch out of line with said vertical branch.

2. In a ventilating-T, the combination of a vertical branch, a horizontal branch, and a vent open at the top, said vent joining said horizontal branch out of line with said vertical branch and the mouth of said vent lying substantially adjacent to the said vertical branch.

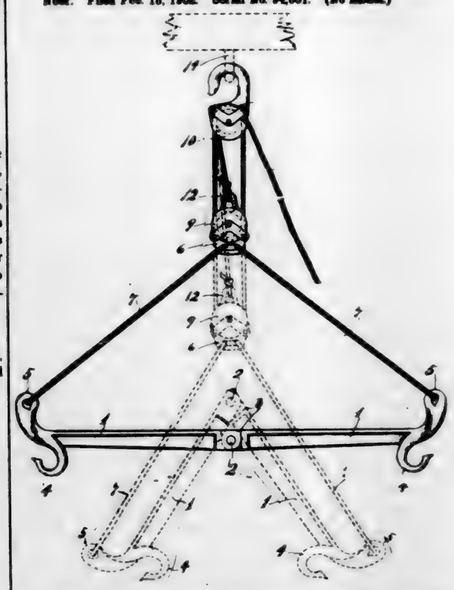
3. In a ventilating-T, the combination of a vertical branch, a horizontal branch, and a vent open at the top, the juncture of said vent lying wholly on said horizontal branch and the mouth of said vent being laterally offset so as not to lie directly above said horizontal branch.

4. A ventilating-T having a horizontal branch, a vertical branch, and a vent, the juncture of the vent with said horizontal branch lying wholly on said horizontal branch and the mouth of said vent lying substantially adjacent to said vertical branch; and the mouth of said vent lying between reference-planes extending transversely to said horizontal branch and tangent to said vertical branch.

708,607. HORSESHOE-PAD. FRANK W. WOOD and MERCER B. MACPHERSON, Chelsea, Mass. Filed Jan. 31, 1902. Serial No. 91,986. (No model.)

Claim.—In a horseshoe-pad, in combination, the rubber cushion comprising the main portion A, the heel portion B, and the substantially elliptical tread portion C, said cushion being formed on its upper surface at the point where the frog is liable to press, with the recess E connecting with the groove F but having no connection with or passage leading to the edge of the cushion; and the leather layer H provided with the hole H' located at the heel but having no connection with or passage to the edge of the layer, and being coincident or registering with said recess, for the purpose of preventing frog-pressure, substantially as set forth.

708,608. GAMBREL. WILLIAM A. H. SANDER, Hopkins, Minn., assignor of one-half to John A. Ehrhardt and Morris B. Myers, Stanton, Nebr. Filed Feb. 18, 1902. Serial No. 94,601. (No model.)



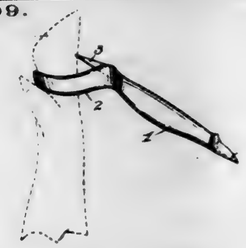
Claim.—The combination with a block and tackle, of a gambrel comprising the compression-toggle 1, the members of which are pivotally connected and are provided with the coöperating stops 3, depending hooks 4 and upwardly-extending lugs 5, and the toggle-links 7 pivotally connected to said lugs 5 and to one of the tackle-blocks, which toggles 1 and 7 are adapted to be buckled or folded into approximately parallel positions, substantially as described.

708,609. COMBINED GRAB AND SCRAPER. WILLIAM A. H. SANDER, Hopkins, Minn., assignor of one-half to John A. Ehrhardt and Morris B. Myers, Stanton, Nebr. Filed Feb. 28, 1902. Serial No. 96,116. (No model.)

Claim.—1. A grab, for use in scalding hogs or for other purposes, comprising a handle provided at one end with a yoke and a brad set at an acute angle to each other, substantially as and for the purposes set forth.

2. A combined grab and scraper, comprising a handle having at one end a yoke and a brad, set at an acute angle to each other, for adapting the device to be used as a grab, and provided at its opposite ends with a scraper, substantially as and for the purposes set forth.

708,609.



708,610. FASTENING DEVICE FOR PINS. JOHN KELLY, Eaton, Ohio. Filed Oct. 5, 1901. Serial No. 77,732. (No model.)

Claim.—1. In a breastpin or the like, the combination with a base-plate, of opposite slotted posts having their slots in mutual alinement, the back of one of the posts having a socket formed therein and communicating with the adjacent edge of the slot thereof, a headed pin thrust through the socket into the slot and having its head loosely received within the socket, the opposite free end of the pin being adapted to be seated in the slot of the other post, and pivotal keepers embracing the respective posts and constructed to prevent accidental displacement of the adjacent ends of the pin.

2. In a breastpin and the like, the combination of a hinge-post having a longitudinal slot formed in one side, and an opening formed in the opposite side and communicating with the slot, a headed pin thrust through the opening in the post with its head received loosely therein and its shank portion working in the slot thereof, and means permanently carried by the post for covering and uncovering the opening therein and to permit insertion and removal of the pin.

3. In a breastpin and the like, the combination of a hinge-post having a longitudinal slot formed in one side, and an opening formed in the opposite side, and communicating with the slot, a headed pin thrust through the opening with its head received loosely therein and its shank working in the slot, and a sleeve permanently swiveled upon the post and having an opening capable of being alined with the opening in the post to uncover the head of the pin.

4. In a breastpin and the like, the combination with a base-plate, of a slotted post projected therefrom and having a socket formed in one side thereof and in communication with the slot, a headed pin-tongue inserted through the socket and the slot with its head loosely received within the socket, and a pivotal keeper embracing the post and constructed to normally lie across the socket to prevent outward displacement of the pin-tongue.

5. A hinge-joint for breastpins and the like, comprising a slotted post having a socket formed in the outer side and communicating with the slot, a headed pin thrust through the socket and the slot and having its head loosely received within the socket, and a pivotal keeper embracing the post and constructed to cover and uncover the socket therein.

6. A hinge-joint for breastpins and the like, comprising a slotted post having a socket formed in its outer side and communicating with the slot, a headed pin thrust through the socket and the slot and having its head loosely received within the socket, a locking-sleeve swiveled upon the post and having an opening to uncover the socket, and also provided in its outer edge with a notch or slot to receive the projected portion of the pin.

7. A hinge-joint for breastpins and the like, comprising a slotted post having a socket formed in its outer side and in communication with one edge of the slot, the outer end of the post having an outwardly-directed marginal flange, a headed pin thrust through the socket and the slot and having its head loosely received within the socket, and a locking-sleeve swiveled upon the post at the inner side of the flange and having an opening to be registered with the socket and also provided with a notch or slot in its outer edge to be normally registered with the opposite edge of the slot.

8. In a breastpin or the like, the combination with a base-plate, of opposite slotted posts projected therefrom and having their slots mutually alined, one of the posts having a socket provided in its outer side and in communication with the slot, a headed pin thrust through the socket and the slot with its head loosely seated in the socket, and keeper-sleeves swiveled upon the respective posts and constructed to lock the adjacent ends of the pin against accidental displacement from the respective posts.

9. In a breastpin or the like, the combination with a base-plate, of opposite slotted posts projected therefrom and having their slots mutually alined, one of the posts having a socket formed in its outer side and in communication with the adjacent slot, a headed pin thrust through the socket and the slot with its head loosely received within the socket and its opposite free end adapted to enter the slot of the other post, a locking-sleeve swiveled upon the socketed post and provided with an opening to register with the socket and also having a notch or slot formed in its outer edge for normal alinement with the inner edge of the slot, and another locking-sleeve swiveled upon the other post and provided with a bayonet-slot to receive and lock the adjacent free end of the pin.

10. A pin-tongue fastener, comprising a stationary post having a longitudinal slot opening outwardly through its outer end, and a keeper comprising a sleeve embracing the slotted portion of the post and permanently swiveled thereon, the sleeve being provided with a substantially L-shaped slot, one member of which is disposed transversely with respect to the slot in the post and located intermediate of the opposite ends thereof, and the other member of the slot opening outwardly through the outer end of the sleeve and adapted to be alined with the slot in the post.

11. The combination with the base-plate of a breastpin and the like, of a pin-tongue fastener comprising a cylindrical post carried by and projected at substantially right angles to the plate and provided with a longitudinal slot opening outwardly through the outer end of the post, and a tubular keeper embracing and permanently swiveled upon the cylindrical slotted portion of the post to cover and uncover the slot.

708,611. SASH-LOCK. ERNEST P. ARMSTRONG, Colorado Springs, Colo. Filed May 7, 1902. Serial No. 106,347. (No model.)

Claim.—1. In a sash lock and holder, the combination of an eccentric cam pivotally mounted on the sash-rail, an adjusting part pivotally connected with the cam and having a limited movement independently thereof, the cam being provided with a projection adapted to be engaged by the adjusting part, for the purpose of regulating the position of the cam, substantially as described.

2. In a sash lock and holder, the combination of an eccentric disk, an adjusting device, a bearing-sleeve connecting the two parts, the extremities of the sleeve projecting beyond the connected parts and being turned over thereon, and a fastening device passed through the bearing-sleeve for securing the lock to the sash-rail, the disk being provided with a stop arranged to be engaged by the adjusting device, substantially as described.

708,612. WIRE-TIE. DANIEL W. AYLWORTH, South Haven, Mich. Filed May 21, 1902. Serial No. 108,223. (No model.)

Claim.—1. In a fence-joint the combination with a wire-stay, of lateral loops integral therewith, a series of line-wires crossing the said loops and crimped within the loop-circle, and means for binding said line-wires to said loops, consisting of individual wire-fasteners one for each loop, each fastener passing through the crimp in the line-wire and having its extremities wrapped about the sides of the loop, substantially as described.

2. The combination with a looped stay, of a line-wire provided with a crimp situated within said loop, and a fastener therefor, consisting of a wire passing through the crimp in the line-wire, and closely wrapped about the sides of the loop.

3. The combination with a looped stay, the said loops extending laterally therefrom and flattened on the sides, of line-wires passing across said loops, the said line-wires being provided with crimps lying within each loop and wire-fasteners wound about the flattened sides of the loops and passing within the crimps in the line-wires, substantially as described.

4. In combination with a stay and line-wire, a loop laterally extending on the stay, a crimp in the line-wire located within the loop, and an individual wire-tie inserted through said crimp and engaging the edges of the loop sides adjacent to the crimps in the line-wire, free extremities of the wire-tie closely wrapped about the sides of the loop and means for preventing the wrapped extremities from slipping longitudinally on the loop, substantially as described.

708,618. WIREWORKING-TOOL. DAVID M. BAILEY, Caldwell, Kans. Filed Sept. 16, 1901. Serial No. 75,528. (No model.)

Claim.—1. A wireworking-tool comprising a handle having a toothed arch, a fixed claw carried by the handle and a movable claw carried by the arch and adapted to be engaged by the teeth thereon and held opposite the fixed claw in position to permit of the twisting of the ends of the wire.

2. A wireworking-tool comprising a handle having an arch, a fixed claw arranged at one end of the handle and situated to one side thereof, a traveling claw mounted on the arch and adapted to be moved to a point opposite the fixed claw.

3. A wireworking-tool comprising a handle 5 having a toothed arch 6, a fixed claw 7, a sliding claw 9 adapted to engage said toothed arch, the fixed claw being provided with a hammer-head.

4. A wireworking-tool comprising a handle having an arched portion and having at one end a curved face, arcuate flanges arranged on said curved face and having oppositely-disposed wire-engaging shoulders.

5. A wireworking-tool comprising a handle having an arched portion and provided at one end with a pair of separated arcuate flanges terminating in recessed shoulders, the ends of said shoulders extending respectively in opposite directions beyond a common medial line in which the wire is situated after the formation of a loop.

6. A wireworking-tool comprising a handle having an arched portion and at one end arcuate flanges 12 provided with oppositely-facing shoulders 13, the opposite ends of said curved portion terminating in claws 20, substantially as specified.

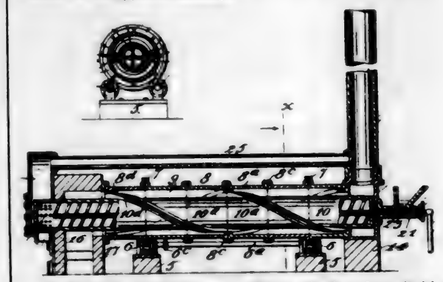
708,614. CARPET-SWEEPER. JONATHAN BARNES, RICHARD W. KENYON, and WILLIAM H. KENYON, Accrington, England. Filed May 2, 1902. Serial No. 105,677. (No model.)

Claim.—1. In a carpet-sweeper the combination with the sweeper-case and the rubber buffer formed in two disconnected lengths, of the corner-bracket provided with slots to receive the ends of the buffer and spring-pieces behind the slots to engage the inner ends of the buffer, substantially as described.

2. In a carpet-sweeper the combination with the sweeper-case and the rubber buffer formed in two disconnected lengths, of the corner-bracket provided with slots to receive the ends of the buffer, spring-pieces behind the slots to engage the inner ends of the buffer, and a guard-piece covering the slot to prevent the end being projected through to too great an extent, substantially as described.

708,615. ORE-ROASTING APPARATUS. ADOLPH M. BEAR, Denver, Colo. Filed Apr. 1, 1901. Serial No. 53,980. (No model.)

Claim.—1. In an ore-roasting apparatus the combination with the source of heat, and a stack, of a shell mounted to rotate, a conveyer located therein and connected to rotate therewith, the relative size of the shell and conveyer being such that a chamber surrounding the conveyer is formed, said chamber being in communication with the source of heat at one extremity and with the stack at the other extremity, but having no communication with the interior of the conveyer, a spiral partition located between the shell and conveyer to cause the heat to travel in a spiral path through the intervening chamber, means for feeding the ore to the conveyer at one extremity, and means for discharging the ore therefrom at the opposite extremity.



2. In an ore-roasting apparatus, the combination of a cylindrical shell mounted to rotate, a conveyer passing through the shell, a space surrounding the conveyer being left within the shell, the shell and the conveyer being respectively provided with interior and exterior spirally-arranged ribs connected to form spiral partitions within the intervening chamber, the said chamber communicating with a source of heat at one extremity and with a stack at the opposite extremity, suitable means for rotating the shell and conveyer which are connected to revolve in unison, means for feeding the ore at one extremity of the conveyer, and means for discharging the roasted ore at the opposite extremity.

3. In an ore-roasting apparatus, the combination with a furnace and stack, of a rotary shell, a cylindrical conveyer passing through the shell and of such size as to leave a concentric chamber between the shell and conveyer, said chamber being in communication with the fire-box of the furnace at one extremity, and with the stack at the opposite extremity, the parts being so arranged that the interior of the conveyer has no communication with the said chamber, the shell and conveyer being respectively provided with interior and exterior spirally-arranged, longitudinally-grooved ribs, and a tongue connecting said ribs whereby the shell and conveyer are made to rotate together.

4. In an ore-roasting apparatus the combination with a furnace and stack, of a chamber communicating with the fire-box of the furnace at one extremity, and with the stack at the opposite extremity, a conveyer passing through said chamber and provided with interior, spirally-arranged ribs or threads arranged to cause the ore to travel therethrough, and a longitudinally-disposed perforated partition located within the conveyer and through which the ore must pass as it travels therethrough, means for rotating the conveyer, means for feeding the ore to one extremity of the conveyer, and means for discharging it at the opposite extremity.

5. In an ore-roasting apparatus, the combination with a furnace and stack, of a combustion-chamber communicating at one extremity with the furnace and at the other extremity with the stack, a revolvable conveyer located in said chamber and provided with spiral threads or ribs formed on its interior, longitudinally-disposed perforated partitions located in the interior of the conveyer, and a feed-screw for feeding the ore to the conveyer, the opposite extremity of the conveyer being perforated to allow the ore to escape.

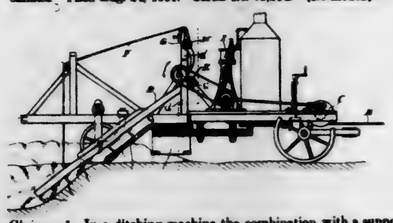
6. The combination with a furnace and stack, of a shell composed of sections suitably connected, a conveyer located within the shell and also composed of sections, the shell and the conveyer being connected by spiral partitions to rotate together, an annular chamber being formed between the shell and conveyer, said chamber communicating at one extremity with the furnace and at the other extremity with the stack, but having no communication with the interior of the conveyer, means for feeding the ore to the conveyer at one extremity, and means for discharging it at the opposite extremity.

7. In an ore-roasting apparatus the combination with a furnace and stack, of a rotary shell, a conveyer located within the shell and connected to rotate therewith, a chamber formed between the shell and conveyer, and communicating with the furnace at one extremity and with the stack at the opposite extremity, but having no communication with the interior of the conveyer, means for feeding the ore to the front end of the conveyer, the opposite extremity of the conveyer being constructed to dis-

charge the ore, and a chamber into which the discharge extremity of the conveyer protrudes, for receiving the gases resulting from the roasting operation, said chamber having a discharge-opening at the bottom for the ore, and an escape-opening communicating with its upper portion through which the gases may be carried to any desired location.

8. In an ore-roasting apparatus, the combination with a furnace and stack, of a shell mounted to rotate, a conveyer passing through the shell, an annular chamber located between the shell and conveyer, the conveyer and shell being connected to rotate together, the chamber between them being in communication at one extremity with the fire-box and at the other extremity with the stack, but having no communication with the interior of the conveyer, a hollow head into which the front extremity of the conveyer protrudes, a screw feed-conveyer connected with the said head for feeding the ore to the rotary conveyer, the rear extremity of the rotary conveyer being perforated, and a chamber surrounding said rear extremity, and having a discharge-opening below, and an escape for the gases above.

708,616. DITCHING-MACHINE. THOMAS BEARMAN, Windsor Canada. Filed Aug. 24, 1901. Serial No. 73,204. (No model.)



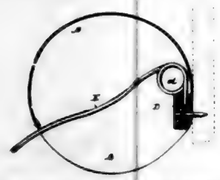
Claim.—1. In a ditching-machine the combination with a supporting-frame mounted upon wheels of a ditching-boom provided with a plurality of hoe or scraper blades fixedly secured thereto at intervals along the under side thereof and extending transversely thereof and carrying means freely supporting said boom in an opening of the frame longitudinally thereof and inclined at an angle to the ground, said carrying means comprising a revolving crank-shaft journaled transversely of the frame and upon which the forward end of the boom is supported above ground free to follow the motion of said crank and a chain or rope supporting the rear end of said boom below the surface of the ground free to rise and fall and having a conjointed movement with the crank to impart to said boom a continuous operative four-motion movement.

2. In a ditching-machine, the combination with a supporting-frame mounted upon wheels of a ditching-boom provided with a plurality of hoe or scraper blades secured thereto at intervals along its under side and extending transversely thereof, and carrying devices movably supporting said boom in an opening of the frame in a longitudinal vertical plane inclined at an angle to the ground said carrying devices comprising a revolving crank-shaft journaled upon the forward part of the frame and supporting the forward end of the frame free to revolve with said crank-shaft at some distance above the ground and a chain or rope supporting the rear end of said boom at a distance below the ground free to rise or fall with the movement of said chain or rope, said rope or chain having a concerted movement with the crank-shaft to impart to the boom a continuous four-motion movement and provided with means for lengthening and shortening it.

3. In a ditching-machine, the combination of the supporting-frame having a central longitudinal opening and supported upon wheels, the ditching-boom movably supported in said opening at an angle with the ground and provided with a series of scraper-blades along its under side, the revolving crank-shaft journaled transversely above the frame and supporting the front end of the boom above the ground, the chain or rope from which the rear end of said boom is supported from the frame below the surface of the ground, the oscillating lever mounted upon the crank-shaft in the path thereof and to which the chain or rope is connected for imparting movement to said rope, the conveyer-trough independently adjustably supported on the frame below the ditching-boom and means for adjusting said ditching-boom and conveyer-trough upon different inclines with the ground.

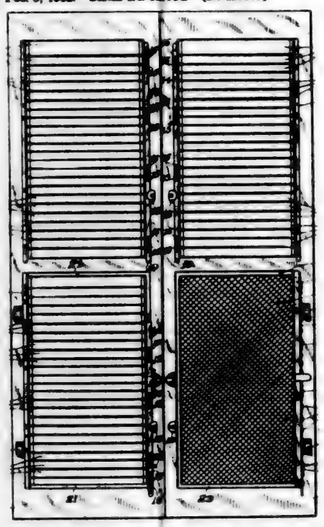
4. In a ditching-machine, the combination with a supporting-frame mounted upon wheels of a four-motion ditching-boom centrally supported in a longitudinal vertical plane in the opening of the frame at an incline to the ground and provided upon its under side with a series of scraper blades for cutting the ditch by the motion of the boom, and two lateral booms supported from the frame at right angles thereto at opposite sides and in the path of the dirt thrown out by the ditching-boom, said lateral booms provided with scraper-blades upon their under side and having a concerted four-motion movement with the ditching-boom.

708,617. RECEPTACLE FOR PAPERS AND LETTERS. DELBERT F. BENNETT, Redding, Cal. Filed May 1, 1902. Serial No. 105,537. (No model.)



Claim.—In a device for receiving and holding papers and letters a cylindrical casing having two circular heads secured to the main portion of the casing and a longitudinal downward opening extending from end to end, the upper part of the device being closed, a cleat fastened to the rear part and inside of said casing, and a spring of wire, the ends of which are secured to said cleat, said wire being provided with coils *d* and extended forward in the form of a loop and bent to form a finger-piece *e*, substantially as and for the purposes described.

708,618. WINDOW-BLIND. WARREN R. BRIGGS, Stratford, Conn. Filed Feb. 5, 1902. Serial No. 92,684. (No model.)



Claim.—1. In a window-blind, the combination of the shutter-frame, having at opposite sides of its opening sockets and inclined open recesses which constitute bearings, the blind-slats having trunnions at both ends adapted to fit within said bearings and provided with elongated recesses in one end of each slat, the locking-strip secured to the shutter-frame in close proximity to the trunnions in said recess-bearings, and the operating-bar adjustably secured to the shutter-frame and having lugs which project within said recesses, substantially as set forth.

2. In a window-blind, the combination of the shutter-frame having the sides of its opening provided with inclined open recesses and sockets, the blind-slats having at their ends metal ferrules and trunnions which latter are adapted to fit within said sockets and recesses, while one end of each slat is provided with an elongated recess, means for locking the trunnions as against displacement in said recesses, and a vertically-adjustable bar carried by the shutter and having lugs which engage with said recesses whereby the blind-slats may be operated in harmony, substantially as set forth.

3. In a window-blind, the combination of the sockets and inclined open recesses which form bearings at opposite sides of a suitable frame, the independent blind-slats provided with trunnions which rest within said bearings, one end of each slat having an elongated recess, the locking-strip secured to said frame and extending in close proximity to the trunnions in said recesses, and the operating-bar adjustably secured to said frame and provided with lugs which project within said recess, substantially as set forth.

4. In a window-blind, the sockets and inclined open recess-bearings arranged at the opposite sides of a suitable frame, the independent slats provided with trunnions which rest within said bearings, and means operatively connected with the slats at one side for turning said slats in unison, substantially as set forth.

5. In a window-blind, the combination of the shutter-frame supporting at opposite sides of its opening sockets and open recess-bearings, the blind-slats having metal ferrules on their ends and provided with trunnions which rest within said bearings, and an operating-bar suitably guided and capable of vertical movements and loosely connected with said slats at one side, substantially as set forth.

6. In a window-blind, the combination of the shutter-frame having on opposite sides of its opening sockets and open recesses, the blind-slats provided at each end with metal ferrules and trunnions which latter extend within said sockets and recesses, the elongated recesses in one end of each slat, the locking-strip secured to the shutter and adapted to confine the trunnions at one side of the slats within said open recesses, the operating-bar having lugs which engage said recesses and provided with elongated slots, and screws extending through said slots into the shutter whereby said bar is guided and is capable of a free vertical play, substantially as set forth.

7. In a window-blind, the combination of the sockets and inclined open recess-bearings arranged at opposite sides of a suitable frame, the independent blind-slats provided with trunnions which rest within said bearings, means for confining said trunnions within the recess-bearings, and an operating-bar adjustably secured at one side of the frame and loosely connected with the ends of the slats, substantially as set forth.

708,619. SHUTTER-FASTENER. WARREN R. BRIGGS, Stratford, Conn. Filed Feb. 5, 1902. Serial No. 92,685. (No model.)

Claim.—1. The herein-described improvement in latches for swinging blinds or shutters, comprising two independent levers pivoted to the inside of the shutter in the plane of the sash, said levers provided at their free extremities with right-angled beveled catches, substantially as set forth.

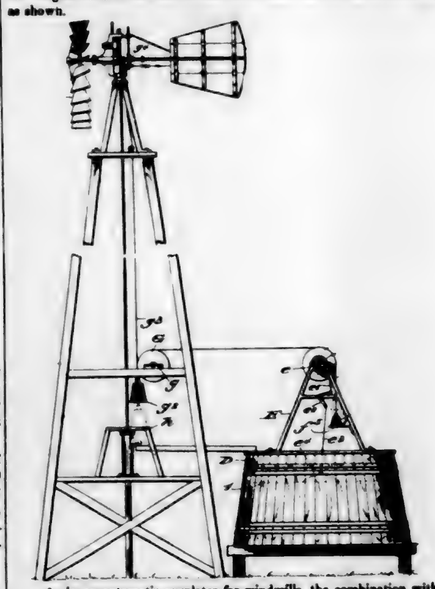
2. The herein-described improvement in catch-holders for swinging shutters and blinds, the same comprising a base-plate having screw-holes at the top and bottom which are separated vertically by a distance slightly greater than the width of a brick, and provided with flanges at the sides, and a plate inserted between said flanges and held in any suitable adjustment by the clamping of said flanges and provided with a suitable catch-holder, substantially as set forth.

708,620. AUTOMATIC REGULATOR FOR WINDMILLS. ERNEST A. BRADLEY, Brighton, Colo. Filed Feb. 6, 1902. Serial No. 92,842. (No model.)

Claim.—1. In a regulator for windmills, the combination with a water-tank and pumping mechanism therefor, of a sheave supported above the said tank; cables passing around the said sheave, one of which carries a weight, while the other carries a float; a cable which passes around the said sheave in an opposite direction to the before-mentioned cable, and over a similar sheave, supported by the windmill-tower; a weight depending from the said cable; a cable connecting the said weight with the pump-operating mechanism; the said weight being designed to drop by gravity and stop the mill, when the tank is full, and to be counterbalanced by the combined weights of the aforesaid float and weight, when the water in the said tank falls, so as to allow the mill to start, substantially as shown.

2. In a regulator for windmills, the combination with a water-tank and pumping mechanism therefor, of a differential sheave, and means, such as standards, for supporting the same, above the tank; a cable, one end of which passes around the said sheave, and is secured thereto, while the other end passes over a suitably-supported sheave within the windmill-tower, and is provided with a weight at its free end; a cable connecting the said weight with the pump-operating mechanism; a pair of cables secured to and passing around the said differential sheave in an opposite direction to the before-mentioned cable, one of said cables being provided with a weight, while the other is provided with a float, the combined weights of said float and weight being greater than that of the before-mentioned weight, so as to counterbalance the same, when the water falls in the tanks, and thus permit the pumping mechanism to operate, substantially as shown.

3. In a regulator for windmills, the combination with a water-tank and pumping mechanism, of a cable one end of which connects with the said pumping mechanism, while the other end carries a weight, which normally prevents the operation of said mechanism, a cable, one end of which is secured to the said weight, the said cable passing over a sheave in proximity thereto, and over a differential sheave secured above the water-tank, its free end being secured thereto; cables secured to the said sheave, and passing around the same in an opposite direction to the before-mentioned cable, one of said cables carrying a weight at its free end, while the other of said cables connects with one arm of a crank-lever, to the other arm of which is secured a cable, the lower end of which carries a float, the said float and weight acting in concert to overbalance the before-mentioned weight, when the water falls in the tank, so as to start the pump, while the before-mentioned weight drops when the tank is full, owing to the reduction in the pull exerted against it, as the float is borne up by the water, so as to stop the pump; and platforms upon which the weights rest, at the limit of their downward movement, substantially as shown.



4. In an automatic regulator for windmills, the combination with a water-tank and pumping mechanism therefor of a differential sheave secured above the tank, the said sheave comprising a plurality of small sheaves of varying diameters, and twin sheaves of larger diameter; a cable which passes around one of the twin sheaves one end of which is secured to the same, while the other end depends therefrom, and carries a weight; a cable which is secured to one of the smaller sheaves, and passes around the same; a bell-crank lever, one arm of which connects with the said cable, while to the other arm is secured a cable, the lower end of which carries a float, which is operated by the rise and fall of the water, in the said tank; a cable secured to the remaining twin sheave and passing around the same in an opposite direction to the before-mentioned cable, the said cable extending to and over a sheave supported within the windmill-tower, and carrying a weight at its free end; a second cable secured to the said weight and connecting the same with the pumping mechanism; the said weight operating when lowered to stop the pump and when lifted by the combined weights of the before-mentioned weight and float, as the water falls in the tank, to start the said pump; and platforms upon which the said weights rest when in their lowered position, substantially as shown.

5. In an automatic regulator for windmills, the combination with a water-tank and pumping mechanism therefor of a differential sheave supported above the tank; a second sheave in line with the first-mentioned sheave, supported within the windmill-tower; a cable secured to the differential sheave which passes around the same and over the second sheave, and carries a weight at its free end; means for connecting the said weight with the pumping mechanism; cables secured to and passing around the differential sheave in opposite direction to the before-mentioned cable, one of which carries a weight, while the other carries a float; the combined weights of said weight and float being greater than the before-mentioned weight, so that, as the water in the tank falls, their combined weights will

tarn the differential sheave, wind the cable connected with the before-mentioned weight, and lift the same, causing the pump to start, substantially as shown.

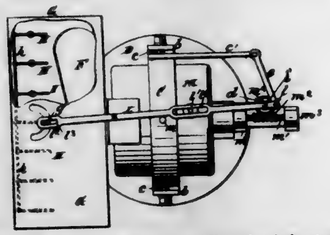
708,621. BABY-BUGGY. RALPH R. CHITMAN, Chattanooga, Tenn.
Filed May 17, 1902. Serial No. 107,795. (No model.)

Claim.—1. A baby-buggy having two beds, the lower being stationary and the other being pivotally supported intermediate of its center and front end and connected at its front end with the lower part of the vehicle by spring-ties, and standards to support the upper bed, said standards having a plurality of notches arranged in step-like series, substantially as described and shown.

2. A baby-buggy having a stationary bed, a pair of standards one on either side of said bed, having a plurality of notches in steps increasing in altitude toward the front of the vehicle, a second body having lateral pins which are supported by the notched standard, said pins being between the center of the second body and the front end and an elastic tie or ties connecting the front end of the second or upper body with the lower vehicle portion, substantially as described and shown.

3. A body mounted on wheels and having a push-bar attachment, standards on either side of said body, a second body pivotally supported above the first on said standards said standards having a plurality of notches of varying altitude and distance from the front end of the body and between that end and the middle of said body, and straps to prevent accidental displacement of said pivots, and elastic and removably-secured ties connecting the two bodies at their front ends, all substantially as described and shown.

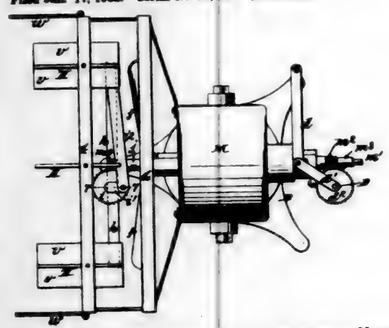
708,622. AUTOMATIC FAN. WALTER R. COLEMAN, Newdorp, N. Y., assignor to the Coleman Manufacturing Company, a Corporation of New York.
Filed Dec. 10, 1901. Serial No. 85,374. (No model.)



Claim.—1. The combination of a fan F, an electrical motor M, pivotally supported in the ring C, said ring C, pivotally supported between the arms *b*, *b*, upon the base B, and formed with the rigid arm *c'*, the lever-arm *c*, pivotally connected to said rigid arm *c'*, and to the crank *d'*, said crank *d'*, shaft D, and pinion *d*, and the motor-shaft *m'*, formed with the worm-screw m^2, engaging with said pinion *d*, for the purpose and substantially in the manner set forth.

2. The combination of a fan F, an electrical motor M, pivotally supported in the ring C, said ring C, pivotally supported between the arms *b*, *b*, upon the base B, and formed with the rigid arm *c'*, the lever-arm *c*, pivotally connected to said rigid arm *c'*, and to the crank *d'*, said crank *d'*, shaft D, and pinion *d*, and the motor-shaft *m'*, formed with the worm-screw m^2 engaging with said pinion *d*, the rock-lever L, connected with the crank *d'*, and the deflectors H, together with said deflectors, arranged and operated substantially in the manner set forth.

708,623. FAN. WALTER R. COLEMAN, Newdorp, N. Y., assignor to the Coleman Manufacturing Company, a Corporation of New York.
Filed Jan. 17, 1902. Serial No. 90,144. (No model.)



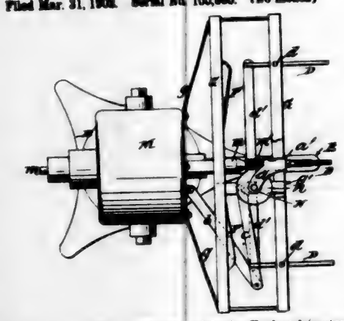
Claim.—1. The combination of the fan *f*, electric motor M mounted upon the vertical spindle S, said spindle S, supported in the base B, by means which admit it to turn axially, said base B, the standard *c'*, rigidly secured to said base, the lever-arm *d*, pivotally connected to said standard *c'*, and to the crank *d'*, the crank *d'*, shaft D, and wheel d^2, and the motor-shaft formed with the screw-worm m^2, engaging with the wheel d^2, for the purpose and substantially in the manner described.

2. The combination of the fan *f*, electric motor M mounted upon the vertical spindle S, said spindle S, supported in the base by means which admit it to turn axially, said base B, means for turning the motor horizontally on said base the guard-frame G, supported upon the motor-casing, the deflectors H pivotally supported in the frame G, the links A, coupling the deflectors H together, the connecting-rod i^2, pivotally connecting the deflectors with the crank i', said crank i', the gear *i*, and the screw-worm m^4, upon the motor-shaft, arranged and operating substantially in the manner and for the purpose set forth

3. The combination of an electric motor and fan, a guard-frame G, supported upon the frame of the motor, deflectors H, mounted pivotally in said guard-frame and formed with cross-vanes *v*, together with means for vibrating said deflectors H on their axes, substantially in the manner and for the purpose set forth.

4. The combination of an electric fan and motor, a guard-frame, deflectors mounted pivotally in said guard-frame, pivotally-connected links coupling said deflectors together, a worm-gear on the motor-shaft in front of the fan, a gear-wheel engaging said worm, a crank attached to and actuating said gear-wheel, and a connection-rod pivotally connecting said crank with the deflectors for the purpose of imparting a vibratory motion to the same, substantially as set forth.

708,624. FAN. WALTER R. COLEMAN, Newdorp, N. Y., assignor to the Coleman Manufacturing Company, a Corporation of New York
Filed Mar. 31, 1902. Serial No. 100,665. (No model.)



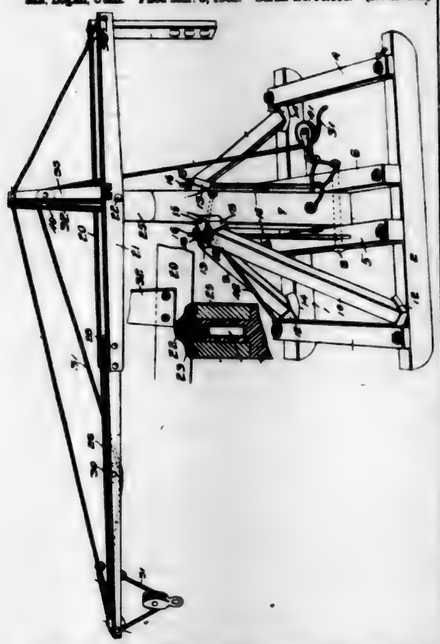
Claim.—1. The combination of the fan F, electric motor M, mounted upon the vertical spindle S, said spindle S, supported in the base B, by means which admit of its turning axially, said base B, the fulcrum-arm *b*, rigidly secured to said base, the lever-arm *c*, pivotally connected to said rigid arm *b*, and to the crank n^3, said crank n^3, the vertical shaft N, the worm-wheel *n*, the motor-shaft *m*, formed with the screw-worm *m'*, engaging with said worm-gear *n*, for the purpose and substantially in the manner set forth.

2. The combination of the fan F, electric motor M, mounted on the vertical spindle S, said spindle S, supported in the base B, by means which admit of its turning axially said base B, the arm E, rigidly secured to the base B, and formed with the longitudinal slot *e*, the stud d^3, attached to a deflector D, and resting in said slot *e*, the deflectors D, pivotally mounted in the guard-frame G, said guard-frame G, rigidly secured to the motor, and means for vibrating the motor for the purpose and substantially in the manner described.

3. The combination of the fan F, electric motor M, mounted upon the vertical spindle S, said spindle S, supported in the base B, by means which admit of its turning axially, said base B, the arm E rigidly secured to the base B, and formed with the longitudinal slot *e*, the stud d^3, attached to a deflector D, and resting in said slot *e*, means for adjusting said stud d^3, horizontally upon said deflector, the deflectors D, pivotally mounted in the guard-frame G, said guard-frame G, rigidly secured to the motor, and means for vibrating the motor for the purpose and substantially in the manner described.

4. The combination of the fan F, the electric motor M, mounted upon the spindle S, said spindle S, supported in the base B, by means which admit of it to turn axially, said base B, the fulcrum-arm *b*, rigidly secured to said base the lever-arm *c*, pivotally connected to said rigid arm *b*, and to the crank n^3, said crank n^3, the vertical shaft N, the worm-gear *n*, the motor-shaft *m*, formed with the screw-worm *m'* engaging said worm-gear *n*, the arm E, rigidly secured to the case B, and formed with the longitudinal slot *e*, the stud d^3 attached to a deflector D, and resting in said slot *e*, the deflectors D, pivotally mounted in the guard-frame G, and said guard-frame G, rigidly secured to the motor, the whole arranged and operating substantially in the manner and for the purpose described.

708,625. HAY DERRICK OR STACKER. WILHELM G. DANIELSEN, Logan, Utah. Filed Mar. 5, 1902. Serial No. 96,806. (No model.)



Claim.—1. The combination with a support and a mast, the one movable angularly with reference to the other, braces disposed radially with reference to the mast, having their lower ends secured on the support against radial movement and their upper ends slidably connected to the mast, and flexible adjustable ties, connecting the support and the upper portions of said braces, whereby the latter may be adjusted on the mast to move the latter angularly, substantially as described.

2. In an apparatus of the character described, a base-platform, a mast supported movably in said platform, braces engaging diametrically opposite points of said platform by their lower ends and loosely engaging diametrically opposite parts of said mast by their upper ends, and adjustable tie-rods connecting the said upper ends of said braces with said platform, whereby the upper ends of said braces may be forcefully adjusted vertically upon said mast, substantially as described.

3. In an apparatus of the character described, a base-platform, a mast supported movably in said platform, braces engaging diametrically opposite points of said platform by their lower ends, cap-blocks upon the upper ends of said braces and adapted to loosely engage diametrically opposite parts of said mast, and means whereby said cap-blocks may be forcefully adjusted vertically upon said mast, substantially as described.

4. In an apparatus of the character described, a base-platform having transverse timbers centrally disposed and spaced apart, a mast pivotally supported by its lower end between said timbers, braces engaging diametrically opposite points of said platform by their lower ends and loosely engaging diametrically opposite parts of said mast by their upper ends, and means whereby the said upper ends of said braces may be forcefully adjusted vertically upon said mast, substantially as described.

5. In an apparatus of the character described, a base-platform having transverse centrally-disposed timbers spaced apart, a mast pivotally connected by its lower end between said timbers, braces engaging diametrically opposite points of said platform by their lower ends and loosely engaging diametrically opposite parts of said mast by their upper ends, adjustable tie-rods connecting said upper ends of said braces and said transverse timbers, whereby the upper ends of said braces may be forcefully adjusted vertically upon said mast, substantially as described.

6. In an apparatus of the character described, the combination of a base-platform having transverse timbers spaced apart and centrally disposed, a mast pivotally supported between said transverse timbers, braces engaging diametrically opposite points of said platform by their lower ends, cap-blocks upon the upper ends of said braces and engaging diametrically opposite parts of said mast loosely, and tie-rods engaging said cap-blocks at one end and said transverse timbers at their other ends, and means for adjusting said tie-rods, whereby said cap-blocks and the braces engaged by them may be adjusted vertically upon said mast, substantially as described.

7. In a device of the character described, a base-platform, a mast supported movably in said platform, braces engaging diametrically opposite points of said platform by their lower ends and engaging diametrically opposite parts of said mast loosely by their upper ends, means for forcefully adjusting the upper ends of said braces vertically upon said mast, a derrick supported upon said mast, a draft-line leading from said derrick to a guide-pulley near the lower end of said mast, and an adjustable stay-rod connecting said mast to said platform in a direction diametrically opposite to the point of attachment of said guide-pulley, substantially as described.

8. In an apparatus of the character described, a base-platform, a mast supported upon said platform, a socket upon the upper end of said mast, a swivel-block revolubly engaged by said socket, a boom formed of spaced side members and pivotally engaging said swivel-block, a hoisting means supported by the forward end of said boom, a strut supported upon said boom at a point in the rear of said swivel means and of said mast, a brace-rod connected to the ends of said boom and supported by said strut, and a draft-cable sheave carried by said strut, and adapted to guide said draft-cable clear of said mast and swivel means, substantially as described.

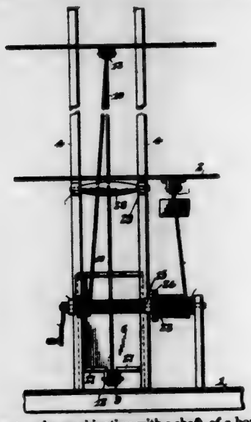
9. In an apparatus of the character described, a mast vertically supported, a socket upon the upper end of said mast, a swivel-block revolubly engaged by said socket, a boom formed of spaced side members and pivotally engaging said swivel-block, a hoisting means supported from the forward end of said boom, a bar pivotally secured by its upper end between the rear ends of said boom members, and depending therefrom and forming a support for a counterweight, substantially as described.

10. In an apparatus of the character described, a mast vertically supported, a socket upon the upper end of said mast, a swivel-block revolubly engaged by said socket, a main boom formed of spaced side members and pivotally engaging said swivel-block, an extension-boom formed of spaced side members and connected removably to the forward end of said main boom, a strut connected to said main boom and rising therefrom, a brace-rod connected by its ends to the rear end of said main boom and the forward or free end of said extension-boom, and supported by said strut, substantially as described.

708,626. ELEVATOR. LEONARD W. DEITZ, San Jose, Cal.
Filed Dec. 23, 1901. Serial No. 86,919. (No model.)

Claim.—1. In an elevator, the combination with a polygonal skeleton shaft made up of upstanding angle-shaped guideways at the corners thereof, of a polygonal open top box or car mounted in the shaft with its upright edges working in the corresponding guideways, guide-pulleys upon the bottom of the car and located between corresponding upright corners thereof, a hoisting-cable having one end fixed at a point between a pair of guideways and its intermediate portion engaging the guide-pul-

lays on the box, a fixed guide-pulley located opposite the fixed end of the cable, the free portion of the cable passing over the fixed guide-pulley, means for operating the cable to raise and lower the box or car, and a counterbalance connected to the operating means and independent of the box or car.



2. In an elevator, the combination with a shaft, of a box or car working therein, a hoisting-cable connected to the box or car, a winding-drum having a cable connected thereto, a weight-drum mounted independently of the hoisting-drum, a pinion upon the hoisting-drum, a gear carried by the weight-drum in mesh with the pinion and of greater diameter than said pinion, and a counterbalance-weight having a cable connected to the weight-drum.

3. In an elevator, the combination with the floor having a shaft-opening therein, of upstanding rigid guideways forming the shaft and projected above the floor, an open-top box or car working in the guideways and provided upon its bottom with a cable-guide, a fixed cable-guide located below the floor at one side of the shaft-opening, a hoisting-cable having one end fixed at a point opposite the fixed cable-guide and passing around the guide on the box or car and around the fixed cable-guide, means for manipulating the cable to raise and lower the box or car, the space across the top of the shaft formed by the guideways being open to permit the box or car to project above the floor into the room when elevated to its upper limit by the hoisting-cable, means carried by the car for engagement with the floor to stop the car, and a counterbalance connected to the manipulating means and independent of the box or car.

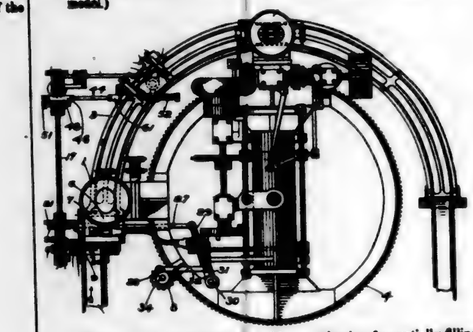
4. In an elevator, the combination with a shaft, a cage or car working therein, a winding-drum, a hoisting-cable connected to the cage or car and the drum, and a supporting-guide for the intermediate portion of the cable, of a tapered antifriction guide-roller located in the path of the cable adjacent to the drum and fixed against endwise movement.

5. In an elevator, the combination with a shaft, a cage or car working therein, a winding-drum, a hoisting-cable connected to the cage or car and the drum, and a supporting-guide for the intermediate portion of the cable, of an antifriction guide-roller which is fixed against endwise movement tapered in opposite directions from the middle thereof and located in the path of the cable adjacent to the drum.

6. In an elevator, the combination of a shaft, a cage or car working therein, a winding-drum mounted externally upon the shaft, a hoisting-cable connected to the cage or car and the winding-drum, a supporting-guide for the intermediate portion of the cable, and an antifriction guide-roller which is fixed against endwise movement tapered in opposite directions from its center and mounted externally upon the shaft above the winding-drum and in the path of that portion of the hoisting-cable which extends to the drum.

7. In an elevator, the combination with the floor having a substantially rectangular shaft-opening formed therein, four angle-guideways rising from below the floor and projected upwardly through the corners of the opening in said floor, a box having its upright corners working in the guideways, guide-pulleys mounted externally upon the bottom of the box, a hoisting-drum, a fixed guide-pulley located above the drum, a hoisting-cable having one end fixed and its opposite end connected to the hoisting-drum, the intermediate portion of the cable being passed across the pulleys of the box and over the fixed guide-pulley, a weight-drum in operative relation to the hoisting-drum, a guide-pulley located above the weight-drum, a weight-cable reeved through the pulley and having one end connected to the weight-drum, and a counterbalancing-weight connected to the opposite free end of the weight-cable.

708,627. **PACKAGING-MACHINE.** WILLIAM H. DOBLE, Quincy, Mass., assignor to Pneumatic Scale Corporation, Portland, Me., a Corporation of Maine. Filed Apr. 3, 1902. Serial No. 101,253. (No model.)



Claim.—1. In a packaging-machine, mechanism for partially filling the package, a support for the package which holds the package stationary and free from agitation during the process of filling, mechanism for suspending the supply after the package is partially filled, mechanism for settling the material in the partially-filled package after the supply is suspended, and mechanism which gives an additional supply of material to the package after the settling, substantially as described.

2. In a packaging-machine, mechanism for partially filling the package, mechanism for suspending the supply after the package is partially filled, mechanism for squeezing the sides of the partially-filled package and mechanism for lifting and dropping the package alternately with the squeezing, and mechanism which after the squeezing and shaking supplies additional material to the package, substantially as described.

3. In a packaging-machine, mechanism for partially filling the package, a support for the package which holds the package stationary and free from agitation during the process of filling, mechanism for removing the partially-filled package and placing another package in position to be partially filled, mechanism for settling the material in the partially-filled package while the succeeding one is receiving its partial load, and mechanism which removes the settled package to another feed and mechanism which furnishes to the settled package an additional supply while one following it is being settled and still another is receiving a partial load, substantially as described.

4. In a packaging-machine, mechanism for partially filling the package, mechanism for suspending the supply after the package is partially filled, mechanism for squeezing the sides of the partially-filled package, and mechanism for supplying additional material to the package after the squeezing, substantially as described.

5. In a packaging-machine, a plurality of feeds, a support for the package which holds it stationary and without agitation during the feeding operation, mechanism for carrying each package to positions to successively receive goods from each feed, and mechanism for settling the goods in the package after the package receives its supply from the first feed and before it receives its supply from the last feed, substantially as described.

6. In a packaging-machine, a plurality of feeding mechanisms, mechanism which places each package in position for each feed in succession, a support for the package which holds it stationary and without agitation during the feeding operation, a vertically-reciprocating member on which the package is deposited after being partially filled before it receives the completion of its supply, and mechanism for vertically reciprocating said member and giving a vertical vibratory movement to the package, substantially as described.

7. In a packaging-machine, two feed mechanisms, intermittent package-moving mechanism which deposits each package under each feed in succession with a rest in its passage from the first feed position to the second feed position, a vertically-reciprocable member upon which the package is deposited by said intermediate movement, mechanism which raises the reciprocable member and package and abruptly drops them onto a seat, and mechanism which squeezes the package alternately with the vertical movement.

8. In a packaging-machine, two feed mechanisms, a package-carrier, mechanism which actuates the carrier to place a package in position to receive material from the first feed, a support for the package which holds the package stationary and free from agitation during the feeding operation, mechanism which actuates the carrier to move the package away from the feed position and brings another package into feed position, mechanism which stops the carrier, mechanism which settles the material in the removed package while the carrier is at rest and while the following package is receiving material, and mechanism which actuates the carrier to transfer the package from the position where it is settled to the second feed mechanism, and mechanism which causes the package to receive an additional supply from the second feed, substantially as described.

9. In a packaging-machine, mechanism for supplying material to a package, mechanism for cutting off the feed, mechanism for shaking the package and mechanism for squeezing it alternately with the shaking a plurality of times, and mechanism for supplying an additional amount of material to the package after the shaking and squeezing, substantially as described.

10. In a packaging-machine, mechanism for squeezing a partially-filled package comprising a pair of pivoted gripping-arms, mechanism which rocks said arms so as to bring them on opposite sides of the package, mechanism which then rocks said arms toward each other to squeeze the package, and mechanism which releases the gripping-arms from the package, substantially as described.

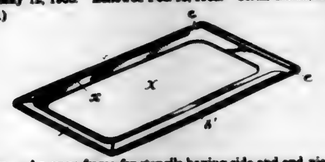
11. In a packaging-machine, mechanism for squeezing a partially-filled package comprising gripping-arms pivoted so as to be capable of turning on two axes at right angles to each other, hinged ears on the inner faces of said arms, mechanism which rocks the arms on their pivots so as to squeeze the package, and mechanism which releases the gripper from the package, substantially as described.

12. In a packaging-machine, mechanism for partially filling the package, while at rest, a support which holds the package stationary and free from agitation during the feeding operation, mechanism for settling the material in the package when partially filled, mechanism for completing the supply to the package and means which cause said filling and settling mechanisms to perform their operations synchronously on different packages and successively on the same package in the order specified, substantially as described.

13. In a packaging-machine, mechanism for partially filling a package, a support which holds the package stationary and free from agitation during the process of filling, mechanism for completing the supply to said package, mechanism for transferring the partially-filled package from the partial supply mechanism to the final supply mechanism, mechanism for stopping the package at a point between the two supply mechanisms, mechanism for agitating said package at said stopping-point, and means which cause the filling and settling mechanisms to operate on different packages while the transferring mechanism is at rest, substantially as described.

14. In a packaging-machine, mechanism for partially filling a package, mechanism for transferring the package to a point where it receives a further supply, mechanism for giving to the package said further supply, mechanism which grasps and agitates said package at a point between said supply mechanisms, and means for moving said package-grasping mechanism into and out of the path of movement of said package, substantially as described.

708,628. **STENCIL-FRAME.** STERLING ELLIOTT, Boston, Mass., assignor to the Elliott Company, Boston, Mass., a Corporation of Maine. Filed May 12, 1900. Renewed Feb. 13, 1902. Serial No. 93,960. (No model.)



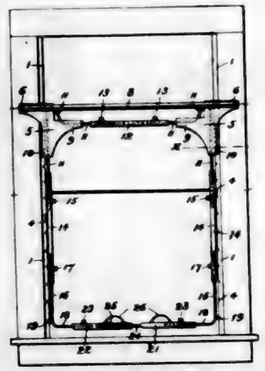
Claim.—An open frame for stencils having side and end pieces with overhanging flanges forming channels in each thereof, the flange of one of the end pieces of a different width from the cross-piece below, and with notches *e s* in the side pieces adjacent to the end piece, substantially as set forth.

708,629. **ADJUSTABLE WINDOW-SHADE CARRIER.** ARTHUR W. ELLIS, Sumpter, Oreg. Filed Feb. 13, 1901. Serial No. 47,177. (No model.)

Claim.—1. In a shade-holder, the combination of a frame comprising vertical extensible members, a lower horizontal extensible member and an upper horizontal extensible member, corner-brackets at the junctures of the vertical and upper horizontal member, and bearing-brackets for a shade-roller on said corner-brackets.

2. In a shade-holder, the combination of vertical extensible members, and upper horizontal extensible member, corner-brackets at the juncture of said members, bearing-brackets on the corner-brackets, a lower extensible member between the vertical members, and a spring carried by the lower extensible member for pressing the vertical members outwardly.

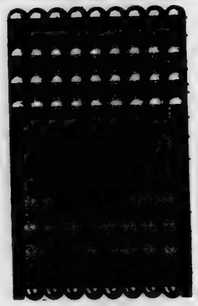
3. In a shade-holder, the combination of a frame comprising vertical and horizontal extensible members, a spring for pressing the vertical members laterally, shade-brackets carried by the frame, and devices to be secured to a window-frame to receive and guide said laterally-pressed vertical members.



4. In a shade-holder, the combination of a frame having vertical and upper and lower horizontal portions, guiding devices to be secured to a window-casing, lugs on the vertical portions to engage the guiding devices on the window-casing and sustain the frame, the lower portion of the frame comprising two sections, a spring between said sections to retain the lugs in engagement with the window-casing, and means on the frame for supporting a roller.

5. In a shade-holder, the combination with upper corner-brackets, a horizontal bar, vertical bars, means for adjustably connecting said bars to the corner-brackets, means for connecting the lower ends of the vertical bars, means for supporting a roller on the frame thus formed and means for adjustably attaching the frame to a window-casing.

708,630. **WOVEN FABRIC.** THEODORE PAPTA, Chicago, Ill. Filed Oct. 3, 1901. Serial No. 77,679. (No specimens.)



Claim.—1. A woven fabric consisting of several weft-planes located one on top of the other and warp-threads separately securing each of said weft-planes to the plane or planes below the same.

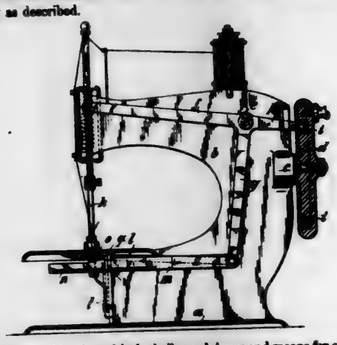
2. A woven fabric consisting of several weft-planes, warp-threads separately securing each of said weft-planes to the plane or planes below the same, and the side edges of the several weft-planes projecting beyond the one next above.

708,631. **FEEDER FOR SEWING-MACHINES.** CARL FÖRSTER, Gablonz, Austria-Hungary. Filed Dec. 9, 1901. Serial No. 85,236. (No model.)

Claim.—1. A sewing-machine feed comprising, the feed-dog provided with an opening, of a horizontally-reciprocating feed-bar projecting at its free end through said opening, provided at opposite sides with oppositely-inclined faces to impart longitudinal reciprocation to the feed-dog and also provided on its upper side with a third inclined face to raise the feed-dog against the goods, and means for effecting the lowering of the feed-dog; substantially as described.

2. The combination with the feed-dog having a depending shank loosely pivoted at its lower end and provided thereabove with an opening.

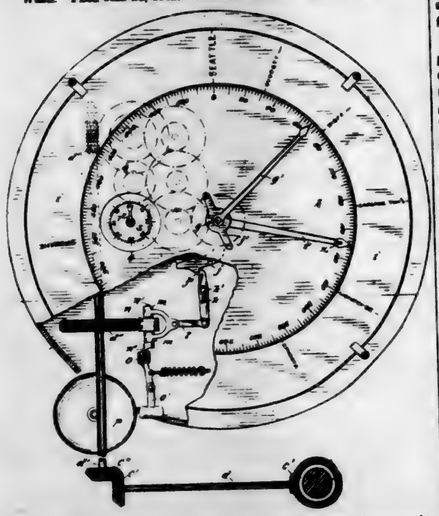
of a horizontally-operating feed-bar, projecting at its free end through said feed-dog opening, provided at opposite sides with oppositely-inclined faces to oscillate the dog back and forth and also provided on its upper side with a third inclined face to raise the feed-dog to the work: substantially as described.



3. The combination with the bell-crank lever and means for operating it, of a needle-bar connected to the horizontal arm of said lever, an oscillating feed-dog having an opening through its shank, a horizontal feed-bar pivoted at one end to the depending arm of the bell-crank lever and at its opposite end passed through the feed-dog opening and there provided on its opposite side with two oppositely-inclined faces to oscillate the feed-dog back and forth, and also provided on its upper side with a third incline to raise the feed-dog to the goods; substantially as described.

4. A sewing-machine comprising the bell-crank lever, means for operating the lever, the needle-bar pivoted to the horizontal arm of the lever, a horizontal pointed looper-bar pivoted to the depending arm of said lever for reciprocation thereby, a loosely-pivoted oscillating feed-dog, having an opening therethrough, and a horizontal feed-bar also pivoted to the depending arm of the said lever, with its free end passed through the feed-dog opening and there provided with three inclined faces to impart positive movement in three directions to the feed-dog; substantially as described.

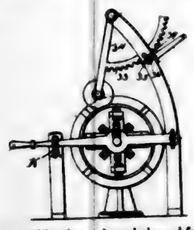
708,682. REGISTER AND ALARM. LAKE E. FORATS, Seattle, Wash. Filed Jan. 23, 1902. Serial No. 91,560. (No model.)



Claim.—1. A combined speed counter, register, and alarm, consisting respectively of a stationary graduated dial, an index-finger, means to revolve said finger from the rotating of one of the wheels of the car; another dial having graduate-marks thereon, an index-finger, means to engage or disengage said finger from its connecting mechanism; and an alarm-bell and means to ring the same from a pointer set at any desired location upon the first-mentioned dial, and adapted to being engaged by the first-named index-finger, and operative connection between the said bell and the said pointer, substantially as and for the purposes set forth.

2. The combination with a car-wheel axle, of a stationary dial having graduate-marks thereon, a train of gears, connection between the said axle and the train of wheels for operating the latter, an index-finger actuated by said train of wheels, a set hand or pointer loosely mounted on a sleeve upon the arbor of the aforesaid index-finger, a bell-crank provided with a stop hung upon said sleeve, means to clamp the said pointer and bell-crank to said sleeve, an alarm-bell, a friction-pulley mounted upon an arbor journaled in swinging boxes, connection between said swinging boxes and the said bell-crank lever such connection being a lever and a reach-rod, a bell-hammer, a crank upon said friction-wheel arbor for vibrating said hammer, a friction-wheel mounted upon the connection between said axle and the said train, a movable annular card having the railway-stations marked thereon; and a speed-meter comprising a graduated dial, an index-finger, geared connection between one of the arbors of the aforementioned train and the last-named index-finger, and means to engage or disconnect said finger from its gear-train, substantially as herein set forth.

708,688. MACHINE FOR MAKING VENEER BARRELS. WILLIS C. CRAFT, Ashtabula, Ohio. Filed June 21, 1901. Serial No. 65,582. (No model.)



Claim.—1. In combination, a barrel-shaped former divided into segmental sections, a main central sleeve passing longitudinally through said former, spiders provided with spider-arms and secured to said sleeve, pins passing radially through said spider-arms and secured individually to said sections, one at either end thereof, short movable sleeves on the main sleeve, bell-cranks pivoted upon the spider-arms, and with their arms severally pivoted to said short sleeves and to the before-mentioned pins, connecting-rods between the short sleeves, a clutch engaging one of the short sleeves, and a main supporting-shaft within said main sleeve, and means for rotating the sleeve, as described.

2. In a machine for the purpose described, comprising a former longitudinally divided into sections, a central supporting-shaft therefor, mounted upon bearings at one end of the former, a main sleeve loosely mounted thereon and secured from longitudinal movement, means for extending and supporting said sections consisting of spiders secured to said main sleeve, bell-cranks pivotally secured to said spiders, short sleeves upon the main sleeve, to which the lower arms of the bell-cranks are secured, and pins mounted radially in said spiders and secured to said sections at their upper extremities and pivoted to the bell-cranks at their lower extremities, connecting-rods between the short sleeves and a clutch upon one of the short sleeves, means for rotating the main sleeve, means for retaining the outer and inner hoops upon the former while the barrel is being constructed, and a temporary support for the face extremity of the shaft, substantially as described.

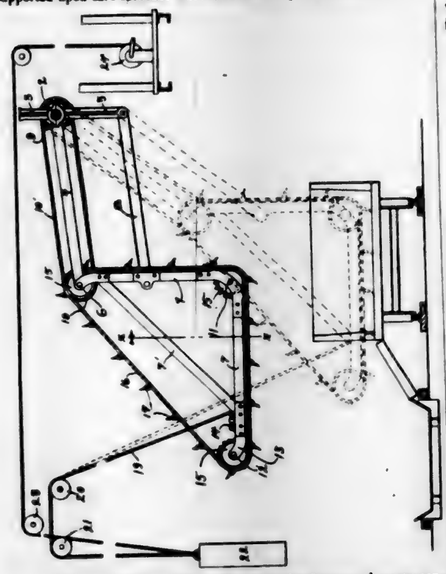
708,684. CANE-UNLOADING MACHINE. WILLIAM C. GIBSON, Minneapolis, Minn. Filed Jan. 14, 1902. Serial No. 89,731. (No model.)

Claim.—1. In a cane-unloading machine, the combination, with a suitable overhead driving-shaft, of bars pivotally supported upon said shaft, an angular frame supported upon said bars, suitable endless rakes supported by said frame and means for operating said rakes, for the purpose specified.

2. In a cane-unloading machine, the combination, with a suitable overhead driving-shaft, of bars pivotally supported upon said shaft a series of angular frames connected together and supported upon said bars, a series of endless rakes mounted upon said frames, and means for simultaneously operating all of said rakes, substantially as described.

3. In a cane-unloading machine, the combination, with a suitable driving-shaft, of bars pivotally supported upon said shaft, a shaft 6 mounted in said bars, means for driving said shaft 6 from said driving-shaft, a series of angular frames mounted upon said shaft 6, means connecting said frames, and a series of endless rakes mounted upon said frames and driven from said shaft 6, substantially as described.

4. In a cane-unloading machine, the combination, of a suitable shaft, means supporting said shaft capable of being raised and lowered, an angular frame mounted upon said shaft, sprocket-wheels upon said shaft, other sprocket-wheels mounted upon said angular frame and endless rakes supported upon said sprocket-wheels, substantially as described.



5. The combination, with a series of angular frames and means connecting said frames, of a shaft upon which said frames are pivoted, supports for said shaft and by means of which said shaft is capable of being raised or lowered, endless rakes supported upon said frames and means for simultaneously operating all of said rakes, substantially as described.

6. The combination, with the angular frame 7, the shaft 6 upon which said frames are mounted, means supporting said shaft and permitting the same to be raised or lowered with said frames, sprocket-wheels upon said shaft 6, other sprocket-wheels upon said frames and endless rakes passing around the sprocket-wheels upon said shaft and also around the sprocket-wheels upon said frames, with means for operating said rakes.

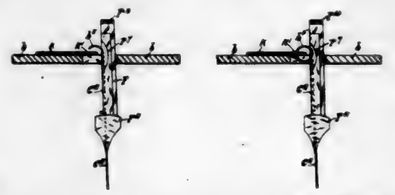
7. The combination, with the driving-shaft 2, of the angular frames, bars 4 pivotally supported upon said driving-shaft and forming pivotal support for said angular frames, bars 8 arranged parallel with said bars 4, endless rakes arranged upon said angular frames, and means for operating said rakes.

708,686. NUT-LOCK. EDWARD S. GEISE, Ottawa, Ohio. Filed June 14, 1901. Serial No. 64,554. (No model.)

Claim.—A nut-lock comprising a piece of tempered sheet metal having a single central bend to form leaves, and curved outward at the bend in opposite directions beyond the planes of the leaves, each of said leaves having an opening one of which is enlarged, and a malleable holding-tongue projecting from one of the leaves, the edges of said leaves being flattened, for the purpose described.

708,686. COMBINED PERFORATING, RING FORMING, AND INSERTING MACHINE. THOMAS HAWTHORNE, London, Canada. Filed Nov. 25, 1898. Serial No. 697,473. (No model.)

Claim.—1. In a machine of the class described, a wiper, D, and means for supporting and operating the same, in combination with a sliding bar, D^2, a toe, D', pivotally supported on said sliding bar, a stop, D^3, rigidly secured to said sliding bar to hold said toe from moving away from said wiper when the latter is moving said sliding bar downward, a head, D^4, secured to the upper end of said sliding bar, and a perforating device, D^5, carried by said head, substantially as and for the purpose set forth.



2. In a machine of the class described, an oscillating disk, B^3, means for supporting and operating the same, and a wiper, D, secured to said disk, in combination with a sliding bar, D^2, a toe, D', pivotally supported on said sliding bar, a stop, D^3, rigidly secured to said sliding bar to hold said toe from moving away from said wiper when the latter is moving said sliding bar downward, a spring, D^4, for returning said sliding bar to its normal position, a head, D^4, secured to the upper end of said sliding bar, and a perforating device, D^5, carried by said head, substantially as and for the purpose set forth.

3. In a machine of the class described, an oscillating disk, B^3, means for supporting and operating the same, and a wiper, D, secured to said disk, in combination with a sliding bar, D^2, a toe, D', pivotally supported on said sliding bar, a stop, D^3, rigidly secured to said sliding bar to hold said toe from moving away from said wiper when the latter is moving said sliding bar downward, a spring, D^4, for returning said sliding bar to its normal position, a head, D^4, secured to the upper end of said sliding bar, a rotating spindle, D^6, supported in said head, a drill, D^7, and pulley-wheel, D^{11}, secured to said spindle, and means for operating said pulley-wheel, substantially as and for the purpose set forth.

4. In a machine of the class described, an oscillating disk, B^3, means for supporting and operating the same, a wiper, D, secured to said disk, a sliding bar, D^2, a toe, D', pivotally supported on said sliding bar, a stop, D^3, rigidly secured to said sliding bar to hold said toe from moving away from said wiper when the latter is moving said sliding bar downward, a head, D^4, secured to the upper end of said sliding bar, a socket, D^{10}, formed in and a perforating device, D^5, secured to said head, in combination with an independently-moving standard, D^{12}, a foot, D^{11}, formed on said standard, a circular aperture, D^{13}, formed in said foot, a guide, D^{14}, secured to said standard, and fitted to and inserted in said socket in said head, and a compression-spring, D^{15}, secured at one end to said standard and at the other end to said head, substantially as and for the purpose set forth.

5. In a machine of the class described, a movable work-support, E^2, in which an opening or recess, E', is formed and means for supporting said movable work-support, in combination with and pivotally secured to a lever, E_2, a notch, E^3, formed in said lever, a wiper, E^4, formed with an angular end, E^5, and means for operating said wiper, substantially as and for the purpose set forth.

6. In a machine of the class described, a movable work-support, E^2, in which an opening or recess, E', is formed and means for supporting said movable work-support, in combination with and pivotally secured to a lever, E, a notch, E^3, formed in said lever, a wiper, E^4, formed with an angular end, E^5, a sliding bar, D^2, to which said wiper is secured, and means for operating said sliding bar, substantially as and for the purpose set forth.

7. In a machine of the class described, a head, D^4, means for supporting the same, a perforating device, D^5, secured to said head, an independently-moving standard, D^{12}, supported in said head, a foot, D^{11}, formed on said standard, a circular aperture, D^{13}, formed in said foot, and a compression-spring, D^{15}, secured at one end to said standard and at the other end to said head, in combination with a movable work-support, E^2, and means for supporting and operating the same, substantially as and for the purpose set forth.

8. In a machine of the class described, a head, D^4, a rotating spindle, D^6, supported in said head, a perforating device, D^5, and a pulley-wheel, D^{11}, secured to said spindle, and means for operating said pulley-wheel, an independently-moving standard, D^{12}, supported in said head, a foot, D^{11}, formed on said standard, a circular aperture, D^{13}, formed in said foot and a compression-spring, D^{15} secured at one end to said standard and at the other end to said head, in combination with a movable work-support, E^2, substantially as and for the purpose set forth.

9. In a machine of the class described, an oscillating disk, B^3, means for supporting and operating the same, a wiper, D, secured to said disk, a

sliding bar, D^3, a toe, D', pivotally supported on said sliding bar, a stop, D^5, rigidly secured to said sliding bar to hold said toe from moving away from said wiper when the latter is moving said sliding bar downward, a spring, D^4, for returning said sliding bar to its normal position, a bracket, d', through which said sliding bar, D^3, extends, a washer, d^2, secured to said sliding bar to prevent the latter from being withdrawn from said bracket by said spring, a head, D^6, secured to the upper end of the sliding bar, D^3, a socket, D^{20}, formed in said head, a perforating device, D^9, secured to said head, and an independently-moving standard, D^{16}, supported in said head, a foot, D^{17}, formed on said standard, a circular aperture, D^{18}, formed in said foot, a compression-spring, D^{21}, secured at one end to said standard, and at the other end to said head, and a guide, D^{19}, secured to said standard and fitted to and inserted in said socket in said head, in combination with a movable work-support, E^3, moving diagonally to and from said perforating device, substantially as and for the purpose set forth.

10. In a machine of the class described, an oscillating disk, B^3, a wiper, D, secured to said disk, a sliding bar, D^3, a toe, D', pivotally supported on said sliding bar, a stop, D^5, rigidly secured to said sliding bar to hold said toe from moving away from said wiper when the latter is moving said sliding bar downward, a wiper, E^4, and a head, D^6, secured to said sliding bar, a perforating device, D^9, secured to said head, an independently-moving standard, D^{16}, supported in said head, a foot, D^{17}, formed on said standard, a circular aperture, D^{18}, formed in said foot, a compression-spring, D^{21}, secured at one end to said standard and at the other end to said head, in combination with a movable work-support, E^3, and a lever, E, pivotally secured to said movable work-support, substantially as and for the purpose set forth.

11. In a machine of the class described, an oscillating disk, B^3, a wiper, D, secured to said disk, a sliding bar, D^3, a toe, D', pivotally supported on said sliding bar, a stop, D^5, rigidly secured to said sliding bar to hold said toe from moving away from said wiper when the latter is moving said sliding bar downward, a wiper, E^4, secured to said sliding bar and formed with an angular end, E^5, a head, D^6, secured to the upper end of said sliding bar, a socket, D^{20}, formed in and a perforating device, D^9, secured to said head, an independently-moving standard, D^{16}, supported in said head, a foot, D^{17}, formed on said standard, a circular aperture, D^{18}, formed in said foot, a compression-spring, D^{21}, secured at one end to said standard, and at the other end to said head, and a guide, D^{19}, secured to said standard and fitted to and inserted in said socket in said head, in combination with movable work-support, E^3, a lever, E, in which a notch, E^6, is formed, and pivotally secured near one end of said movable work-support, substantially as and for the purpose set forth.

12. A ring-former consisting of an inner section, F', in which a groove, F^6, curved outward at the upper end is formed, in combination with an outer section, F^2, provided with longitudinal flanges, F^3, and means for supporting said sections and holding them together, substantially as and for the purpose set forth.

13. A ring-former consisting of an inner section, F', in which a groove, F^6, curved outward at the upper end is formed, in combination with an outer section, F^2, formed with longitudinal flanges, F^3, and means for supporting said sections, holding them together, and for adjusting one section longitudinally on the other, substantially as and for the purpose set forth.

14. A ring-former consisting of an inner section, F', in which a groove, F^6, curved outward at the upper end is formed and an overhanging forked end, F^8, formed on said section, in combination with an outer section, F^2, formed with longitudinal flanges, F^3, and with a cross-flange, F^4, a screw-threaded socket formed in said cross-flange, and a double-headed screw, F^{10}, secured in said screw-threaded socket, and engaging with the overhanging forked end of the inner section, substantially as and for the purpose set forth.

15. A ring-former consisting of an inner section, F', in which a groove, F^6, curved outward at the upper end is formed, in combination with an outer section, F^2, provided with the flanges, F^3, a recess, F^7, formed in said sections, and means for supporting said sections and holding them together, substantially as and for the purpose set forth.

16. A ring-former consisting of an inner section, F', in which a groove, F^6, curved outward at the upper end is formed, in combination with an outer section, F^2, formed with longitudinal flanges, F^3, a recess, F^7, formed in said sections, and means for supporting said sections, holding them together and for adjusting one section longitudinally on the other, substantially as and for the purpose set forth.

17. A ring-former consisting of an inner section, F', in which a groove, F^6, curved outward at the upper end is formed, and an overhanging forked end, F^8, formed on said section, in combination with an outer section F^2, formed with longitudinal flanges, F^3, and with a cross-flange, F^4, a screw-threaded socket formed in said cross-flange, a double-headed screw, F^{10}, secured in said screw-threaded socket, and engaging with the overhanging forked end of the inner section, and a recess, F^7, formed in said sections, substantially as and for the purpose set forth.

18. A ring-former consisting of an inner section, F', and an outer section, F^2, in combination with a socketed support, F^{11}, in the socket in which the lower ends of said sections are inserted and held together, and a bracket, F^{12}, to which said support is pivotally secured, substantially as and for the purpose set forth.

19. The horizontally-adjustable slide, F^{13}, the slide, F^{14}, vertically adjustable on said horizontal slide, and an arm, F^{15}, secured to said vertically-adjustable slide, in combination with a ring-former, F, pivotally secured to the arm, F^{15}, substantially as and for the purpose set forth.

20. The horizontally-adjustable slide, F^{13}, the slide, F^{14}, vertically adjustable on said horizontal slide and an arm, F^{15}, secured to said vertically-adjustable slide, in combination with a ring-former, F, provided with a stud, F^{16}, a socketed support, F^{11}, in the socket in which the lower end of said ring-former is inserted and held together, and a bracket, F^{12}, to which said support is pivotally secured, substantially as and for the purpose set forth.

21. The horizontally-adjustable slide, F^{13}, the slide, F^{14}, vertically adjustable on said horizontal slide, and an arm, F^{15}, secured to said vertically-adjustable slide, in combination with a ring-former, formed in two sections, F', and F^2, means for holding said sections together and for adjusting one longitudinally on or within the other, a stud, F^{16}, on said ring-former with which the arm, F^{15}, engages, a socketed support, F^{11}, in which the lower end of said sections, F', and F^2, are inserted and held together, and a bracket, F^{12}, to which said support is pivotally secured, substantially as and for the purpose set forth.

22. In a machine of the class described, a shaft, B^3, a ratchet-wheel, B^{14}, fixed on said shaft, a cam, B^{26}, mounted loosely on said shaft, and provided with an arm, B^{28}, and a stationary bar, B^{29}, to which said arm is adjustably secured, in combination with a dog, B^{16}, in which an elongated opening, B^9, and socket, B^{18}, is formed and which is provided with an arm, B^{12}, an oscillating disk, B^3, in which an elongated slot, B^{13}, is formed to receive the arm, B^{12}, and a stud or pin, B^{11}, for holding said dog against the face of said disk, and a spring B^{17}, inserted in the socket, B^{18}, and means for operating said disk, substantially as and for the purpose set forth.

23. In a machine of the class described, the grooved feed-wheels, C, and, C^3, and means for supporting and operating said wheels, a shaft, B^3, a ratchet-wheel, B^{14}, fixed on said shaft, a cam, B^{26}, mounted loosely on said shaft, and provided with an arm, B^{28}, and a stationary bar, B^{29}, to which said arm is adjustably secured, in combination with a dog, B^{16}, in which an elongated opening, B^9, and socket, B^{18}, is formed, and which is provided with an arm, B^{12}, an oscillating disk, B^3, in which an elongated slot, B^{13}, is formed to receive the arm B^{12}, and a stud or pin, B^{11}, for holding said dog against the face of said disk and a spring, B^{17}, inserted in the socket, B^{18}, and means for operating said disk, substantially as and for the purpose set forth.

24. In a machine of the class described, the shaft, B^3, the ratchet-wheel, B^{14}, fixed on said shaft, a cam, B^{26}, mounted loosely on said shaft and provided with an arm, B^{28}, and means for holding the latter at the position to which it may be adjusted in combination with a plate, B^{30}, mounted loosely on said shaft and means for operating and limiting the movement of said plate, substantially as and for the purpose set forth.

25. In a machine of the class described, the shaft B^3, a ratchet-wheel, B^{14}, fixed on said shaft, a cam, B^{26}, mounted loosely on said shaft, and provided with an arm, B^{28}, a bar B^{29}, to which said arm is adjustably secured, a dog, B^{16}, and means for supporting and operating the latter, in combination with a slotted plate, B^{30}, provided with a shoulder, b^3, and an arm, B^{32}, an elongated slot, B^{31}, formed in said plate, a pin, B^{33}, secured to a rigid support and resting in said slot in said plate and a spring, B^{34}, connected at one end to said arm, and at the other end to a stationary support, substantially as and for the purpose set forth.

26. In a machine of the class described, the shaft, B^3, ratchet-wheel, B^{14}, fixed on said shaft, a cam, B^{26}, mounted loosely on said shaft and provided with an arm, B^{28}, and means for holding said arm at the position to which it may be adjusted, a slotted plate, B^{30}, provided with a shoulder, B^3, and an arm, B^{32}, an elongated slot, B^{31}, formed in said slotted plate, a spring, B^{34}, connected at one end to said arm and at the other end to a stationary support, a stationary sleeve, B^7, a flanged sleeve, B^{17}, and a pin, B^{35}, for securing said flanged sleeve to said stationary sleeve, in combination with a dog, B^{16}, in which an opening, B^9, and socket, B^{18}, are formed, an arm, B^{12}, formed on said dog, a stud or pin, B^{11}, a spring, B^{17}, located in said socket, B^{18}, an oscillating disk, B^3, in which an elongated slot, B^{13}, is formed, and a sleeve, B^7, on said disk, substantially as and for the purpose set forth.

27. In a machine of the class described, the slide-box, H, secured to a fixed support, cutter-carrying slides, H', and, H^2, supported in said box, a cutter, H^3, and a stud, H^4, secured to each of said cutter-carrying slides, and an antifriction-sleeve, H^5, supported on each of said studs in combination with the rock-shaft, H^{12}, and the right and left worms, H^{13}, and, H^{14}, formed on said shaft, substantially as and for the purpose set forth.

28. In a machine of the class described, the slide-box, H, secured to a fixed support, cutter-carrying slides, H', and, H^2, supported in said box, a cutter, H^3, and a stud, H^4, secured to each of said cutter-carrying slides and an antifriction-sleeve supported on each of said studs, in combination with a rock-shaft, H^{12}, worms, H^{13}, and, H^{14}, formed on said shaft, a toe, H^{15}, secured to said shaft, a wiper, H^{16}, for operating said toe, an oscillating disk, B^3, for supporting and operating said wiper, and means for operating said disk, substantially as and for the purpose set forth.

29. The combination of a former in which a groove F^6, curved outward at the upper end is formed for forming rings and simultaneously with their formation, inserting them in perforations in articles for the purpose of suspension, means for feeding wire to the ring-forming mechanism, a dog, a ratchet, and means for operating them to intermittently feed the wire to the ring-forming mechanism, substantially as described.

30. The combination of a former constructed in two sections in one of which sections a groove, F^6, curved outward at the upper end is formed for forming rings and said sections adjustable on one another to form rings of different diameter, and simultaneously with their formation, inserting them in perforations in articles, for the purpose of suspension, means for feeding wire to the ring-forming mechanism, a dog, a ratchet, and means for operating them to intermittently feed the wire to the ring-forming mechanism, and for causing the amount of wire presented to the wire-feeding mechanism to vary to accord with the diameter of the ring, substantially as described.

31. The combination of means for forming perforations in articles, means for operating and alternately throwing the perforating mechanism in and out of operation, means for forming rings and simultaneously with their formation inserting them in perforations in said articles for the purpose of suspension, a dog, a ratchet, and means for operating them to intermittently feed the wire to the ring-forming mechanism, substantially as described.

32. The combination of means for forming perforations in articles, means for operating and alternately throwing the perforating mechanism in and out of operation, adjustable means for forming rings, of different diameter and simultaneously with their formation inserting them in the perforations in said articles for the purpose of suspension, means for feeding the wire to the ring-forming mechanism, a cam, a ratchet-wheel and dog and means for operating them to cause the amount of wire presented to the wire-feeding mechanism to vary to accord with the diameter of the ring required, substantially as described.

33. The combination of means for forming perforations in articles consisting of a vertically-adjustable sliding bar carrying rotating perforating mechanism, means for operating and alternately throwing the perforating mechanism in and out of operation, a former in which a groove, F^6, curved outward at the upper end is formed for forming rings, and simultaneously with their formation inserting them in the perforations in said articles for the purpose of suspension, a dog, a ratchet, and means for operating them to intermittently feed the wire to the ring-forming mechanism, substantially as described.

34. The combination of means for forming perforations in articles, consisting of an adjustable sliding bar and an adjustable standard provided with a foot, and a compression-spring by which said standard is automatically adjusted to the thickness of the article, and to firmly hold the article while the perforation is being formed therein, and while withdrawing the perforating device therefrom, means for operating and alternately throwing the perforating mechanism in and out of operation, a former in which a groove, F^6, curved outward at the upper end is formed for forming rings and simultaneously with their formation inserting them in the perforations in said articles for the purpose of suspension, a dog, a ratchet and means for operating them to intermittently feed the wire to the ring-forming mechanism, substantially as described.

35. The combination of means for forming perforations in articles, consisting in part of a work-support moving diagonally to and from the perforating mechanism, means for operating and alternately throwing the perforating mechanism in and out of operation, means for alternately positioning the work-support toward the perforating mechanism, for holding it under the perforating mechanism while the perforation is being formed, and for positioning it from the perforating mechanism, a former in which a groove, F^6, curved outward at the upper end is formed, for forming rings and simultaneously with their formation inserting them in the perforations in said articles for the purpose of suspension, a dog, a ratchet and means for operating them to intermittently feed the wire to the ring-forming mechanism, substantially as described.

36. The combination of means for forming perforations in articles, consisting in part of a movable work-support, a lever formed with a notch, and a wiper formed with an angular end for the purpose of operating said lever and positioning the movable work-support under the perforating device, means for operating and alternately throwing the perforating mechanism in and out of operation, a former in which a groove, F^6, curved outward at the upper end is formed, for forming rings, and simultaneously with their formation inserting them in the perforations in said articles, for the purpose of suspension, a dog, a ratchet and means for operating them to intermittently feed the wire to the ring-forming mechanism, substantially as described.

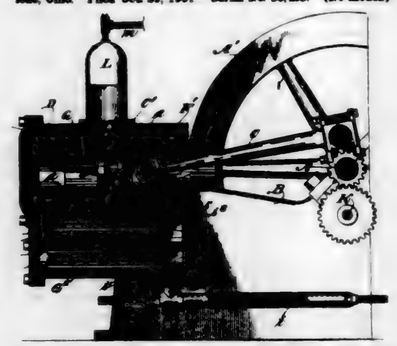
37. The combination of a former in which a groove, F^6, curved outward at the upper end is formed, for forming rings, and simultaneously with their formation inserting them in perforations in articles, for the purpose of suspension, means for feeding wire to the ring-forming mechanism, a dog, a ratchet and means for operating them to intermittently feed the wire to the ring-forming mechanism, means for severing the ring from the wire and means for operating the severing mechanism when required, substantially as described.

38. The combination of a former constructed in two sections in one of which sections a groove, F^6, curved outward at the upper end is formed for forming rings, and said sections adjustable on one another to form rings of different diameter, and simultaneously with their formation inserting them in articles, for the purpose of suspension, means for feeding the wire to the ring-forming mechanism, a cam, B^{26}, a ratchet-wheel, B^{14}, and a longitudinally-adjustable dog, B^{16}, and means for operating them to cause the amount of wire presented to the wire-feeding mechanism to vary to accord with the diameter of the ring required, substantially as described.

39. The combination of means for forming rings and simultaneously with their formation, inserting them in perforations in articles for the purpose of suspension, a dog, a ratchet and means for operating them to intermittently feed the wire to the ring-forming mechanism, and means for preventing the dog from engaging with the ratchet when said dog is returning to its normal position, substantially as described.

40. The combination of means for forming perforations in articles, a former in which a groove, F^6, curved outward at the upper end is formed, for forming rings and simultaneously with their formation inserting them in perforations in said articles for the purpose of suspension, a dog, a ratchet and means for operating them to intermittently feed the wire to the ring-forming mechanism, means for severing the ring from the wire, and means for stopping the machine at a given point, or just after the operation of perforating, forming, inserting and cutting off the ring is completed, substantially as described.

708,687. COMBINED GAS AND STEAM ENGINE. William Hickert, Findlay Ohio, assignor of one-half to Henry W. Busey, Toledo, Ohio. Filed Oct. 29, 1901. Serial No. 80,433. (No model.)



Claim.—1. A self-contained motor or engine comprising in a unitary structure a cylinder having a water-space around the same, a subjacent water way or passage extending upwardly in a serpentine or zigzag course from a source of supply to said water-space, heat-flues extending downwardly from said cylinder to the exhaust through said serpentine or zigzag waterway, and a piston working in said cylinder having a suitable connection with the driving-shaft, together with mechanism for automatically controlling the admission and exhaust of steam at one side and of explosive gases at the other side of the piston to actuate the latter by the expansive force of said gases and steam operating alternately to drive the piston in opposite directions; substantially as described.

2. A self-contained motor or engine comprising in a unitary structure a cylinder having a water-space around the same opening into a steam-dome at the top, a subjacent water way or passage extending upwards in a serpentine or zigzag course from a source of supply to said water-space, heat-flues forming a descending passage for the residue of heat and products of combustion from said cylinder through said water-space and subjacent water-passage, and a reciprocating piston working in said cylinder having a suitable connection with the driving-shaft, together with

mechanism for automatically controlling the admission and exhaust of steam at one side and of explosive gases at the other side of the piston to actuate the latter by the expansive force of said gases and steam operating alternately to drive the piston in opposite directions; substantially as described.

3. A self-contained motor or engine comprising in a unitary structure a cylinder, a subjacent waterway ascending step by step in reverse directions from a source of supply to a water-space at the boiler, a passage for the residue of heat and products of combustion descending step by step through said ascending waterway, and a piston working in said cylinder having a suitable connection with the driving-shaft, together with means for automatically admitting explosive gases and exploding the same at every second reverse stroke of the piston, for effecting such reverse stroke, and means for automatically admitting steam at the other side of the piston for impelling it at each forward stroke, substantially as described.

4. A self-contained motor or engine comprising in a unitary structure, a cylinder having a water-space around the same opening into a steam-dome at the top, a subjacent waterway gradually ascending from a source of supply to said water-space, a heat-passage gradually descending through said waterway to the exhaust, and a reciprocating piston working in said cylinder having a suitable connection with the driving-shaft, together with means for automatically admitting explosive gases and exploding the same at every second reverse stroke of the piston, for effecting such reverse stroke, and means for automatically admitting steam at the other side of the piston for impelling it at each forward stroke, substantially as described.

5. A motor or engine comprising in a unitary structure a cylinder having a surrounding water-space and air spaces or flues at its ends, tubes connecting said air-spaces through said water-space, a subjacent ascending waterway connecting said water-space with a feed-pipe, and other tubes passing through said subjacent waterway and connecting the air-spaces with the exhaust; a piston working in said cylinder, means for automatically admitting explosive gases at one end of said cylinder and for exhausting the residues of combustion into and out through said air-flues and tubes, and means for automatically controlling the admission and exhaust of steam at the other side of the piston for impelling the latter in a direction opposite to the action of the expansive gases, substantially as described.

6. A motor or engine consisting of a cylinder having a surrounding water-space and fire-flues separated therefrom, one at each end, a subjacent waterway ascending from a feed-pipe to said water-space, fire-flue tubes connecting said flues through said water-space, other tubes connecting similar flues at opposite ends of the cylinder with an exhaust-pipe and passing downwardly through said subjacent waterway, means for automatically admitting explosive gases at one end of said cylinder and igniting the same, and mechanism for automatically controlling the admission and exhaust of steam at the other end of said cylinder to effect the movements of the piston in one direction only, together with means for exhausting the residues of combustion through said fire-flues and fire-flue tubes, substantially as described.

7. In a combined gas and steam engine, a cylinder having a piston-chamber, and an explosion-chamber at one end, together with a water-space around the cylinder and flues at each end separated from said water-spaces by suitable partitions or webs between the inner and outer walls of the cylinder, a series of fire-flue tubes connecting said flues through said water-space, and a subjacent water-chamber with fire-flue tubes therein connecting a flue at the outlet from said first-mentioned flues, with a similar flue at the other end of said water-chamber; the latter flue communicating with the exhaust, so as to provide a zigzag course for the escape of the residues of combustion, together with a feed-pipe for supplying said water-space through said fire-flue-tube-containing water-chamber, substantially as described.

8. In a combined gas and steam engine, a cylinder having a piston-chamber, and an explosion-chamber at one end, together with a water-space around the cylinder and flues at each end separated from said water-space by suitable partitions or webs between the inner and outer walls of the cylinder, a series of fire-flue tubes connecting said flues through said water-space, and a subjacent water-chamber with fire-flue tubes therein connecting a flue at the outlet from said first-mentioned flues with a similar flue at the other end of said water-chamber; the latter flue communicating with the exhaust, so as to provide a zigzag course for the escape of the residues of combustion, together with a feed-pipe for supplying said water-space through said fire-flue-tube-containing water-chamber, and a steam-dome mounted on said cylinder in communication with the water-space around the same, substantially as described.

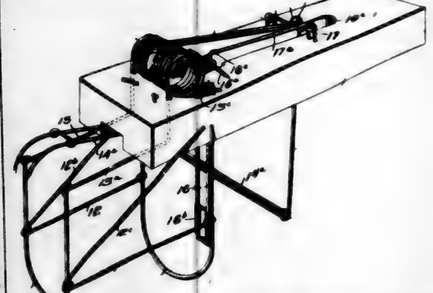
9. In combination with the piston-cylinder and piston working therein and a steam-dome at the top, a water-space around said cylinder, flues through said water-space, a subjacent ascending water-passage connecting said water-space with a feed-pipe at the bottom or lowest point in the circuit, and heat-flues extending downwardly through said subjacent water-chamber at the ends thereof, tubes connecting said flues, an inlet-valve for the admission of explosive gases at one side of the piston, a valve at the same side for exhausting the residues of combustion through said flues and tubes, and a valve at the other end of the cylinder for admitting steam to impel the piston in a direction opposite to the direction given by the expansive gases, whereby the heat and residues of combustion resulting from the explosion of the gases is utilized in heating the feed-water and reheating or superheating the steam, substantially as described.

10. In combination with the cylinder having a water-space around the same, a steam-dome mounted thereon, flues at the ends thereof, and tubes connecting said flues through said water-space, a subjacent water-chamber having a series of tubes therein which communicate with the outlet from said flues at one end and with a similar flue at the other end, other tubes connecting the latter flue through said subjacent chamber with the exhaust, and means for feeding the water in a zigzag course through said subjacent chamber in contact with said tubes and the walls of said flues, substantially as described.

11. In a combined gas and steam engine a piston having a reduced area working in the steam end of cylinder and an enlarged portion or area in end forming a gas-explosion chamber, said piston having a hollow extension or trunk extending through stuffing-box in one head of cylinder to receive the connecting-rod of engine and provide reduced steam-piston area around said extension in cylinder, as and for the purpose described.

12. In combination with the cylinder and its surrounding water-space and subjacent water-chamber, flues at the ends of the cylinder and subjacent chamber communicating at opposite ends, and a series of pipes forming a zigzag course for the escape of the residues of combustion through said water-space and subjacent chamber, together with a boiler feed-pipe and means for supplying water in a zigzag course through said subjacent water-chamber and water-space in contact with the fire-flues, whereby the feed-water is gradually heated as it ascends to the water-space at the top of the boiler, substantially as described.

708,638. ANIMAL-TRAP. SAM HUTCHERSON, Rongan, Tex. Filed Mar. 25, 1902. Serial No. 99,907. (No model.)



Claim.—1. In an animal-trap, a base-plate, a runway connected with said base-plate and formed by the wire cage open at the ends and wires forming the top member of said cage, said wires being extended through the base, turned into spring-coils and having connected ends forming an arm whereby the impaling device is actuated, substantially as set forth.

2. In an animal-trap, a pair of spring-coils having their inner connected ends extended to form an arm and having their outer ends extended vertically through a base supporting said coils and thence forwardly to form the upper members of a cage or runway, combined with a vibrating impaling device mounted pivotally between the top members of the runway, a rod connecting the rear end of said impaling device with the arm formed by the connected ends of the coiled springs, and suitable trigger mechanism, substantially as set forth.

3. In an animal-trap, a base-plate, a runway formed of a wire cage open at the ends and with the upper members extended through said base and turned into spring-coils and with spring-arms extending from said spring-coils, an impaling-bar movably connected to said base and operating in said runway, a rod connecting the inner end of said impaling-bar to said spring-arms, and a yieldable trigger mechanism operating from within said runway and adapted to actuate said releasing means, substantially as described.

708,639. TOOL FOR ELECTRICIANS. ISAAC W. HETHERER, Philadelphia, Pa. Filed Oct. 26, 1901. Serial No. 80,087. (No model.)

Claim.—1. The electrician's tool consisting of a blade provided with a double-beveled screw-driver point, a knife-edge along one margin thereof, and a saw-file on the opposite side, and a supporting-shank forming the rear end thereof provided with a cross-groove, in combination with a hollow handle, in which said blade and its shank are adapted to be longitudinally reciprocated, and a spring-latch to close said hollow handle when said blade is within the same, and close upon said blade when the same has been projected therefrom, and by engagement in said cross-groove prevent the withdrawal of said blade into said handle when said latch is held down thereupon, said reciprocation being produced by gravity when said handle is held upward to withdraw, or downward to project said blade therefrom, substantially as described.

2. A combined knife and screw-driver blade having a supporting and guiding shank and a cross-groove in the same, a double-beveled screw-driver point and a double-beveled knife-blade edge along one margin of said blade, the beveled sides of said knife-blade continued along the sides of said screw-driver without obstruction against sharpening said knife-edge on a sharpener of any size, substantially as described.

3. A hollow tool-handle having an opening at one end, and closed at the opposite end and at sides thereof, a spring thumb-latch guarding said opening, a passage within said handle for the longitudinal travel of a flat blade and shank, and a detachable blade-cover on one side of said flat blade, together with a screw at the rear end adapted to freely pass through said detachable blade-cover, and, be seated in the opposite blade-cover, so as to detachably secure the same together as a single construction, substantially as described.

4. In combination with a tool-blade, substantially as shown, and having a projecting stop-pin at the rear end of the shank thereof and a cross-groove in said shank, a hollow handle open at one end and closed at the other, said open end adjustably closed by a spring thumb-latch, an abutment in the fixed frame of said handle in rear of said latch adapted to engage with the stop-pin on said blade, and limit its projection from said handle when reciprocated therein, substantially as described.

5. In combination with a hollow tool-handle having a longitudinal passage open at one end through the same for the reciprocation of a tool-blade therein, and its projection therefrom, a spring thumb-latch operated at one end of said passage to close the same when said blade is withdrawn into said handle, and its edge adapted to enter a cross-groove in the shank of said blade when the same is projected, and lock the same in position vertical ears between which said thumb-latch is supported and operated, a passage-way for said blade beneath said latch, and fixed lugs, D^2 D^2, within said ears and above said blade-passage, to prevent said blade from being lifted from its place when projected, substantially as described.

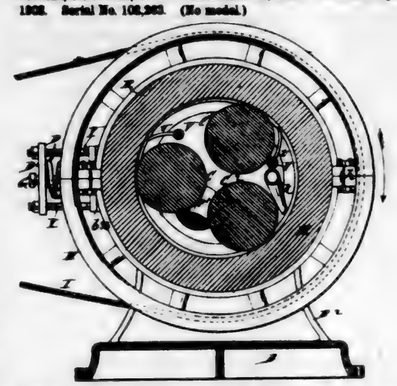
6. In combination with a tool-blade substantially as described and provided with a cross-groove thereupon, the hollow handle having longitudinal passage-way for the reciprocation of said blade therein, and a thumb-latch provided with a lip and adapted to close the open end of said passage when said blade is retracted, and close upon said blade and engage with said cross-groove when the same is projected, and guards to limit the projection of said blade, the thumb-latch pivot G, and the coiled spring F F' around the same, one leg thereof adapted to engage with and be supported by the raised cross-rib, E^2, on the under and concave side of said latch, and between the front and rear margins thereof, and the opposite leg, F, adapted to engage with a support on the handle of said tool in rear of said latch, said spring adapted to close the open end of said hollow handle under spring tension, substantially as described.

7. In combination with a tool-blade adapted to be reciprocated in a hollow handle, and withdrawn within or partially projected from one end of the same, and having a rear supporting-shank and a cross-groove, the rear portion of said shank longitudinally bifurcated, a hollow handle adapted for the reciprocation of said blade, the flat side or sides thereof closed by blade-slot cover or covers, the projection, D^2, at the rear end of said blade-slot adapted to enter said bifurcation, B^2, and the screw hole or opening C' extended transversely through said projection, substantially as and for the purposes set forth.

8. In combination with the hollow tool-handle substantially as described, having blade-slot for the reciprocation of a flat blade adapted to be retracted within the same, or partially projected longitudinally therefrom, and blade-stops and locking-latch therefor and a blade provided with a cross-groove adapted to said latch, the blade-slot covers adapted to the flat sides of said handle, one of which is fixed and the opposite one detachably secured thereto, substantially as and for the purposes described.

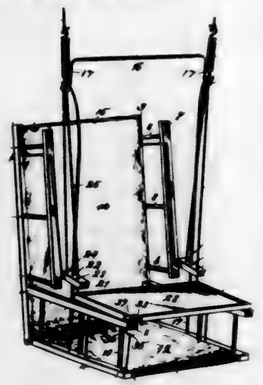
9. In combination with a sectionally-flat, hollow tool-handle, substantially as described, and a tool-blade substantially as described and provided with a cross-groove and shank, a knife, saw-file and screw-driver, integral therewith in a single construction, and adapted to be reciprocated by gravity within the same, and partially projected longitudinally therefrom, and means to adjust and control said projection and reciprocation, one or more detachable blade-slot covers provided with recessed end or ends adapted to engage upon the opposite flat sides of said blade-slot, and contiguous to said blade, substantially as described.

708,640. PULVERIZER. ALBERTH C. HILSENBEK, New York, N. Y., and ABEL W. HILSENBEK, Orange, N. J., assignor to Calvin Amory Stevens, New York, N. Y. Filed Nov. 24, 1899. Renewed Apr. 10, 1902. Serial No. 102,263. (No model.)



Claim.—In pulverizing apparatus the combination of a rotatable crushing-ring to the periphery of which the power is applied directly, two internal crushing-rolls with fixed bearings arranged to oppose the power applied to the ring, and a crushing-roll having two movable bearings connected with springs which allow the said roller to yield to the material under treatment and to distribute and equalize the strain, substantially in the manner and for the purpose described.

708,641. BABY-JUMPER. GEORGE J. HOLTON, Ponca, Okla., assignor of one-half to George W. Diehl, Ponca, Okla. Filed Feb. 23, 1902. Serial No. 96,049. (No model.)



Claim.—1. A baby-jumper, comprising a seat portion having at its front end an adjustable board to be used as a foot-rest or a tray, a back hinged to the seat portion, an arch secured to the seat portion, clamping-blocks slidingly mounted on the arch, and flexible connections slidingly connected to the arch and extending down through the clamping-blocks and connected to the seat portion at one end and extending down through the clamping-blocks and connected at their opposite ends to the upper part of the back portion.

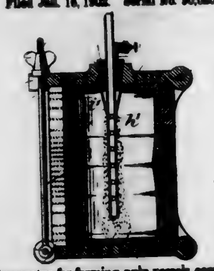
2. A baby-jumper, comprising a seat portion having at its front end an adjustable board to be used as a foot-rest or a tray, a back hinged to the seat portion, an arch secured to the seat portion, clamping-blocks slidingly mounted on the arch, flexible connections slidingly connected to the arch and extending down through the clamping-blocks and connected to

the seat portion at one end and extending down through the clamping-blocks and connected at their opposite ends to the upper part of the back portion, and springs suitably suspended and attached at their lower ends to the arch.

5. A baby-jumper, comprising a seat portion, side rails or arms therefor, a rod connecting the front ends of one set of the side rails with the seat portion proper below, and having its upper end formed with a shoulder 35, and a loop above said shoulder, a board having an eye engaging said rod and adapted to rest as a tray upon the side rails, means for additionally securing the tray in such position.

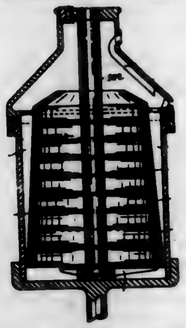
4. A baby-jumper, comprising a seat portion, side rails or arms therefor, a rod connecting the front ends of one set of the side rails with the seat portion proper, below, and having its upper end formed with a shoulder 35, and a loop above said shoulder, a board having a sliding connection with said rod and adapted to rest upon the seat portion proper, and a brace for detachably hooking said board to the side rails and thus supporting it as a foot-rest.

708,642. APPARATUS FOR MANUFACTURING CLOSED VESSELS OF PULP. FRANK B. HOWARD, New York, N. Y., assignor to Laflin & Rand Powder Company, New York, N. Y., a Corporation of New York. Filed Jan. 16, 1902. Serial No. 90,085. (No model.)



Claim.—Apparatus for forming pulp vessels comprising a perforated mold and an expansible former within the mold, the perforations in the mold being arranged at more frequent intervals throughout a portion of the mold than throughout another portion of the mold for the purpose of varying the thickness of the pulp wall of the vessel to be formed, substantially as set forth.

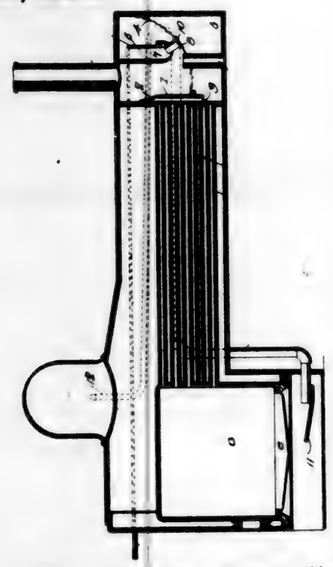
708,643. CENTRIFUGAL SEPARATOR. JONAS P. HULTGREN, Stockholm, Sweden, assignor of one-half to Filip Henrik Getzmann, Stockholm, Sweden. Filed Mar. 7, 1901. Serial No. 50,219. (No model.)



Claim.—The combination with a centrifugal separator-drum, of a liner consisting of a vertical series of rings, each elliptical in cross-section, substantially as and for the purpose set forth.

708,644. SMOKE-CONSUMER. JOHN W. JOHNSON, Trenton, Mo. Filed Apr. 15, 1902. Serial No. 102,910. (No model.)

Claim.—1. A smoke-consumer for steam-boiler furnaces, comprising a funnel in the smoke-box in advance of the smoke-stack and forming a partition in the upper portion of the smoke-box, a downwardly-directed baffle in the smoke-box in rear of the smoke-stack, an intake-pipe leading from the funnel, a return-pipe into which the intake-pipe discharges, said return-pipe discharging into the furnace, under the fire-box, and means to discharge a jet of live steam rearwardly in the return-pipe and thereby maintain an exhaust-current of air through the intake-pipe, substantially as described.



2. A smoke-consumer for steam-boiler furnaces, comprising a downwardly-directed baffle in the smoke-box in rear of the smoke-stack, a funnel forming a transverse partition in the upper portion of the smoke-box in advance of the smoke-stack and having a trough on its front side, an air-exhaust pipe leading from the said trough, to the furnace, under the fire-box, and having its intake end extended through the bottom of the trough and projecting upwardly therein, means to maintain an exhaust current of air through the said pipe, and a blower, discharging into the trough and on the intake end of the air-exhaust pipe to keep the latter clear, substantially as described.

3. A smoke-consumer for steam-boiler furnaces comprising a downwardly-directed baffle in the smoke-box, in rear of the smoke-stack, a transversely-disposed partition across the upper portion of the smoke-box, in advance of the smoke-stack, a funnel in front of said partition, a pipe leading from said funnel to the furnace, and means to maintain an exhaust current of air through said pipe, substantially as described.

4. In combination with a boiler having draft-tubes, a smoke-box into which they discharge, a smoke-stack leading from the smoke-box and an exhaust-steam pipe discharging into the smoke-box, a downwardly-directed baffle on the boiler-head, opposite the discharge ends of the draft-tubes, a transversely-disposed funnel in the upper portion of the smoke-box, forming a partition therein in advance of the smoke-stack and having a trough on its front side, an intake-pipe leading from said trough, a return-pipe communicating with the intake-pipe and discharging into the furnace under the fire-box, and a steam-pipe having a rearwardly-directed nozzle in the return-pipe to discharge a jet of steam under pressure therein and thereby maintain an exhaust current of air through the intake-pipe, substantially as described.

5. A boiler having a smoke-box into which the smoke-flues discharge, a smoke-stack leading from the smoke-box, a downwardly-directed baffle in the smoke-box in rear of the smoke-stack, a transversely-disposed partition across the upper portion of the smoke-box in advance of the smoke-stack, and having a funnel on its front side, a steam-exhaust pipe discharging upwardly in the smoke-box, between the baffle and the partition, a pipe leading from the funnel to the furnace, and means to maintain an exhaust current of air through said pipe, substantially as described.

708,645. TYPE-CONTAINING CHANNEL. LOUIS K. JOHNSON and ABBOT A. LOW, Brooklyn, N. Y., assignor to Alden Type Machine Company, New York, N. Y. Filed Jan. 18, 1899. Serial No. 702,518. (No model.)

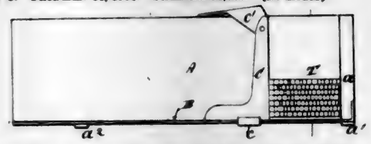
Claim.—1. The combination of a type-containing channel, a fillet fitting therein and adapted to compensate for variations in the width of the fonts of types to be used, substantially in the manner and for the purpose described.

2. The combination with a type-containing channel formed on one side with the opposed return-flanges for retaining the types but otherwise open upon that side of a fillet fitting therein and adapted to compensate for variations in the width of the fonts of types, to be used, substantially as set forth.

3. The combination with a type-containing channel formed on one side with opposed return-flanges for retaining the types, but otherwise open upon that side, of a fillet fitting therein, said fillet being made of two thicknesses for the purpose and substantially in the manner set forth.

4. The combination with a type-containing channel formed upon one side with return-flanges having grooves in their opposed edges, of a fillet fitting in said grooves, said fillet being made of two thicknesses, substantially in the manner and for the purpose set forth.

708,646. COMPOSITOR'S TYPE-STICK. LOUIS K. JOHNSON, Brooklyn, N. Y., assignor to Alden Type Machine Company, New York, N. Y. Filed Mar. 18, 1901. Serial No. 51,586. (No model.)

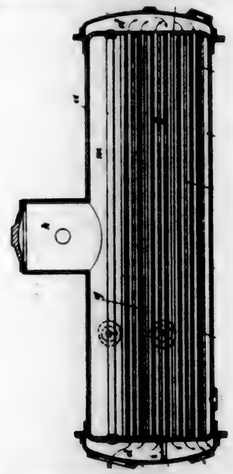


Claim.—1. In a compositor's type-stick, the combination of the type-plate A, and abutment a, the adjustable abutment C, formed with means for holding it in position upon the plate A, and the movable front flange B, supported adjustably upon said plate, for the purpose set forth.

2. A compositor's type-stick formed with a movable front flange substantially in the manner and for the purpose set forth.

3. In a compositor's type-stick the combination with the plate A, and abutment a, and with the movable front flange B, of the adjustable abutment C, formed with the clasp c, to straddle the upper edge of the front flange B, said abutment C, being also formed with means by which it may be held stationary upon the plate A, substantially in the manner and for the purpose set forth.

708,647. VAPORIZER FOR COLD VAPORS OR THE LIKE. EMIL JONAS, Wilmersdorf, Germany. Filed May 17, 1901. Serial No. 60,645. (No model.)



Claim.—1. A vaporizer, comprising a chamber or casing provided with an inlet and an outlet, heating-tubes extending through said chamber, and a partition located in the chamber between the inlet and the outlet, to retard the flow of the fluid through the chamber.

2. A vaporizer, comprising a chamber or casing provided with an inlet and an outlet, heating-tubes extending through said chamber, and a partition located in the chamber between the inlet and the outlet and extending lengthwise of said tubes, to divide the said chamber into a preheating-compartment and a vaporizing-compartment.

3. A vaporizer, comprising a chamber or casing provided with an inlet and an outlet, heating-tubes extending through said chamber, a partition located in the chamber between the inlet and the outlet, to divide said chamber into a preheating-compartment and a vaporizing-compartment, and a perforated partition located between the first-named partition and the outlet, whereby a superheating-compartment will be formed adjacent to the outlet.

708,648. JAR-COVER AND FASTENING THEREFOR. JULIUS KARRMANN, Indianapolis, Ind., assignor of one-half to Charles C. Caldwell, Indianapolis, Ind. Filed Feb. 24, 1902. Serial No. 95,457. (No model.)

Claim.—1. In a jar-cover and fastening for the same, the combination with the body of the jar, and a cover provided with a gradually-ascending surface having at its apex a depression or recess, said cover being also provided at a point intermediate its lower edge and said depression or recess with an annular bead or shoulder, of a bail pivotally connected to the body of the jar and provided with an enlarged portion adapted to be seated upon said annular shoulder or be received by said recess or depression at the apex of the cover, according to the degree of pressure which it is desired to impart to the cover.

2. In a jar-cover and fastening for the same, the combination with the body of the jar, and a cover provided with a gradually-ascending surface having at its apex a depression or recess, said cover being also provided at a point intermediate its lower edge and said depression or recess with an annular bead or shoulder, of a bail pivotally connected to the body of the jar and provided with a ball adapted to be seated upon said annular shoulder or be received by said recess or depression at the apex of the cover, according to the degree of pressure which it is desired to impart to the cover.

708,649. INSECT-REPELLENT. JOHN C. KNEELER, Milwaukee, Wis. Filed Sept. 8, 1899. Serial No. 729,803. (No specimens.)

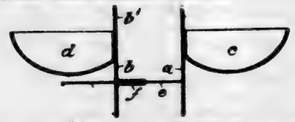
Claim.—1. A composition of matter, consisting of fat acids of cocoanut-oil, combined with a suitable solvent, and sassafras-oil.

2. A composition of matter consisting of a solution of fat acids of cocoanut-oil, in amyl acetate, and alcohol.

3. A composition of matter consisting of a solution of fat acids of cocoanut-oil, in amyl acetate, and alcohol, and sassafras-oil.

4. A composition of matter, consisting in the combined fat acids of cocoanut-oil, in combination with a suitable solvent and sufficiently liquefied thereby to be readily distributed upon the hair or skin of an animal, substantially for the purpose set forth.

708,650. ASH-TRAY. PAUL KULICKE, Buckow, Germany. Filed Apr. 17, 1902. Serial No. 103,463. (No model.)

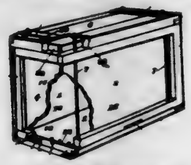


Claim.—1. An ash-tray having an adjustable cigar-support and consisting of two vertical plates forming stands and supports an adjustable connection between said plates and trays secured thereto so as to extend at opposite sides therefrom, substantially as described.

2. In an ash-tray the combination of two vertical plates cut out so as to form stands and cigar-supporting recesses, a sliding bar secured to the one plate and guided in a horizontal sleeve extending from the other

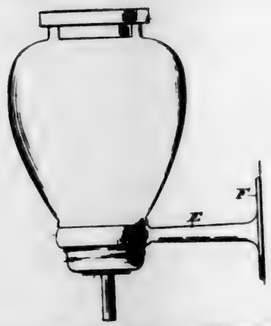
plate, means for limiting the sliding motion of said guide-bar and two trays secured to said plates, substantially as described.

708,651. KNOCKDOWN SHIPPING-CRATE. JOHN F. LAY, Louisville, Ky. Filed Nov. 26, 1901. Serial No. 83,602. (No model.)



Claim.—In a knockdown crate or other box, the combination of a rabbeted bottom, rabbeted sides, a framed recessed cover, rods or bolts passing vertically through the bottom frame, side frames and cover-frame, and dowel-pins between the bottom frame and the bottom edges of the side and end frames, all substantially as and for the purposes specified.

708,652. RESERVOIR FOR DISPENSING LIQUID SOAP. ELMER LEE, New York, N. Y. Filed May 17, 1901. Serial No. 60,735. (No model.)



Claim.—1. A reservoir for liquid soap—said reservoir being provided with a constricted base and constructed substantially as hereinbefore described, in combination with a divided valve-casing adapted to engage the inner and outer surface of said constricted base, means for making a tight joint between the said valve-casing and the said base, and a valve operatively mounted within the divided valve-casing, all constructed and arranged substantially as shown and described.

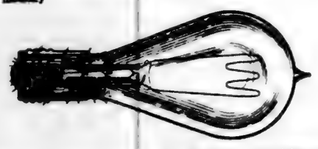
2. A reservoir for liquid soap provided with an annular neck for filling, a constricted base adapted to be detachably secured in the ring of a supporting-bracket, in combination with a divided valve-casing adapted to engage the inner and outer surface of said constricted base, means for making a tight joint between the said valve-casing and the said base, and a valve operatively mounted within the divided valve-casing, all constructed and arranged substantially as shown and described.

3. A reservoir for liquid soap provided with an annular neck for filling, a constricted base provided with external screw-threads, in combination with a divided valve-casing adapted to engage the inner and outer surface of said constricted base, means for making a tight joint between the said valve-casing and said base, and a valve operatively mounted within the divided valve-casing, all constructed and arranged substantially as shown and described.

4. As an article of manufacture, a reservoir for liquid soap comprising a glass body constricted at its upper end to provide an annular plain neck and constricted at its lower end to provide an open base having external threads thereon, in combination with a divided valve-casing adapted to engage the inner and outer surface of said constricted base, means for making a tight joint between the said valve-casing and the said base, and a valve operatively mounted within the divided valve-casing, all constructed and arranged substantially as shown and described.

5. A reservoir for liquid soap provided with an annular neck for filling, a cover, a constricted base adapted for detachably securing in the ring of a supporting-bracket, in combination with a divided valve-casing adapted to engage the inner and outer surface of said constricted base, means for making a tight joint between the said valve-casing and the said base, and a valve operatively mounted within the divided valve-casing, all constructed and arranged substantially as shown and described.

708,653. INCANDESCENT ELECTRIC LAMP. ALBERT W. W. MILLER, South Orange, N. J., assignor to American Electric Company, a Corporation of New Jersey. Filed Oct. 17, 1901. Serial No. 79,000. (No model.)



Claim.—1. An incandescent electric lamp comprising a bulb having a neck, a removable sleeve enveloping the neck, means for clamping the sleeve against endwise withdrawal from the neck, the base-terminal of the lamp and its insulating medium, the opening in the base end of the sleeve being other than circular and loosely embracing a correspondingly-shaped insulating medium to lock the sleeve against rotation.

2. An incandescent electric lamp having a neck, insulation applied at the end thereof, the base-terminal seated in or upon such insulation, a sleeve adapted to be passed endwise over the neck and means for clamping it thereupon, the base end of the sleeve being loosely interlocked with said insulation to prevent rotation of the sleeve and at the same time permit of its ready removal.

3. An incandescent electric lamp comprising a bulb having a neck, the base-terminal of the lamp, insulation in which it is seated having a raised portion of other than circular cross-section, a removable sleeve adapted to pass endwise over the neck and having an opening conforming to and embracing the raised part of said insulation and means for clamping the sleeve against endwise withdrawal from the neck.

4. An incandescent electric lamp comprising a bulb having a neck, the base-terminal of the lamp, its insulation, a removable sleeve adapted to be passed endwise over the neck and means for detachably securing it in position, said insulation and the base end of the sleeve being so formed as to loosely interlock and prevent rotation of the sleeve.

5. An incandescent electric lamp comprising a bulb having a neck, the base-terminal of the lamp, its insulation, a removable sleeve formed at its base end to interlock the said insulation to prevent rotation of the sleeve and slotted at its other end to form a number of tongues or projections and a binding-wire applied around said tongues to clamp them to the lamp.

6. An incandescent electric lamp comprising a bulb having a neck, a removable sleeve enveloping the neck, a packing interposed between the neck and sleeve, means for clamping the sleeve against endwise withdrawal from the neck, the base-terminal of the lamp and its insulating medium, the opening in the base end of the sleeve being other than circular and embracing the correspondingly-shaped insulating medium of the base-terminal to lock the sleeve against rotation.

7. An incandescent electric lamp having a neck, insulation applied at the end thereof, the base-terminal seated in or upon such insulation, a sleeve adapted to be passed endwise over the neck, means for clamping it thereupon, the base end of the sleeve being loosely interlocked with said insulation to prevent rotation of the sleeve and at the same time permit of its ready removal, and a packing interposed between the neck and sleeve.

8. An incandescent electric lamp comprising a bulb having a neck, the base-terminal of the lamp, insulation in which it is seated having a raised portion of other than circular cross-section, a removable sleeve adapted to pass endwise over the neck and having an opening conforming to and embracing the raised part of said insulation, a packing interposed between the neck and sleeve and means for clamping the sleeve against endwise withdrawal from the neck.

9. An incandescent electric lamp comprising a bulb having a neck, the base-terminal of the lamp, its insulation, a removable sleeve adapted to be passed endwise over the neck and means for clamping it in position, said insulation and the base end of the sleeve being so formed as to interlock and prevent rotation of the sleeve, and a packing interposed between the neck and sleeve.

10. An incandescent electric lamp comprising a bulb having a neck, the base-terminal of the lamp, its insulation, a removable sleeve formed at its base end to interlock with the said insulation to prevent rotation of the sleeve and slotted at its other end to form a number of tongues or projections, a binding-wire applied around said tongues to clamp them to the lamp and a packing interposed between the neck and sleeve.

11. An incandescent electric lamp comprising a bulb having a neck, an insulating-filling of cement or plaster applied at the base end of the lamp, an insulating-button seated upon said filling and having a raised boss of irregular contour in cross-section, the base-terminal of the lamp seated in said button, a sleeve adapted to be slipped over the neck and having an opening at its base end conforming to and embracing the raised boss of the button and means for clamping the sleeve upon the neck to prevent its endwise withdrawal therefrom.

12. An incandescent electric lamp comprising a bulb having a neck, an insulating-filling of cement or plaster applied at the base end of the lamp, an insulating-button seated upon said filling and having a raised boss of irregular contour in cross-section, the base-terminal of the lamp seated in said button, a sleeve adapted to be slipped over the neck and having an opening at its base end conforming to and embracing the raised boss of the button, a packing interposed between the neck and sleeve and means for clamping the sleeve upon the neck to prevent its endwise withdrawal therefrom.

708,654. BANANA-CRATE. WALTER B. MONTGOMERY, Shreveport, La., assignor of one-half to John H. Shepherd, Shreveport, La. Filed Jan. 24, 1902. Serial No. 91,107. (No model.)

Claim.—1. A banana-crate comprising a plurality of staves, hoops secured to the terminals of the staves, a sack having its ends turned over the hoops, and means for detachably clamping the sack ends against the hoops.

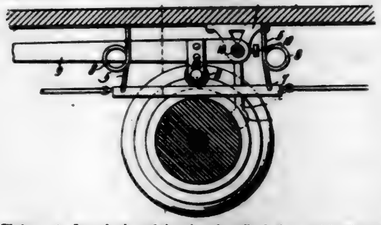
2. A banana-crate comprising a plurality of staves, hoops secured to the terminals of the staves, a sack having its ends turned over the hoops, clamping-bands disposed against the overturned ends of the sack, and bolts passing through the bands, sack ends and hoops and detachably secured in the staves.

3. A banana-crate comprising a plurality of staves, each provided near its terminals with an orifice, hoops secured to the terminals of the staves, a sack having its ends turned over the hoops, clamping-bands disposed against the overturned ends of the sack, bolts passing through the bands, sack ends, and hoops and having their ends projected into the said orifices, and nuts arranged in the orifices to engage the ends of the bolts.

4. A banana-crate comprising a plurality of staves provided near their terminals with orifices and transverse depressions, hoops secured to the ends of the staves, a sack having its ends clamped against the hoops, and holding-cords to engage either the orifices or depressions for securing the mouths of the sack.

5. A banana-crate comprising a plurality of staves, hoops secured to the terminals of the staves, a sack having its ends turned over the hoops and corded, clamping-bands having flanges to inclose the periphery of the hoops and engage the corded edges of the sack, and means for securing the clamping-bands to the staves.

708,655. FRICTION POWER. ANDREW R. MOORE, Charlotte, Mich., assignor of one-half to Lyman H. McCall, Charlotte, Mich. Filed May 6, 1902. Serial No. 106,206. (No model.)



Claim.—1. In a device of the class described, the combination with a friction-wheel designed to be mounted on a car-axle, of a reciprocating block or bar arranged adjacent to the friction-wheel, springs supporting the block or bar and permitting the same to move upward and downward and backward and forward, and means for forcing the block or bar into contact with the friction-wheel, substantially as described.

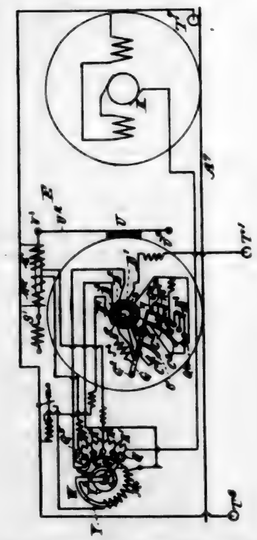
2. In a device of the class described, the combination with a friction-wheel designed to be mounted on a car-axle, of a reciprocating bar located above the friction-wheel and designed to be connected with a brake, and springs suspending the block or bar normally out of contact with the friction-wheel and provided with intermediate coils, and means for forcing the block or bar into contact with the friction-wheel, substantially as described.

3. In a device of the class described, the combination with a friction-wheel, of a reciprocating brake-actuating block or bar designed to be connected with a brake and located above the friction-wheel, springs normally supporting the block or bar out of contact with the friction-wheel, and a lever located above the block or bar and provided with a roller arranged to engage the said block or bar to carry the same into engagement with the friction-wheel, substantially as described.

4. In a device of the class described, the combination with a friction-wheel, of a reciprocating brake-actuating block or bar designed to be connected with a brake and located adjacent to the friction-wheel, springs supporting the block or bar normally out of contact with the friction-wheel, a lever located adjacent to the block or bar and provided with means for engaging the same to force the block or bar against the friction-wheel, and a weighted arm connected with the lever and normally located in a vertical position and adapted to be shifted from such position when the brake is applied, substantially as described.

5. In a device of the class described, the combination with a friction-wheel, of a brake-actuating block or bar located above the friction-wheel, means for supporting the block or bar normally out of engagement with the wheel and for permitting the bar or block to move upward and downward and backward and forward, a shaft mounted above the block or bar, weighted arms depending from the shaft and normally arranged in a vertical position, an operating-bar fixed to the shaft, arms 12 arranged at opposite sides of the operating-bar and disposed at an inclination, and a roller carried by the arms 12, substantially as described.

708,656. ELECTRIC RAILWAY. THOMAS E. MURRAY and JOHN VAN VLECK, New York, N. Y. Original application filed Nov. 22, 1901, Serial No. 83,318. Divided and this application filed Feb. 26, 1902. Serial No. 95,677. (No model.)



Claim.—1. In an electric railway, the combination of a track, a car, a main feeder-line, a main conductor-line divided into block-sections, and a breaker-line parallel to said conductor-line and divided into similar block-sections, a circuit-breaker interposed between one end of each main conductor-line block-section and said main feeder, and means for electrically opening said circuit-breaker interposed between the opposite end of each breaker-line block section and said main feeder, substantially as described.

2. In an electric railway, the combination of a track, a car, a main feeder-line D, a main conductor-line L′ divided into block-sections *a*, *b*, a breaker-line L^2 divided into similar block-sections *a′*, *b′*, a circuit-breaker O interposed between block-section *a* and main feeder-line D, a solenoid M^{13} interposed between block-section *b′* and said main feeder-line and operating to control said circuit-breaker, and circuit connections on said car for closing circuit between lines L′, L^2 and return, substantially as described.

3. In combination with an electric-railway car, a motor, means for varying the strength of current actuating said motor, a centrifugal governor controlling said means and having an arm eccentrically pivoted upon one of the car-wheels, substantially as described.

4. In combination with an electric-railway car, a motor, a centrifugal governor having an arm pivoted eccentrically upon one of the car-wheels and a variable resistance on said wheel in circuit with said motor, said resistance being controlled by said arm, substantially as described.

5. In combination with an electric-railway car, the governor-arm G, eccentrically pivoted on one car-wheel, a variable resistance controlled by said arm, pivoted finger F, and means for electrically vibrating the same, variable resistance controlled by said finger, and motor K and circuit connections, substantially as described.

6. In combination with a main-line conductor, a car provided with means for taking current from said conductor, an arm pivoted eccentrically on one of said car-wheels, a variable resistance controlled by said arm, and a driving-motor for said car in circuit with said resistance; whereby changes of position of said arm due to changes in centrifugal force dependent on speed of rotation of said car-wheel shall cause a variation in strength of current actuating said motor, substantially as described.

7. In an electric railway, a main-line conductor, a car provided with means for taking current from said conductor, and on said car, a driving motor, a controlling device constructed to control the current passing to said motor, means for electrically actuating said controlling device, and a centrifugal governor actuated by said car-wheel and controlling said actuating means, substantially as described.

8. In an electric railway, a main-line conductor, a car provided with means for taking current from said conductor, means on said car for varying the strength of said current, a solenoid operated by said variable current and a driving-motor on said car; the said controlling-solenoid being constructed and arranged to control the current passing to said motor, substantially as described.

9. In combination with an electric-railway car, a motor, a variable resistance in the circuit thereof, electrically-actuated means for varying said resistance, a variable resistance in the circuit of said means, and a centrifugal governor controlling said last-named resistance.

10. In combination with an electric-railway car, a motor, an electrically-actuated speed-regulator therefor, and means for cutting resistances into the circuit of said speed-regulator controlled by the speed of travel of said car.

11. In combination with an electric-railway car, a motor, an electrically-actuated speed-regulator therefor, a centrifugal governor, and a variable resistance governed and controlled by said governor and interposed in the circuit of said speed-regulator.

708,657. DREDGE. RALPH R. OSGOOD, Upper Troy, N. Y. Filed Feb. 6, 1902. Serial No. 92,982. (No model.)

Claim.—1. A dredge-boat having a turn-table foundation built integral therewith and projecting therefrom, said foundation having a well or passage within it for the hauling chain or cable, substantially as described.

2. A dredge-boat having a massive or substantial integral or built-in overhanging turn-table support, substantially as described.

3. A dredge-boat having at one end a hawser-hole below its platform or deck line, and a turn-table foundation overhanging said end and having a well extending vertically from the deck-line to a point below the hawser-hole, substantially as set forth.

4. A dredge-boat having a hawser-hole and a turn-table foundation forming a well extending some distance below the hawser-hole for the lead of a cable, substantially as and for the purpose set forth.

5. A dredge-boat having a hawser-hole located below its platform or deck line, and a well communicating at its upper end with the hawser-hole and extending continuously from a point above to a point below the hawser-hole, substantially as and for the purpose set forth.

6. A dredge-boat having a turn-table, a guide-sheave below the turn-table and directly connected thereto to turn therewith, and a hauling chain or cable guided by said sheave, substantially as set forth.

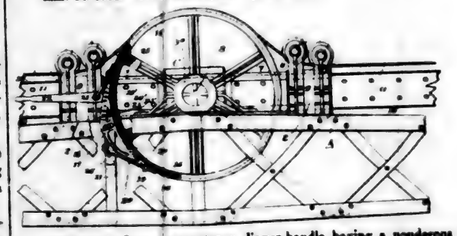
7. A dredge-boat having a hawser-hole, a turn-table foundation having a well in communication with its upper end with the hawser-hole and extending some distance below the same, a turn-table resting on said foundation, guide-sheaves located adjacent to the hawser-hole and at the lower end of the well for maintaining a cable-lead in line with the center of the table, and a hanger extending vertically through the well and carrying the lower sheave and connected at its upper end to the movable part of the turn-table.

8. A dredge-boat having a hawser-hole, a turn-table, guide-sheaves for guiding the lead of the cable to and from the hawser-hole in the central line of the turn-table, one of said sheaves being located adjacent to and the other below the hawser-hole, and means directly connecting the latter-named sheave with the turn-table to move with said turn-table, substantially as specified.

9. A dredge-boat having a hawser-hole, a turn-table foundation forming a well in communication at its upper end with the hawser-hole and extending some distance below the same, a turn-table resting on said foundation, guide-sheaves located adjacent to the hawser-hole and at the lower end for maintaining a cable-lead in line with the center of the table, means independent of the table for connecting the lower sheave to turn with the table, substantially as and for the purpose described.

10. A dredge-boat having a hawser-hole, a turn-table, a well beneath the turn-table and extending below the hawser-hole, a backing-cable extending vertically in the well and passing through the hawser-hole, a guide-sheave for the cable at the lower end of the well, and a connection through the well between the turn-table and sheave, whereby the latter is directly connected to swing with the said turn-table, substantially as described.

708,658. DREDGE. RALPH R. OSGOOD, Upper Troy, N. Y. Filed Mar. 18, 1902. Serial No. 98,303. (No model.)



Claim.—1. In an excavator, a dipper-handle having a ponderous flaring outer end, reinforcing-plates applied to said outer end, and a dipper directly abutting said plates and detachably connected to the handle, substantially as described.

2. In an excavator, the combination with a trunnion-supported sleeve; of extensions from said sleeve comprising embracing members at the front and rear of the trunnion-sleeve and arms connecting the extensions and sleeve, the extensions thus being open between the embracing members and trunnion-sleeve, and a dipper-handle reciprocatory in said sleeve and reinforced by bolted or riveted plates, the ends of the bolts or rivets projecting and being exposed through the open portions of the extensions of the sleeve, substantially as specified.

3. In an excavator, the combination with a rectangular trunnion-supported sleeve; of rectangular extensions from said sleeve comprising boxes and angle-arms connecting said boxes with the trunnion-sleeve, a rectangular dipper-handle reciprocatory in said sleeve, plates upon the handle, and bolts or rivets connecting said plates to the handle and having projecting ends, the angle-arms serving as guides to prevent interference between the bolt or rivet ends and sleeve and boxes as the dipper-handle reciprocates, substantially as specified.

4. In an excavator, the combination with a trunnion-supported reinforcing-sleeve; of a dipper-handle reciprocatory in said sleeve, plates reinforcing the dipper-handle and secured thereto by bolts or rivets having projecting ends, and spacing means for guiding the handle through the sleeve and preventing interference between said sleeve and the projecting ends of said bolts or rivets, substantially as described.

5. In an excavator, the combination of a rectangular trunnion-supported sleeve, a rectangular dipper-handle reciprocatory in said sleeve, boxes embracing the handle on opposite sides of the sleeve, and angle-iron arms connecting the corners of the boxes with the corners of the sleeve, substantially as specified.

6. In an excavator, the combination with a dipper-handle, a dipper carried thereby, and controlling means for regulating the action of the handle and dipper; of chains or cables attached to opposite sides of the dipper, a spreader-bar spacing the outer ends of the chains and pivotally connected thereto to allow said chains to yield independently, guide-frames connected to the outer ends of the chains, followers movable in said frames, springs acting on said followers, and an attaching device connected to both followers for connecting the same with the controlling-cable, substantially as specified.

7. In an excavator, a dipper-handle having a tapered or outwardly-flaring outer end, plates reinforcing the handle, a dipper the walls of which

aline with said plates, and metallic straps or plates detachably connecting the dipper with the said tapered end of the handle, substantially as specified.

8. In an excavator, a dipper-handle, tapered pieces giving a flaring formation to the outer end of the dipper-handle, plates reinforcing the handle, a dipper the wall of the shell of which alines with said plates, bridge-plates overlapping the dipper and reinforcing-plates, and bolts or rivets securing said bridge-plates to the dipper, handle and reinforcing-plates, substantially as described.

9. In an excavator, the combination with a dipper-handle, a dipper carried thereby, and a hoisting-chain; of yielding connections between the sides of the dipper and said hoisting-chain, substantially as specified.

10. In an excavator, the combination with a dipper-handle, a dipper carried thereby, and a hoisting-chain; of yielding connections between the sides of the dipper and said hoisting-chain, and a spreader spacing said connections, substantially as set forth.

11. In an excavator, the combination with a dipper-handle, a dipper carried thereby, and a hoisting-chain; of suspending chains or cables attached to opposite sides of the dipper, a spreader spacing the suspending-chains, and means for connecting the suspending-chains to the hoisting-chain, substantially as and for the purpose described.

12. In an excavator, the combination with a dipper-handle, a dipper carried thereby, and a hoisting-cable; of suspending chains or cables attached to opposite sides of the dipper, a spreader spacing the suspending-chains, means for connecting the suspending-chains to the hoisting-chain, guide-frames connected to the suspending-chains, followers attached to said connecting means, and springs in said frames acting on the followers and adapted to allow either side of the dipper to yield without throwing undue strain on the handle, substantially as described.

13. In an excavator, the combination with a trunnion-supported sleeve, a dipper-handle reciprocatory therein, and means for oscillating said handle; of a winding-drum, cables operatively connecting the drum with the dipper-handle near its opposite ends, a band-wheel fixed to the drum and having a friction-surface, a friction-band adapted to engage said surface but held from rotating with the wheel, and a lever operatively connected with the ends of the band for moving the same into and out of engagement with said friction-surface, substantially as set forth.

14. In an excavator, the combination with a trunnion-supported sleeve, a dipper-handle reciprocatory therein, and means for oscillating said handle; of a winding-drum, cables operatively connecting the drum with the dipper-handle near its opposite ends, a band-wheel fixed to the drum and having a friction-surface, a friction-band adapted to engage said surface but held from rotating with the wheel, an operating-lever connected with one end of the band, and means for adjustably connecting the lever with the opposite end of the band, substantially as and for the purpose set forth.

15. In an excavator, the combination with a boom, a trunnion-supported sleeve thereon, a dipper-handle reciprocatory in said sleeve, and means for oscillating said handle; of a drum having connected thereto cables operatively connected to the dipper-handle near its opposite ends, a band-wheel fixed to the drum and provided with a friction-surface, a friction-band adapted to engage said surface, a block having a slot-and-pin connection with the boom and connected to the band, and a lever operatively connected to the ends of the band for moving the same into and out of engagement with said friction-surface, substantially as set forth.

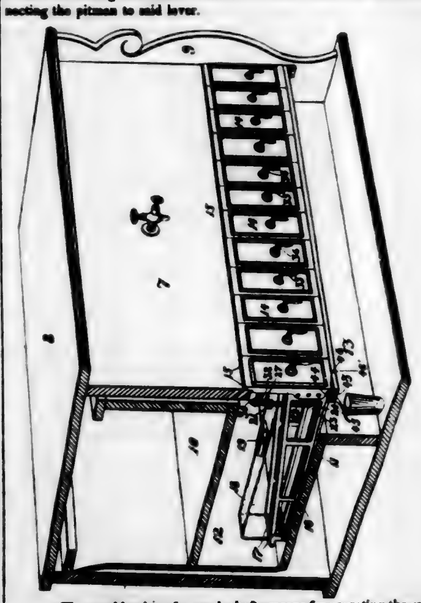
16. In an excavator, the combination with a boom, a trunnion-supported sleeve thereon, a dipper-handle reciprocatory in said sleeve, and means for oscillating said handle; of a drum having connected thereto cables operatively connected to the dipper-handle near its opposite ends, a band-wheel fixed to the drum and provided with a friction-surface, a friction-band adapted to engage said surface, a block having a slot-and-pin connection with the boom and connected to one end of the band, said block forming a brake-shoe, and an operating-lever connected to the opposite ends of the block and band, substantially as and for the purpose specified.

708,659. SODA-WATER-DISPENSING FOUNTAIN. MORRIS H. PERSON, New York, N. Y. Filed Sept. 16, 1901. Serial No. 75,454. (No model.)

Claim.—1. The combination of a drawer; a vessel located therein having an orifice; a valve effective to close said orifice; a lever pivoted to the front of the drawer and effective to raise the valve; and means comprising a crank and pitman operable from the outside of the drawer to actuate said lever.

2. The combination of a drawer; a vessel located therein having an orifice; a valve effective to close said orifice; a lever pivoted to the front of the drawer and effective to raise the valve; means comprising a crank and pitman operable from the outside of the drawer to actuate said lever; and means for automatically seating said valve.

3. The combination of a crank-shaft; means for operating the same; a crank mounted thereon; a pitman pivoted thereto; a lever mounted above said crank-shaft and pivoted at one end to a relatively fixed support and carrying at the other end a valve-stem; a jar having an orifice; a valve for closing said orifice connected to said stem; and means connecting the pitman to said lever.



4. The combination of a crank-shaft; means for operating the same; a crank mounted thereon; a pitman pivoted thereto; a lever mounted above said crank-shaft and pivoted at one end to a relatively fixed support and carrying at the other end a valve-stem; a jar having an orifice; a valve for closing said orifice connected to said stem; and means comprising a link connecting the pitman to said lever.

5. The combination of a crank-shaft; means for operating the same; a crank mounted thereon; a pitman pivoted thereto; a lever mounted above said crank-shaft and pivoted at one end to a relatively fixed support and carrying at the other end a valve-stem; a jar having an orifice; a valve for closing said orifice connected to said stem; means connecting the pitman to said lever; and means for seating the valve.

6. The combination of a crank-shaft; means for operating the same; a crank mounted thereon; a pitman pivoted thereto; a lever mounted above said crank-shaft and pivoted at one end to a relatively fixed support and carrying at the other end a valve-stem; a jar having an orifice; a valve for closing said orifice connected to said stem; means comprising a link connecting the pitman to said lever; and means for seating the valve.

7. The combination of a crank-shaft; means for operating the same; a crank mounted thereon; a pitman pivoted thereto; a lever mounted above said crank-shaft and pivoted at one end to a relatively fixed support and carrying at the other end a valve-stem; a jar having an orifice; a valve for closing said orifice connected to said stem; means connecting the pitman to said lever; and a spring secured at one end to a fixed part and at the other end to the pivot connecting the crank and pitman and effective to return the same to normal position.

8. The combination of a crank-shaft; means for operating the same; a crank mounted thereon; a pitman pivoted thereto; a lever mounted above said crank-shaft and pivoted to a relatively fixed support and carrying a valve-stem; a jar having an orifice; a valve for closing said orifice connected to said stem; means comprising a link connecting the pitman to said lever; and a spring secured to a fixed part and to the pivot connecting the crank and pitman and effective to return the same to its normal position.

9. The combination of a crank-shaft; means for operating the same; a crank mounted thereon; a pitman pivoted thereto; a lever mounted above said crank-shaft and pivoted to a relatively fixed support and carrying a valve-stem; a jar having an orifice; a valve for closing said orifice connected to said stem; means connecting the pitman to said lever; and detents controlling the extent of oscillation of the crank-shaft.

10. The combination of a crank-shaft; means for operating the same;

a crank mounted thereon; a pitman pivoted thereto; a lever mounted above said crank-shaft and pivoted to a relatively fixed support and carrying a valve-stem; a jar having an orifice; a valve for closing said orifice connected to said stem; means comprising a link connecting the pitman to said lever; a spring secured to a fixed part and to the pivot connecting the crank and pitman and effective to return the same to its normal position; and detents carried by the crank and effective to engage the pitman to limit the oscillation of the crank-shaft.

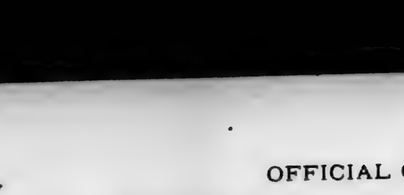
11. The combination of a crank-shaft; means for operating the same; a crank mounted thereon; a pitman pivoted thereto; a lever mounted above said crank-shaft and pivoted to a relatively fixed support; means connecting the pitman to said lever; a valve-stem carried by said lever; means for locking the valve-stem to the lever; a jar having an orifice; and a valve connected to said stem for closing said orifice.

12. The combination of a crank-shaft; means for operating the same; a crank mounted thereon; a pitman pivoted thereto; a lever mounted above said crank-shaft and pivoted to a relatively fixed support and carrying a valve-stem; a jar having an orifice; a valve for closing said orifice connected to said stem; means connecting the pitman to said lever; and means embodying a hook for locking the valve-stem to a pin on the lever.

13. The combination of a jar having an orifice; a valve therefor; a valve-stem connected to the valve at one end and having its other end slotted; a pin crossing said slot; means including a lever for actuating said valve-stem and adapted to be embraced by said slot and pin; a lug on the lever; a hook carried by the stem and adapted to secure the lever and stem; and a handle for actuating the hook and organized in such relation to the valve-stem that on the hook engaging the lug the handle will spring past the side of the stem and thereby maintain the hook in position.

14. In a soda-water fountain, a valve effective to control the emission of syrup, &c.; a two-part valve-stem one part of which is secured to the valve, the other part of which has a screw-threaded connection therewith and provided with a bifurcated end; means comprising a lever received in such bifurcated end for actuating the valve; and means comprising a hook for locking the valve-stem to the actuating-lever.

708,660. PICKLING AND SWILLING APPARATUS. JAMES R. PHILLIPS, Pittsburg, Pa., assignor to the American Tin Plate Company, Pittsburg, Pa., a Corporation of New Jersey. Filed July 10, 1901. Serial No. 67,779. (No model.)



Claim.—1. A pickling-trough having a series of feed-rolls of acid-proof material located therein, and mechanism for brushing the plates as they pass through said rolls; substantially as described.

2. A pickling-trough having feed-rolls of acid-proof material therein, and brushing-rollers located between the feed-rollers and arranged to brush the faces of the sheets while fed along by the feed-rollers; substantially as described.

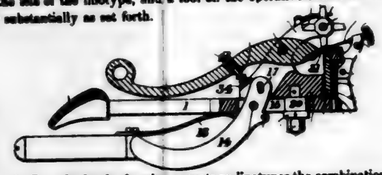
3. A pickling-tank having feed-rollers arranged in pairs therein to feed the sheets successively through the vat, brushing-rollers arranged to act upon the sheets during the pickling operation, and mechanism for driving the brush-rollers at a higher rate of speed than the feed-rollers; substantially as described.

4. A pickling-trough having a swilling-trough arranged in tandem therewith, rollers arranged to feed the sheets successively through both troughs, and brushing-rollers in both troughs having driving mechanism arranged to rotate them at a higher rate of speed than the feed-rollers; substantially as described.

5. A pickling-trough having brush-rollers arranged to act simultaneously upon the upper and lower faces of the sheet, said rollers having projecting plugs of a yielding material substantially as described.

708,661. DEVICE FOR FORMING ACCENTS ON LINOTYPES. JOSEPH PEIRS, Altrincham, England, assignor to the Linotype Company, Limited, London, England. Filed June 14, 1902. Serial No. 111,966. (No model.)

Claim.—1. In a device for forming accents on linotypes the combination of a base-plate, a gripper-jaw fast to the base-plate on one side of the site for the linotype, a movable gripper-jaw adjustable on the base-plate, on the other side of the said site, a lever pivoted to the base and movable jaw for adjusting the latter, a matrix on the movable gripper-jaw overhanging the site of the printing edge of the linotype, a lever pivoted to the movable gripper-jaw with its operative end movable adjacent to the site of the linotype, and a tool on the operative end of the said lever substantially as set forth.



2. In a device for forming accents on linotypes the combination with relatively movable jaws of a linotype-gripper, of a matrix on one jaw overhanging the site for the linotype, a lever pivoted to the said jaw with its operative end movable adjacent to the said site, and a tool on the operative end of the lever, substantially as set forth.

3. In a device for forming accents on linotypes, the combination with a base-plate and a gripper-jaw fast to the base-plate, of a second gripper-jaw adjustable on the base-plate toward and away from the fixed jaw, a lever operatively connected to both the base-plate and movable gripper-jaw, a retracting-spring for the movable jaw, a lever in pivotal connection with the movable jaw, with its operative end movable adjacent to the site of the linotype, a tool on the said operative end, a retracting-spring for the last-named lever, and a matrix overhanging the site of the printing edge of the linotype substantially as set forth.

4. In a device for forming accents on linotypes, the combination with relatively movable jaws of a linotype-gripper of a matrix overhanging the site for the printing edge of the linotype, a lever pivoted to one of the gripper-jaws, with its operative end movable adjacent to the site of the linotype, a tool on said operative end and an indicator for the linotype adjustable on the gripper-jaw substantially as set forth.

5. In a device for forming accents on linotypes, the combination with a gripper for the linotype, of a boss pivoted to the gripper over the site of the linotype, a plurality of matrices on the boss, a lever pivoted to the gripper with its operative end movable adjacent to the above-named site, and a tool on the operative end of the lever substantially as set forth.

6. In a device for forming accents on linotypes, the combination with a gripper for the linotype, of a boss pivoted to the gripper over the site of the linotype, a plurality of matrices on the boss, a detent for the matrices adjustable on the gripper, a lever pivoted to the gripper with its operative end movable adjacent to the above-named site, a tool on the said operative end, and an indicator for the linotype adjustable on the gripper, substantially as set forth.

7. In a device for forming accents on linotypes, the combination with a base-plate, a gripper-jaw fast to the base-plate, and a second gripper-jaw movable on the base-plate, of a matrix mounted on the movable jaw and overhanging the site of the linotype, a lever in pivotal connection with the movable jaw, with its operative end movable adjacent to the said site, a tool on this operative end, a groove in the base-plate adjacent to the fixed jaw, a shelf on the base-plate between the groove and the fixed jaw and a spring on the fixed jaw to push the linotypes off the shelf substantially as set forth.

8. In a device for forming accents on linotypes, the combination with a gripper for the linotype, of a matrix on the gripper over the site for the linotype, a pivot in the gripper, a block on the pivot, a lever rocking on the pivot and adjustable on the said block with its operative end movable adjacent to the said site and a tool on the operative end of the lever substantially as set forth.

9. In a device for forming accents on linotypes, the combination with a gripper for the linotype, of a matrix on the gripper, over the site for the linotype, a lever pivoted to the gripper with its operative end movable adjacent to the said site, a tool on the operative end of the lever, a stop adjustable on the lever with its effective end adjacent to the tool, and adjusting devices for the stop substantially as set forth.

10. In a device for forming accents on linotypes, the combination with a gripper for the linotype, of a matrix on the gripper over the site for the linotype, a pivot in the gripper, a block on the pivot, a lever rocking on the pivot and adjustable on the said block with its operative end movable adjacent to the said site, a tool on the operative end of the lever, a stop adjustable on the lever with its effective end adjacent to the tool, and adjusting devices for the stop substantially as set forth.

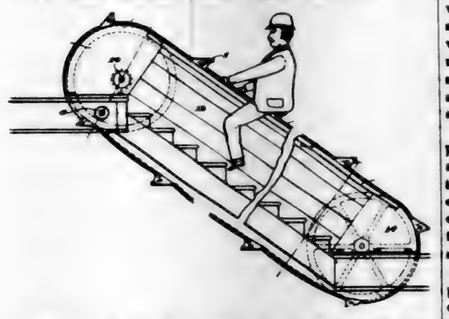
708,662. BLUE SULFUR DYE AND PROCESS OF MAKING SAME. ALBERT F. FOERSTER, Paris, France, assignor to Ste. Anon des Matières Colorantes et Produits Chimiques de St. Denis, Paris, France. Filed Mar. 28, 1901. Serial No. 53,519. (No specimens.)

Claim.—1. The herein-described process of producing coloring-matter consisting in treating a solution of an indophenol and sodium sulfid, with the product resulting from the action of chlorid of sulfur on phenols.

2. The herein-described process of producing coloring-matter consisting in oxidizing a mixture of paraphenylenediamin and a phenol, forming a solution of the indophenol thus obtained with sodium sulfid, and then treating said solution with the product resulting from the action of chlorid of sulfur on phenols.

3. The described coloring-matter obtained by oxidizing a mixture of paraphenylenediamin and a phenol, forming a solution of the indophenol thus obtained with sodium sulfid, and then treating said solution with the product resulting from the action of chlorid of sulfur on phenols, the said coloring-matter being black in appearance, very soluble in water giving a blue solution from which it is completely precipitated by acids, the precipitate being soluble in soda and especially in alkali sulfids, and solutions thereof in alkali sulfids or water dyeing unmordanted cotton in blue tints of high resistance.

708,663. INCLINED ELEVATOR. JAMES W. RENO, New York, N. Y. Filed Feb. 20, 1902. Serial No. 95,004. (No model.)



Claim.—1. In an inclined elevator, the combination with an inclined support, of an endless chain adapted to travel on said support, and seats secured to said chain.

2. In an inclined elevator, the combination with an inclined support, guide-sheaves located at the upper and lower ends of said support, an endless chain adapted to travel upon said support and around said guide-sheaves, and seats secured at intervals to said chain.

3. In an inclined elevator, the combination with an inclined support, guide-sheaves located at the upper and lower ends of said support, an endless chain adapted to travel upon said support and around said guide-sheaves, seats secured at intervals to said chain and a loose flexible connection between said seats independent of said chain.

4. In an inclined elevator, the combination with an inclined support and guide-sheaves located at either end of said support, of an endless chain adapted to travel upon said support and around said guide-sheaves, seats provided with hinged connections to said chain at their front ends and a roller-support to the rear of said hinged connections.

5. In an inclined elevator, the combination with an inclined support and guide-sheaves located at either end of said support, of an endless chain, a track for said chain, seats having hinged connections to said chain at their forward ends, a roller-support to the rear of said hinged connections, an independent track for said roller-support, whereby said seats may be maintained in a horizontal position.

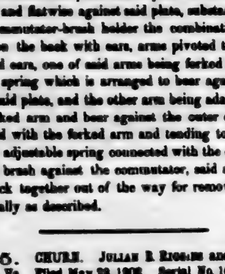
6. In an inclined elevator, the combination with a stairway and its banister of a track upon said banister, an endless chain adapted to operate upon said track and seats secured to said endless chain.

7. In an inclined elevator, the combination with a stairway and banister of a track upon said banister centrally located, an endless chain adapted to travel upon said track, seats having hinged connections to said chain, bearing-rollers mounted under said seats, and independent tracks upon said banister for said bearing-rollers.

708,664. COMMUTATOR-BRUSH HOLDER. WALTER J. RICHARDS, Milwaukee, Wis. Filed Jan. 20, 1902. Serial No. 90,473. (No model.)

Claim.—1. In a commutator-brush holder the combination of a bearing-plate, means for pressing the brush endwise against the commutator, an arm extending over the outer end of said plate and adapted to bear at its free end against the face of the brush opposite said plate and to hold the same against said plate, substantially as described.

2. In a commutator-brush holder the combination of a bearing-plate, a pivoted arm adapted to bear against the outer end of the brush, a spring tending to press said arm against the end of the brush, a spring tending to press the brush endwise against the commutator, and another arm extending over the outer end of said plate and provided with a spring adapted to press and hold said brush against said plate, substantially as described.



3. In a commutator-brush holder the combination of a plate against which one side of a brush is adapted to bear and slide, a pivoted arm adapted to bear against the outer end of the brush, a spring connected with said arm and adapted to press the brush endwise against the commutator, another movable arm extending normally over the outer end of said plate and bearing against the face of the brush opposite said plate, and a spring arranged to act on the latter arm and to hold the brush against said plate, substantially as described.

4. In a commutator-brush holder the combination with a bearing-plate, of a pivoted arm adapted to bear against the outer end of the brush, a spring acting on said arm and tending to press the brush endwise against the commutator, another pivoted arm extending normally over the outer end of said plate and provided at its free end with a spring which is adapted to bear against the face of the brush opposite said plate, and a spring tending to hold the latter arm in working position, substantially as described.

5. In a commutator-brush holder the combination of a bearing-plate provided on the back with ears, an arm pivoted on a pin between said ears and adapted to bear against the outer end of the brush, a spring adapted to act upon said arm and press the brush against the commutator, another arm pivoted on the same pin and provided with a spring which is adapted to hold the brush flatwise with yielding pressure against said plate, and means for holding said arm in working position, substantially as described.

6. In a commutator-brush holder the combination with a bearing-plate, a pivoted arm adapted to bear against the outer end of the brush, a spring connected with said arm and adapted to press the brush against the commutator, another pivoted arm adapted to bear against the face of the brush opposite said plate, and a spring connected with the last-mentioned arm and adapted to hold the brush with yielding pressure against said plate and to permit said arm to be turned back out of the way for removing or replacing a brush in the holder, substantially as described.

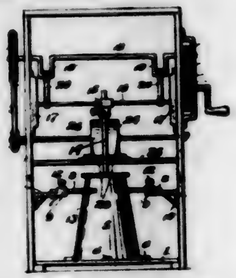
7. In a commutator-brush holder the combination with a bearing-plate, of two arms pivoted concentrically with each other to said plate, one of said arms being adapted to bear against the outer end of the brush and the other arm being provided with a spring which is adapted to bear against the side of the brush opposite said plate, and springs tending to swing said arms toward said plate and to press the brush endwise against the commutator and flatwise against said plate, substantially as described.

8. In a commutator-brush holder the combination with a bearing-plate provided on the back with ears, arms pivoted together on a cross-pin between said ears, one of said arms being forked and provided at its free end with a spring which is arranged to bear against the face of the brush opposite said plate, and the other arm being adapted to pass loosely through the forked arm and bear against the outer end of the brush, a spring connected with the forked arm and tending to hold it in working position, and an adjustable spring connected with the other arm and tending to press the brush against the commutator, said arms being adapted to be turned back together out of the way for removing or replacing a brush, substantially as described.

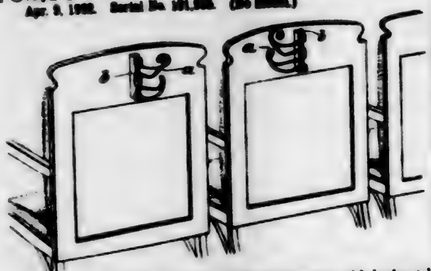
708,665. CHURN. JULIAN B. RIGGINS and HERBERT GORDAN, Clarksville, Va. Filed May 28, 1902. Serial No. 109,593. (No model.)

Claim.—In a churn, a supporting-frame, a churn-body carried thereby and having a reciprocating dasher, rearwardly-projecting bearing-brackets fixed to said supporting-frame, a transversely-disposed horizontal shaft journaled in bearings adjustably mounted in said bearing-brackets, a fan fixed to said shaft, a shelf or bracket carried by the supporting-frame, a casing slidably mounted upon said shelf and inclosing said fan, and having discharge-openings arranged to direct a blast of air upon the top of

the sleeve, and gearing for reciprocating the dasher-shaft and driving the fan-shaft, substantially as described.



708,666. HAT-HOOK. JOSEPH ROSENBERG, New York, N. Y. Filed Apr. 9, 1902. Serial No. 101,999. (No model.)



Claim.—1. A folding hat-hook, having elastic arms with horizontal portions and vertical pintles at their ends, and a securing-bracket provided with upper and lower vertical bearings to receive the pintles, said bearings being notched on their opposite ends to receive the horizontal portions of the elastic arms and hold the hook either in its folded or extended position.

2. A folding hat-hook, consisting of a hook having elastic arms with horizontal portions and vertical pintles at their ends, and an intermediate pivotal portion between the arms and in line with the pintles, and a securing-bracket having upper and lower vertical bearings to receive the pintles, and a central bearing for the intermediate pivotal portion of the hook.

3. A folding hat-hook, consisting of a single piece of wire bent into the form of a duplex hook, having elastic arms with horizontal portions and vertical pintles at their ends, the pintles of the upper and lower hooks extending in opposite directions, and a securing-bracket having upper and lower vertical bearings to receive the pintles, and a central bearing through which the intermediate pivotal portion of the hook between its arms passes.

708,667. CORKSCREW. RICHARD ZIEBELLS, Westerly, R. I. Filed Sept. 20, 1901. Serial No. 75,603. (No model.)

Claim.—1. A corkscrew, having a shank portion, a sleeve surrounding the corkscrew and designed to engage with a cork, a spring surrounding the sleeve, said spring being secured at its lower end to the sleeve, a connection between the upper end of the spring and the corkscrew, and a bar arranged transversely in the sleeve for engaging the screw, substantially as specified.

2. A corkscrew, a sleeve surrounding the corkscrew and having points or pins at its lower end, a rod extended transversely in said sleeve and at one side of its axial center for engaging with the screw, a ring through which the sleeve is movable, a spring surrounding the sleeve and connected thereto at its lower end, the upper portion of the spring being connected to the ring, an eye portion on the upper end of the spring, and a rod carried on the shank of the corkscrew and engaging in said eye, substantially as specified.

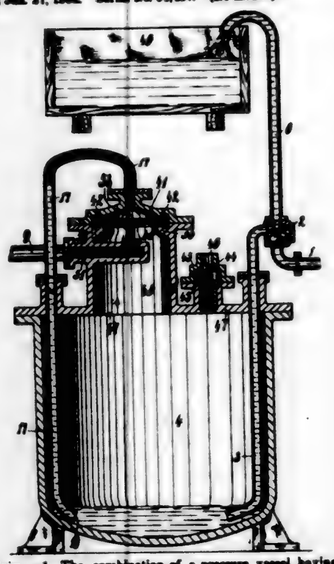
3. A corkscrew, a sleeve surrounding the corkscrew and having a flange at its lower end, pin-points on said flange, a cross-rod in the sleeve for engaging with the screw, a ring through which the sleeve is movable, a spring surrounding the sleeve and connected at its lower end to said flange and at its upper portion to the ring, the upper coil of said spring being turned outward to form an eye, a cross-head on the shank of the corkscrew, and a rod depending from said cross-head and engaging in said eye, substantially as specified.

708,668. OVERSHOE FOR HORSES. FREDERICK SMEDBERG, New York, N. Y. Filed Jan. 16, 1902. Serial No. 90,018. (No model.)

Claim.—1. An overshoe for horses consisting of an upper of leather shaped to fit the hoof and provided with fastening means, a sole of thick felt flexible material secured to said upper, and a metallic shield and stiffener comprising a sole-plate and an upper-plate having a lateral flange interposed between the said upper and sole and means passed through said flange and sole for securing the parts together, as set forth.

2. An overshoe for horses consisting of a thick sole of felt adapted for direct contact with the ground, an upper of leather to which said sole is secured, and an interposed reinforcing-stiffener resting upon said sole and against the front portion of the upper and having a lateral flange with means securing said upper and sole to the flange, said stiffener serving the double function of reinforcing the upper and sustaining the same and preventing penetration of and injury to the felt sole by the metallic shoe of the animal, as set forth.

708,669. APPARATUS FOR RAISING LIQUIDS BY MEANS OF STEAM OR COMPRESSED AIR. ALBERT SCHOLL, Mannheim, Germany. Filed Jan. 27, 1902. Serial No. 91,457. (No model.)



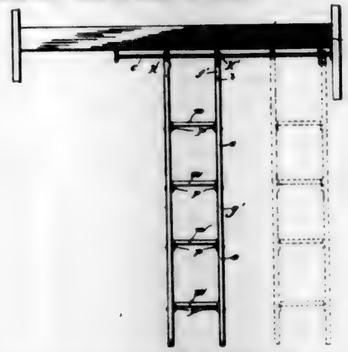
Claim.—1. The combination of a pressure vessel having a compressed-air space at its upper part and inlets for liquid and compressed fluid and an outlet for the liquid to be raised, a stand-pipe extending into said vessel and in communication with said air-space, a valve in said compressed-fluid inlet a valve-plate rigidly connected with said valve and adapted to close communication between said stand-pipe and air-space and opening the compressed-fluid valve on overpressure existing in the vessel, and means for putting the pressure vessel into communication with the atmosphere on cessation of overpressure therein, substantially as described for the purpose set forth.

2. The combination of a pressure vessel having a compressed-air space at its upper part, a stand-pipe extending at one end into said vessel and in communication at the other end with said air-space, an inlet-pipe for liquid, an inlet-nozzle for compressed fluid, a valve in said nozzle, a valve-plate rigidly connected with said valve and adapted to close communication between the stand-pipe and air-space and open the compressed-fluid valve on overpressure existing in the vessel, an outlet-pipe for the liquid to be raised, and means for putting said vessel into communication with the atmosphere on cessation of overpressure therein, substantially as described for the purpose set forth.

3. The combination of a pressure vessel having a flat cover and a compressed-air space at its upper part, a stand-pipe extending into said vessel and in communication with said air-space, an inlet-pipe for liquid, an inlet-nozzle for compressed fluid, a valve in said nozzle, a valve-plate rigidly connected with said valve and adapted to close communication between said stand-pipe and air-space, and open the compressed-fluid valve on overpressure existing in the vessel, an outlet-pipe for the liquid to be raised and an exhaust-valve in said cover adapted to put the pressure vessel into communication with the atmosphere on cessation of overpressure in said vessel, substantially as described for the purpose set forth.

4. The combination of a pressure vessel having a flat cover and a compressed-air space at its upper part, a stand-pipe extending below to near the bottom of said vessel and in communication above with said air-space, an inlet-pipe for liquid, an antireturn-valve in said pipe, an inlet-nozzle for compressed fluid, a valve in said nozzle, a valve-plate rigidly connected with said valve and adapted to close communication between said stand-pipe and air-space and open the compressed-fluid valve on overpressure existing in the vessel, an outlet-pipe for the liquid to be raised and an exhaust-valve adapted to be closed by the liquid and to put the pressure vessel into communication with the atmosphere on cessation of overpressure in said vessel substantially as described, for the purpose set forth.

708,670. LADDER. CHARLES R. SEE, Charlevoix, Mich. Filed Jan. 18, 1902. Serial No. 90,344. (No model.)



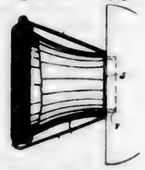
Claim.—1. The combination with the foldable stringers, and the broad steps pivoted thereto, of the berth track-bar, the runner connections of the inner stringers, and means for holding the outer stringers in folded position and in fixed relation to the end of the berth, substantially as specified.

2. The combination with a berth track-bar, and adjustable collapsing stairs having runner connections with said track-bar, of means for holding the stairs in collapsed or folded position and in fixed relation to the track-bar, substantially as specified.

3. A collapsible step-ladder consisting of the outer and inner pairs of stringers or side bars having the steps pivotally connected thereto, said outer pair of stringers being arranged to rest upon the floor of the room, when lowered, and a catch device for holding said outer pair of stringers in raised position, substantially as specified.

708,671. ANTISEPTIC ATTACHMENT FOR TELEPHONE-MOUTHPIECES. HENRY C. SMITH and MARK H. WOOLSEY, San Francisco, Cal. Filed Feb. 24, 1902. Serial No. 95,448. (No model.)

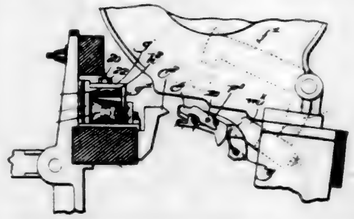
Claim.—1. The combination with a telephone-mouthpiece of a cap containing an interior filling of porous or absorbent material saturated with a sterilizing substance, and divergent spring-arms embracing the mouthpiece one of said arms forming a hinge member for one edge of the cap and the other member having a latch to engage the opposite edge of said cap.



2. The combination with a telephone-mouthpiece of a cap fitting over the outer end of the mouthpiece having the interior lined with an absorbent saturated material, a plate having a central hole through which the screw-threaded end of the mouthpiece passes so that the shoulder of the mouthpiece will lock the plate in position, divergent arms extending outwardly upon each side of the mouthpiece, one of said arms carrying a hinged member to which the cap is connected, and the other being elastic and provided at its free end with a latching device whereby the cap is retained in position between the free ends of the arms in closed position upon the mouthpiece.

3. The combination with a telephone-mouthpiece of a perforated plate through which the screw-threaded end of the mouthpiece passes and by which it is secured to the case, divergent arms extending outwardly upon each side of the mouthpiece, one of said arms carrying a hinged member and the other being elastic and having, at its free end, a latching device, a cap confined between the free ends of the arms and having the other hinged member upon one edge and a catch upon the opposite side to engage with the latch, said cap having an interior cavity hooking over the mouthpiece when closed, and an absorbent material fitted therein adapted to close against the periphery of the mouthpiece.

708,672. SHUTTLE-GUIDE FOR WEFT-REPLENISHING LOOMS. ALFRED R. STAFFORD, Hopedale, Mass., assignor to Draper Company, Hopedale, Mass., a Corporation of Maine. Filed May 10, 1902. Serial No. 106,735. (No model.)



Claim.—1. In a loom, the lay, a shuttle-box thereon, and a depending shuttle-guide beyond and near the mouth of the box, leaving a clearance between the race of the lay and the lower edge of the guide, the inner face of the latter being located in the plane of the inner face of the front wall of the box.

2. In a loom, the lay, a shuttle-box thereon, comprising front and back walls and a top plate, and a depending shuttle-guide mounted on the latter near and beyond the mouth of the shuttle-box, the inner face of said guide being in the plane of the inner face of the front wall of the box, a clearance being left between the front wall and the guide, and between the lower edge of the latter and the race of the lay.

3. In a loom, the lay, a shuttle-box thereon having the inner end of its top plate extended beyond the mouth of the box and above the shuttle-path, and a shuttle-guide rigidly mounted on such extension, and depending therefrom beyond the mouth of the box, to direct the shuttle as it leaves the box.

4. In a loom, the lay, a shuttle-box thereon, a top plate therefor extended beyond the mouth of the box and provided at the top of the extension with a seat, and a shuttle-guide secured to the seat and depending therefrom in alinement with the front wall of the box beyond the latter, an unobstructed thread-passage being left between the lower edge of the guide and the race of the lay.

5. In a loom provided with automatic filling-replenishing mechanism, the lay, a shuttle-box thereon, a shuttle-feeler movable into operative position across the mouth of the replenishing-box when a change of filling is to be effected, and a depending shuttle-guide fixedly mounted near the mouth of such box beyond the feeler-path, to direct the shuttle as it leaves the box, an open thread-passage being left between the lower edge of the said guide and the race of the lay.

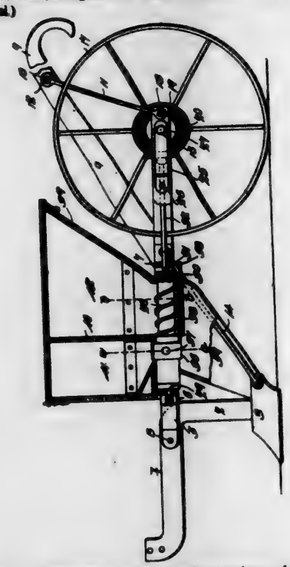
6. In a loom provided with automatic filling-replenishing mechanism, the lay, a shuttle-box thereon, the beat wall and top plate whereof are extended beyond the mouth of the box, to direct the shuttle at its back and top as it leaves the box; a shuttle-fender movable across the mouth of the shuttle-box when a change of filling is to be effected, and a shuttle-guide mounted on the extension of the top plate and depending toward, but not to, the race of the lay, said guide being in alinement with the front box-wall and beyond the path of the fender, to direct the shuttle at its front side when leaving the box.

708,673. BUTTON. FREDERICK R. STANLEY, Waterbury, Conn., assignor to Scovill Manufacturing Company, Waterbury, Conn., a Corporation of Connecticut. Filed Aug. 15, 1901. Serial No. 72,183. (No model.)

Claim.—1. A bar-button, having a hub, and a bar of less length than the internal diameter of the hub arranged in the bottom of said hub, and lateral indentations in the hub overlying and embracing the ends of the bar and restraining it against vertical and lateral displacement.

2. A bar-button, having a bar of less length than the internal diameter of the hub, and lateral indentations in the hub overlying and embracing the ends of the bar, the said indentations being substantially concentric with the circumference of the bar.

708,674. CORN-PLANTER AND FERTILIZER-DISTRIBUTER. JOHN W. STEVENS, Lonaconing, Va. Filed Dec. 12, 1901. Serial No. 85,681. (No model.)



Claim.—1. In a planter, a frame having bearings, a hopper on said frame, a roller coacting with the hopper to discharge material therefrom, said roller having a trunnion at one end journaled in one of said bearings and having a socket in its opposite end, a longitudinally-movable shaft 32, journaled in the other bearings and having one end detachably connected to said socket, a traction-wheel, a gear revolved thereby and a gear on said shaft 32 and engaging said first-mentioned gear, substantially as described.

2. In a planter, the combination of a frame, a hopper, a removable element, coacting therewith to discharge material therefrom, said element having a projecting shaft, a shiftable pinion on said shaft, a longitudinally-shiftable shaft 16, disposed transversely with reference to and journaled in bearings in the frame, a traction-wheel and a gear, rotated thereby and adapted to be moved into and out of engagement with the pinion by shifting said shaft 16, said gear having concentric series of gear elements to respectively engage said pinion and thereby vary the speed of said revolvable element and means to lock said shaft 16 when shifted, substantially as described.

3. In a planter, the combination of a frame, a hopper detachably secured thereto, a revolvable roller having one end journaled in a bearing in the frame, a shaft, detachably connected to the opposite end of said roller, bearings for said shaft, a traction-wheel, and means to convey power therefrom to said shaft, substantially as described.

708,675. DEVICE FOR THE MANUFACTURE OF PHOTOGRAPHIC CARD-MOUNTS. PAUL J. STUPARICH, San Francisco, Cal. Filed Jan. 20, 1902. Serial No. 90,477. (No model.)

Claim.—A device for simultaneously punching and embossing photographic mounts, consisting of a stationary die having a plain surface, and a central opening, a reciprocating block having its lower end turned down to form a punch which fits said opening, and a removable embossing-ring embracing the punch and resting against the shoulder of said turned-down portion of the block.

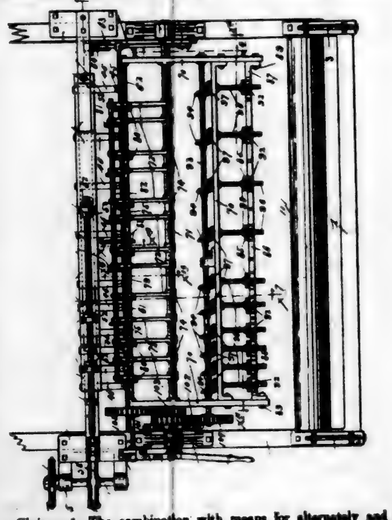
708,676. HARNESS ATTACHMENT. JOSEPH T. SUEDADOR, Arbuckle, Cal. Filed Feb. 6, 1902. Serial No. 92,881. (No model.)

Claim.—In a harness attachment and in combination with a strap and a fastening device carried thereby, a retainer for said device consisting of a metal plate between the layers of the strap said plate of less width than the strap and bent at its center and the members brought together to lie one on the other in direct contact, and concealed from view by stitching the edges of the layers together, and a rivet passing through the ends of the plate and the strap and securing the parts substantially as herein described.

708,677. WITHDRAWN.

708,678. WITHDRAWN.

708,679. WIRE-FABRIC MACHINE. THOMAS SUTHERLAND, Hutchinson, Minn. Filed Mar. 22, 1902. Serial No. 99,409. (No model.)



Claim.—1. The combination with means for alternately and reversely lapping the line-wires and twisting the same together to form stays, of means for moving the fabric to draw out the line-wires, and means for twisting together the adjacent line-wires of the several sections of the fabric, to form cables thereof and connect the said fabric-sections.

2. The combination with a plurality of wire-delivery shuttles or guides working in reversely-movable pairs to lap the line-wires, of stay-twisters operating to twist together the lapped section, to form stays thereof, means for intermittently moving the fabric to draw out the line-wires, and line-twisters arranged to twist together the line-wires between the stays, to form a cable thereof and bind together the sections of the fabric.

3. The combination with wire-delivery shuttles or guides, of a plurality of stay-twisters operative on the transverse sections of the incomplete fabric, to form the stays thereof, and a plurality of line-twisters operating to twist together adjacent line-wires between the stays, to form cables thereof and bind together the sections of the fabric.

4. The combination with wire-delivery shuttles or guides, of an oscillating frame, a series of stay-twisters and a series of line-twisters mounted on said frame and carried in reverse directions, to and from operative positions, under the movements of said frame, and means for driving the said twisters, to twist the stay and line sections of the fabric, substantially as described.

5. The combination with reciprocating wire-delivery shuttles or guides working in reversely-movable pairs to lap the line-wires, of corner-pins over which the wires are bent, stay-twisters operating to twist together the lapped sections of the wires, to form stays thereof, means for intermittently moving the fabric to draw out the line-wires, and line-twisters arranged to twist together the adjacent line-wires between the stays, to bind together the sections of the fabric, substantially as described.

6. The combination with a pair of reversely-reciprocating wire-delivery shuttles or guides, of a pair of coöperating corner-pins over which the wires are bent, under the movements of said shuttles, to overlap the line-wires, stay-twisters for twisting together the overlapped sections of the wires, means for moving the fabric to draw out the line-wires, and means for causing said stays and corner-pins to clear each other, under the movement of the fabric.

7. The combination with a pair of reversely-reciprocating wire-delivery shuttles or guides, of a pair of corner-pins over which the line-wires are bent, under the movements of said shuttles, to overlap the line-wires, and twisters operating to twist together the overlapped sections of the wires while the same are held stretched by the said corner-pins.

8. The combination with a pair of reversely-reciprocating wire-delivery shuttles or guides, of a pair of corner-pins over which the line-wires are bent, under movements of said shuttles to overlap said wires, twisters for twisting together the overlapped sections of the wires to form stays thereof, means for throwing said corner-pins into inoperative positions, to permit the twisted stays to pass over the same, and means for intermittently moving the fabric to draw out the line-wires, substantially as described.

9. The combination with a plurality of reversely-reciprocating wire-delivery shuttles or guides, coöperating corner-pins over which the line-wires are bent to overlap the same, a latch normally holding said corner-pins in operative positions, an oscillating frame or support, stay-twisters and line-twisters carried by said support and movable thereby into and out of operative positions, and a trip for said latch arranged to be thrown into action under that movement of said frame which carries the said twisters from their operative into their inoperative positions.

10. The combination with a plurality of wire-delivery shuttles or guides working in reversely-reciprocating pairs, of a rock-shaft provided with a plurality of corner-pins, a latch normally holding said corner-pins in operative positions, an oscillating frame, stay-twisters and line-twisters mounted on said frame and receiving reverse movements thereby, to and from operative positions, means for drawing the fabric forward to draw out the line-wires, and a trip for the said latch arranged to be thrown into action and then to be again released or rendered inoperative by that movement of said frame which carries the said twisters from their operative into their inoperative positions.

11. The combination with a reciprocating driver, of a plurality of slides receiving different movements therefrom, wire-delivery shuttles or guides carried by said slides, means for moving the fabric to draw out the line-wires, and means for twisting together the stay and line forming sections of the wires, substantially as described.

12. The combination with a pair of reversely-movable drivers, of slides driven by said drivers, wire-delivery shuttles or guides carried by said slides and operating in reversely-movable pairs, means for feeding the fabric to draw out the line-wires, and stay-twisters for twisting together the overlapped sections of the wires, to form stays thereof, substantially as described.

13. The combination with reversely-reciprocating drivers, of slides receiving different movements from each driver, wire-delivery shuttles or guides carried by said slides, the upper and lower members thereof coöperating in reversely-movable pairs, means for moving the fabric to draw out the line-wires, and means for twisting together the overlapped stay-forming sections and the parallel line-sections of the wires, substantially as described.

14. The combination with parallel upper and lower guides of a plurality of slides on each guide, wire-delivery shuttles or guides carried by said slides, reversely-reciprocating driving-plungers operating one on the upper and one on the lower series of slides, and adjustable driving collars or elements on said plungers for varying the driving actions thereof, on the respective slides, substantially as described.

15. The combination with a pair of parallel guides, of slides movable thereon, wire-delivery shuttles or guides carried by said slides and operating in reversely-movable pairs, and means for reversely reciprocating the upper and the lower members of said slides, and an oscillating lever with connections extending thereto, substantially as described.

16. The combination with a pair of parallel guides, of slides movable thereon, wire-delivery shuttles or guides carried by said slides and operating in reversely-movable pairs, and means for reversely reciprocating the upper and lower members of said slides, involving a reversible frictional clutch, an oscillating lever driven from said clutch and connections from said lever to said slides, substantially as described.

17. The combination with means for disposing the wires to form stay and line sections, of stay-twisters for twisting together the stay-forming sections of the wires, line-twisters spaced transversely of the fabric with their axes at right angles to the common axes of the stay-twisters, and means for adjusting the said line-twisters toward and from the stay-twisters, substantially as described.

18. The combination with a wire-twister and a stop for limiting to normal the return or unwinding movement thereof, of a drive for imparting twisting movements to said twister, and a reverse drive normally tending to impart return or untwisting movement to the said twister, but adapted to be overcome by the said former drive, substantially as described.

19. The combination with a wire-twister and a stop for limiting the return or unwinding movement thereof, of a frictional return drive tending to impart return or unwinding movements to said twister, and a primary drive for imparting twisting movements to said twister, against the action of said frictional return drive, substantially as described.

20. The combination with a plurality of twisters and a stop for limiting to normal positions the return movements thereof, of a primary drive for imparting twisting movements to said twisters and a secondary or return drive for said twisters adapted to be overcome by said primary drive and involving in itself a pair of coöperating pulleys and a belt running loosely thereover, substantially as described.

21. The combination with corner-pins over which the wires are adapted to be bent, of means for bending the wires and overlapping the same from one corner-pin to the other, and a pair of reversely-rotatable twisters for twisting together the overlapped wire-sections between said corner-pins, substantially as described.

22. The combination with corner-pins over which the wires are adapted to be bent, of reversely-movable wire-delivery shuttles or guides operating in pairs to cause the wires to overlap from one pin to the other, and a pair of reversely-rotatable twisters, for twisting together the overlapped wire-sections, between said corner-pins, substantially as described.

23. The combination with corner-pins arranged in pairs, of reversely-movable upper and lower wire-delivery shuttles or guides for lapping the wires over said corner-pins, means for twisting together the lapped wire-sections to form stays thereof, means for releasing said corner-pins after the stays have been twisted, means for moving the fabric to draw out the line-wires, and means for restoring the said corner-pins to their normal positions and there locking the same, substantially as described.

24. The combination with means for disposing the wires to form line and stay sections, of an oscillating frame pivoted at its intermediate portion and provided with a handpiece by means of which it will be moved at will, a plurality of stay-twisters mounted at one end of said frame and provided with normally downturned wire-receiving slits, another series of line-twisters mounted at the other end of said frame and provided with normally upturned wire-receiving slits, corner-pins over which the line-wires may be bent to form the stays, an automatic lock for holding said corner-pins in operative positions, a trip for said lock operated by said oscillating frame, and means for automatically restoring said corner-pins to normal positions and rendering the same again subject to said lock, substantially as described.

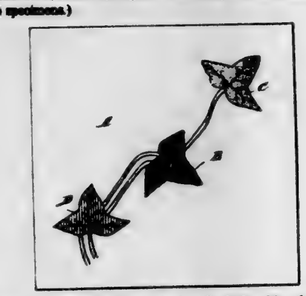
25. The combination with means for delivering the wires and twisting the same together to form a fabric, of a drum for receiving the finished fabric and drawing the same forward, and a tension-equalizing drum provided with a facing of soft rubber over which the fabric is adapted to be rolled, but by which it is held against slipping, substantially as described.

26. The combination with an oscillating frame provided with a plurality of twisters and with a handpiece for moving the same to carry the

twisters to and from operative positions, of reversely-reciprocating wire-delivery shuttles or guides, and means for moving said guides involving a foot-operated lever adapted to be engaged by the foot and operated, substantially as described.

27. The combination with means for disposing the wires to form the line and stay sections, of an oscillating frame, a plurality of twisters for twisting together the line and stay sections of the fabric, a drum onto which the finished fabric is wound, and means for intermittently driving said drum and said twisters in alternate order involving a pair of driven friction-wheels, and a shiftable frictional driving-wheel movable alternately into engagement with said friction-wheels, substantially as described.

708,680. **PROCESS OF MAKING DECORATIVE TILES.** EMILE R. TABOUREY, Brussels, Belgium. Filed July 19, 1901. Serial No. 68,551. (No specimens.)



Claim.—1. The process herein described of making decorative tiles, which consists in sifting powdered materials of different colors one upon the other in layers, then uniting the layers by pressure, and finally removing parts of outermost layers to varying depths at different places in reproduction of different portions of any suitable design in any of the colors of the different layers of which the tile may be constituted.

2. The process herein described of making decorative tiles, which consists in sifting powdered materials of different colors one upon the other in layers, then uniting the layers and hardening the materials, and finally removing parts of outermost layers to varying depths at different places in reproduction of different portions of any suitable design in any of the colors of the different layers of which the design may be constituted.

3. The process herein described of making decorative tiles, which consists in sifting powdered materials of different colors one upon the other in layers, then uniting the layers and firing the mass to harden the same, and finally removing parts of outermost layers to varying depths at different places in reproduction of different portions of any suitable design in any of the colors of the different layers of which the tile may be constituted.

4. The process herein described of making decorative tiles, which consists in sifting powdered materials of different colors one upon the other in layers, then uniting the mass by pressure and hardening the same, and finally removing parts of outermost layers to varying depths at different places in reproduction of different portions of any suitable design in any of the colors of the different layers of which the tile may be constituted.

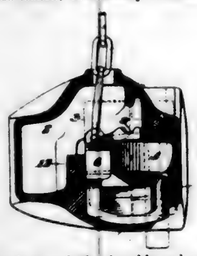
5. The process herein described of making decorative tiles, which consists in sifting powdered materials of different colors one upon the other in layers, then uniting the mass by pressure and hardening the same by firing, and finally removing parts of outermost layers to varying depths at different places in reproduction of different portions of any suitable design in any of the colors of the different layers of which the tile may be constituted.

6. The process herein described of making decorative tiles, which consists in sifting powdered materials of different colors one upon the other in layers, then uniting and hardening the mass, and finally removing parts of outermost layers to varying depths at different places in reproduction of different portions of any suitable design in any of the colors of the different layers of which the tile may be constituted.

708,681. **CAR-COUPLING.** CLINTON A. TOWER, Cleveland, Ohio, assignor to the National Malleable Castings Company, Cleveland, Ohio, a Corporation of Ohio. Filed Nov. 15, 1901. Serial No. 82,201. (No model.)

Claim.—1. A coupler having a swinging knuckle, and a tipping locking and opening piece, said piece being bodily movable upwardly and comprising a locking member, an opening-arm, and a connecting member which extends under the knuckle and connects the opening-arm with the locking member; substantially as described.

2. A coupler having a swinging knuckle, and an upwardly-movable and tipping knuckle locking and opening piece comprising a locking member, an opening-arm, and a connecting member which extends under the knuckle and connects the opening-arm with the locking member; said piece having a tipping-bearing above the knuckle and above the position of the said piece when locked; substantially as described.

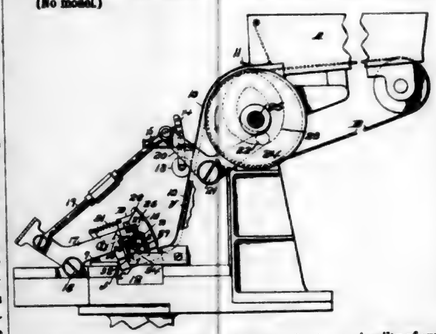


3. A coupler having a swinging knuckle, and a tipping locking and opening piece, said piece being bodily movable upwardly and comprising a locking member, an opening-arm and a connecting member between the locking member and opening-arm, said connecting member being shaped to permit the passage of the knuckle when the said piece has been raised; substantially as described.

4. A coupler having a swinging knuckle, and a tipping locking and opening piece, said piece being bodily movable upwardly and comprising a locking member, an opening-arm, and a connecting member which extends under the knuckle and connects the opening-arm with the locking member, the rear end of the knuckle being shaped to prevent the back movement of the opening-arm when the knuckle is open; substantially as described.

5. A knuckle locking and opening piece having in a single piece a locking member, a top bearing or fulcrum, a rear vertical opening-arm and a connecting member extending from the lower portion of the opening-arm horizontally and upwardly to the locking member; substantially as described.

708,682. **PACKING MECHANISM.** OLOF TYBERG, New York, N. Y., assignor to the American Tobacco Company, New York, N. Y., a Corporation of New Jersey. Filed Nov. 22, 1898. Serial No. 697,124. (No model.)



Claim.—1. The combination of a carrier having a plurality of supports arranged in the line of delivery of the articles from the carrier and adapted for holding articles in a plurality of separate layers, and means for withdrawing said supports for the delivery and packing together of the separate articles, substantially as described.

2. The combination of a carrier having a plurality of supports arranged in the line of delivery of the articles from the carrier and adapted for holding articles in a plurality of separate layers, means for withdrawing said supports for the delivery and packing together of the separate articles, and a pressure-plate acting upon the delivered articles after the supports are withdrawn, substantially as described.

3. The combination of a carrier having a plurality of supports arranged in the line of delivery of the articles from the carrier and adapted for holding articles in a plurality of separate layers, and means for simultaneously withdrawing said supports for the simultaneous delivery of the articles, substantially as described.

4. The combination of a carrier having a plurality of supports arranged one above the other adapted to hold separate articles simultaneously, and means for withdrawing said supports for the delivery of the articles superposed, substantially as described.

5. The combination of a vertically-moving carrier having a plurality of supports arranged one above the other adapted to hold separate articles simultaneously, and means for actuating said carrier and withdrawing said supports for the delivery of the articles superposed, substantially as described.

6. The combination of a vertically-moving carrier having a plurality of supports arranged one above the other adapted to hold separate articles simultaneously, means for actuating said carrier and withdrawing said supports for the delivery of the articles superposed, and a presser-plate acting upon the delivered articles after the supports are withdrawn, substantially as described.

7. The combination of a carrier pivoted to swing vertically between its receiving and delivering positions and having a plurality of supports arranged one above the other adapted to hold separate articles simultaneously, and means for actuating said carrier and withdrawing said supports for the delivery of the articles superposed, substantially as described.

8. The combination of a carrier pivoted to swing vertically between its receiving and delivering positions and having a plurality of supports arranged one above the other adapted to hold separate articles simultaneously, and means for actuating said carrier and withdrawing said supports for the delivery of the articles superposed, said carrier having a further movement toward the articles independently of the supports after the latter are withdrawn, substantially as described.

9. The combination of a carrier pivoted to swing vertically between its receiving and delivering positions and having a plurality of supports arranged one above the other adapted to hold separate articles simultaneously, means for actuating said carrier and withdrawing said supports for the delivery of the articles superposed, and a presser-plate in the carrier moving toward the articles after the supports are withdrawn, substantially as described.

10. The combination of a carrier having a plurality of supports arranged one above the other adapted to hold separate articles simultaneously and having a withdrawal movement substantially parallel to the surface on which the articles are delivered, and means for withdrawing said supports for the delivery and packing of the articles together, substantially as described.

11. The combination of a carrier pivoted to swing vertically between its receiving and delivering positions and having a plurality of supports arranged one above the other adapted to hold separate articles simultaneously, said supports being pivoted on a horizontal axis to swing during withdrawal in a plane substantially parallel to the surface on which the articles are delivered, and means for withdrawing said supports for the delivery of the articles, substantially as described.

12. The combination of a carrier pivoted to swing vertically between its receiving and delivering positions and having a plurality of supports arranged one above the other for holding separate articles, said supports being pivoted on a horizontal axis to swing during withdrawal in a plane substantially parallel to the surface on which the articles are delivered, means for withdrawing said supports for the delivery of the articles, and a presser-plate in the carrier having a movement toward the articles after the supports are withdrawn, substantially as described.

13. The combination of a carrier pivoted to swing vertically between its receiving and delivering positions and provided with a plurality of supports arranged one above the other and each adapted to receive a row of cigarettes or similar articles on a surface inclined in the direction of movement of the cigarettes into the carrier, and means for actuating said carrier and withdrawing said supports for the delivery of the rows of cigarettes superposed, substantially as described.

14. The combination of a carrier pivoted to swing vertically between its receiving and delivering positions and provided with a plurality of supports arranged one above the other and each adapted to receive a row of cigarettes or similar articles on a surface inclined in the direction of movement of the cigarettes into the carrier, means for actuating said carrier and withdrawing said supports for the delivery of the rows of cigarettes superposed, and a presser-plate in the carrier having a further movement toward the cigarettes after the supports are withdrawn, substantially as described.

15. The combination of a carrier pivoted to swing vertically between its receiving and delivering positions and provided with a plurality of supports arranged one above the other and each adapted to receive a row of cigarettes or similar articles, and means for moving said carrier intermittently to bring the successive supports into position to receive the cigarettes and to carry the superposed rows of cigarettes to delivering position and withdraw the supports for the delivery of the cigarettes superposed, substantially as described.

16. The combination of a carrier pivoted to swing vertically between its receiving and delivering positions and having a plurality of supports arranged one above the other and each adapted to receive a row of cigarettes or similar articles, of a single way through which the cigarettes are fed into the carrier, and means for moving said carrier intermittently to bring the successive supports into position to receive the cigarettes and to carry the superposed rows of cigarettes to delivering position and withdraw the supports for the delivery of the cigarettes superposed, substantially as described.

17. The combination of a carrier pivoted to swing vertically between its receiving and delivering positions and having a plurality of supports arranged one above the other and each adapted to receive a row of cigarettes or similar articles, of a single way through which the cigarettes are fed into the carrier, means for moving said carrier intermittently to bring the successive supports into position to receive the cigarettes and to carry the superposed rows of cigarettes to delivering position and withdraw the supports for the delivery of the cigarettes superposed, and a presser-plate having a further movement toward the cigarettes after the supports are withdrawn, substantially as described.

18. The combination of a carrier pivoted to swing vertically and having a plurality of supports arranged one above the other and arranged with the supports inclined when in receiving position, a single raceway down which the cigarettes or similar articles are fed to the carrier by gravity, and means for moving said carrier intermittently to bring the supports successively into position to receive the cigarettes from the raceway and to carry the superposed rows of cigarettes to delivering position and withdraw the supports for the delivery of the cigarettes, said way having the bottom surface of its lower end curved to a substantially horizontal plane from which the cigarettes pass to the inclined supports, substantially as described.

19. The combination of a carrier pivoted to swing vertically and having a plurality of supports arranged one above the other and arranged with the supports inclined when in receiving position, a single raceway down which the cigarettes or similar articles are fed to the carrier by gravity, means for moving said carrier intermittently to bring the supports successively into position to receive the cigarettes from the raceway and to carry the superposed rows of cigarettes to delivering position and withdraw the supports for the delivery of the cigarettes, said way having the bottom surface of its lower end curved to a substantially horizontal plane from which the cigarettes pass to the inclined supports, and a roller pressing against and supporting the cigarettes in the upper part of the raceway, substantially as described.

20. The combination of a carrier having a plurality of receiving-chambers, a single way delivering to said chambers, and means for moving said carrier intermittently to bring successive receiving-chambers into position for delivery from the way to said chambers and for moving the carrier from receiving to delivering position, substantially as described.

21. The combination of a carrier having a plurality of supports arranged in the line of delivery for holding articles in separate layers, means for withdrawing said supports for the delivery and packing together of the separate articles, catches for holding the supports withdrawn and means for tripping the catches for the return of the supports, substantially as described.

22. The combination of a carrier having a plurality of supports arranged in the line of delivery for holding articles in separate layers, means for withdrawing said supports for the delivery and packing together of the separate articles, and means for holding said supports withdrawn during the return movement of the carrier until the supports are moved beyond the delivered articles, substantially as described.

23. The combination of a vertically-moving carrier having a plurality of supports arranged one above the other for holding separate articles, means for actuating said carrier and withdrawing said supports for the delivery of the articles superposed, catches for holding the supports withdrawn and means for tripping the catches for the return of the supports, substantially as described.

24. The combination of a carrier pivoted to swing vertically between its receiving and delivering positions and having a plurality of supports arranged one above the other for holding separate articles, means for actuating said carrier and withdrawing said supports for the delivery of the articles superposed, said carrier having a further movement toward the articles independently of the supports after the latter are withdrawn, catches for holding the supports withdrawn and means for tripping the catches for the return of the supports, substantially as described.

25. The combination of a carrier having a plurality of supports arranged one above the other for holding separate articles and having a withdrawal movement substantially parallel to the surface on which the articles are delivered, means for withdrawing said supports for the delivery and packing of the articles together, catches for holding the supports withdrawn and means for tripping the catches for the return of the supports, substantially as described.

26. A carrier having the supports *b*, *b'* arranged one above the other and carried by arms pivoted to swing on a horizontal axis, and means for actuating said carrier and swinging said arms to withdraw the supports, substantially as described.

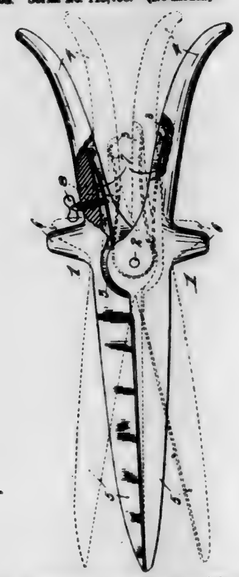
27. The combination with a vertically-moving carrier having the supports *b*, *b'* arranged one above the other and carried by arms pivoted to swing on a horizontal axis, of slides having a vertical movement in the carrier and in which said arms are mounted, and means for actuating said carrier and swinging said arms to withdraw the supports with the carrier moving independently of the slides after the supports are withdrawn, substantially as described.

28. The combination of a carrier pivoted to swing vertically and having supports *b*, *b'* arranged one above the other, of means for actuating said carrier and withdrawing said supports, and a presser-plate in the carrier acting upon the delivered articles, substantially as described.

29. In a packing-carrier, pivoted arms 32 carrying side plates *c* and supports *b b'* arranged in the line of delivery of the articles from the carrier and adapted for holding articles in separate layers, substantially as described.

30. In a packing-carrier, pivoted arms 32 carrying supports *b b'* arranged in the line of delivery of the articles from the carrier and adapted for holding articles in separate layers, substantially as described.

708,683. SHEARS. ANNA E. WALSH, Minneapolis, Minn. Filed July 16, 1902. Serial No. 115,799. (No model.)



Claim.—1. A pair or scissors or shears, involving pivotally-connected members, a spring applied to said members for automatically closing the blade portions thereof, and means for varying the tension of said spring, substantially as described.

2. The combination with the members 1 pivoted at 2 and recessed at 3, of the springs 7 applied to the said members 1, for automatically closing the blade portions 5 thereof, and the adjusting-screw 8 for varying the tension of said spring, substantially as described.

708,684. ROTARY STEAM-ENGINE. ISAAC W. WEPPLO, Bandon, Minn. Filed Aug. 20, 1900. Serial No. 27,382. (No model.)

Claim.—1. In a rotary engine of the class described, the combination with the piston-chamber, of a piston-cylinder eccentrically supported in said chamber, and wings slidable in pockets in said cylinder, said wings being loosely fitted in said pockets and each provided with a space at its rear end.

2. In a rotary engine of the class described, the combination with a piston-chamber, and a piston-cylinder eccentrically mounted therein, of piston-wings slidable in pockets in said cylinder, said wings being loosely fitted in said pockets and formed with ports connecting the space upon opposite sides of said wings, and springs normally holding said wings outward.

3. In a rotary engine of the class described, the combination with a piston-chamber and a piston-cylinder eccentrically supported therein, of piston-wings slidable in pockets in said cylinder, said wings being each formed upon its opposite sides with channels connected by ports in the manner and for the purpose specified.

708,685. ARTIFICIAL LIMB. CHARLES P. WHITE, Spencer, N. C. Filed Jan. 23, 1902. Serial No. 91,631. (No model.)

Claim.—1. In an artificial limb, the combination of the outer casing, with a stump-receiving pocket formed of a loosely-supported pneumatic cushion having a closed bottom and open top and located between the stump and casing, said cushion serving as the sole means of connection between the stump and casing.

2. In an artificial limb, the combination with a stump-receiving pocket, of a mechanically-operated pump operatively connected to a movable member of the limb and serving to artificially ventilate said pocket.

3. In an artificial limb, the combination with a stump-receiving pocket, of an air-pump having an outlet in said pocket and adapted to discharge a current of air therein to ventilate the pocket, and means for operating said pump.

4. The combination in an artificial limb, of the casing, a stump-receiving pocket arranged therein, an air-pump comprising a bellows located in the lower portion of said casing, a plate hinged to the casing and connected to a movable part of the bellows, a foot member, and a flexible connecting means between said foot member and said plate.

5. The combination in an artificial foot, of the pivotally-connected body and toe members, and a pneumatic sole having a connected portion forming an air-chamber between the two members.

6. The combination in an artificial foot, of the body member, a pivotally-connected toe member, a channeled plate carried by said members, and a pneumatic sole having an outer portion shaped to engage said plate.

7. The combination in an artificial limb, of two pivotally-connected members, a pneumatic cushion carried by one of such members, and a pair of disks adapted for contact with said pneumatic cushion and having guided shanks in operative contact with the second member, substantially as specified.

8. The combination in an artificial limb, of the foot and leg members having a pivotal connection to form an ankle-joint, a pneumatic sole on the foot member, a pair of compression-disks carried by the foot member and adapted for contact with the pneumatic sole at the front and rear of the joint, said disks having shank members in operative contact with the leg member.

9. The combination in an artificial limb, of a pair of movable members, a ball, a rectangular shank secured to or formed with the ball and connected to one of the members, a pair of semispherical plates carried by the opposite member and adapted to embrace the ball, said plates being spaced to permit of the movement between them of the rectangular shank of the ball member, and a screw independent of the plate-securing devices for adjusting said plates.

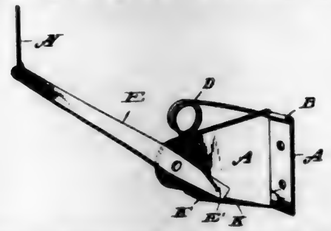
10. In an artificial limb having two pivotally-connected members, a pair of connected fluid-containing chambers situated one on each side of the pivotal connection between the members.

11. In an artificial limb having two pivotally-connected members, a pair of connected fluid-containing chambers situated one on each side of the pivotal connection between the members, and means for regulating the flow of fluid between said chambers.

12. The combination in an artificial limb, of a pair of leg members having inclined faces to form approximately V-shaped recesses between them, a pivot connecting said members, a pair of triangular fluid-containing chambers situated within said recesses, a tube carried by one of the leg members and connecting said chambers, and means for regulating the flow of fluid through said tube.

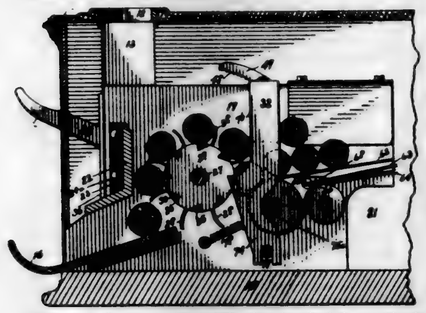
13. In an artificial limb, a pair of leg members having a pivotal connection, compressible chambers situated between said members and an auxiliary tension-spring connecting said members, substantially as specified.

708,686. ATTACHMENT FOR BUGGY-BOOTS. ARTHUR W. WILSON, Moline, Ill. Filed May 27, 1902. Serial No. 109,167. (No model.)



Claim.—A carriage-boot attachment comprising a plate A having two right-angled portions A' and K at angles to each other, the upper end of said flange A' being rolled to form a bearing B, a bar E pivotally connected to said plate A, a carriage-boot and rod connecting the same with said bar, a coil-spring D having a bearing at one end in said roll B and its other end fastened to the pivoted end of said bar and adapted to hold the under edge of the bar against the end K' of said flange K or the inner end of the bar against the upper surface of the flange K accordingly as the boot is closed or raised to its highest limit, as set forth.

708,687. EXHIBITING AND VENDING MACHINE. DANIEL M. WHAM, Binghamton, N. Y., assignor to Albert L. Weaver, New York, N. Y. Original application filed Sept. 14, 1899, Serial No. 730,454. Divided and this application filed Nov. 27, 1899. Renewed May 26, 1902. Serial No. 108,970. (No model.)



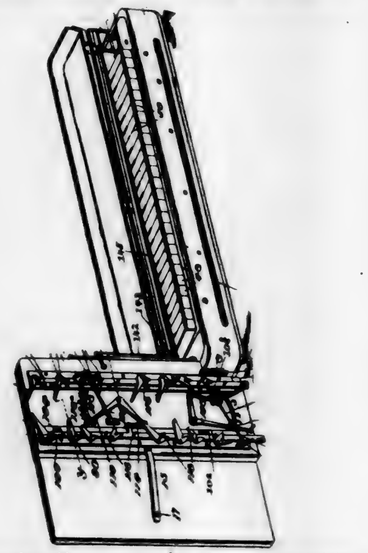
Claim.—1. In an apparatus of the class described the combination of a conveyor adapted to be inserted in a box packed with merchandise articles and below the articles contained therein, with mechanism for operating said conveyor whereby the underlying articles are successively withdrawn from said box, substantially as described.

2. In an apparatus of the class described, the combination of a conveyor adapted to be inserted in a box packed with merchandise articles and below the articles contained therein, with mechanism for operating said conveyor, and a discharge-drum arranged adjacent to the forwardly-projecting end of said conveyor, substantially as described.

3. In an apparatus of the class described the combination of a conveyor adapted to be inserted in a box packed with merchandise articles and below the articles contained therein, with mechanism for operating said conveyor, a discharge-drum arranged adjacent to the forwardly-projecting end of said conveyor, and a rocking gate arranged in the pathway of said conveyor, substantially as and for the purpose set forth.

708,688. MUSIC-TEACHING APPARATUS. HENRY WOODSIDE, Winlock, Wash. Filed Nov. 26, 1901. Serial No. 83,787. (No model.)

Claim.—1. In a music-teaching apparatus, a staff, and a single musical character coöperating with said staff, in combination with a keyboard having a number of keys operatively connected with said single character, whereby the movement of any of the keys connected with said character moves the latter with reference to said staff, substantially as described.



2. In music-teaching apparatus, treble and bass staffs, musical characters, one of said characters coöperating with each of said staffs, in combination with a keyboard having certain keys operatively connected with one of said characters, and other keys operatively connected with the other character, whereby the movement of certain of said keys moves one of said characters, and the movement of other keys operates the other character, substantially as described.

3. In music-teaching apparatus, a staff, and a single musical character coöperating with said staff, in combination with a keyboard, and operative connections between the keys of said keyboard and said single character, said connections being such that the movement of the keys imparts varying movement to said character, substantially as described.

4. In music-teaching apparatus, treble and bass staffs, musical characters, there being one character for each staff, in combination with a keyboard having part of its keys operatively connected with one character, and other keys connected with the other character, the connections between said keyboard and characters being such that the movements of certain keys cause varying action of one character and the movements of other keys cause varying movements of the other character, substantially as described.

5. In music-teaching apparatus, the combination of a keyboard, a staff-board detachably connected with said keyboard, and a single musical character coöperating with said staff-board, the said keyboard having a number of keys operatively connected with said single character, whereby the movement of any of the keys connected with said character moves the latter with reference to said staff-board, substantially as described.

6. In music-teaching apparatus, a staff-board, said staff-board folding upon itself, and a single musical character coöperating with said staff-board, in combination with a keyboard having a number of keys operatively connected with said single character, whereby the movement of any of the keys connected with said character moves the latter with reference to said staff-board, substantially as described.

7. In music-teaching apparatus, the combination of a staff, and a single musical character coöperating with said staff, a keyboard having a number of keys operatively connected with said single character, whereby the movement of any of the keys connected with said character moves the latter with reference to said staff, sharps and flats, and mechanism for controlling the same, substantially as described.

8. In music-teaching apparatus, the combination of a staff, and a single musical character coöperating with said staff, a keyboard, operative connections between the keys of said keyboard and said single character, said connections being such that the movements of the keys impart

varying movements to said character, sharps and flats, and mechanism for controlling the same, substantially as described.

9. In music-teaching apparatus, the combination of a staff, and a single musical character coöperating with said staff, a keyboard, operative connections between the keys of said keyboard and said single character, said connections being such that the movements of the keys impart varying movements to said character, sharps and flats, and mechanism for controlling the same comprising a lever and intermediate connections, substantially as described.

10. In a music-teaching apparatus, a staff-board having a recess or opening therein, sharps and flats normally hidden behind the board, the sharps being hidden on one side of the recess and the flats on the other, and mechanism for moving said sharps or flats to exhibit them through said opening from opposite sides thereof, substantially as described.

11. In music-teaching apparatus, a staff-board having a series of sharps and a series of flats on one side thereof, hand-levers on the opposite side of said staff-board controlling the movements of said sharps and flats, and intermediate connections between said levers and said sharps and flats, substantially as described.

12. In music-teaching apparatus, a staff-board having an opening or recess therein, series of sharps and flats normally located behind the walls of said recess and on opposite sides thereof, a hand-lever for the sharps and a hand-lever for the flats, both on the rear side of the staff-board, and intermediate connections between the levers and said sharps and flats, substantially as described.

13. In music-teaching apparatus, a staff having a series of characters thereon and means for controlling the positions of said characters comprising a cam-lever and reciprocating stud or pin for each character, substantially as described.

14. In music-teaching apparatus, a staff having a series of characters thereon and means for controlling the positions of said characters comprising a cam-lever and reciprocating stud or pin for each character, said levers combined with mechanism to progressively display said characters on said staff, substantially as described.

15. In music-teaching apparatus, a staff, a series of sharps and flats pivotally mounted with relation to said staff, mechanism for moving the sharps on their pivots, mechanism for moving said flats on their pivots, each of said mechanisms comprising cam-levers and reciprocating studs or pins and a lock arranged to lock one of said mechanisms when the other mechanism is being moved, substantially as described.

16. In music-teaching apparatus, a staff, a series of musical characters, a lever connected with each of said characters, a slide having means coöperating with all of said levers for controlling the position of said characters, and a hand-lever for operating said slide, substantially as described.

17. In music-teaching apparatus, a staff, a series of musical characters, a series of levers connected with said characters, a slide having studs coöperating with said levers, and a lever for operating said slide and said first-mentioned levers and a quadrant for holding said lever, substantially as described.

18. In a music-teaching apparatus, a staff, a series of musical characters arranged to be displayed thereon, a cam-lever and reciprocating studs or pins for each character, and means for operating said cam-levers; the said cam-levers being arranged to progressively display the said musical characters, substantially as described.

19. In music-teaching apparatus, a staff having an opening therein, a series of sharps and flats concealed by said staff, and mechanism for displaying said characters through said openings, comprising a lever and a reciprocating stud or pin for each sharp and flat, substantially as described.

20. In music-teaching apparatus, a staff having a character-rod pivoted thereon, a character supported by said rod, and a keyboard having its keys connected with said character-rod and imparting varying movements thereto, substantially as described.

21. In music-teaching apparatus, a staff, a musical character supported thereon, a keyboard having its keys arranged to move said character varying distances, an accidental concealed behind said character, and means for displaying said accidental, substantially as described.

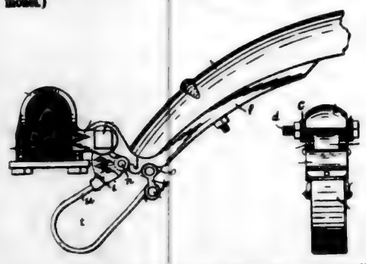
22. In music-teaching apparatus, a staff having a musical character thereon, in combination with a keyboard having a series of keys, a lever under said keys arranged to be depressed thereby and having connections with the character on said staff, and means whereby the different keys impart varying movements to said character, substantially as described.

23. In music-teaching apparatus, a staff having two cleffs thereon, a musical character for each cleff, in combination with a keyboard, levers under said keyboard arranged to be operated by said keys, connections between one of said levers and one of said musical characters and connections between the other lever and the other musical character, means whereby the different keys impart varying movements to said character, substantially as described.

24. In music-teaching apparatus, a staff having treble and bass characters arranged to be displayed thereon, in combination with a keyboard, bass and treble levers under said keys, the treble lever being connected with the treble character and the bass lever with the bass character, and means for causing the keys of said keyboard to operate said characters varying distances, substantially as described.

25. In music-teaching apparatus, a staff having a musical character arranged to be displayed thereon, in combination with a keyboard having its keys arranged to move said character, and adjustable stops under said keys, whereby the movements of said keys may be graduated, substantially as described.

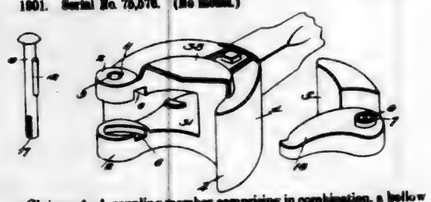
708,689. THILL-COUPLING. ALFRED H. WORREST, Lancaster, Pa., assignor to the Metal Stamping Company, New York, N. Y., a Corporation of New York. Filed Mar. 13, 1900. Serial No. 8,438. (No model.)



Claim.—1. The combination, in a thill-coupling, of a coupling-bolt, a hook-eye connected with a thill and having a slot in the lower side thereof, a pivoted lever, a dog on the lever and adapted to enter said slot and bear against the bolt, a link so located that its upper end is pivoted below the lever-pivot when the thills are in their normal position, and a spring having one end connected with the lower end of the link and the other end secured to the swinging end of the lever, the spring forming a loop between its ends, for the purpose specified.

2. The combination, in a thill-coupling, of a coupling-bolt, a hook-eye connected with a thill and having the slot in the lower side thereof, a pivoted lever, a dog on the lever and adapted to enter said slot and bear against the bolt, a link so located that its upper end is pivoted below and in front of the lever-pivot when the thills are in their normal position, and a spring having one end connected with the lower end of the link and the other end secured to the swinging end of the lever, the spring forming a loop between its ends, for the purpose specified.

708,690. CAR-COUPLING. BIRD O. YEARWOOD, Toccoa, Ga., assignor of one-half to Edward Schaefer, Toccoa, Ga. Filed Sept. 16, 1901. Serial No. 75,576. (No model.)



Claim.—1. A coupling member comprising in combination, a hollow draw-head having upper and lower knuckle pivoting-ears 2 provided with pivot-recesses 6, said recesses being extended to the inner edges of the ears, a knuckle having an enlarged head and a reduced tailpiece 18 thereon, upper and lower pivot-bosses 7 formed integral with the tailpiece and adapted to be entered in the recesses 6 from the inner edges of the ears, there being alining pivot-openings in the tailpiece, the bosses and ears, and the walls of the opening of the upper ear and of the tailpiece and bosses being slotted, a pivot-pin 10 having an integral or fixed key 12 intermediate of its length adapted to pass through said opening and to interlock with the slotted portion of the tailpiece and bosses, a torsion-spring 15 disposed on the lower end of said pin and having one end secured thereto and its opposite end secured to a fixed point, a fixed stop 30 in the form of a curved wall having an opening 31 and serving to limit the outward swinging movement of the tailpiece, the wall 30 presenting a solid unbroken surface to receive the initial impact of a mating coupling member, a locking-latch 19 pivoted within the draw-head and having its outer end extending through a slotted opening 26 in said draw-head, a pin 22 carried by the draw-head, a compression-spring 21 surrounding said pin, and a lug 34 disposed on the latch for engagement with the outer end of said spring, said lug being provided with an opening for the reception of said pin, substantially as specified.

2. In a car-coupling, a draw-head having knuckle pivot-ears arranged at one side and a guard arranged at the opposite side thereof, there being a curved recess between the two and an upper guard 33 forming an integral part of the draw-head and bridging said curved recess between the upper knuckle pivot-ear and the guard, said upper guard having its front edge inclined to permit of greater extension of the same over the mating coupling without allowing the upper guards of mating coupling members to come into contact.

708,691. OIL-BURNER. GEORGE W. ARPER, Oakland, Cal. Filed May 1, 1901. Serial No. 58,322. (No model.)

Claim.—1. A burner comprising a casing having alined openings through the wall thereof, a removable cover for said casing, an oil-supply at the lower portion of the casing, and a nozzle supported at a point adjacent to one of the openings in the casing and adapted to discharge a jet of steam through said opening into the flame of burning oil and out of the opposite opening to induce the discharge of the burning fuel in the direction of said last-mentioned opening; substantially as described.

2. A burner comprising a casing having an opening through the wall thereof, a pipe having a plurality of coils wound around the interior surface of the wall of the casing, the adjacent coils of said pipe being superposed the one upon the other and the whole constituting a water-back for the fire-chamber, an inlet to said pipe, an outlet therefrom, and a nozzle in communication with said outlet and arranged to discharge a jet of steam through the opening in the casing into the flame of burning oil; substantially as described.

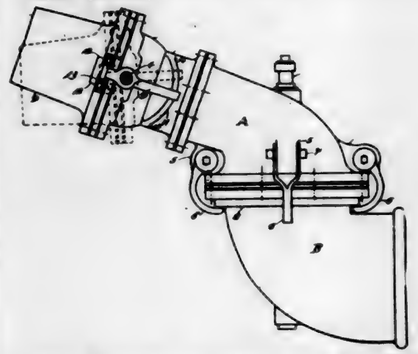
708,692. JUNCTION-BOX. WILLIAM F. BONNET, Utica, N. Y., assignor to the Bonnet Electric Construction Company, Utica, N. Y. Filed June 4, 1902. Serial No. 110,171. (No model.)

Claim.—1. A junction-box for electric conductors, having double sides and ends, the walls of the outer casing dovetailed at their corners and provided with a bottom of insulating material fitting closely therein, the walls of the inner casing resting upon the bottom piece and breaking joints with the ends and sides of said piece, and also breaking joints with the corners of the outer casing; a cover secured to the outer casing; corner-pieces having right-angled parts embracing the corners of the outer casing and secured thereto by screw-bolts, a seat extending inwardly from the said parts under the corner of the said bottom piece and secured thereto by a screw-bolt, and an outwardly-projecting foot below the said seat; with two or more interiorly-threaded bushings screwed into holes in the sides or ends of the outer casing provided with an abutment-ring and a squared end; orifices in the inner casing concentric with the said holes and larger in diameter, having chamfered or rounded edges, as set forth.

2. A junction-box for electric conductors, having double sides and ends, the walls of the outer casing dovetailed at their corners and provided with a bottom of insulating material fitting closely therein, the walls of the inner casing resting upon the bottom piece and breaking joints with the ends and sides of said piece, and also breaking joints with the corners of the outer casing; a cover secured to the outer casing; corner-pieces having right-angled parts embracing the corners of the outer casing and secured thereto by screw-bolts, a seat extending inwardly from the said parts under the corner of the said bottom piece and secured thereto by a screw-bolt, and an outwardly-projecting foot below the said seat; with two or more interiorly-threaded bushings screwed into holes in the sides or ends of the outer casing, provided with an abutment-ring and a squared end; orifices in the inner casing concentric with the said holes and larger in diameter, having chamfered or rounded edges; and means secured to the bottom piece for the transposition of conductors from one bushing to another, as set forth.

3. A junction-box for electric conductors, having double sides and ends, the walls of the outer casing dovetailed at their corners and provided with a bottom of insulating material fitting closely therein, the walls of the inner casing resting upon the bottom piece and breaking joints with the ends and sides of said piece, and also breaking joints with the corners of the outer casing; a cover secured to the outer casing; corner-pieces having right-angled parts embracing the corners of the outer casing and secured thereto by screw-bolts, a seat extending inwardly from the said parts under the corner of the said bottom piece and secured thereto by a screw-bolt, and an outwardly-projecting foot below the said seat; with two or more interiorly-threaded bushings screwed into holes in the sides or ends of the outer casing, provided with an abutment-ring and a squared end; orifices in the inner casing concentric with the said holes and larger in diameter, having chamfered or rounded edges; metal bars secured to said bottom piece, with conduits entering said internally-threaded bushings carrying conductors whose ends are led into the box to the metal bars, the said bars provided with means for transposing the conductors to similar bars and to other conductors, as set forth.

708,698. SAFETY ATTACHMENT FOR HYDRAULIC NOZZLES. PIERRE BOUDET, Weaverville, Cal. Filed May 1, 1902. Serial No. 105,532. (No model.)



Claim.—1. In a device of the character described, the combination of a nozzle turnable on trunnions on a pipe-section, arms secured to the nozzle and turnable therewith, and segmental flanges on the pipe-section with which said arms are adapted to engage.

2. In a device of the character described, the combination of a section having a spherical segment at one end, a nozzle having a corresponding socket adapted to receive said segment, trunnions or pivot-bolts about which the nozzle is turnable, arms secured at one end to the nozzle and embracing and turnable about said pivots, claws or projections on the free end of said arms, and segmental flanges concentric with said pivots with which said claws are adapted to engage.

3. The combination of two pipe-sections, one of which is turnable in relation to the other, flanges on the adjacent edges of said sections, curved fingers detachably secured to one of said sections and adapted to engage the flange on the opposite section, a nozzle and a pivot connection by which it is secured to the movable section, arms embracing and turnable about said pivot connection and having one end fixed to one of said pivoted parts and the other end engaging segmental flanges on the other.

708,694. METHOD OF MANUFACTURING SECONDARY-BATTERY PLATES. GEORGE H. CHESTNAM, Cleveland, Ohio, assignor of one-half to Charles Herbert Taylor, East Cleveland, Ohio. Filed Dec. 7, 1901. Serial No. 85,073. (No specimens.)

Claim.—1. In the process of manufacturing plates for secondary batteries, the step which consists in electrolytically reducing an oxid of lead in an electrolytic cell having an electrolyte containing a compound of an organic reducing agent.

2. In the process of manufacturing plates for secondary batteries, the step which consists in electrolytically reducing an oxid of lead in an electrolytic cell having an electrolyte containing an organic-acid compound.

3. In the process of manufacturing plates for secondary batteries, the step which consists in electrolytically reducing an oxid of lead at the

cathode of an electrolytic cell having an electrolyte containing an organic-acid compound.

4. The process of converting an oxid of lead into spongy lead, which consists in electrolytically reducing such oxid in an electrolytic cell having an electrolyte containing a compound of an organic reducing agent.

5. The process of converting an oxid of lead into spongy lead, which consists in electrolytically reducing such oxid in an electrolytic cell having an electrolyte containing an organic-acid compound.

6. The process of converting an oxid of lead into spongy lead, which consists in electrolytically reducing such oxid in an electrolytic cell having an electrolyte containing an oxalic-acid compound.

7. The process of manufacturing spongy-lead plates for secondary batteries, which consists in electrolytically reducing an oxid of lead in an electrolytic bath having an electrolyte containing a compound of an organic reducing agent and strengthening such electrolyte periodically by addition of such compound as reduction progresses.

8. The process of manufacturing spongy-lead plates for secondary batteries which consists in electrolytically reducing an oxid of lead in an electrolytic bath having an electrolyte containing an organic-acid compound and strengthening such electrolyte periodically by addition of such compound as reduction progresses.

9. The process of manufacturing spongy-lead plates for secondary batteries which consists in electrolytically reducing oxid of lead in an electrolytic bath having an electrolyte containing oxalic-acid compound and strengthening such electrolyte periodically by addition of such compound as reduction progresses.

10. The process of manufacturing spongy lead, which consists in electrolytically reducing lead peroxid in an electrolytic cell having an electrolyte containing a compound of an organic reducing agent.

11. The process of manufacturing spongy lead, which consists in electrolytically reducing lead peroxid in an electrolytic cell having an electrolyte containing an organic-acid compound.

12. The process of manufacturing spongy lead, which consists in electrolytically reducing lead peroxid in an electrolytic cell having an electrolyte containing an oxalic-acid compound.

13. The step in the process of manufacturing secondary batteries, which consists in the deoxidation of an oxid of lead by means of electrolysis in a bath containing a compound of an organic reducing agent.

14. The step in the process of manufacturing secondary batteries, which consists in the deoxidation of an oxid of lead by means of electrolysis in a bath containing an organic-acid compound.

15. The step in the process of manufacturing secondary batteries, which consists in the deoxidation of an oxid of lead by means of electrolysis in a bath containing an oxalic-acid compound.

16. The process of converting an oxid of lead into spongy lead which consists in electrolytically reducing said oxid in an electrolytic cell having an electrolyte containing compound of an organic acid and an alkaline earth.

17. The process of converting an oxid of lead into spongy lead, which consists in electrolytically reducing such oxid in an electrolytic cell having an electrolyte containing a compound of an organic reducing agent and an alkaline earth.

18. The process of converting an oxid of lead into spongy lead, which consists in electrolytically reducing such oxid in an electrolytic cell having an electrolyte containing a solution of a compound of an organic reducing agent and an alkaline earth.

19. The process of converting an oxid of lead into spongy lead, which consists in electrolytically reducing such oxid in an electrolytic cell having an electrolyte containing a solution of a compound of an organic acid and an alkaline earth.

20. The process of converting an oxid of lead into spongy lead, which consists in electrolytically reducing such oxid in an electrolytic cell having an electrolyte containing a solution of a compound of oxalic acid and an alkaline earth.

708,695. METHOD OF MANUFACTURING PLATES FOR SECONDARY BATTERIES. GEORGE H. CRESSLER, Cleveland, Ohio, assignor of one-half to Charles Herbert Taylor, East Cleveland, Ohio. Filed Dec. 7, 1901. Serial No. 85,574. (No specimens.)

Claim.—1. In the process of manufacturing plates for secondary batteries, the step which consists in electrolytically deoxidizing an oxid of lead in an electrolytic cell having an electrolyte containing an organic reducing agent.

2. In the process of manufacturing plates for secondary batteries, the step which consists in electrolytically deoxidizing an oxid of lead in an electrolytic cell having an electrolyte containing an organic acid.

3. In the process of manufacturing plates for secondary batteries, the step which consists in electrolytically deoxidizing an oxid of lead at the cathode of an electrolytic cell having an electrolyte containing an organic acid.

4. The process of converting an oxid of lead into spongy lead, which consists in electrolytically deoxidizing such oxid in an electrolytic cell having an electrolyte containing an organic reducing agent.

5. The process of converting an oxid of lead into spongy lead, which consists in electrolytically deoxidizing such oxid in an electrolytic cell having an electrolyte containing an organic acid.

6. The process of converting an oxid of lead into spongy lead, which consists in electrolytically deoxidizing such oxid in an electrolytic cell having an electrolyte containing oxalic acid.

7. The process of manufacturing spongy-lead plates for secondary batteries, which consists in electrolytically deoxidizing an oxid of lead in an electrolytic bath having an electrolyte containing an organic reducing agent, and strengthening such electrolyte periodically by addition of such agent as electrolysis progresses.

8. The process of manufacturing spongy-lead plates for secondary batteries which consists in electrolytically deoxidizing an oxid of lead in an electrolytic bath having an electrolyte containing an organic acid, and strengthening such electrolyte periodically by addition of such acid as deoxidation progresses.

9. The process of manufacturing spongy-lead plates for secondary batteries which consists in electrolytically deoxidizing an oxid of lead in an electrolytic bath having an electrolyte containing oxalic acid, and strengthening such electrolyte periodically by addition of such acid, as deoxidation progresses.

10. The process of manufacturing spongy lead, which consists in electrolytically deoxidizing lead peroxid in an electrolytic cell having an electrolyte containing an organic reducing agent.

11. The process of manufacturing spongy lead, which consists in electrolytically deoxidizing lead peroxid in an electrolytic cell having an electrolyte containing an organic acid.

12. The process of manufacturing spongy lead, which consists in electrolytically deoxidizing lead peroxid in an electrolytic cell having an electrolyte containing oxalic abid.

13. The step in the process of manufacturing secondary batteries, which consists in the deoxidation of an oxid of lead by means of electrolysis in a bath containing an organic acid.

14. The step in the process of manufacturing secondary batteries, which consists in the deoxidation of an oxid of lead by means of electrolysis in a bath containing oxalic acid.

15. The process of converting an oxid of lead into spongy lead, which consists in electrolytically deoxidizing such oxid in an electrolytic cell having an electrolyte composed of a solution of water and an organic reducing agent.

16. The process of converting an oxid of lead into spongy lead, which consists in electrolytically deoxidizing such oxid in an electrolytic cell having an electrolyte composed of a solution of water and an organic acid.

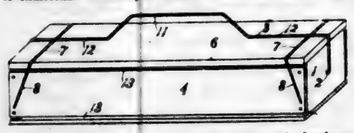
17. The process of converting an oxid of lead into spongy lead which consists in electrolytically deoxidizing such oxid in an electrolytic cell having an electrolyte composed of a solution of an organic reducing agent.

18. The process of converting an oxid of lead into spongy lead which consists in electrolytically deoxidizing such oxid in an electrolytic cell having an electrolyte composed of a solution of an organic acid.

19. The process of converting an oxid of lead into spongy lead which consists in electrolytically deoxidizing such oxid in an electrolytic cell having an electrolyte composed of a solution of oxalic acid.

20. The process of converting an oxid of lead into spongy lead, which consists in electrolytically deoxidizing such oxid in an electrolytic cell having an electrolyte composed of a solution of water and oxalic acid.

708,696. PACKAGE. EDWARD H. DAVIS, Mesa Grande, Cal., assignor to Hallless Lid Box Company, San Francisco, Cal., a Corporation of California. Filed Sept. 20, 1901. Serial No. 75,970. (No model.)



Claim.—1. A package comprising a receptacle having a loose lid provided with transverse grooves which extend continuously across the same; bails of a length sufficient to extend continuously across the top said bails adapted to be seated in said grooves and to embrace the sides of the receptacle, said bails arranged astant and having sperred terminals adapted for driving into the sides of the body of the receptacle, to retain the lid in place.

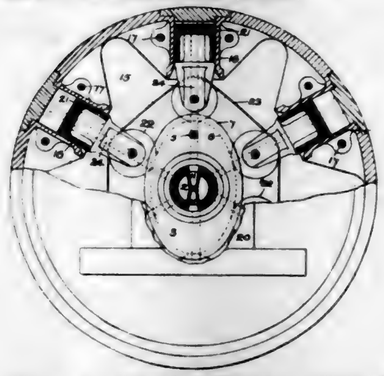
2. A package comprising a receptacle, a loose lid having transverse grooves extending continuously across it near the ends; and bails seated on the lid near the ends and having bent portions to extend over the edge of the lid and down along the body of the receptacle, and provided with inturned prongs to be forced into said receptacle to retain the lid in place independent of other fastening devices.

3. A package comprising a receptacle having a bottom, sides and ends, and a removable top, said ends having holes near the center; bails seated on the top near the ends and having bent portions embracing the sides of the receptacle and having spurs to be forced directly into said sides, and a spring-bail arranged at right angles to and above the bails and having the ends to pass over the ends of the package and seat in said holes.

4. A package comprising a receptacle; a lid therefor, and a bail said bail having its ends fitted to the receptacle and having portions extending parallel and in contact with the lid and having said portions connected by an intermediate loop whereby an inward pressure upon the loop causes the angles at the junction of the loop with the said parallel portions to fulcrum against said lid and detach the ends of the bails from the receptacle.

5. A package comprising a receptacle; a lid fastened on said receptacle; and a bail having inbent ends inserted in the receptacle, the central portion of the bail being bent to form a loop, each end of which loop is bent at an angle to the central portion and to the portions of the bail beyond, whereby each end will act as a fulcrum to swing the ends of the bail outward when the central portion is pressed downward.

708,697. ENGINE. THOMAS DRAKE, Eccles, England, assignor to himself and Charles Herbert Dunkin, Monton, Eccles, England. Filed Dec. 5, 1901. Serial No. 84,771. (No model.)



Claim.—1. In an engine, the combination of a stationary hollow shaft, a non-circular track arranged around the said shaft, admission-ports and exhaust-ports in the said shaft, a wheel rotatable around the said shaft and having steam-passages in its walls, a number of inwardly-directed cylinders carried by the said wheel and having admission-ports and exhaust-ports in communication with the said steam-passages, pistons adapted to reciprocate in the said cylinders, and rollers carried by the said pistons and adapted to make contact with the said track, substantially as and for the purpose set forth.

2. In an engine, the combination of a hollow shaft having non-circular ends, standards adapted to hold the said shaft by its non-circular ends, a non-circular track arranged around the said shaft, admission-ports and exhaust-ports in the said shaft, a wheel rotatable around the said shaft, and having radial steam-passages in its walls, trunnions on the said wheel, pedestals, bearings mounted in the said pedestals and adapted to carry the said trunnions, a number of inwardly-directed cylinders carried by the said wheel and having admission-ports and exhaust-ports in communication with the said steam-passages, pistons adapted to reciprocate in the said cylinders, and rollers carried by the said pistons and adapted to make contact with the said track, substantially as and for the purpose set forth.

3. In an engine, the combination of a stationary hollow shaft, a non-circular track arranged around the said shaft, admission-ports and exhaust-ports in the said shaft, a wheel rotatable around the said shaft, and having steam-passages in its walls, a number of inwardly-directed cylinders carried by the said wheel and having admission-ports and exhaust-ports in communication with the said steam-passages, pistons adapted to reciprocate in the said cylinders, and a rotatable sleeve introduced between the said shaft and the said wheel and having apertures therein, substantially as and for the purpose set forth.

4. In an engine, the combination of a stationary hollow shaft, a non-circular track arranged around the said shaft, admission-ports and exhaust-ports in the said shaft, a wheel rotatable around the said shaft, and having steam-passages in its walls, a number of inwardly-directed cylinders carried by the said wheel and having admission-ports and exhaust-ports in communication with the said steam-passages, pistons adapted to reciprocate in the said cylinders, and two concentric rotatable sleeves introduced between the said shaft and the said wheel and having apertures therein, substantially as and for the purpose set forth.

5. In an engine, the combination of a stationary hollow shaft, a non-circular track arranged around the said shaft, admission-ports and exhaust-ports in the said shaft, a wheel rotatable around the said shaft, and having radial steam-passages in its walls or otherwise, compounding, inwardly-directed cylinders carried by the said wheel, circumferential steam-passages communicating between the said cylinders, admission-ports and exhaust-ports communicating with between said cylinders and the said radial passages, and pistons adapted to reciprocate in the said cylinders around the said track or tracks, substantially as and for the purpose set forth.

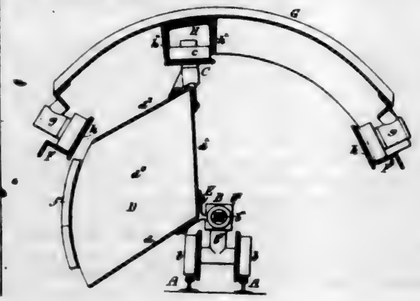
6. In an engine, the combination of a stationary hollow shaft, a non-circular track arranged around the said shaft, admission-ports and exhaust-ports in the said shaft, a wheel rotatable around the said shaft, and having steam-passages in its walls or otherwise, a number of inwardly-directed cylinders carried by the said wheel and having admission-ports and exhaust-ports in communication with the said steam-passages, pistons adapted to reciprocate in the said cylinders, a rim, and spokes connecting the said rim with the said wheel, substantially as set forth.

7. In an engine, the combination of a stationary hollow shaft, a non-circular track arranged around the said shaft, admission-ports and exhaust-ports in the said shaft, a wheel rotatable around the said shaft and having steam-passages in its walls or otherwise, a number of inwardly-directed cylinders carried by the said wheel and having admission-ports and exhaust-ports in communication with the said steam passages, pistons adapted to reciprocate in the said cylinders, a rim, spokes connecting the said rim with the said wheel, and a tire carried by the said rim, substantially as and for the purpose set forth.

8. In an engine, the combination of a stationary hollow shaft, a plurality of non-circular tracks arranged around the said shaft, admission-ports and exhaust-ports in the said shaft, a wheel rotatable around the said shaft, a number of inwardly-directed cylinders carried by the said wheel, and pistons adapted to reciprocate in the said cylinders some around each track, substantially as and for the purpose set forth.

9. In an engine, the combination of a hollow shaft having non-circular ends, standards adapted to hold the said shaft by its non-circular ends, a non-circular track arranged around the said shaft, admission-ports and exhaust-ports in the said shaft, a wheel rotatable around the said shaft and having radial steam-passages in its walls or otherwise, trunnions on the said wheel, pedestals, bearings mounted in the said pedestals and adapted to carry the said trunnions, compounding inwardly-directed cylinders carried by the said wheel, circumferential steam-passages communicating between the said cylinders, admission-ports and exhaust-ports communicating between the said cylinders and the said radial passages, pistons adapted to reciprocate in the said cylinders, rollers carried by the said pistons and adapted to make contact with the said track, means for retaining the said rollers in contact with the said track, two concentric rotatable sleeves introduced between the said shaft and the said wheel and having apertures therein, and means for transmitting motion from the said wheel, substantially as and for the purpose set forth.

708,698. HORIZONTAL CONVEYER. JAMES M. DODGE, Philadelphia, Pa., assignor to the Link Belt Engineering Company, Philadelphia, Pa., a Corporation of Pennsylvania. Filed Jan. 8, 1901. Serial No. 42,583. (No model.)



Claim.—1. The combination of a chain, a carrier therefor, buckets having one or more brackets pivoted to the chain, each bucket having a bottom extending from a point above the chain to one side thereof, a bracket secured to the inner end of the bucket, a wheel carried by the bracket, and a rail upon which the wheel travels, the outer end of the bucket being inclined and the inner end of the bucket being on the same incline as the outer end of the bucket, substantially as described.

2. The combination in an endless chain made up of a series of links, means for supporting the said chain, a series of buckets pivoted to the chain, a rail for supporting the bucket on one side of the chain, a second rail mounted above the first rail, a switch for transferring the bucket from the lower to the upper rail, and a discharge device for tipping the bucket, substantially as described.

3. The combination of an endless chain, supports therefor, buckets pivoted to the chain, a wheel on the inner end of each bucket, a rail on which the wheel travels so as to support the bucket on one side of the chain, a movable discharge device consisting of a frame mounted on longitudinal rails, and a curved channel-rail, with means for transferring the wheel of each bucket from the supporting-rail to the curved channel-rail, substantially as described.

4. The combination of two rails arranged side by side, an endless chain B, brackets depending from the chain, wheels having their axles mounted in the brackets, said wheels arranged to travel on the rails, a series of buckets pivoted to the chain so as to swing laterally on the chain, brackets on the inner end of each bucket, a wheel carried by each bracket, a rail A' upon which the wheels travel so that the load is carried by the rails A and A', rails F and F', a frame mounted on the said rails F, F', a curved rail mounted on the frame, switch-rails for transferring the wheels from the rail A' to the rail F', so that the wheels of the buckets will travel on the rails F', and on the curved rail to turn the buckets on their pivots and discharge the same, substantially as described.

5. The combination of an endless chain, a support therefor, buckets longitudinally pivoted on the chain, a rail supporting the inner end of each bucket, a rail mounted above the said supporting-rail, switch-rails for transferring the buckets from the supporting-rail to the upper rail, a frame longitudinally movable, and a channeled tipping-rail carried by the said frame and arranged to turn each bucket on the chain to the discharge position, substantially as described.

6. The combination of an endless chain made up of a series of links, wheels mounted on each link of the chain, two rails upon which the wheels travel, a bucket pivoted to each link of the chain, a wheel mounted on the inner end of each bucket, a rail upon which the wheel travels so that the load is supported by the three rails, rails parallel with the supporting-rails, a frame having wheels arranged to travel on the said rails, a curved tipping-rail carried by the frame, switch-rails at each end of the rail directly above the single supporting-rail so that the wheels at the rear end of the buckets will travel first on the supporting-rail, then upon the rail directly above the supporting-rail, and then upon the tipping-rail to the discharge-point, causing the contents of the buckets to be discharged, and back again to the supporting-rails, substantially as described.

7. The combination of an endless chain made up of a series of links, a bucket pivoted to each link, each bucket having one or more brackets, bushings on the links upon which the brackets are mounted, said bushings made in two parts coupled together, substantially as described.

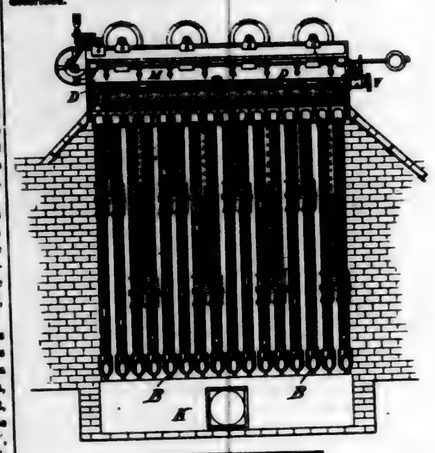
8. The combination in an endless-chain conveyer, of a chain made up of a series of links pivoted together, the links being quadrangular in cross-section, a two-part bushing on each link, each part having a flange and a square opening adapted to the square link and means for coupling the parts together, a bracket, and a bracket on the bucket mounted on the bushing, substantially as described.

708,699. FUEL-ECONOMIZER FEED-WATER HEATER. WILLIAM DOWNS, Orange, N. J. Filed May 7, 1902. Serial No. 106,272. (No model.)

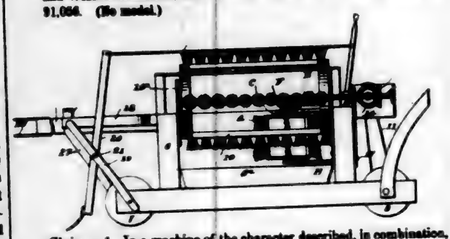
Claim.—1. In a fuel-economizer of the character specified, the combination of a series of tap boxes, outlet and supply pipe, and vertical circulating-tubes, with a series of lower headers arranged parallel, said lower headers having boxes to receive the vertical tubes, and also having internally-contracted portions between the boxes, substantially as and for the purpose as shown and described.

2. In a fuel-economizer of the character specified, a series of headers with boxes to receive vertical tubes, said headers being contracted internally and extended vertically in the portion between the boxes, in combination with a supply-pipe, vertical circulating-tubes, tap boxes; and outlet-pipe substantially as and for the purposes shown and described.

3. In a fuel-economizer of the character specified, a series of headers with boxes to receive vertical tubes, said headers being contracted internally and provided with ribs and extended vertically in the portion between the boxes, in combination with a supply-pipe, vertical circulating-tubes, top boxes, and outlet-pipe, substantially as and for the purposes shown and described.



708,700. INSECT-DESTROYING MACHINE. CHARLES V. DYER and WILL S. WILLETT, Cuero, Tex. Filed Jan. 24, 1902. Serial No. 91,056. (No model.)



Claim.—1. In a machine of the character described, in combination, a casing, a rotatable brush adjustably supported adjacent thereto, means to drive the brush, normal draft appliances, and a supplementary detachable draft-beam connected to the casing.

2. In a combined insect-destroyer and cultivator, a plow-supporting frame, in combination with an insect-receiving casing and coöperating horizontal and vertical rotatable brushes adjacent to the casing.

3. In a machine of the character described, in combination, a wheeled casing, rotatable coöperative brushes secured adjacent thereto, the axes of the brushes being at an angle to each other, and means to drive the brushes.

4. In a machine of the character described, in combination, a movable casing open at one side, horizontal and vertical rotatable brushes at the open side of the casing, coöperating to sweep the same plant, and means to drive the brushes.

5. In a combined insect-destroyer and cultivator, the combination with a plow-supporting frame, of an insect-receptacle carried thereby, and coöperating horizontal and vertical rotatable brushes beside the receptacle, the horizontal brush being vertically adjustable.

708,701. SHADE-ROLLER. OLIVER M. EDWARDS, Syracuse, N. Y. Filed Aug. 27, 1900. Serial No. 28,126. (No model.)

Claim.—1. In a shade-roller the combination, substantially as set forth, of a barrel-head provided with an abutting surface arranged substantially radial to the axis and open or accessible from the end of the roller, and a spindle provided with an abutting surface, which is arranged relatively to the surface on the barrel-head to abut against a device manually inserted between the two from the end of the roller.

2. In a shade-roller the combination, substantially as set forth, of a barrel-head and a spindle one of which is provided with an abutting surface and the other is provided with a plurality of abutting surfaces, whichever is on the barrel-head being arranged substantially radial to the axis and open or accessible from the end of the roller, with the surfaces on the head and spindle arranged relatively to each other to abut against a device manually inserted between a surface on the spindle and a surface on the head from the end of the roller.

3. In a shade-roller the combination, substantially as set forth, of a barrel-head provided with an abutting surface open or accessible from both the side and the end of the roller, and a spindle also provided with an abutting surface, the surface on the head being arranged relatively to the surface on the spindle to abut against a device manually inserted between the surface on the head and the surface on the spindle.

4. In a shade-roller the combination, substantially as set forth, of a barrel-head provided with an abutting surface open or accessible from the end of the roller, and a spindle also provided with an abutting surface, the surface on the head being arranged to pass near to the surface of the spindle, such surfaces being so constructed and arranged as to adapt them to abut against a device manually inserted between them from the end of the roller.

5. In a shade-roller the combination, substantially as set forth, of a barrel-head and a spindle each of which is provided with an abutting surface, one of which surfaces is arranged substantially parallel with the axial line of rotation of the head and spindle and is open or accessible from the end of the roller, the two surfaces being arranged to abut against a device manually inserted between them, from the end of the roller.

6. In a shade-roller the combination, substantially as set forth, of a barrel-head and a spindle each of which is provided with a plurality of abutting surfaces arranged substantially parallel with the axial line of rotation of the head and spindle and open or accessible from the end of the roller, the surfaces on one being arranged relatively to the surfaces on the other to abut against a device manually inserted between them from the end of the roller.

7. In a shade-roller the combination, substantially as set forth, of a barrel-head provided with a recess having one open end and one open side, and a spindle provided with a recess having one open end, the open end of the recess in the head being arranged to pass near to the open end of the recess in the spindle, the side-wall surface of the recess in the head being arranged substantially parallel with the axial line of rotation of the head, portions of such surface and of the recess in the spindle being adapted to abut against a device manually inserted between them from the open side of the recess in the head.

8. In a shade-roller the combination, substantially as set forth, of a barrel-head provided with a recess having open ends and one open side and a spindle provided with a recess having one open end and one open side, the open end of the recess in the spindle being arranged to pass near one of the open ends of the recess in the barrel-head, the side-wall surfaces of both of the recesses being arranged substantially parallel with the axial line of rotation of the head and spindle and portions of such surfaces being adapted to abut against a device manually inserted between them.

9. In a shade-roller the combination, substantially as set forth, of a barrel-head provided with an abutting surface and a spindle provided with a plurality of abutting surfaces, the surface on the head or the surfaces on the spindle being open or accessible from the end of the roller and arranged relatively to the other surface or surfaces to abut against a device manually inserted from the end of the roller between any abutting surface on the spindle and the abutting surface of the head.

10. In a shade-roller the combination, substantially as set forth, of a barrel-head provided with a plurality of abutting surfaces each of which is open or accessible from both the side and the end of the roller, and a spindle provided with a plurality of abutting surfaces which are arranged relatively to the surfaces on the barrel-head to abut against a device manually inserted between any abutting surface on the barrel-head and any abutting surface on the spindle.

11. In a shade-roller the combination, substantially as set forth, of a barrel-head provided with an abutting surface and a spindle provided with a plurality of recesses having one open end and one open side, the side-wall surfaces of the recesses being arranged substantially parallel with the axial line of rotation of the spindle and are adapted to abut against a device manually inserted between the side wall of any recess in the spindle and the abutting surface on the barrel-head.

12. In a shade-roller the combination, substantially as set forth, of a barrel-head provided with an abutting surface, a spindle adapted to be received by the barrel-head and to receive a disk, and a disk made separable from the spindle and provided with oppositely-arranged abutting surfaces and an opening through the disk of suitable shape to receive the spindle and be locked thereto in opposite directions, one of the oppositely-arranged abutting surfaces on the disk forming the operative abutting surface when the disk is placed on the spindle in one direction and the opposite surface thus forming it when the disk is placed on the spindle in the other direction, the abutting surfaces on the disk and barrel-head being arranged to pass near to each other and adapted to abut against a device manually inserted between them.

13. In a shade-roller the combination, substantially as set forth, of a barrel-head provided with an abutting surface, a spindle adapted to be received by the head and to receive a disk, and a disk made separable from the spindle and provided with an opening through it of suitable shape to receive the spindle and be locked thereto in opposite directions and also provided with a recess having one open end and one open side, the side-wall surfaces of the recess being arranged substantially parallel with the axial line of rotation of the spindle, one side-wall surface forming the abutting surface when the disk is placed on the spindle in one direction and the opposite surface thus forming it, when the disk is placed on the spindle in the other direction, the abutting surfaces of the recess in the spindle and the abutting surface on the head being adapted to abut against a device manually inserted between them.

14. In a shade-roller the combination, substantially as set forth, of a barrel-head provided with an abutting surface, a spindle adapted to be received by the barrel-head and to receive a disk, and a disk made separable from the spindle and provided with a recess having one open and one closed side and an open end and also provided with an opening through it of suitable shape to receive the spindle and be locked thereto, the open end of the recess in the disk being arranged to pass near the abutting surface on the barrel-head and the two adapted to abut against a device manually inserted between them.

15. In a shade-roller the combination, substantially as set forth, of a barrel-head provided with an abutting surface, a spindle adapted to be received by the barrel-head and to receive a disk, and a disk made separable from the spindle and provided with a plurality of recesses having one open and one closed side and an open end and also provided with an opening through it to receive the spindle and be locked thereto, the open end of the recess in the disk being arranged to pass near to the abutting surface on the barrel-head, and the two adapted to abut against a device manually inserted between them.

16. In a shade-roller the combination, substantially as set forth, of a barrel-head provided with an abutting surface, a spindle adapted to be received by the barrel-head and to receive a disk, and a disk made separable from the spindle and provided with a plurality of recesses having one open and one closed side and an open end and also provided with an opening through it to receive the spindle and be locked thereto, the open ends of the recesses in the disk being arranged to pass near to the abutting surface on the barrel-head and the side-wall surfaces of the recesses arranged substantially parallel with the axial line of rotation of the spindle, the abutting surface on the head and the side-wall surface of any recess in the disk being adapted to abut against a device manually inserted between them.

17. In a shade-roller, the combination, substantially as set forth, of a barrel-head provided with a plurality of recesses having two open ends and one open side, a spindle adapted to be received by the barrel-head and to receive a disk, and a disk made separable from the spindle and provided with a plurality of recesses having one open and one closed side and an open end, the disk being provided with an opening through it of suitable shape to receive the spindle from opposite directions and be locked thereto, the open ends of the recesses in the disk being arranged to pass near the recesses in the barrel-head and the side-wall surface of one recess in the disk and the side-wall surface of any recess in the head are adapted to abut against a device manually inserted between them.

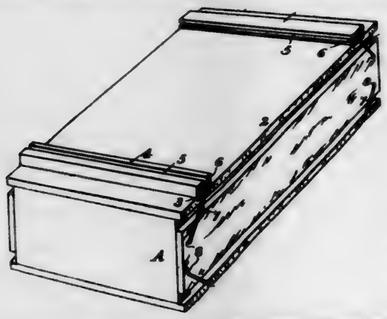
708,702. BOX-FASTENING. EDWARD FLETCHER, San Francisco, Cal., assignor to Mailless Lid Box Company, San Francisco, Cal., a Corporation of California. Filed Mar. 20, 1902. Serial No. 98,143. (No model.)

Claim.—1. The combination with boxes and the like, of covers having grooves or channels in their outer surfaces a short distance from the ends, and wires fitting said channels and having their ends extending divergently along the sides of the box and interned and driven through the sides to look the latter and the covers in place.

2. A box or similar receptacle including mailless sides, ends and tops said tops having grooves or channels across their upper surfaces, in combination with wire bails fitting said grooves or channels and having their opposite ends bent and extending divergently over the sides, and with the extremities of said bent portions turned inward and driven through the sides into the end portions of the box thereby securing the parts of the box independent of nails or other fastening means.

3. A box or receptacle and a cover therefor, said cover having parallel transverse grooves or channels near its ends, strips fitting said channels having grooves made longitudinally in their surfaces, wires seated in

said grooves extending thence divergently along the sides having interned ends driven into the sides whereby the parts are locked together.

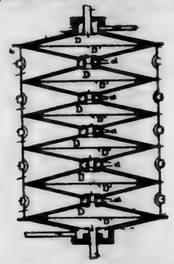


4. A box having unconnected sides, ends and tops said tops having channels across their upper surfaces, and bails fitted in said grooves and having their opposite portions embracing the sides and edges of the tops and with the extremities of said portions driven through said sides and into said ends to secure the unconnected portions without the use of nails and other independent fastenings.

5. A box or receptacle having opposite lids provided in their outer surface with transverse grooves or channels, and wire bails fitting said grooves or channels and having their end portions extending diagonally and driven directly into the sides of the box.

6. A box or like receptacle including a top having a groove near each end; a cleat engaging said groove and having its upper surface channeled; and a wire bail seated in said channeled surface and having its opposite portions embracing the sides of the box and edges of the top and driven into said sides.

708,703. MACHINE OR APPARATUS FOR RAISING OR LOWERING THE TEMPERATURE OF LIQUIDS. FRANK H. FLOYD, Quincy, Mass. Filed Apr. 23, 1902. Serial No. 104,323. (No model.)



Claim.—1. In a machine for the purpose described, the combination of a series of hollow outer sections, a series of hollow inner sections arranged within the spaces between the outer sections and separated therefrom by narrow surrounding spaces, circulating connections between the inner sections and also with the end sections thereof, and means for effecting a circulation through the outer sections and also through the spaces between the inner and outer sections.

2. In a machine for the purpose described, the combination of a series of separably-superimposed hollow outer sections, a series of separably-superimposed inner hollow sections arranged between opposing surfaces of the outer sections and separated therefrom by narrow surrounding spaces, circulating connections between the individual inner sections extending through the outer sections, and means for effecting a circulation through both the inner and the outer sections and also through the spaces between said sections.

3. In means for the purpose described, a series of double-concave hollow annular outer sections superimposed one upon another, a series of double-convex hollow inner sections inclosed between the concave faces of the outer sections and separated therefrom by narrow spaces, and means whereby a circulation may be effected through each of said inner and outer sections and also through the said spaces.

4. In means for the purpose described, a series of double-concave, hollow, annular outer sections separably superimposed one upon another, a series of double-convex hollow inner sections inclosed in the spaces formed between the concave faces of the outer sections, hollow separable connections joining said sections through the central openings of the outer sections, and circulating-pipes connected to the said sections and with the spaces between the same.

5. In means for the purpose described, an inner series of hollow sections, superimposed one upon another and means for effecting a circulation therethrough, an outer series of sections entirely inclosing the sections of the inner series and separated from the surfaces thereof by narrow spaces, means for effecting a circulation through said outer sections, and circulating-pipes connecting with the said spaces.

6. In apparatus for changing the temperature of milk and other liquids, a plurality of hollow sections arranged in an inner and an outer series, the opposing surfaces of the sections of the two series forming between them a connected series of narrow spaces of double conical form adapted for the passage therethrough of the milk or other liquid to be treated.

7. In apparatus for the purpose described, the combination of the outer concave hollow, annular sections superimposed one upon another, and gaskets between said sections, of the inner convex hollow sections inclosed by the concave faces of the outer sections, and separable hollow stems connecting said inner sections through the central openings of the outer sections.

8. In apparatus for the purpose described, the combination of the top and bottom plates having the concave, inner surfaces, the series of separable, double-concave, hollow, annular outer sections, having detachable circulating connections, the inner hollow, double-convex sections having detachable, interfitting hollow stems, circulating connections for the upper and lower inner sections, and circulating connections communicating with the inclosed connected spaces between the inner and outer sections.

9. In apparatus for the purpose described, the combination with the series of separable superimposed hollow, double-concave, annular outer sections, of the series of hollow inner sections inclosed between the concave faces of the outer sections and separated therefrom by narrow spaces, separable hollow clutch connections, and means for rotating the series of inner sections.

10. In apparatus for the purpose described, the combination of the outer series of fixed separable sections, the inner sections inclosed by the outer sections and separably connected with each other, said inner and outer sections having parallel surfaces separated from each other at all points by narrow spaces, a circulating system connected with both inner and outer sections and also with the said spaces, bearings upon which the said inner sections may rotate, and joints in the circulating-pipes leading to said inner sections for permitting rotation thereof.

11. In apparatus for the purpose described, the series of superimposed hollow annular double-concave sections, and gaskets seated between the said sections near their peripheries, in combination with hollow inner sections seated between the concave faces of the outer sections and separated therefrom.

12. In a machine for the purpose described, the combination with a series of hollow outer sections superimposed upon each other at their peripheral portions, but having their adjacent surfaces separated by spaces, hollow inner sections arranged in said spaces with their surfaces separated from the surfaces of the outer sections, and central connections between said inner sections.

13. In a machine for the purpose described, the combination with a series of hollow outer sections, a series of hollow inner sections entirely inclosed by the outer sections and separated therefrom by spaces, means for effecting a circulation through each of said sections and also through the said spaces, and means for rotating the inner sections.

14. The herein-described machine for attemperating liquids, consisting of a plurality of hollow sections for the attemperating medium, separably superimposed upon each other in an inner and outer series and inclosing between their opposing surfaces a narrow passage of large superficial area for the liquid to be attemperated, together with means for effecting a circulation through said sections and passage.

708,704. BRAKE-SHOE. JOSEPH D. GALLAGHER, Glenridge, N. J. Filed June 13, 1901. Serial No. 64,422. (No model.)

Claim.—1. As a new article of manufacture, a brake-shoe formed of annealing-iron, having an outer shell of soft metal and an inner core of hard metal, substantially as described.

2. As a new article of manufacture, a brake-shoe formed of cast-iron, the back and lugs of which are annealed and the core of which is formed of hard iron so as to present during its use a compound wearing-surface, substantially as described.

3. As a new article of manufacture, a brake-shoe comprising malleable-iron and relatively hard cast-iron portions formed integral with each other, the malleable-iron portion comprising a layer disposed at the back of the shoe, substantially as described.

4. As a new article of manufacture, a brake-shoe comprising malleable-iron and relatively hard cast-iron portions formed integral with each other, the malleable-iron portion thereof comprising a layer disposed at the back of the shoe and the attaching-lug, substantially as described.

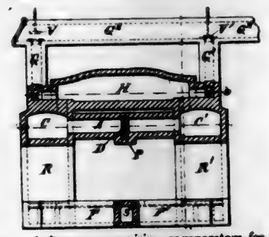
5. As a new article of manufacture, a brake-shoe comprising layers of malleable iron extending from the face or friction-surface thereof toward the back of the shoe and relatively hard cast-iron portions, the malleable and hard portions being integral with and merging gradually into each other, substantially as described.

6. As a new article of manufacture, a brake-shoe comprising a layer of malleable iron disposed at the back of the shoe, layers of malleable iron extending from the face or friction-surface thereof toward the back of the shoe, and relatively hard cast-iron portions, substantially as described.

7. As a new article of manufacture, a brake-shoe comprising outer layers of malleable iron on all exposed surfaces, and an inner portion of relatively hard cast-iron, substantially as described.

8. As a new article of manufacture, a brake-shoe consisting of an integral piece of metal and comprising outer layers of malleable iron and inner portions of relatively hard cast-iron, substantially as described.

708,705. FURNACE FOR HEATING AND MELTING IRON, &c. HENRY L. GANTT, Fountain Hill, Pa. Filed Mar. 22, 1901. Serial No. 52,336. (No model.)



Claim.—1. A furnace comprising regenerators for air, a heating-chamber, waste-gas-burning chambers respectively connecting on one side with the space at the end of the regenerator checker-work, and on the other side with the heating-chamber, and that act as dust-collectors to protect the regenerators, means for introducing into the heating-chamber a finely-divided or attenuated fuel that is burned in suspension in said chamber, and a passage, connecting the waste-gas-burning chambers, through which part of the incoming heated air passes, and which is of such cross-sectional area as compared with the passages between the combustion-chambers and the heating-chamber that the incoming heated air passing to the heating-chamber is of such volume as to produce therein a partial combustion only of the fuel the unconsumed parts of the fuel leaving the heating-chamber being completely burned in the waste-gas-burning chambers.

2. A furnace comprising regenerators for air, a heating-chamber, waste-gas-burning chambers, one for each regenerator, respectively interposed between the regenerators and the heating-chamber, means for introducing into the heating-chamber a finely-divided or attenuated fuel that is burned in suspension in said chamber, a passage connecting the waste-gas-burning chambers, and means for varying at will the cross-sectional area of said passage to so control the quantity of air passing to the heating-chamber as to produce therein the desired character of flame or atmosphere.

3. A furnace comprising two regenerators, a heating-chamber interposed between their inner ends with a space of material dimensions between the checker-work of each regenerator and the heating-chamber, means for introducing into the heating-chamber a finely-divided or attenuated fuel that is burned in suspension in said chamber, an air-passage connecting said spaces at the inner ends of the regenerators, and means for varying at will the cross-sectional area of said passage to so control the quantity of air passing to the heating-chamber as to produce therein the desired character of flame or atmosphere.

4. A furnace comprising regenerators for air, a heating-chamber interposed between the inner ends of the regenerators with a space of material dimensions between the checker-work of each regenerator and the heating-chamber, a passage connecting said spaces, means for introducing into the heating-chamber a finely-divided or attenuated fuel that is burned in suspension, and means for regulating the relative quantities of incoming heated air passing through the passage connecting the regenerators, and into the heating-chamber, respectively.

5. A furnace comprising regenerators for air, a heating-chamber, waste-gas-burning chambers, one for each regenerator, respectively interposed between the regenerators and the heating-chamber, means for introducing into the heating-chamber a finely-divided or attenuated fuel that is burned in suspension, a passage connecting the waste-gas-burning chambers, and means for varying at will the quantity of incoming heated air passing to the respective combustion-chambers and to the heating-chamber to produce in the latter the desired character of atmosphere.

708,706. WIRE-STRETCHER. ANDREW J. GOLDSBY, Proctor, Mo. Filed July 16, 1901. Serial No. 68,514. (No model.)

Claim.—1. A wire-stretcher, embodying a pair of lever members terminating at corresponding ends in handles, and having a mutual fulcrum connection at their corresponding opposite terminals, and wire-clamps carried intermediately by the members and at corresponding distances from the fulcrum connection thereof, the clamp of each lever member being active when inward strain is placed upon said lever.

2. A wire-stretcher, embodying a pair of lever members terminating at corresponding ends in handles, and having a mutual fulcrum connection at their corresponding opposite terminals, each member being formed of pivotally-connected sections having mutually-coöperating clamp members, the clamp members of each lever being active when inward strain is placed upon said lever.

3. A wire-stretcher comprising opposite members, each of which is formed by a bowed section and a handle-section, which are pivotally connected and are constructed to mutually coöperate and form a wire-clamp, the outer corresponding ends of the opposite bowed sections having a pivotal connection.

4. A wire-stretcher comprising opposite duplicate members, each of which is formed by a bowed section and a handle-section which have their inner ends overlapped and pivotally connected, the bowed member having a shoulder extended transversely across and in coöperative relation with the inner end of the handle-section to form therewith a wire-clamp, the outer ends of the opposite bowed sections having a common pivotal connection.

5. A wire-stretcher, comprising a pair of members pivotally connected at their terminals, corresponding wire-clamps provided at an intermediate point of the members, and a wire guide or holder disposed between the clamps.

6. A wire-stretcher, comprising a pair of lever members having a mutual pivotal connection at their terminals, corresponding wire-clamps carried at an intermediate point by the members, and a wire guide or holder carried by the pivotal connection of the members at one side of the plane of said members, and adjustable across the members into positions between the wire-clamps when in use and outside of the lever members when not in use.

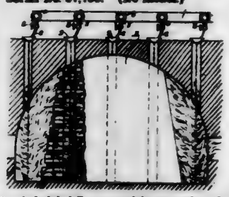
7. A wire-stretcher, comprising a pair of lever members having a mutual pivotal connection, corresponding wire-clamps carried at an intermediate point by the members, and a wire guide or holder pivotally carried at the pivotal connection of the members at one side of the plane of the members and movable across the same into positions between the clamp members when in use and outside of the lever members when not in use.

8. A wire-stretcher, comprising a pair of lever members having a mutual terminal pivotal connection, corresponding wire-clamps carried at an intermediate point by the members, and a wire guide or holder pivotally carried by the pivotal connection of the members and having a forked free end, the guide or holder being movable in an arcuate path upon its pivotal support in a plane at one side of the plane of the lever members to positions between the clamp members when in use and outside of the lever members when not in use.

9. In a wire-stretcher, the combination of opposite duplicate members, each of which comprises a bowed member and a lever member which have their inner ends overlapped and pivotally connected, the bowed member having a transverse shoulder located adjacent to and extended transversely across the inner end of the lever-section, the outer ends of the opposite bowed sections having a common pivotal connection, a wire guide or holder having one end loosely mounted upon the said common pivotal connection and normally lying between the opposite members, the free

end of the guide being provided with an inwardly-tapered, longitudinal bifurcation which is normally aligned with the inner ends of the opposite lever-sections, and a plurality of laterally-projected post-engaging hooks of different sizes, said hooks having common pivotal connection which is interchangeable from one bowed section to the other and located intermediate of the ends of said sections.

708,707. **KILN-BURNING APPARATUS.** GEORGE F. GRAY, HARRY H. GRAY, and RICHARD SOUTH, San Francisco, Cal. Filed Dec. 30, 1901. Serial No. 87,756. (No model.)



Claim.—1. A brick-kiln comprising a series of chambers containing the bricks; open combustion-chambers between the bricks and interior walls of the chamber; and oil-drip tubes and nozzles located above the roof of the kiln said roof having openings through it in line with the drip-tubes and leading the oil into the upper limits of the combustion-chambers whereby the oil is successively burned while dropping through the vertical height of said chambers.

2. A brick-kiln comprising a series of chambers containing the bricks; open combustion-chambers between the bricks and interior walls of the chamber; oil-drip tubes and curved nozzles located above the roof of the kiln said roof having vertical openings through it and leading the oil into the upper limits of the combustion-chambers whereby the oil is successively vaporized and burned while dropping from roof to floor of the chambers; seats fitting the upper ends of the vertical openings and funnels fitting said seats and receiving the drip from the nozzles.

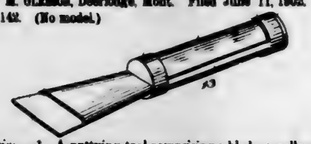
708,708. **ELECTRODE-SEPARATOR FOR BATTERIES.** ARTHUR W. HARRISON, Los Angeles, Cal., assignor of two-thirds to F. A. Marcher, Los Angeles, Cal. Filed May 7, 1902. Serial No. 106,260. (No model.)

Claim.—1. In a battery an electrode-separator composed of yucca having the non-fibrous portion thereof removed.

2. In a battery an electrode-separator therefor composed of the fibrous portion of yucca.

3. As a new article of manufacture a battery electrode-separator of yucca deprived of the non-fibrous portions thereof.

708,709. **PUTTYING-TOOL.** ELLA T. HENNESSEY and MARGARET M. GLENNON, Deerlodge, Mont. Filed June 11, 1902. Serial No. 111,142. (No model.)

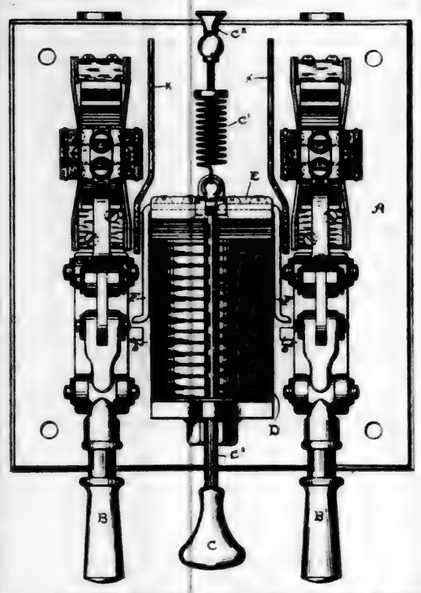


Claim.—1. A puttying-tool comprising a blade, a collapsible handle connected to the blade and adapted to deliver its contents to the blade and a rigid connection between the ends of the handle.

2. A puttying-tool comprising a blade and a collapsible handle connected thereto, said handle having metallic terminals to one of which the blade is directly connected and the other of which is open, a rigid connection between the metallic terminals and a closure for the open metallic terminal, the blade having an opening therethrough leading from the handle and arranged to deliver putty to the blade.

708,710. **CIRCUIT-BREAKER.** EDWARD M. HEWLETT, Schenectady, N. Y., assignor, by mesne assignments, to H. Ward Leonard, Bronxville, N. Y. Filed Sept. 26, 1896. Serial No. 606,160. (No model.)

Claim.—1. In an electric switch, the combination of a pair of fixed contacts, a bridging-contact and a barrier of insulating material between the fixed contacts and spanned by the bridge; the barrier consisting of fixed and movable portions, and means for causing the movable part to follow the bridge as the switch is opened.



2. In a switch, the combination of a spring for opening the switch, a toggle for closing it, and a second toggle holding the first one extended.

3. In a switch, the combination of fixed and movable contacts, a toggle connected to the movable contacts, and a second toggle for holding the first in its extended position.

4. In a switch, the combination of fixed and movable contacts, a toggle connected to the movable contacts, a second toggle for holding the first in its extended position, and a spring for cramping the second toggle positively out of line.

5. An automatic circuit-breaker provided with a switch, a toggle for closing the switch, a second toggle for holding the first one extended, and an armature and series coil for causing the second toggle to release the switch.

6. The combination of a plurality of electric switches each comprising terminal blocks, a laminated member for bridging said blocks, independent means for bringing the laminated member into engagement with the terminal blocks, and a single controlling device for automatically controlling the movement of said switches.

7. The combination of a plurality of electric switches each comprising separated terminal blocks, a laminated bridging member for engaging said blocks, a toggle for operating each laminated bridging member, independent means in each switch for operating said toggle, and a single controlling device for automatically controlling the movement of said switches.

8. The combination of a plurality of electric switches, each comprising separated terminal blocks, a laminated bridging member for engaging said terminal blocks, a pivoted arm supporting said laminated bridging member at approximately its middle, independent means in each switch for operating said pivoted arms, and a single controlling device for automatically controlling the movement of said switches.

9. The combination of a plurality of electric switches, each comprising separated terminal blocks, a pivoted laminated bridging member for engaging said terminal blocks, independent means in each switch for operating the pivoted laminated bridging member, and a single controlling device for automatically controlling the movement of said switches.

10. The combination of a plurality of electric switches, each comprising separated terminal blocks, a pivoted laminated bridging member for engaging said blocks, a toggle for operating said pivoted laminated member, and independent means in each switch for operating the toggle, and a single controlling device for automatically controlling the movement of said switches.

11. The combination of a plurality of electric switches juxtaposed, and in series in the same electric circuit, each switch comprising separated terminal blocks, a laminated bridging member for engaging said terminal blocks to close the circuit, independent means in each switch for operating said bridging member, and a single electric responsive device for automatically controlling the movement of said switches.

12. The combination of a plurality of electric switches capable of independent manual movement into normal position, each switch comprising separated terminal blocks, a laminated bridging member for engaging said blocks, means for locking said bridging member in engagement with said terminal blocks, and a single electroresponsive device for automatically unlocking all the switches.

13. The combination of a plurality of electric switches designed to be moved independently into normal position, each switch comprising separated terminal blocks, a pivoted laminated bridging member for engaging said terminal blocks, independent locking devices for holding said switches in their normal position, and a single electroresponsive device for automatically releasing said switches.

14. The combination of a plurality of electric switches capable of independent movement into normal position, each switch comprising separated terminal blocks, one vertically above the other, a laminated bridging member for engaging said blocks, independent means in each switch for operating said bridging member, and a single controlling device for automatically controlling the movement of said switches.

15. The combination of a plurality of electric switches capable of independent movement into normal position, each switch comprising separated terminal blocks whose contact-faces are in approximately the same plane, a laminated bridging member for engaging said terminal blocks, independent means in each switch for operating said bridging member, and a single controlling device for automatically controlling the movement of said switches.

16. The combination of a plurality of electric switches, capable of independent movement into normal position, each switch comprising separated terminal blocks, one vertically above the other, and whose contact-surfaces are in approximately the same vertical plane a laminated bridging member for engaging said terminals, independent means in each switch for operating the laminated member, and a single electroresponsive device for automatically controlling or effecting the simultaneous movement of said switches.

17. The combination of a plurality of switches, independently movable into normal position, each switch comprising separated terminal blocks, a laminated bridging member for engaging said terminal blocks, a stationary shunt-contact located upon and above the upper terminal block, a movable shunt-contact cooperating with said fixed shunt-contact, locking devices for holding said switches in their normal positions and a single electroresponsive device for automatically and simultaneously releasing said switches.

18. The combination of a plurality of electric switches independently movable into normal position, each switch comprising separated terminal blocks, a laminated bridging member normally engaging with said terminal blocks, locking means for holding said bridge in engagement with said terminal blocks and a single electroresponsive device for automatically and simultaneously releasing the bridging devices of the switches from the control of their locking devices.

19. The combination of a plurality of electric switches independently movable into normal position and juxtaposed upon a common base, each switch comprising separated terminal blocks, one vertically above the other, a laminated bridging member cooperating with said terminal blocks, independent means in each switch for operating the laminated member, and a single electroresponsive device located between a pair of said switches for automatically and simultaneously releasing all the switches.

20. The combination of a plurality of electric switches independently movable into normal position, each switch comprising separated contact terminals, a laminated bridging member for engaging said contact terminals, independent means in each switch for operating the laminated member, a single electroresponsive device for automatically and simultaneously releasing said switches, and barriers of insulating material located between the independent switches.

21. An electric switch comprising separated contact-blocks one vertically above the other, and whose engaging faces are in approximately the same vertical plane, a laminated bridging member engaging with the ends of the laminæ upon said contact-blocks, means for bringing said bridging member into engagement with said blocks, means for locking said bridging member in engagement with said blocks and electroresponsive means for controlling the switch.

22. In an electric switch the combination of separated contact-blocks one vertically above the other and whose contact-surfaces are in approximately the same vertical plane, a stationary shunt-contact, a movable laminated bridging member for engagement with said contact-blocks, a vertically-extending member, a movable shunt-contact carried thereby, means for maintaining said bridging member in engagement with said contact-blocks, and electroresponsive means for controlling the switch.

23. In an electric switch the combination of separated contact-blocks one vertically above the other, and whose engaging faces are in approximately the same vertical plane, a shunt-contact in electrical communication with the upper contact-block and located above the engaging surface thereof, a laminated bridging member, for engaging with the ends of its laminæ with the engaging surfaces of said contact-blocks, a vertically-extending pivoted member, a movable shunt-contact carried at the upper end thereof, means for restraining the laminated bridging member in normal position, and electroresponsive means for controlling the switch.

24. In an electric switch the combination of separated contact-blocks one vertically above the other, and whose engaging faces are in approximately the same vertical plane, a shunt-contact in electrical communication with the upper contact-block and located above the engaging surface thereof, a laminated bridging member, for engaging at the ends of its laminæ with the engaging surfaces of said contact-blocks, a vertically-extending pivoted member, a movable shunt-contact carried at the upper end thereof, and means for restraining the laminated bridging member in normal position.

25. In an electric switch, the combination of separated contact-blocks one vertically above the other, and whose engaging faces are in approximately the same vertical plane, a shunt-contact in electrical communication with the upper contact-block and located above the engaging surface thereof, a pivoted laminated bridging member for engaging at the ends of its laminæ with the engaging surfaces of said contact-blocks, a vertically-extending pivoted member a movable shunt-contact carried at the upper end thereof, and means for restraining the laminated bridging member in normal position.

26. In an electric switch the combination of separated terminal blocks, one vertically above the other and having their engaging faces in approximately the same vertical plane, a horizontally spring-pressed member located between such terminal blocks, a laminated bridging member for engaging with said terminal blocks and in its normal position compressing said spring-pressed member, means for restraining said laminated member in its normal position, and means for releasing the switch.

27. In an electric switch the combination of separated contact-blocks one vertically above the other, and having their engaging faces in approximately the same vertical plane, a stationary shunt-contact in electrical communication with the upper contact-block and located above the engaging face thereof, a laminated bridging member for engaging said terminal blocks, a spring-pressed member located between said terminal blocks and exerting pressure against said laminated member in its normal position, a vertically-extending pivoted member, a movable shunt-contact carried at the upper end thereof, and means for restraining the laminated bridging member in normal position.

28. In an electric switch the combination of separated contact-blocks one vertically above the other, and having their engaging faces in approximately the same vertical plane, a stationary shunt-contact in electrical communication with the upper contact-block and located above the engaging face thereof, a laminated bridging member for engaging said terminal blocks pivoted on an axis parallel with the base, a spring-pressed member located between said terminal blocks, and exerting pressure against said laminated member in its normal position, a vertically-extending pivoted member, a movable shunt-contact carried at the upper end thereof, and means for restraining the laminated bridging member in normal position.

29. In an electric switch the combination of separated contact-blocks one vertically above the other, and having their engaging faces in approximately the same vertical plane, a stationary shunt-contact in electrical communication with the upper contact-block and located above the engaging face thereof, a laminated bridging member for engaging said terminal block, spring means located between said terminal blocks and exerting pressure against said laminated member in its normal position, a vertically-extending pivoted member, a movable shunt-contact carried at the upper end thereof, and means for restraining the laminated bridging member in normal position.

30. In an electric switch the combination of separated contact-blocks one vertically above the other, and having their engaging faces in approximately the same vertical plane, a stationary shunt-contact in electrical communication with the upper contact-block and located above the engaging face thereof, a laminated bridging member for engaging said terminal blocks pivoted on an axis parallel with the base, and spring means located between said terminal blocks and exerting pressure against said laminated member in its normal position, a vertically-extending pivoted member, a movable shunt-contact carried at the upper end thereof, and means for restraining the laminated bridging member in normal position.

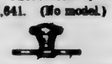
31. In an electric switch the combination of a base of insulating material, separated contact-blocks secured thereto by means of bolts extending through said base and serving also as an electrical connection to

said blocks, one of said blocks located vertically above the other, said blocks having their engaging surfaces in approximately the same vertical plane, a laminated bridging member for engaging with said contact-blocks, resilient means located between said blocks and exerting pressure against said bridging member in its normal position, means for forcing said bridging member into engagement with the contact-blocks and means for restraining said bridging member in its normal position.

32. In an electric switch the combination of separated contact-blocks, one vertically above the other and having their contact-faces approximately in the same vertical plane, a laminated bridging member for engaging said contact-blocks, a lever pivoted on an axis parallel with the base and carrying at its upper end said laminated contact member, a toggle controlling said pivoted lever, and means for locking the toggle in its extended position.

33. In an electric switch the combination of separated contact-blocks, one vertically above the other, a laminated bridging member for engaging said contact-blocks, a lever pivoted on an axis parallel with the base and carrying at its upper end said laminated contact member, a toggle controlling said pivoted lever, and a second toggle for locking said toggle in its extended position.

708,711. BUTTON. JACOB HILDER, New York, N. Y. Filed May 16, 1902. Serial No. 107,641. (No model.)



Claim.—1. The combination of a base-plate, a shank or stem projecting therefrom, an apertured cap attached to said shank or stem and a piece of yielding material seated beneath said cap and projecting through said aperture.

2. The combination of a base-plate, a shank or stem projecting therefrom and having a seat or shoulder on its upper end, an apertured cap attached to said shank or stem and a piece of yielding material seated beneath said cap and projecting through said aperture.

3. A button comprising an apertured cap or top and a piece of yielding material projecting through said aperture beyond the plane of said cap or top.

4. A button comprising a stem and a head, the latter being of greater diameter than the former and having a metal periphery or rim and a central fabric-engaging piece of yielding material.

5. A button having a shank and a head the latter being apertured and a piece of yielding material clamped between said head and shank so as to project through the aperture of said head.

6. A button having a shank and a head the latter being apertured and a piece of yielding material interposed between said shank and cap and compressed so as to project through the aperture of said head.

7. The combination of a base-plate, a shank or stem projecting therefrom, a plate or disk seated on the top of said shank or stem, a piece of yielding material seated upon said plate or disk and an apertured cap, the said yielding material projecting through the aperture of said cap.

708,712. CONDENSING OR COOLING APPARATUS. CHRISTIAN C. HILL, Chicago, Ill. Filed Oct. 23, 1901. Serial No. 79,683. (No model.)

Claim.—1. A condensing or cooling apparatus, comprising in combination, inlet and outlet heads, and a condensing or cooling chamber yieldingly connected to said heads by flexible connections which are adapted to permit of a ready detachment of said chamber from said head, substantially as set forth.

2. A condensing or cooling apparatus comprising in combination, inlet and outlet heads, and a series of condenser-sections yieldingly connected to said heads by flexible connections which are adapted to permit of a ready detachment of said chamber from said head, substantially as set forth.

3. A condensing or cooling apparatus, comprising in combination, inlet and outlet heads, and a condensing or cooling chamber yieldingly connected to said heads by flexible connections which are adapted to permit of a ready detachment of said chamber from said head, the same comprising flexible nipples and tubular necks on the respective parts, substantially as set forth.

4. A condensing or cooling apparatus, comprising in combination, inlet and outlet heads, and a series of condenser-sections yieldingly connected to said heads by flexible connections which are adapted to permit of a ready detachment of said chamber from said head, the same comprising flexible nipples and tubular necks on the respective parts, substantially as set forth.

5. A condensing or cooling apparatus, comprising in combination, inlet and outlet heads, a series of condenser-sections, a series of flexible nipples secured to the inlet and outlet heads, and a series of tubular necks attached to the condenser-sections and adapted for engagement with the flexible nipples which are adapted to afford individual yielding connections between said chambers and heads, and permit of a ready and individual detachment of the parts, substantially as set forth.

6. A condensing or cooling apparatus, comprising in combination, inlet and outlet heads, a series of condenser-sections, a series of flexible nipples having enlarged and integrally-formed bases common to a series of such nipples and secured to the inlet and outlet heads, and a series of tubular necks attached to the condenser-sections and adapted for engagement with the flexible nipples which are adapted to afford individual yielding connections between said chambers and heads, and permit of a ready and individual detachment of the parts, substantially as set forth.

7. A condensing or cooling apparatus comprising in combination, inlet and outlet heads formed with longitudinal depressions in their sides and with orifices in the sunken walls of such depressions, a series of condenser-sections, a series of flexible nipples secured to the inlet and outlet heads, and a series of tubular necks attached to the condenser-sections and adapted for engagement with the flexible nipples, which are adapted to afford individual yielding connections between said chambers and heads, and permit of a ready and individual detachment of the parts, substantially as set forth.

8. A condensing or cooling apparatus comprising in combination, inlet and outlet heads formed with longitudinal depressions in their sides and with orifices in the sunken walls of such depressions, a series of condenser-sections, a series of flexible nipples having enlarged and integrally-formed bases common to a series of such nipples and secured to the respective inlet and outlet heads outside the longitudinal depressions aforesaid, and a series of tubular necks attached to the condenser-sections and adapted for engagement with the flexible nipples, substantially as set forth.

9. A condensing or cooling apparatus, comprising in combination, upper and lower inlet-heads, an outlet-head arranged to the rear of the lower inlet-head, and a series of condenser-sections arranged between the upper and lower inlet-heads and forward of the outlet-head and connected to said heads by flexible connections, substantially as set forth.

10. A condensing or cooling apparatus, comprising in combination, upper and lower inlet-heads, an outlet-head arranged to the rear of the lower inlet-head, and a series of condenser-sections arranged between the upper and lower inlet-heads and forward of the outlet-head, and connected to said heads by flexible connections, the same comprising flexible nipples and tubular necks on the respective parts, substantially as set forth.

11. A condensing or cooling apparatus, comprising in combination, upper and lower inlet-heads, an outlet-head arranged to the rear of the lower inlet-head, a series of condenser-sections arranged between the upper and lower inlet-heads and forward of the outlet-head, a series of flexible nipples secured to the inlet and outlet heads, and a series of tubular necks attached to the condenser-sections and adapted for engagement with the flexible nipples, substantially as set forth.

12. A condensing or cooling apparatus, comprising in combination, upper and lower inlet-heads, an outlet-head arranged to the rear of the lower inlet-head, a series of condenser-sections arranged between the upper and lower inlet-heads and forward of the outlet-head, a series of flexible nipples having enlarged and integrally-formed bases common to a series of such nipples and secured to the inlet and outlet heads, and a series of tubular necks attached to the condenser-sections and adapted for engagement with the flexible nipples which are adapted to afford individual yielding connections between said chambers and heads, and permit of a ready and individual detachment of the parts, substantially as set forth.

13. A condensing or cooling apparatus, comprising in combination, upper and lower inlet-heads, an outlet-head arranged to the rear of the lower inlet-head, a series of condenser-sections arranged between the upper and lower inlet-heads and forward of the outlet-head, a series of flexible nipples secured to the inlet and outlet heads, and a series of tubular necks attached to the condenser-sections and having horizontal extensions adapted for engagement with the flexible nipples, substantially as set forth.

14. In a cooling or condensing apparatus of the character herein described, a condenser-section comprising two parallel plates, marginal folds on the opposing faces of such plates adapted to maintain the plates in separated relation, and means for securing the margins of the plates together, substantially as set forth.

15. In a cooling or condensing apparatus of the character herein described, a condenser-section comprising two parallel plates, marginal folds on the opposing faces of such plates adapted to maintain the plates in separated relation, and a binding cap-piece embracing the margins of the plates and securing the same together, substantially as set forth.

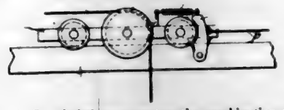
16. In a cooling or condensing apparatus of the character herein described, a condenser-section comprising two parallel plates, marginal folds on the opposing faces of such plates adapted to maintain the plates in separated relation, said plates having a depression adjacent to said folds, and a binding cap-piece embracing the margins of the plates and provided with inturned lips engaging the depressions aforesaid, substantially as set forth.

17. In a cooling or condensing apparatus of the character herein described, a condenser-section comprising two parallel plates, marginal folds on the opposing faces of such plates adapted to maintain the plates in separated relation, means for securing the margins of the plates together, and a series of stay-rivets arranged between the plates and provided with an enlarged central body portion and reduced rivet extensions at opposite ends, substantially as set forth.

18. In a cooling or condensing apparatus of the character herein described, a condenser-section comprising two parallel plates, marginal folds on the opposing faces of such plates adapted to maintain the plates in separated relation, a binding cap-piece embracing the margins of the plates and securing the same together, and a series of stay-rivets arranged between the plates and provided with an enlarged central body portion and reduced rivet extensions at opposite ends, substantially as set forth.

19. In a cooling or condensing apparatus of the character herein described, a condenser-section comprising two parallel plates, marginal folds on the opposing faces of such plates adapted to maintain the plates in separated relation, said plates having a depression adjacent to said folds, a binding cap-piece embracing the margins of the plates and provided with inturned lips engaging the depressions aforesaid, and a series of stay-rivets arranged between the plates and provided with an enlarged central body portion and reduced rivet extensions at opposite ends, substantially as set forth.

708,718. HOISTING APPARATUS. CHARLES W. HUNT, West New Brighton, N. Y. Filed Feb. 20, 1902. Serial No. 94,574. (No model.)



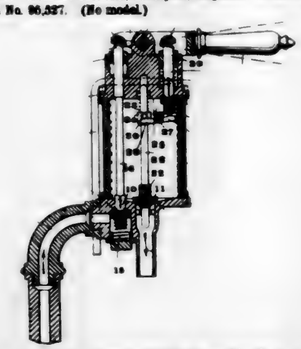
Claim.—1. In a hoisting apparatus, the combination of a trolley, a support therefor, a hoisting-rope, a rope for effecting movement of the trolley on its support, operating means for said ropes, and a trolley-brake or holding device in operative relation with one of said ropes, substantially as described.

2. In a hoisting apparatus, the combination of a trolley, a support therefor, a hoisting-rope, a rope for effecting movement of the trolley on its support, operating means for said ropes, a trolley-brake or holding-arm in operative relation with one of said ropes, and a spring coöperating with said arm, substantially as described.

3. In a hoisting apparatus, the combination of a trolley, a support therefor, a hoisting-rope, a rope for effecting movement of the trolley on its support, operating means for said ropes, a trolley-brake or holding device having the second-named rope connected thereto, and a spring coöperating with said brake or holding device against the tension of the rope, substantially as described.

4. In a hoisting apparatus, the combination of a trolley, a support therefor, a hoisting-rope, a rope for effecting movement of the trolley on its support, operating means for said ropes, a trolley-brake or holding-arm having the second-named rope connected thereto, and a spring coöperating with said arm against the tension of the rope, substantially as described.

708,714. APPARATUS FOR SERVING AERATED WATERS ON DRAFT. JOHN P. JACKSON, Liverpool, England. Filed Feb. 25, 1902. Serial No. 96,327. (No model.)



Claim.—1. In a counter-fountain, in combination, a receiver connected to a supply of aerated water, inlet, outlet, and snifting valves therefor, a syrup-measuring chamber communicating with the outlet from said receiver, a syrup-reservoir connected with said chamber, valves controlling the inlet of syrup to and its exit from said chamber, and a single operating-handle having connections for controlling all of said valves, substantially as described.

2. In a counter-fountain in combination with a receiver in communication with a supply of aerated water and having inlet, outlet and snifting valves, a handle operating said valves; two syrup-chambers in communication with syrup-reservoirs and having inlet and outlet valves and means capable of being adjusted whereby the movement of the handle may be made to operate the valve of either syrup-chamber at will; substantially as described.

3. In a counter-fountain, in combination with a receiver in communication with a supply of aerated water and having inlet, outlet and snifting valves, a handle for operating said valves; two syrup-chambers whose outlets communicate with the outlet of the receiver, a syrup-reservoir connected with each chamber each of said chambers being provided with a double valve which normally closes the outlet and a vent-pipe which allows the said chambers to fill from the reservoir, and adjustable means interposed between the handle and double valves whereby the movement of the handle when discharging the receiver moves the double valve of either chamber as may be desired so as to close the inlet and open the outlet; substantially as described.

4. In a counter-fountain in combination with the receiver, and its valves, the two syrup-chambers and their valves; the handle adapted to operate the valves of the receiver and having a movable catch 52 adapted to operate the valve of either syrup-chamber at will; substantially as described.

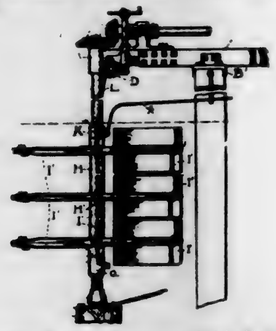
5. In a counter-fountain and in combination with the receiver, a syrup-chamber communicating with a syrup-reservoir and provided with a vent-pipe, a double valve which normally opens the inlet and closes the outlet; and means consisting of an operating-handle and adapted, when the latter is operated to discharge the receiver, to move the said double valve so that it closes the inlet and opens the outlet; substantially as described.

708,715. WATER-WHEEL. GEORGE W. JOHNSTON, St. Joseph, Mo., assignor of twenty-seven one-hundred-and-fortieths to Horace F. Whiteford, St. Joseph, Mo., and Charles J. Hunt, Beloit, Iowa. Filed Dec. 12, 1901. Serial No. 85,638. (No model.)

Claim.—1. In a wheel for utilizing the current of a stream, its supporting pile and sockets, the shaft and its bearings, the hub and its radially-projecting sets of sockets, the arms carried by said hub-sockets, the duplicate leaves hinged to each arm and the clamps and lugs to support said leaves when spread out against the current of the stream, substantially as described and for the purposes set forth.

2. In a water-wheel a shaft set vertically, a hub adapted to revolve on said shaft and provided with arms and leaves, the adjustable lower part of said hub having clutch connection therewith, and adapted to be

rigidly fastened to said shaft and to support the upper part of the hub, the collar on the hub and the cables forming connection between said collar and the gear and adapted to raise the hub out of clutch connection thereby stopping the revolutions of the shaft, or to lower the hub into clutch connection thereby setting the mechanism in motion, substantially as described.



3. The combination with a water-wheel of the hinges upon an arm each having its strap rigidly attached to the back of the leaf, the depressions in the arm, the clamps the two parts of each of which fit into said depressions, the lugs on said clamps extending horizontally in opposite directions across the backs of the hinge-straps and leaves preventing the leaves being crowded back of their respective centers by the pressure of the current of the stream, substantially as described and for the purpose specified.

4. In a wheel for utilizing the power in the current of a stream, the vertically-set shaft adapted to revolve in the piling or support thereunder, the hub carried on said shaft, the flange at the top of said hub and the loosely-fitted collar thereunder adapted to serve in lowering and hoisting the hub, the rod attached to said collar and adapted to form connection with the shore-piling, together with the cable connection between the collar and the gearing, substantially as described and for the purpose specified.

5. The combination with the shaft and hub and lower member of said hub of a water-wheel, of triple sets of arms and leaves the sets being arranged vertically one above another with leaves of heaviest weight in the bottom set and lightest weight in the top set, substantially as described.

6. In a wheel for utilizing the power of the current of a stream the combination with the shaft and its hub, of the lower member of said hub, of the clutch connection between said hub and its lower member, of the keyways and keys below such clutch connection for attaching said lower part of the hub immovably to the shaft at the depth of water desired, of the set-screws to said therein, substantially as described and for the purpose specified.

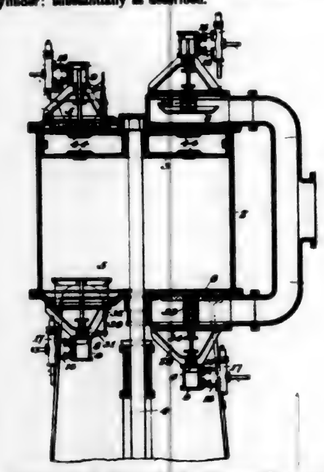
7. In a water-wheel the combination with the arms provided with depressions and the leaves and the hinges attached thereto, of the clamps adapted to fit into said depressions in the arms, the lugs on said clamps to prevent the leaves passing back of their respective centers and the projections on said clamps to prevent said leaves passing forward of their centers or coming into actual contact, substantially as described.

8. The combination in a water-wheel of the upper bearing, cables and gearing for the purpose set forth, and pile E, with the vertical shaft, the hub thereon and its horizontally-projecting arms and sets of leaves of differing weights set vertically above each other, the lower member of the hub adapted to form clutch connection with said hub, the socket in said piling and the cap at the bottom of the shaft to prevent the filling of the socket set with sand, substantially as described.

708,716. BLOWING-ENGINE. WALTER KENNEDY, Pittsburg, Pa. Filed July 2, 1900. Serial No. 22,268. (No model.)

Claim.—1. A blowing-engine having a piston represented by external power connections, the head of the cylinder having inlet and outlet puppet-valves, motive cylinders having their pistons connected with said puppet-valves, and a source of fluid-pressure connected to the valve-cylinders and arranged to actuate the pistons in both directions, said source of pressure being separate from the engine-cylinder; substantially as described.

2. A blowing-engine having its piston connected to an external source of power, the engine-cylinder having a puppet-valve, a double-acting motive cylinder having its piston connected to said valve, a source of fluid-pressure separate from the cylinder of the engine connected to the motive cylinder, and arranged to actuate the piston in both directions, and means for automatically applying the fluid to and exhausting it from the motive cylinder; substantially as described.



3. A blowing-engine having its piston connected to an external source of power, the engine-cylinder having a puppet-valve, a double-acting motive cylinder connected thereto, a source of fluid-pressure separate from the engine-cylinder connected to said motive cylinder and arranged to actuate its piston in both directions, and a valve controlling the supply of fluid to the motive cylinder and connected to a moving part of the engine; substantially as described.

4. A blowing-engine having its piston connected to an external source of power, the engine-cylinder having a puppet-valve in its head, a motive cylinder, a piston therein connected to the said valve and arranged to move the same positively in both directions, a source of fluid-supply separate from the engine cylinder and connected to the motive cylinder, a valve controlling said supply to and its exhaust from both ends of the cylinder, and a connection between said valve and a moving part of the engine; substantially as described.

5. A blowing-engine having its piston connected to an external source of power, the engine-cylinder having inlet and outlet puppet-valves in its head, double-acting motive cylinders connected to the said valves, a source of pressure separate from the engine-cylinder connected to the motive cylinders, and valves controlling the fluid-supply to said motive cylinders and connected to a moving part of the engine; substantially as described.

6. A blowing-engine having its piston connected to an external source of power, the engine-cylinder having a puppet-valve connected to a cylinder having a piston therein, said valve-cylinder having valve-controlled ports at each end whereby the seating of the puppet-valve is cushioned, and a source of fluid-pressure separate from the engine connected to the valve-operating cylinder; substantially as described.

7. An air-compressor having its piston connected to an external source of power, the engine-cylinder having a puppet-valve in its head, a motive cylinder connected to said valve and arranged to move it in one direction, and power mechanism for moving it in the opposite direction, both the motive cylinder and the power mechanism being independent of the pressure in the compressor-cylinder; substantially as described.

8. A blowing-engine comprising an engine-cylinder, wind-box, piston, piston-driving means, an outwardly-opening puppet-valve controlling the passage from the cylinder to the wind-box, a motor connected to said valve and a source of power for said motor distinct from the air-pressure in said cylinder or wind-box but controlled by the movement of said piston; substantially as described.

9. A blowing-engine comprising an engine-cylinder, wind-box, piston, piston-driving means, a poppet-valve in the cylinder-head, a motor connected to the valve and arranged to move it in both directions, and a source of power distinct from the air-pressure in the cylinder or wind-box but controlled by the movement of said piston; substantially as described.

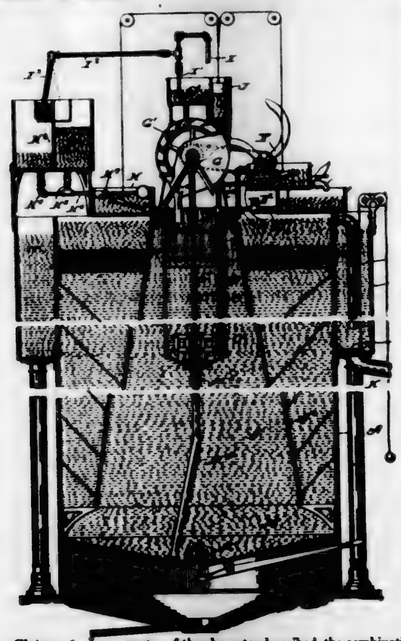
10. A blowing-engine comprising an engine-cylinder, wind-box, piston, piston-driving means, an outwardly-opening puppet-valve controlling the passage from the cylinder to the wind-box, a motor connected to said valve, a source of power for said motor distinct from the air-pressure in said cylinder or wind-box but controlled by the movement of said piston and a regulator capable of adjustment during the operation of the engine, for maintaining the power applied to the motor substantially uniform; substantially as described.

11. A blowing-engine comprising an engine-cylinder, wind-box, piston, piston-driving means, a puppet-valve in the cylinder-head, a motor connected to the valve and arranged to move it in both directions, a source of power for said motor distinct from the air-pressure in said cylinder or wind-box but controlled by the movement of said piston and a regulator capable of adjustment during the operation of the engine, for maintaining the power applied to said motor substantially uniform; substantially as described.

12. A blowing-engine comprising an engine-cylinder, wind-box, piston, piston-driving means, an outwardly-opening puppet-valve controlling the passage from the cylinder to the wind-box, a motor connected to the valve, a source of power distinct from the air-pressure in said cylinder or wind-box but controlled by the movement of said piston, and a device arranged to maintain the power supplied to said motor at a point insufficient to open the valve against the back pressure of the air in the wind-box; substantially as described.

13. A blowing-engine comprising an engine-cylinder, wind-box, piston, piston-driving means, a puppet-valve in the cylinder-head, a motor connected to the valve and arranged to move it in both directions, a source of power distinct from the air-pressure in said cylinder or wind-box but controlled by the movement of said piston, and a device arranged to maintain the power supplied to said motor at a point insufficient to open the valve against the back pressure of the air in the wind-box; substantially as described.

708,717. WATER-PURIFYING APPARATUS. CARL L. KENNICOTT, Chicago, Ill., assignor to Kennicott Water Softener Company, Chicago, Ill., a Corporation of Illinois. Filed May 9, 1902. Serial No. 106,661. (No model.)



Claim.—1. In apparatus of the character described, the combination of a precipitating-tank, a chemical-solution tank therein having its upper portion serving as a mixing-chamber and provided with an overflow into said precipitating-tank, and a water-supply source with a discharge opening into said mixing-chamber.

2. In apparatus of the character described, the combination of a precipitating-tank, a chemical-solution tank therein having its upper portion serving as a mixing-chamber and provided with an overflow into said precipitating-tank, a water-supply source with a discharge opening into said mixing-chamber, and a second chemical-solution tank with a discharge opening into said mixing-chamber.

3. In apparatus of the character described, the combination of a precipitating-tank, a chemical-solution tank therein having its upper portion serving as a mixing-chamber and provided with an overflow into said precipitating-tank, a water-supply source with a discharge opening into said mixing-chamber, a second chemical-solution tank with a discharge opening into said mixing chamber, and stirrers for the lower portion of said first-named chemical-solution tank and said mixing-chamber.

4. In apparatus of the character described, the combination of a precipitating-tank, a chemical-solution tank equipped with a horizontal screen near its upper end and divided thereby to afford a mixing-chamber above said screen, means of admitting liquid to said chemical-solution tank beneath said screen, and a water-supply source discharging into said mixing-chamber.

5. In apparatus of the character described, the combination of a precipitating-tank, a chemical-solution tank having its upper portion serving as a mixing-chamber and provided with an overflow into said precipitating-tank, an elevated source of supply connected with the lower portion of said second-named tank, a hard-water-supply source discharging into said mixing-chamber, and a second chemical-solution tank discharging into said mixing-chamber, for the purpose set forth.

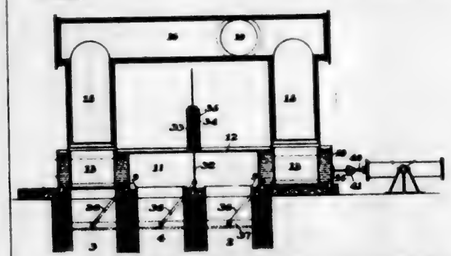
6. In apparatus of the character described, the combination of a precipitating-tank, a chemical-solution tank, a charge-preparing tank communicating through a valved pipe with the lower portion of said chemical-solution tank, a soft-water tank communicating with the lower portion of said chemical-solution tank, and a source of hard-water supply, for the purpose set forth.

7. In apparatus of the character described, the combination of a precipitating-tank, a chemical-solution tank, a charge-preparing tank communicating through a valved pipe with the lower portion of said chemical-solution tank, a soft-water tank communicating with said valved pipe, a source of hard-water supply discharging into the upper portion of said chemical solution tank, and a second chemical-solution tank discharging into the upper portion of said first-named chemical-solution tank, the overflow passing into said precipitating-tank, for the purpose set forth.

8. The combination of a precipitating-tank, a hard-water source, a chemical source, a soft-water-storage tank having a closed discharge-valve, and means for directing the water from the precipitating-tank upon said valve, for the purpose set forth.

9. The combination of a precipitating-tank, a hard-water source, a chemical source, an annular soft-water-storage tank encircling the precipitating-tank and having a closed discharge-valve, and an overflow-pipe leading from the upper portion of said precipitating-tank to a point adjacent to said valve, for the purpose set forth.

708,718. WATER-COOLED REVERSING-VALVE. LUTHER L. KNOX, Pittsburg, Pa. Filed Apr. 2, 1902. Serial No. 101,135. (No model.)



Claim.—1. A water-cooled reversing-valve comprising a stationary tank, ports extending up through the tank, a second tank resting within the stationary tank and containing ports extending up through it, and mechanism for shifting the second tank; substantially as described.

2. A water-cooled reversing-valve, comprising a tank, three ports extending up through the tank, a movable tank resting within the stationary tank, and containing a passage arranged to connect two of the ports, said movable tank having a third port leading up through it and arranged to connect with the third port, and mechanism for shifting the movable tank; substantially as described.

3. A water-cooled reversing-valve, comprising a tank, a series of at least three flanged ports extending upwardly through the tank, a movable tank resting within the stationary tank and having its bottom provided with an inverted box or channel arranged to connect two of the ports, a shell extending up through the movable tank and arranged to connect with another port, and mechanism for lifting the movable tank and shifting it longitudinally; substantially as described.

4. A water-cooled reversing-valve comprising a stationary tank having three flues extending upwardly through it, a movable tank supported in the stationary tank and containing a channel arranged to connect two

of the parts, vertical flue connections extending through the end portions of the movable tank, a gaseous supply-flue connecting to the end flue portions of the tank, and mechanism for shifting the movable tank longitudinally; substantially as described.

5. A water-cooled reversing-valve comprising a stationary water-tank having flues extending upwardly through it, a movable water-containing tank resting within the stationary tank and containing a connecting-flue, and an end flue, pivotal links connected to the movable tank and mechanism for shifting said movable tank longitudinally; substantially as described.

6. A water-cooled reversing-valve comprising a stationary tank with ports opening through it, a movable tank resting therein with a connecting-flue, a water-cooled damper within said flue, and mechanism for shifting the movable tank; substantially as described.

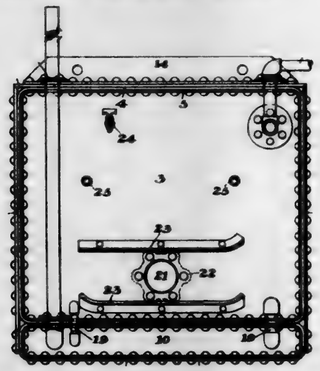
7. A water-cooled reversing gas-valve, consisting of vertically-extending gas-flues, a tank surrounding their upper ends, a movable tank within the stationary tank and having a port leading upwardly through it, said movable tank having a horizontal connecting-passage, and mechanism for shifting the movable tank horizontally in a vertical plane; substantially as described.

8. A vertical cylindrical supply-flue having an internal annular water seal, a vertically-movable tank within the flue having a depending flange within the water seal, an upper depending shell extending downwardly within the tank, and connections for moving the tank vertically, substantially as described.

9. A water-cooled reversing-valve comprising a tank, three ports extending up through the tank, a movable tank within the stationary tank and containing a passage arranged to connect two of the ports, said movable tank having end ports leading upwardly through it, mechanism for shifting the movable tank longitudinally in a vertical plane, and a gas-supply flue in constant connection with the end ports of said movable tank; substantially as described.

10. A water-cooled reversing-valve comprising a stationary tank with ports extending through it, a movable tank resting within the stationary tank and containing a connecting-flue, said movable tank having a third port extending upwardly through it, and mechanism for shifting the movable tank longitudinally in a vertical plane; substantially as described.

708,719. **FURNACE-DOOR.** LUTHER L. KNOX, Pittsburg, Pa. Filed May 5, 1902. Serial No. 105,907. (No model.)



Claim.—1. A furnace-door formed at least in part of spaced-apart sheets with pressed-up flanges extending at an angle to the plane of the door, and secured together, and a water inlet and outlet leading to the space between the sheets; substantially as described.

2. A furnace-door having an inner and outer shell with pressed flanges secured together, and a water inlet and outlet leading to the space between the shells; substantially as described.

3. A furnace-door having a lower sill formed of pressed-up steel sheets secured together with a space between them and a water inlet and outlet leading to said space; substantially as described.

4. A furnace-door having its body formed of pressed-up plates with the flanges secured together, a lower sill also formed of pressed plates with flanges secured together, and water inlets and outlets for the door and sill; substantially as described.

5. A furnace-door having converging sides and pressed-up shells forming a body with a space between them; substantially as described.

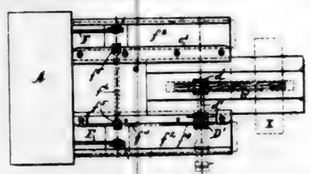
6. A furnace-door having a rim portion arranged to receive refractory material, and a pair of shells outside the refractory material formed of pressed plates to form a water-space between them; substantially as described.

7. A furnace-door having a body formed of pressed plates with a space between them, a lower sill extending inwardly beyond the pressed body, and means for feeding water to one of said parts and from said part to the other; substantially as described.

708,720. **PRISMATIC SIGHTING-TELESCOPE.** ALBERT KÖNIG, Jena, Germany, assignor to Firm Carl Zeiss, Jena, Germany. Filed Nov. 14, 1901. Serial No. 82,328. (No model.)

Claim.—A prismatic sighting-telescope for rifles and other small arms having the eyepiece-axis and the object-glass axis in such a way inclined to each other, that they are more distant from each other behind the eyepiece than before the object-glass, essentially as described.

708,721. **CAMERA.** HARVEY W. LOCKE, Rochester, N. Y. Filed Apr. 23, 1902. Serial No. 104,269. (No model.)



Claim.—1. In a camera, a camera-box, a support for the lens-frame hinged thereto, link mechanism hinged to the box and to a movable part on the support, and means for moving said movable part relatively to said support for tilting the latter, substantially as described.

2. In a camera, a camera-box, a support for the lens-frame hinged thereto, link mechanism hinged to the box and to a movable part on the support, means for moving said movable part relatively to said support for tilting the latter, and means for fastening said movable part in the various positions relatively to said support to which it may be moved, substantially as described.

3. In a camera, a camera-box, a support for the lens-frame hinged thereto, an extensible section on said support to which the lens-frame is adapted to be attached, link mechanism pivoted to the camera-box and to a movable part on said support, and means for moving said link mechanism and extensible section simultaneously, substantially as described.

4. In a camera, a camera-box, a support for the lens-frame hinged thereto comprising a slide on said support, a link pivoted at one end to the camera-box and at the other end to the slide, and rack-and-pinion devices for shifting said slide for tilting said support, substantially as described.

5. In a camera, a camera-box, a support for the lens-frame hinged thereto comprising a slide on said support, a link pivoted at one end to the camera-box and at the other end to the slide, rack-and-pinion devices for shifting said slide for tilting said support, and a rack on said support adapted to engage said pinion for locking the same in any position to which said parts may be moved, substantially as described.

6. In a camera, a camera-box, a support for the lens-frame hinged thereto, a pair of links each hinged to one side of the box and to a movable part on said support, and means for moving said movable part with reference to said support for tilting the latter, substantially as described.

7. In a camera, a camera-box, a support for the lens-frame hinged thereto, a pair of links each hinged to one side of the box and to a movable part on said support, means for moving said movable part with reference to said support for tilting the latter, and means for fastening said movable parts in the various positions to which they may be moved, substantially as described.

8. In a camera, a camera-box, a support for the lens-frame hinged thereto, comprising an extensible section on said support to which the lens-frame is adapted to be attached, a pair of links each pivoted to one side of the camera-box and to a movable part on said support, and means

for moving the ends of said links and said extensible section simultaneously, substantially as described.

9. In a camera, a camera-box, a support for the lens-frame hinged thereto comprising an extensible section on said support to which the lens-frame is adapted to be attached, a pair of links each pivoted to one side of the camera-box and to a movable part on said support, means for moving the ends of said links and said extensible section simultaneously and means for fastening said movable parts in any position to which they may be moved, substantially as described.

10. In a camera, a camera-box, a support for the lens-frame hinged thereto comprising a pair of slides on said support, a pair of links each pivoted at one end to the camera-box and at the other end to one of the slides, and rack-and-pinion devices for shifting said slides simultaneously for tilting said support, substantially as described.

11. In a camera, a camera-box, a support for the lens-frame hinged thereto comprising a pair of slides on said support, a pair of links each pivoted at one end to the side of the camera-box and at the other end to one of the slides, and rack-and-pinion devices for shifting said slides simultaneously for tilting said support comprising means for fastening said slides in the different positions to which they may be moved, substantially as described.

12. In a camera, a camera-box, a support for the lens-frame hinged thereto, a pair of links each pivoted at one end to one side of the camera-box and at the other end to a movable part on said support, rack-and-pinion devices for operating said movable parts simultaneously for tilting said support, and a stationary rack upon said support adapted to engage said pinion for locking the same in any position to which the parts may be moved, substantially as described.

13. In a camera, a rack-and-pinion device, a relatively movable part carrying one element of said rack-and-pinion device, a relatively stationary support carrying said movable part and bearing the other element of said rack-and-pinion device, in combination with locking mechanism consisting of said pinion as one component and a second rack immovable by rotation of the pinion as the other component, one of said components being movable into and out of mesh with the other for locking said first-mentioned rack-and-pinion device, substantially as described.

14. In a camera, a rack-and-pinion device always in mesh, a relatively movable part carrying one element of said rack-and-pinion device, a relatively stationary support carrying said movable part and bearing the other element of said rack-and-pinion device, in combination with locking mechanism consisting of said pinion as one component and a second rack immovable by rotation of the pinion as the other component, one of said components being movable into and out of mesh with the other for locking said first-mentioned rack-and-pinion device, substantially as described.

15. In a camera, a rack-and-pinion device having an axially-movable pinion, a relatively movable part carrying one element of said rack-and-pinion device, a relatively stationary support carrying said movable part and bearing the other element of said rack-and-pinion device, in combination with locking mechanism consisting of said pinion as one component and a second rack immovable by rotation of the pinion as the other component, the pinion component being movable axially into mesh with the rack component for locking said first-mentioned rack-and-pinion device, substantially as described.

16. In a camera, a rack-and-pinion device having an axially-movable pinion which is always in mesh with said rack, a relatively movable part carrying one element of said rack-and-pinion device, a relatively stationary support carrying said movable part and bearing the other element of said rack-and-pinion device, in combination with locking mechanism consisting of said pinion as one component and a second rack immovable by rotation of the pinion as the other component, the pinion component being movable into mesh with the rack component for locking said first-mentioned rack-and-pinion device, substantially as described.

17. In a camera, a camera-box, a support for the lens-frame hinged thereto, a rack thereon, a part movable on said support, a rack thereon, and an axially-movable pinion device meshing with the rack on said movable part and adapted to be moved into mesh also with said rack on said support for locking said movable part with reference to the support, in any position to which it may be moved, substantially as described.

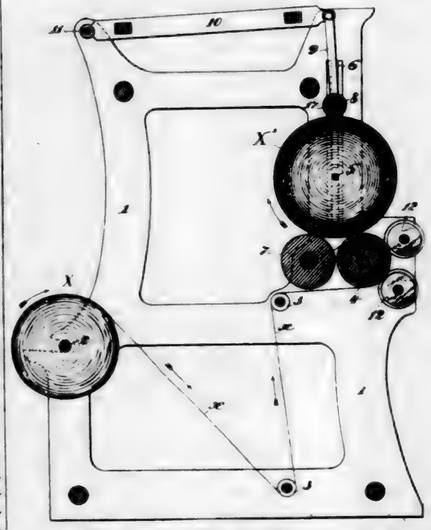
18. In a camera, a camera-box, a support for the lens-frame hinged thereto comprising a main section and an extensible section to which said lens-frame is attached, a pair of slides on said main section, a pair of links each hinged at one end to the side of the camera-box and to one of the slides, a rack on each slide, a stationary rack on said main section, a rack on said extensible section, a pinion mechanism connecting the racks on the slides, and an axially-movable pinion mechanism on said main section meshing with the rack on the extensible section and adapted to be moved into and out of mesh with the stationary rack and with the rack on one of the slides, whereby on operating said pinion mechanism the extensible section may be extended or retracted and simultaneously said support may be raised or lowered, and the parts may be locked in any position to which they may be moved, substantially as described.

19. In a camera, a camera-box, a folding front consisting of a main section hinged to said camera-box, and an extensible section sliding on the main section and to which the lens-frame is attached, a pair of slides on said main section, a pair of links each hinged at its ends to a side of the camera-box and to one of said slides, a rack on each slide, a stationary rack on said main section, a rack on said extensible section, a pinion mechanism connecting the racks on the slides, a pinion carried on the main section in mesh with the rack on the extensible section, and an axially-movable sleeve for operating said pinion and having a pinion thereon adapted to be moved into and out of mesh with the rack on one of said slides and with said stationary rack, substantially as described.

20. In a camera, a folding front having an angular lower edge, a camera-box hinged to said front above the lower edge of the latter and having a recess in the lower rail of the camera-box cut out on the curve of movement of said angular lower edge, substantially as described.

21. In a camera, a rack-and-pinion device, a relatively movable part carrying one element of said rack-and-pinion device, a relatively stationary support carrying said movable part and bearing the other element of said rack-and-pinion device, in combination with locking mechanism consisting of said pinion as one component and a second component immovable by rotation of the pinion, one of said components being movable into and out of engagement with the other for locking said first-mentioned rack-and-pinion device, substantially as described.

708,722. **PAPER-CUTTING MACHINE.** HENRY W. MATHER, Roseville, N. J. Filed Nov. 22, 1900. Serial No. 37,351. (No model.)



Claim.—1. In a machine for slitting paper into strips, the combination with the slitting mechanism, and means for rolling up the slitted paper, of means for separating the rolls of strips, said means comprising a pressure-roller 8, on the top of the roll of slitted paper, said roller having a projecting V-shaped edge which enters the slit between the strips and wedges them apart, substantially as set forth.

2. In a machine for slitting paper into strips, the combination with the circumferentially-grooved roller 4, the slitting-roller 12, having its cutters set to register with the grooves in the roller 4, and the said cutters, of the roughened bearing and driving roller 7, and upright guides, for the shaft 5, said shaft being so situated above the roller 7 that the roll of slitted paper bears peripherally on the latter, substantially as set forth.

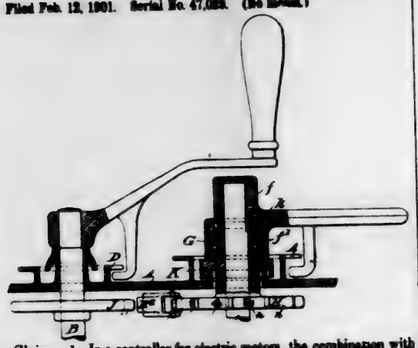
3. In a machine for slitting paper into strips, the combination with the circumferentially-grooved roller 4, the slitting-roller 12, provided with cutters which register with the respective grooves in the roller 4, the bearing and driving roller 7, and the shaft 5 for the slitted paper, of means for separating the rolls of strips, said means comprising a pressure-roller on the top of the roll of slitted paper, said roller having projecting V-shaped edges which enter the slits between the strips and wedge them apart, substantially as set forth.

708,728. SHEET-METAL SEAM OR JOINT. JULIUS W. MATHIS, Chicago, Ill., assignor of one-half to August Mathis, Chicago, Ill. Filed Apr. 28, 1902. Serial No. 104,958. (No model.)

Claim.—1. A sheet-metal seam or joint comprising in combination, a sheet end formed with a flange folded upon itself to form an open loop and provided with an orifice or oblong orifices through the metal of such loop, and a companion sheet end formed with a flange having an extension or extensions which are adapted to pass through the aforesaid orifices and be bent upon themselves to constitute a locking means for the seam or joint, the flanges aforesaid having an arrangement at right angles to the surface of the sheets to constitute a standing seam and afford longitudinal stiffness to the article, substantially as set forth.

2. A sheet-metal seam or joint comprising in combination, a sheet end formed with a flange folded upon itself to form an open loop and provided with an orifice or oblong orifices extending through the crown portion of such loop, and a companion sheet end formed with a flange having an extension or extensions at its free end which are adapted to pass through the aforesaid orifices and be bent upon themselves to constitute a locking means for the seam or joint, the flanges aforesaid having an arrangement at right angles to the surface of the sheets to constitute a standing seam and afford longitudinal stiffness to the article, substantially as set forth.

708,724. OPERATING MECHANISM FOR MOTOR-CONTROLLERS. FRANK A. MERRICK and JOSEPH D. FOUSER, Johnstown, Pa., assignors, by mesne assignments, to Westinghouse Electric and Manufacturing Company, Pittsburg, Pa., a Corporation of Pennsylvania. Filed Feb. 12, 1901. Serial No. 47,088. (No model.)



Claim.—1. In a controller for electric motors, the combination with a regulating-switch and a reversing-switch, of a handle for the reverse-switch composed of two complementary members, one of which has an operative engagement with the reverse-switch shaft, and the other of which is loose with respect to said shaft, and means controlled by the regulating-switch for preventing movement of the loose member in certain positions of the regulating-switch.

2. In a controller for electric motors, the combination with a regulating-switch and a reversing-switch, of a two-part handle for the reversing-switch, one part of which is operatively engaged with the switch-shaft, and the other of which is loose with respect to said shaft, and means for locking the loose part except when the motor-circuit is opened at the regulating-switch.

3. In a controller for electric motors, a reverse-switch handle composed of two members, one of which is operatively engaged with the reverse-switch shaft, and the other of which is loose with respect to said shaft, and means for locking the loose member under certain circuit conditions.

4. In a controller for electric motors, the combination with a regulating-switch and a reversing-switch, of a handle composed of two complementary members, one of which has a rotative engagement with the shaft of said reversing-switch, a sleeve loosely mounted on said shaft, and with which the other member of said handle has a rotative engagement, and means controlled by the regulating-switch for locking the said sleeve against movement on said shaft unless the regulating-switch is at its open-circuit position.

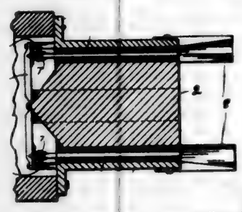
5. In a controller for electric motors, the combination with a regulating-switch and a reversing-switch, of a handle for the reversing-switch composed of two members, only one of which has an operative engagement with the switch-shaft, and means for locking the other of said members against movement except when the regulating-switch is at its off position.

6. In a controller for electric motors, the combination with a regulating-switch and a reversing-switch, of a handle for the reversing-switch composed of two complementary members, one of which is rotatively engaged with the switch-shaft, a sleeve loosely mounted on said shaft and to which the other handle is rotatably connected, a notched plate or disk carried by said sleeve, a pawl device engaging said plate or disk, and means carried by the regulating-switch for preventing the disengagement of the said pawl device except when the regulating-switch is at its off position.

7. In a controller for electric motors, the combination with a reverse-switch, of a handle therefor composed of two complementary members, one of which is rotatively engaged with the shaft of said switch, a sleeve loosely mounted on said shaft and carrying the other member of said handle, means for locking the said sleeve unless the motor-circuit has first been opened at the regulating-switch of the controller, and means for preventing removal of the said handle except when the reverse-switch is at its off position.

8. The combination with two related electric switches, of a handle for one of said switches composed of two complementary members, one of which is rotatively engaged with the shaft of that switch, and the other of which is locked to the other switch except when the latter is at its open-circuit position.

708,725. BUILDING-BLOCK DIE. NICHOLAS MERLEY, Canton, Ohio. Filed Apr. 17, 1902. Serial No. 103,308. (No model.)



Claim.—1. The combination of an outer shell or die provided with a flange, a core located within the shell and spaced from the inner sides thereof, posts or arms connected to the flange of the shell, cross-bars secured to the posts, bars or cores located in the space between the outer shell and the inner core and extended parallel with the inner and outer faces of said parts, and the cross-bars and the inner core beveled upon their rear edges or ends, substantially as and for the purpose specified.

2. A die of the class described, an outer shell, a core located therein, and angled extensions secured to the shell of the die and provided with inner beveled faces, substantially as and for the purpose specified.

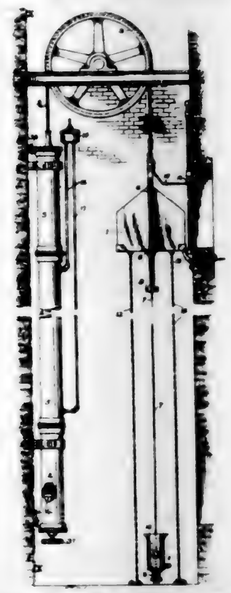
708,726. DROP. GEORGE MILES, Boston, Mass. Filed Aug. 17, 1900. Serial No. 27,188. (No model.)

Claim.—1. In a drop, a car guided by cables having tension-adjustments, and a piston with connections to normally overbalance the car, combined with means to form air-cushions to control the travel of the piston toward each limit of its stroke, and adjustable devices to admit air-pressure behind the piston at the beginning of its stroke, substantially as described.

2. In a drop, the combination with a car, a piston, a fluid-cylinder, and a fitting having chambers connected with opposite portions of and near the extremities of the said cylinder, of a valve controlling each chamber of the fitting so that if the pressure increases in either chamber its valve will allow escape of fluid from the said chamber, to permit motion of the piston, substantially as described.

3. In a drop, the combination with a car, a piston, a fluid-cylinder, and a fitting having inlet-chambers both of which are in connection with a relief-passage of the fitting and each of which chambers is in connection with an opposite portion of the fluid-cylinder, of valves controlling ports in each chamber of the fitting so that if the pressure in either chamber falls below the pressure in the relief-passage, the valve of that chamber will permit some fluid to pass from the relief-passage to its end of the cylinder to relieve the drag on the piston, substantially as described.

4. In a regulating device for drops, chambers having inlets, a relief-passage having an outlet, and connections from each chamber to the relief-passage, combined with valves arranged to normally close the connections from the chambers to the relief-passage, but having devices adapted to automatically allow motion of the valves so either or both of the chambers may connect with the relief-passage, substantially as described.



5. In a regulating fitting for drops, means forming inlets to, devices forming an outlet from, and ports between the inlets and outlet of the fitting, combined with valves and yielding supports for the valves arranged to close the ports normally, but when the pressure in an inlet increases its valve may open to discharge fluid to the outlet, and upon excessive increase of pressure in the outlet the valve of the other inlet may open so that inlet may receive fluid from the outlet, substantially as described.

6. In a drop, a car, a chain, a cylinder, a tight piston moving in the cylinder adapted to lift the car and chain, and connections for the moving parts, combined with automatically-acting valves and connections with opposite ends of the cylinder so air may be passed from one to the other side of the piston to increase its speed, substantially as described.

7. In a drop, a car, a chain, a cylinder and a tight piston moving in the cylinder to lift the car and chain through suitable connections, combined with means acting automatically for normally forming air-cushions at each end of the cylinder to retard the piston when approaching the said ends, and also acting to relieve a reduction of air-pressure at the ends of the cylinder as the piston leaves the said ends, substantially as described.

8. In a drop, a car, a chain, a cylinder, a tight piston and connections between the car and piston, combined with means to form air-cushions at each end of the cylinder, to freely pass air to or from the middle of the cylinder and devices for forming an adjustable air-cushion beneath the car as the car nears the limit of its downward travel, substantially as described.

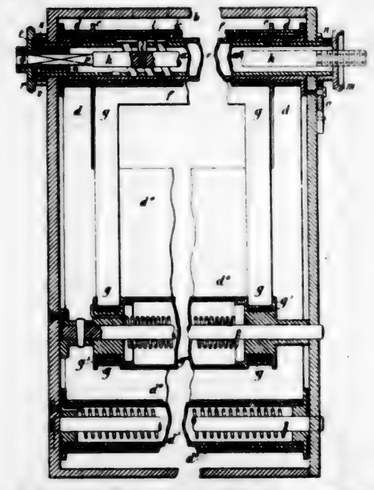
9. In a drop, a car, a cylinder and a piston suitably connected with the car actuated by gravity to lift the empty car from its lower positions, combined with a chain hanging from the car when in position to receive a load to cause the car to fall by gravity, automatic devices to apply air-pressure behind the piston at the start and means for forming air-cushions in front of the piston near its limit of travel, substantially as described.

10. In a drop, a cylinder, a car, and a piston connected to the car, combined with an adjustable stop at one end of the cylinder to position the piston and car at a point of their travel, substantially as described.

11. In a drop, a cylinder, piston, and a car connected with the piston, combined with a plunger attached to the car, a stop for the plunger, and adjustments to determine the final position of the car, substantially as described.

708,727. CURTAIN-SHUTTER. OSWALD SATHER, Jena, Germany, assignor, by mesne assignments, to Firm Carl Zeiss, Jena, Germany. Filed Dec. 13, 1901. Serial No. 85,760. (No model.)

Claim.—1. In a curtain-shutter having an adjustable aperture and a triplex setting-spool the combination, with two side spools controlling one half of the curtain and a middle spool controlling the other half of the curtain, of a hollow axle on which both side spools are secured and the middle spool is rotatably mounted, a central axle, a tappet non-rotatably mounted on the central axle, penetrating a helical slot in the hollow axle and projecting into a longitudinal slot in the middle spool, means for non-rotatably connecting the central axle and the hollow axle at different angular positions relatively to each other, and a setting device connected with one of the axles, essentially as described.



2. In a curtain-shutter having an adjustable aperture and a triplex setting-spool the combination, with two side spools controlling the opposite half of the curtain and a middle spool controlling the adjacent half of the curtain, of a hollow axle carrying the side spools fixed and the middle spool rotatable thereon, a central axle, a tappet guided in a longitudinal slot of the central axle, in a helical slot of the hollow axle and in a longitudinal slot of the middle spool, a bush in which the central axle is longitudinally guided, means for non-rotatably connecting the bush and the hollow axle at different angular positions relatively to each other, and a setting device connected with the hollow axle, essentially as described.

3. In a curtain-shutter having two curtain-webs the combination with two side spools controlling one curtain-web and a middle spool controlling the other curtain-web, of a hollow axle on which both side spools are secured and the middle spool is rotatably mounted, a central axle, a tappet non-rotatably mounted on the central axle, penetrating a helical slot in the hollow axle and projecting into a longitudinal slot in the middle spool, and means for rotating both the central axle and the hollow axle independently of each other.

708,728. ROASTER. JAMES A. OGDEN, Philadelphia, Pa., assignor of one-third to Charles H. Cornell, Valentine, Nebr. Filed Apr. 5, 1900. Serial No. 11,631. (No model.)

Claim.—1. The combination, in a roaster, of a furnace having a flue, an inclined plate situated in said flue, supports for said plate, swinging links connecting said plate with said supports, and mechanism for positively moving said plate in one direction, and means for suddenly checking its motion in the other; substantially as described.

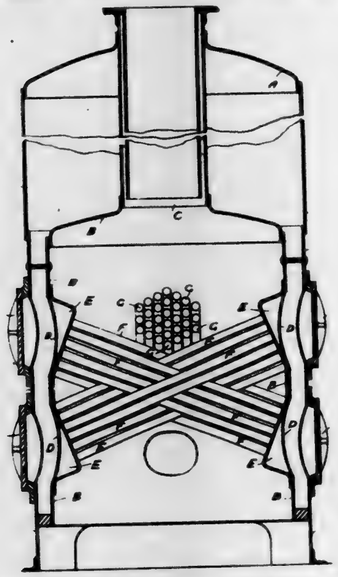
2. The combination in a roaster, of a furnace having an inclined flue, a fire-box situate at one end of the flue, a plate for containing the ore to be roasted situated in said flue, said plate projecting completely through said fire-box, and means for suspending said plate, and giving it a freely-swinging motion, substantially as described.

3. In a roaster the combination of a furnace having an inclined flue, an inclined plate passing through the said flue, and projecting at either end, supports for the plate exterior to the furnace, and swinging links provided with turnbuckles, connecting the said plate with the said supports; substantially as described.

4. In a roaster, the combination with a furnace having an inclined flue, of an inclined plate passing through the said flue, supports above the plate, swinging links connecting said plate to said supports, and mechanism for bumping said plate; substantially as described.

5. The combination in a roaster, of a furnace having an inclined flue, a fire-box situate in said flue, a plate for containing the ore to be roasted, situated in said flue, a portion of said plate being situated over the said fire-box, means for suspending said plate and giving it a freely-swinging motion and mechanism for bumping said plate substantially as described.

708,729. VERTICAL STEAM-BOILER. WILLIAM PENMAN, Glasgow, Scotland. Filed Aug. 19, 1901. Serial No. 72,544. (No model.)



Claim.—1. A vertical steam-boiler comprising the usual outer shell, in combination with an inner shell formed with dished portions arranged in pairs opposite each other, one of each pair being in proximity to the fire-grate and the other to the furnace-crown, cross-rows of inclined tubes expanded into these dished portions approximately at right angles to the dished surfaces, and additional rows of tubes extending horizontally across the boiler above said inclined rows of tubes and orifices in the outer shell covered by doors substantially as described.

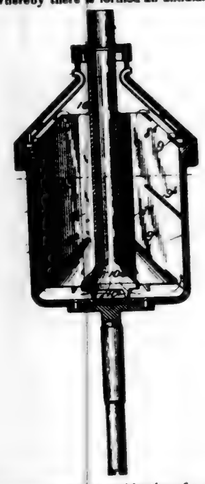
2. The herein-described vertical steam-boiler comprising in combination with an outer shell an inner cylindrical shell formed with dished portions diametrically opposite each other, cross-clusters of inclined tubes expanded into said dished portions, the outer shell having orifices opposite said dished portions closed by doors, substantially as and for the purpose set forth.

3. The herein-described vertical steam-boiler comprising in combination with an outer shell an inner cylindrical shell formed with orifices diametrically opposite each other, dished plates riveted to the inner shell covering said orifices, cross-clusters of inclined tubes expanded into said dished plates, the outer shell having orifices opposite those on the inner shell and closed by doors, substantially as and for the purpose set forth.

708,730. CREAM-SEPARATOR. CHARLES B. PHILLIPS, Bloomfield, Mich. Filed Aug. 13, 1901. Serial No. 71,730. (No model.)

Claim.—1. In a cream-separator, the combination with a bowl, of a vertical series of cones, a plurality of which extend to the wall of said bowl, and of a cone stopping short of said wall to form a passage-way between the edge of said cone and the wall of the bowl.

2. In a cream-separator, the combination with a bowl of a vertical series of cones, the upper and intermediate cones of which extend to the interior wall of the bowl, and of a bottom cone which stops short of the wall of said bowl whereby there is formed an annular passage-way.



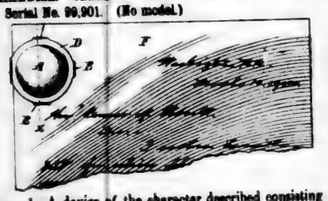
3. In a cream-separator, the combination of a series of hollow truncated cones arranged one above the other, a series of vertical radial wings rigidly connected with and supporting said cones, a separator-bowl, means for normally securing said series of cones and radial wings in operative relation within said bowl, the outer and larger edge of the upper and the intermediate truncated cones being in direct contact with the inner wall of the separator-bowl to force the material to travel inward as it rises past each of said cones, the lowermost cone of the series having a passage-way between its outer edge or margin and the interior wall of the separator-bowl.

4. In a cream-separator, the combination of a bowl, a series of hollow truncated cones arranged one above the other, a series of vertical radial wings rigidly connected with and supporting said truncated cones, said radial wings and upper and intermediate cones being in contact with the inner wall of the separator-bowl, the lowermost truncated cone having a space between its edge and the wall of said bowl, and having its inner edge extended toward the center of the bowl beyond the inner edges of the upper and intermediate cones.

5. In a cream-separator, the combination of a series of deflecting hollow truncated cones arranged one above the other, a series of vertical radial wings rigidly connected with and supporting said cones, a separator-bowl, means for normally securing said series of cones and radial wings in operative relation within said bowl, the outer and larger edge of the upper and the intermediate truncated cones being in contact with the inner wall of the separator bowl, the lowermost cone of the series having a passage-way between its outer edge or margin and the interior wall of the separator-bowl, and a down-feed tube disposed axially of said bowl.

6. In a cream-separator, a separator-bowl, a series of inclined cones arranged one above the other within said bowl, each of said cones above the lowermost deflector having its outer margin or edge in removable contact with the inner wall of the separator-bowl, and the lowermost cone having its outer edge or margin out of contact with the inner surface of the bowl to provide a space between the bowl and said outer edge for the passage of milk.

708,731. RECEPTACLE FOR COINS OR SMALL ARTICLES OF MERCHANDISE. CHARLES B. PIKE, Whitehall, N. Y. Filed Mar. 25, 1902. Serial No. 99,901. (No model.)



Claim.—1. A device of the character described consisting of a receptacle designed to receive coins or small articles of merchandise, a cover therefor, and a prong or prongs designed to penetrate a sheet of paper or other material inserted between said receptacle and cover and be thereafter bent for securing the cover to the receptacle and the device as a whole to the sheet of paper, substantially as described.

2. A device of the character described consisting of a receptacle designed to receive coins or small articles of merchandise, a flat cover therefor, and a prong or prongs designed to penetrate a sheet of paper or other material inserted between said receptacle and cover and be thereafter bent for securing the cover to the receptacle and the device as a whole to the sheet of paper, substantially as described.

3. A device of the character described consisting of a receptacle designed to receive coins or small articles of merchandise, a cover therefor, and a prong or prongs projecting from said receptacle designed to penetrate a sheet of paper or other material inserted between said receptacle and cover and be thereafter bent for securing the cover to the receptacle and the device as a whole to the sheet of paper, substantially as described.

4. A device of the character described made from a single piece of sheet metal consisting of a receptacle designed to receive coins or small articles of merchandise, a cover therefor connected to the marginal edge of said receptacle by a narrow neck of metal which is bent to bring said cover and receptacle into proper relations, and a prong or prongs designed to penetrate a sheet of paper or other material inserted between said receptacle and cover and be thereafter bent for securing the parts together, substantially as described.

5. A device of the character described made from a single piece of sheet metal and consisting of a receptacle designed to receive coins or small articles of merchandise, a flat cover therefor connected to the marginal edge of said receptacle, and a prong or prongs designed to penetrate a sheet of paper or other material inserted between said receptacle and cover and be thereafter bent for securing the parts together, substantially as described.

6. A device of the character described made from a single piece of sheet metal and consisting of a receptacle designed to receive coins or small articles of merchandise, a flat cover therefor, a prong or prongs projecting from said receptacle designed to penetrate a sheet of paper or other material inserted between said receptacle and cover and be thereafter bent for securing the cover to the receptacle and the device as a whole to the sheet of paper, substantially as described.

7. A device of the character described consisting of a receptacle designed to receive coins or small articles of merchandise, a substantially flat flange around the marginal edge of said receptacle, a cover, and a prong or prongs designed to penetrate a sheet of paper or other material inserted between said receptacle and cover and be thereafter bent for securing the cover to the receptacle and the device as a whole to the sheet of paper, substantially as described.

8. In combination with a sheet of paper or other material, of a receptacle designed to receive coins or small articles of merchandise for mailing or advertising purposes, said receptacle having its marginal edge in contact with said paper or other material, a cover for said receptacle on the opposite side of said paper, and a prong or prongs passing through said paper and binding said receptacle and cover together, substantially as described.

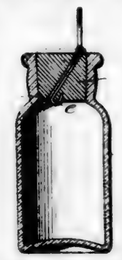
9. In combination with a sheet of paper or other material, of a receptacle designed to receive coins or small articles of merchandise for mailing or advertising purposes, said receptacle having its marginal edge in contact with said paper or other material, a flat cover for said receptacle on the opposite side of said sheet, a prong or prongs passing through said sheet and binding said receptacle and cover together, substantially as described.

10. In combination with a sheet of paper or other material, of a receptacle designed to receive coins or small articles of merchandise for mailing or advertising purposes, a cover on the opposite side of said sheet connected to said receptacle at its marginal edge, and a prong or prongs passing through said sheet and binding said receptacle and cover together, substantially as described.

11. In combination with a sheet of paper or other material, of a receptacle designed to receive coins or small articles of merchandise for mailing or advertising purposes, said receptacle having a substantially flat marginal flange in contact with said sheet, a cover on the opposite side of said sheet, and a prong or prongs passing through said sheet and binding said receptacle and cover together, substantially as described.

12. In combination with a sheet of paper or other material, of a receptacle designed to receive coins or small articles of merchandise for mailing or advertising purposes, said receptacle having a substantially flat marginal flange in contact with said sheet, a cover for said receptacle on the opposite side of said sheet connected to said receptacle at its marginal edge, and a prong or prongs at the marginal edge of said receptacle passing through said sheet and bent over said cover for securing the parts together, substantially as described.

708,732. STOPPER FOR BOTTLES. MARY PITTS, Chicago, Ill. Filed Feb. 14, 1901. Serial No. 47,210. (No model.)



Claim.—1. A closure for vessels, comprising a stopper *b* a finger-piece *c*, and a retaining device secured in said stopper and extending diagonally therethrough, and binding said finger-piece pivotally upon the upper surface of the stopper and near one edge thereof, whereby the finger-piece may be folded down upon the upper surface of the stopper, said retaining device operating to bind the parts of the stopper together and to prevent disintegration, substantially as described.

2. A closure for vessels comprising a stopper, a finger-piece, and a retaining device secured in said stopper at a point between the center and the edge thereof, extending diagonally therethrough and securing said finger-piece to the upper surface of the stopper, said retaining device adapted to bind the parts of the stopper together and to prevent disintegration, substantially as described.

708,733. COIN-HOLDER. STANLEY RAY, Cambridge, Mass. Filed Feb. 17, 1902. Serial No. 94,357. (No model.)

Claim.—1. A coin-holder comprising an inclosing case having a movable cover, and a raceway within the case, to receive a series of coins superposed one upon the other and inclined relatively to the length of the raceway, said raceway being substantially elliptical in cross-section and provided at its lower end with an upturned stop, and having on its top a detent to engage and hold the rim of the next to the endmost coin of a series, the endmost coin being free to move against the stop into position to be withdrawn when the case is opened.

2. A coin-holder comprising an inclosing case having a movable cover, and a trough-like raceway within the case provided at its lower delivery end with an upturned stop for the endmost coin, and means on the raceway to engage the rim of and retain in place the next to the endmost coin when the case is opened, removal of the endmost coin effecting the release of the next coin and permitting it to move forward against the stop.

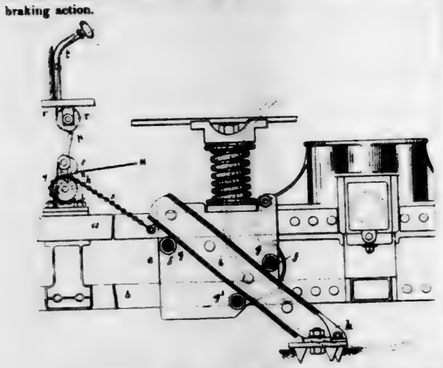
3. A coin-holder comprising a flattened, substantially oval case having a cover hinged thereto at its side, and an elongated, trough-like raceway secured within the case and extending in the direction of its length, said raceway having an upturned stop at its lower end and an adjacent delivery-opening, and means on the raceway at the upper end of the delivery-opening to engage the rim of and retain in place the next to the endmost coin, the endmost coin moving into position against the stop when the cover of the case is opened.

4. A coin-holder comprising a flattened case having a cover hinged thereto at its side, an elongated trough-like raceway in the case and adapted to receive a series of coins superposed one upon the other in an inclined position, said raceway having an upturned stop at its lower end and a detent to engage the rim of the next to the endmost coin, opening of the cover permitting the endmost coin to swing on its edge into upright position against the stop, withdrawal of such coin releasing the next coin from the detent and permitting it to slide down the raceway against the stop.

708,734. EMERGENCY-BRAKE FOR TRAMWAY-CARS. CARL REAL, Schwyz, Switzerland. Filed May 29, 1902. Serial No. 109,449. (No model.)

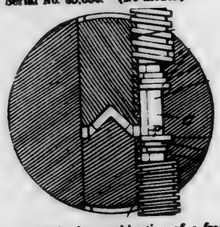
Claim.—1. An emergency-brake for tramway-cars comprising a

brake-beam, provided with means for gripping the roadway, and capable of being lowered from the driver's platform, said brake being fitted between two or more bolts secured to the under frame of the car in such a manner that the brake-beam, when released, is capable of fastening itself into the roadway so that as the vehicle tends to ride up the inclined part of the brake-beam, thereby causing the weight of the car to assist the braking action.



2. In combination with a car or like vehicle, a roadway-engaging brake device carried thereby, and means whereby said brake device may be inclined in the direction the car is going and caused to engage the roadway whereby the momentum of the car causes said car to be raised by said inclined brake device, substantially as described.

708,735. CHUCK. CHARLES H. REID, Danbury, Conn. Filed Dec. 7, 1901. Serial No. 85,036. (No model.)



Claim.—1. In a chuck, the combination of a frame, threaded jaws therein, and a screw arranged in the frame and having right and left handed threaded portions engaging the threads of the jaws, and shoulders *c* at the inner ends of said threaded portions arranged to abut against the frame, and also having collars disposed between the shoulders *c;* the said collars being reduced in diameter outwardly, and arranged in correspondingly-shaped recesses of and bearing against the frame.

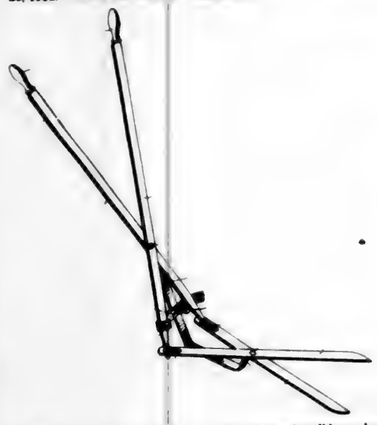
2. In a chuck, the combination of a frame, threaded jaws therein, and a screw arranged in the frame and having right and left handed threaded portions engaging the threads of the jaws, and shoulders *c* at the inner ends of said threaded portions arranged to abut against the frame, and also having cone-shaped collars provided with steps, at points between the shoulders *c;* the said collars being arranged with their reduced ends outwardly, and in correspondingly shaped and stepped recesses of the frame.

3. In a chuck, the combination of a frame, threaded jaws therein and a screw arranged in the frame and having right and left handed threaded portions engaging the threads of the jaws, and shoulders *c* at the inner ends of said threaded portions arranged to abut against the frame, and also having, at points between the shoulders *c*, cone-shaped collars provided with steps, the perimeters of which are beveled or tapered toward the reduced ends of the collars; the said collars being arranged with their reduced ends outwardly and in correspondingly shaped and stepped recesses of the frame.

708,736. ROLLER-BEARING SUPPORT FOR SHADE-ROLLERS. JOHN RESNER, Burlington, Iowa. Filed May 17, 1901. Serial No. 60,746. (No model.)

Claim.—As a new article of manufacture, a support for shade-rollers comprising a depending bracket having an opening therein, an internally-screw-threaded sleeve passing through said opening and secured therein, two rings screwed into said sleeve, each ring having a concave groove adapted to register with the groove in the other ring, the two grooves forming a runway, and balls located within said runway and projecting therefrom to form a bearing for the journal for a shade-roller.

708,737. SHEARS FOR CUTTING GRASS. JAMES R. RHODES, Grand Rapids, Mich., assignor to the Cronk and Carrier Manufacturing Company, Elmira, N. Y., a Corporation of New York. Filed Apr. 26, 1902. Serial No. 104,788. (No model.)



Claim.—1. The combination of a shoe adapted to slide on the ground, a pair of shear-blades pivotally attached to the forward end of the shoe, and a pair of operating-levers pivotally attached to the rear of the shoe and extending upward therefrom, and also connected to the rear of the shear blades to operate the same, substantially as described.

2. The combination of a shoe having a middle portion adapted to slide on the ground, an upright forwardly-extended forward end, and an upwardly and rearwardly extended rear end, a pair of horizontal shear-blades pivoted upon the forward end of the shoe, a pair of crossed and inclined levers pivoted upon the rear end of the shoe and slidably connected to the shear-blades at their lower ends, substantially as described.

3. The combination of a shoe having a middle portion adapted to slide on the ground and upwardly and oppositely inclined ends, a pair of shear-blades arranged horizontally and pivotally attached to the end of the shoe and having slots in their rear ends, and a pair of inclined levers pivotally attached to the other end of the shoe, and provided with handles at their upper ends, and also slidably engaging the slots in the extensions of the blades at their lower ends, substantially as described.

4. The combination of a shoe having an upwardly-extended rear portion, horizontal shear-blades pivoted to the shoe, inclined levers pivoted to the rear portion of the shoe and a transverse bar attached to the shoe and having stops at its ends to engage the levers, substantially as described.

5. The combination of a shoe having an upwardly-extended rear portion, horizontal shear-blades pivoted to the shoe, crossed levers pivoted to the rear portion and connected to the shear-blades, a transverse bar attached to the shoe and having forwardly-bent ends to engage the levers, and a middle stud to engage the levers, substantially as described.

6. The combination of a shoe having a middle portion adapted to slide on the ground, an upwardly and forwardly extended front portion, and an upwardly and rearwardly extended rear portion; horizontal shear-blades pivoted on the front portion of the shoe, and having slotted rear extensions, inclined and crossed levers pivoted to the rear portion of the shoe, and having handles at their upper ends and slidably engaging the slots at their lower ends, a transverse bar on the shoe having forwardly-extended ends to engage the levers, and a central stud to engage the levers, and to secure the bar in place, substantially as described.

708,738. PASTEURIZING APPARATUS. BALDWIN F. SCHIRMER, Indianapolis, Ind. Filed Mar. 4, 1902. Serial No. 96,598. (No model.)

Claim.—1. In a pasteurizing apparatus, the combination with a fluid-tank having inlet and outlet openings at opposite ends, of means for heating the tank, a normally closed door at each opening, an endless carrier in the tank, a supplementary carrier connected therewith, means for propelling the supplementary carrier through the inlet-opening, bottle-holders on the supplementary carrier for opening the inlet-door, and means for receiving the bottle from the main carrier at the outlet-door

2. In a pasteurizing apparatus the combination with a fluid-tank having inlet and outlet openings at opposite ends, normally closed doors at said openings, an endless carrier in the tank, a shaft and sprocket-wheels at the inlet end for supporting and driving said carrier, a supplementary carrier mounted at its inner end on said shaft and extending through the inlet-opening, means for adjusting the shaft to take up slack, and bottle-holding receptacles carried by the supplementary carrier and serving to open the normally closed inlet-door.

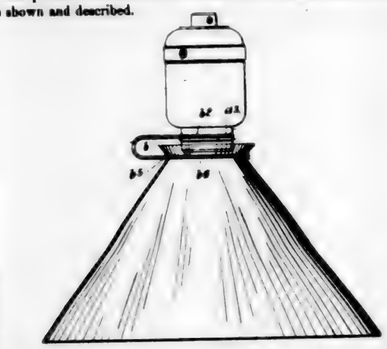
3. In a pasteurizing apparatus, the combination with a normally closed fluid-tank, a main endless carrier, means for propelling it through the tank, inwardly-projecting side flanges on the side of the tank engaging the carrier and deflecting it downward from the inlet end to the center of the tank and upward from the center to the outlet end, a supplementary carrier mounted upon and driven by the shaft at the inlet end of the main carrier, bottle holders on the supplementary carrier serving to open the inlet of the tank, a receiving roller-carrier outside the outlet of the tank, and means for projecting the bottle-holders on the main carrier through the outlet and upon the receiving roller-carrier.

4. In a pasteurizing apparatus, the combination with a fluid-tank, of a transverse shaft at each end near the outlet and inlet respectively and near the top of the tank, sprocket-wheels on said shafts, an endless carrier engaging said sprocket-wheels, horizontal flanges projecting inwardly from the sides of the tank at its mid-length and near the bottom, said flanges being parallel with the bottom of the tank for some distance and provided with upwardly-inclined ends, and rollers at the sides of the carrier engaging between and guided by said flanges.

708,739. SHADE-HOLDER FOR INCANDESCENT ELECTRIC LAMPS. RICHARD W. SCHNELL, Brooklyn, N. Y., assignor of one-half to William V. Gein, New York, N. Y. Filed Oct. 7, 1901. Renewed July 17, 1902. Serial No. 115,894. (No model.)

Claim.—1. A shade-holder composed of a spring-wire bent centrally to form a spring-ring b^3 and open at one side and provided at the open side with a laterally-directed loop or shank b^4 composed of two parts, the bottom portion of said loop or shank being shorter than the other and the separate parts thereof being bent to form a spring-ring b^4 open at one side, substantially as shown and described.

2. A shade-holder composed of a spring-wire bent centrally to form a spring-ring open at one side and provided at the open side with a laterally-directed loop or shank which is U-shaped in form and one side of which is shorter than the other, said shorter side of said loop or shank being also provided with a spring-ring open at one side and held in a concentric position with reference to the first-named spring-ring, substantially as shown and described.



708,740. MANDREL FOR PAPER-ROLLS. FRANK SCHÖN, New York, N. Y. Filed Oct. 1, 1901. Serial No. 77,178. (No model.)

Claim.—1. The herein-described thimbles or socket-sleeves for use in connecting a roll of paper with a shaft or mandrel which is passed therethrough, said thimbles or socket-sleeves comprising a body portion composed of two parts, the adjacent side edges of which are inclined or wedge-shaped in form, one of said parts being also provided with an annular head, and means for preventing the roll of paper from turning on said thimbles or socket-sleeves, substantially as shown and described.

2. The herein-described thimbles or socket-sleeves for use in connection with a roll of paper and through which a shaft or mandrel is passed, said thimbles or socket-sleeves comprising a body portion composed of two parts, the adjacent side edges of which are inclined or wedge-shaped in form, one of said parts being provided with an annular head, and that part which has no head being provided with projections or teeth on its outer surface, substantially as shown and described.

708,741. SHEET-DELIVERY MECHANISM. WALTER SCOTT, Plainfield, N. J. Filed Aug. 18, 1898. Serial No. 688,854. (No model.)

Claim.—1. In a sheet-delivery having a to-and-fro-moving sheet support or carrier, a combined sheet stop and gripper comprising a relatively fixed sheet-stop against which the sheet is fed, and two independently-movable gripper members, coacting to grip the sheets between them, substantially as described.

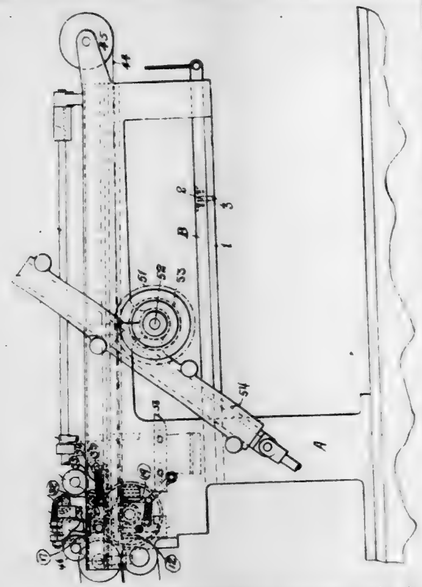
2. In a sheet-delivery having a to-and-fro-moving sheet support or carrier, a relatively fixed sheet-stop moving with said carrier or support and against which the sheet is fed, a gripper above said stop and adapted to move up and down, and a gripper in front of said stop adapted to be depressed below the said stop, substantially as described.

3. In a sheet-delivery having a to-and-fro-moving sheet support or carrier, a relatively fixed sheet-stop moving with said carrier or support, a gripper above said stop adapted to move up and down, a spring for pressing the gripper downwardly, a second gripper in front of and adapted to be depressed below said sheet-stop, and a spring for pressing said second gripper upward, all in combination, substantially as described.

4. In a sheet-delivery having a to-and-fro-moving sheet carrier or support, a relatively fixed sheet-stop moving with said carrier or support, a gripper above said sheet-stop, means for moving and holding said gripper in each of two positions, a second gripper in front of and adapted to be depressed below said sheet-stop, and mechanism for moving said second gripper toward and from the first-named gripper, substantially as described.

5. In a to-and-fro-moving sheet-delivery, the combination of a to-and-fro-moving sheet support or carrier, a sheet-stop fixed thereto and moving therewith, a gripper above said stop, mechanism for operating said gripper to open and close the same, a second gripper in front of and adapted to be depressed below the said sheet-stop, and mechanism for

depressing said second gripper while sheets are being run in over it and against said stop and for closing said gripper, substantially as described.



6. In a sheet-delivery, the combination of a to-and-fro-moving sheet carrier or support, a combined sheet and gripper stop moving with said support or carrier, a gripper above said stop and arrested in its downward movement thereby, a second gripper below the first-named gripper and in front of the sheet-stop, mechanism for moving said grippers downwardly and holding them apart while the sheets are fed in between them and against said stop and for releasing or closing said second gripper, and mechanism for opening said first-named gripper to release the sheets for delivery, substantially as described.

7. In a sheet-delivery, a to-and-fro-moving sheet carrier or support, a combined sheet and gripper stop moving with said carrier or support, a gripper above said stop adapted to be arrested in its downward movement thereby, mechanism for moving and holding said gripper against and away from said stop, a second gripper below and in front of said stop, a spring for pressing said gripper upward against the first-named gripper, and a cam on the framework for depressing said second gripper to provide a space between it and the first gripper into which the sheets are fed against said stop said second gripper raising said sheets up against said first-named gripper in position to be delivered over said stop, substantially as described.

8. In a sheet-delivery, the combination of a to-and-fro-moving carriage, a sheet-stop fixed thereto, a sheet support or carrier connected with said carriage, a gripper intermediate the stop and the support or carrier adapted to lie in or slightly above the horizontal plane including the top of the stop and to be depressed below said top, a gripper above said stop adapted to be stopped in its downward movements by said stop and to coact with the lower gripper to grip sheets, springs pressing said grippers toward each other, and mechanism for separating said grippers to allow the sheets to be fed in between them and to allow the sheets to be dropped or moved from said support or carrier, substantially as described.

9. In a sheet-delivery, the combination of a to-and-fro-moving carriage, a sheet and gripper stop fixed thereto, a sheet support or carrier connected with said carriage, a gripper between said stop and said support or carrier adapted to lie in or slightly above the top of said stop, a spring pressing said gripper upwardly, an adjustable stop for limiting the upward motion of said gripper, a cam for moving said gripper against the force of said spring to move the gripper below said stop-top, a gripper above the stop adapted to be stopped in its down movement by said top and to coact with the lower gripper to grip sheets, and mechanism for moving and holding said upper gripper toward and away from said stop-top and lower gripper, substantially as described

10. In a sheet-delivery having a to-and-fro-moving sheet support or carrier, a combined sheet stop and gripper comprising a relatively fixed sheet-stop against which the sheet is fed, and two independently-movable gripper members, one of which is stopped by said sheet-stop and the other of which is stopped by the first-named gripper, substantially as described.

11. In a sheet-delivery having a to-and-fro-moving sheet support or carrier, a relatively fixed sheet-stop moving with said carrier or support and against which the sheet is fed, a gripper above said stop and adapted to be stopped thereby in its downward movement, a gripper in front of said stop adapted to be depressed below the said stop and to be stopped in its upward movements by the first-named gripper, substantially as described.

12. In a sheet-delivery having a to-and-fro-moving sheet support or carrier, a relatively fixed sheet-stop moving with said carrier or support, a gripper above said stop adapted to move up and down, and to be arrested thereby in its downward movement, a spring for pressing the gripper downwardly, a second gripper in front of and adapted to be depressed below said sheet-stop and to coact with said first-named gripper to grip sheets, and a spring for pressing said second gripper upward, all in combination, substantially as described.

13. In a sheet-delivery having a to-and-fro-moving sheet carrier or support, a relatively fixed sheet-stop moving with said carrier or support, a gripper above said sheet-stop adapted to be arrested thereby in its downward movement, means for moving and holding said gripper in each of two positions against and away from said sheet-stop, a second gripper in front of and adapted to be depressed below said sheet-stop and coacting with said first-named gripper to grip sheets, and mechanism for moving said second gripper toward and from the first-named gripper, substantially as described.

14. In a to-and-fro-moving sheet-delivery, the combination of a to-and-fro support or carrier, a sheet-stop fixed thereto and moving therewith, a gripper above said stop and arrested by the top thereof as it moves downwardly, mechanism for operating said gripper to open and close the same, a second gripper below the first gripper and coacting therewith to grip sheets said second gripper being in front of and adapted to be depressed below the said sheet-stop, and mechanism for depressing said second gripper while sheets are being run in over and against said stop and for closing said gripper against the first-named gripper, substantially as described.

15. The combination of a delivery-board, a to-and-fro-moving sheet-delivering mechanism receiving printed sheets at one end of its path of motion and delivering them as it returns toward that end of its path on said board, and a second sheet-delivering mechanism adjustably connected with said first-named sheet-delivering mechanism, whereby the first-named mechanism begins its delivery at one point and the point of beginning of the delivery by the second mechanism may be varied, substantially as described.

16. The combination of a delivery-board, a to and-fro-moving carriage, a set of grippers carried thereby, a sheet support or carrier connected with said carriage, means for delivering printed sheets to said grippers and support or carrier, a second set of grippers and a sheet support or carrier adjustable along said carriage toward and from said first set and carrier or support, and an adjustable feed-board from which sheets are supplied to said second set of grippers and carrier or support, substantially as described.

17. The combination of a delivery-board, a sheet-delivering mechanism movable to and fro over said board and provided with a set of movable grippers and delivering printed sheets on said board, a second sheet-delivering mechanism also movable to and fro over said board in the same direction as the first mechanism and also provided with a set of movable grippers, and a connection between said sets of grippers for moving them simultaneously, substantially as described.

18. The combination of a delivery-board placed over the inking apparatus of a printing-press, a pair of side supports for said board, and a pin-and-hole connection between said board and said supports, whereby the board may be disconnected from said supports and slid along the same, substantially as described.

19. The combination of a delivery-board, horizontal bars for supporting the same at opposite edges thereof, and connections for holding said board in place on said bars and disconnectible by lifting or tilting said board, whereby the board may be disconnected from and be slid along said bars, substantially as described.

20. In a sheet-delivery having a to-and-fro-moving sheet supporter or carrier, a relatively fixed sheet-stop moving with said carrier or support and against which the sheet is fed, a movable gripper above said stop, and a movable gripper in front of said stop adapted to be depressed below the same while the sheet is being fed between the grippers, substantially as described.

21. In a sheet-delivery having a to-and-fro-moving sheet supporter or carrier, a relatively fixed sheet-stop moving with said carrier or support and against which the sheet is fed, a movable gripper above said stop, and a movable gripper in front of said stop adapted to be depressed below the same while the sheet is being fed between the grippers and raised to grip the sheet after the delivery has commenced its outward stroke, substantially as described.

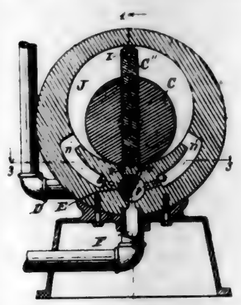
22. In a sheet-delivery having a to-and-fro-moving sheet support or carrier, a relatively fixed stop against which the sheet is fed, combined with a depressible gripper member in front of said stop and adapted to lie flush with or slightly above the top of said stop, whereby the sheet is first arrested by the stop and is afterward lifted into position to be run out over said stop.

23. In a printing-press, the combination of two rotatable shafts each provided with a plurality of flaring notches along the same, a pulley for and mounted on each of said shafts to slide along the same, a spring-pressed pin for each slidable pulley adapted to engage with the notches of the corresponding shaft, whereby the slidable pulleys may be moved along their shafts by pressure applied to their sides, and a tape on and moved in two directions by said pulleys, substantially as described.

24. In a printing-press, the combination of two rotatable shafts each provided with a plurality of notches theresalong, a pulley for and mounted on each of said shafts to slide theresalong, a spring pin for each of said pulleys adapted to engage with the notches of the corresponding shaft, the coacting parts of the pins and notches being oblique to the axes of said shafts and a tape on and moved in two directions by said pulleys, substantially as described.

25. In a printing-press, the combination of a rotatable shaft having a plurality of flaring notches theresalong, a pulley slidable along said shaft, a spring-pressed pin on said pulley engaging with said notches, whereby the pulley may be slid along the shaft by pressure thereon and the pin snap from one to another of said notches, and a sheet-moving tape on and moved in two directions by said pulley, substantially as described.

708,742. ROTARY ENGINE. GEORGE SPRICH, Paragould, Ark., assignor of one-half to Charles Loesche and Hermann B. Steinheimer, Paragould, Ark. Filed Mar. 20, 1901. Serial No. 52,064. (No model.)



Claim.—1. In a rotary steam-engine, the combination of a cylinder; a rotary piston within the same; ports leading to each side of said cylinder to serve alternately as inlets or exhausts, said ports being divided into two separate passages at their outer ends; a valve having two passages, one of which connects one of said ports to the supply-pipe while the other connects the opposite port to the exhaust, alternately as the valve is shifted, coacting for the purpose specified.

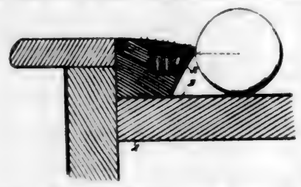
2. In a rotary steam-engine, the combination of a cylinder, a cross-section of which is half-circular and half in the form of an ellipse, merging into each other; a rotary head eccentric thereto; a piston adapted to slide radially through the rotary head with suitable packings between it and the cylinder; ports leading to each side to serve alternately as inlets or exhausts, said ports being divided into two passages at their outer ends; a valve having two passages one of which connects one of said ports to the supply-pipe while the other connects the opposite port to the exhaust alternately as the valve is shifted, coacting for the purpose specified.

3. In a rotary steam-engine, the combination of a cylinder, a cross-section of which is half-circular and half in the form of an ellipse, merging into each other; a rotary head eccentric thereto; a piston adapted to slide radially through the rotary head with suitable packings between it and the cylinder; ports leading to each side to serve alternately as inlets or exhausts, said ports being divided into two passages at their outer ends; a valve having two passages one of which connects one of said ports to the supply-pipe while the other connects the opposite port to the exhaust, alternately as the valve is shifted; and an auxiliary exhaust leading into the main exhaust from the exhaust side of the cylinder-chamber, coacting for the purpose specified.

708,743. CLEANING AND POLISHING COMPOSITION. IDA STERN, Chicago, Ill. Filed Feb. 28, 1902. Serial No. 96,160. (No specimens.)

Claim.—The herein-described composition of matter for cleaning and polishing consisting of ammonia, varnish composed of turpentine and resin, and kerosene in substantially the proportions specified to wit: one (1) teaspoonful of varnish composed of turpentine and resin; thirty-eight (38) teaspoonfuls of ammonia of ten-per-cent. strength; and two (2) teaspoonfuls of kerosene.

708,744. BILLIARD-CUSHION. BENJAMIN A. STEVENS, Toledo, Ohio. Filed Nov. 21, 1901. Serial No. 83,071. (No model.)



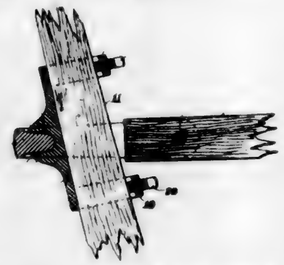
Claim.—1. The combination of a billiard-table rail and a resilient cushion, the cushion being secured to the rail, two series of grooves crossing each other being provided between adjacent surfaces of the cushion and rail.

2. A billiard-cushion provided with a longitudinal aperture therein, and a strip of softer rubber than that of which the body of the cushion is composed inserted in said aperture, the strip of softer rubber having a less area of cross-section than that of said aperture, said strip being of a uniform cross-section of such a form that it shall contact the walls of said aperture in two or more points.

3. A billiard-cushion provided with a longitudinal aperture therein, a strip of softer rubber than that of the body of the cushion of less area of cross-section than said aperture, lying therein and being in contact with the front and rear walls of said aperture, and a flexible inextensible strip embedded in the material of the cushion adjacent to the front wall of said aperture.

4. A rubber billiard-cushion provided with a longitudinal aperture, a strip of resilient material of a different degree of hardness from that of the cushion inserted in said aperture, said strip having a shape of cross-section such that it shall contact the wall of said aperture at two or more points and shall leave an opening between its periphery and the wall of said aperture between said contacting points, said opening being so located that the rubber displaced by the contact of the ball shall pass into it.

708,745. CONNECTOR FOR SWEEP-STICKS AND PICKER-STICKS OF LOOMS. HOMER R. TAPLIN, Lawrence, Mass. Filed Aug. 26, 1901. Serial No. 73,216. (No model.)



Claim.—1. A connector for the sweep-sticks and picker-sticks of looms comprising a block secured to the picker-stick, and a rigid loop secured to the sweep-stick and encircling the picker-stick and block, one of these members being provided with a projection and the other with a recess adapted to receive the projection and to permit its outward movement, and means for finally arresting said outward movement before the projection is withdrawn from the recess whereby the separation of the elements of the connector is prevented.

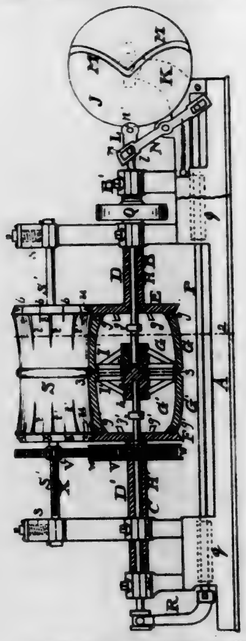
2. A connector for the sweep-sticks and picker-sticks of looms comprising a block secured to the picker-stick, and a rigid loop secured to the sweep-stick and encircling the picker-stick and block, one of these members being provided with a projection and the other with a recess adapted to receive the projection and to permit its outward movement until ar-

rested by a contact-face carried by the companion member before the projection is withdrawn from the recess.

3. A connector for the sweep-sticks and picker-sticks of looms comprising a block secured to the picker-stick, and a rigid loop secured to the sweep-stick and encircling the picker-stick and block, one of these members being provided with a projection and the other with a recess adapted to receive the projection, the depth of engagement between the members being greater than the distance between the end of the sweep-stick and the adjacent side of the picker-stick.

4. A connector for the sweep-sticks and picker-sticks of looms comprising a member formed with side bars secured at each side of the sweep-stick and a cross-bar connecting said side bars and provided with a projection having a curved end, and a block carried by the picker-stick within the sweep-stick member and provided with a recess adapted to receive the projection, the depth of engagement between the members being greater than the distance between the end of the sweep-stick and the adjacent side of the picker-stick.

708,746. BARREL-MAKING MACHINERY. JOHN VAN DEVELDE, Cleveland, Ohio. Filed Jan. 3, 1902. Serial No. 88,273. (No model.)



Claim.—1. A collapsible mandrel consisting of disks, tubular shafts attached to said disks, curved and tapered body-sections hinged to said disks, central shafts supported in said tubular shafts, hubs on said central shafts, links connecting the hubs with the sections, adapted to collapse and withdraw substantially as described.

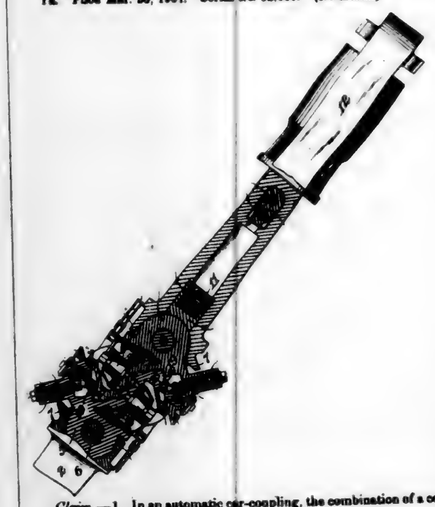
2. A collapsible mandrel consisting of disks, tubular shafts attached to said disks, curved and tapered body-sections hinged to said disks, central shafts supported in said tubular shafts, holes or cavities in said sections, leaves hinged in said cavities, cross-grooves in the peripheries of the disks, hubs on the inner ends of the central shafts, links connecting the hubs with the sections, adapted to operate substantially as described.

3. A collapsible mandrel consisting of disks, tubular shafts attached to said disks, curved and tapered body-sections, hinged to said disks, holes or cavities in said sections, leaves hinged in said cavities, cross-grooves in the peripheries of the disks, central shafts supported in said tubular shafts, hubs on the inner ends of said central shafts, links connecting the hubs with the sections, in combination with a pressure-roller mounted on a shaft over said mandrel, blades on the roller adapted to mesh with the cavities in the mandrel, and cutting-blades on said roller, adapted to crimp and cut the paper on the mandrel, substantially as described.

4. A collapsible mandrel consisting of disks, tubular shafts attached to said disks, curved and tapered body-sections, hinged to said disks, holes or cavities in said sections, leaves hinged in said cavities, cross-grooves in the peripheries of the disks, central shafts supported in the tubular shafts, hubs on the inner ends of said central shafts, links connecting the hubs with the sections, in combination with a pressure-roller mounted on a shaft over said mandrel, blades on the roller adapted to mesh with the cavities in the mandrel, and cutting-blades on said roller, gears on the mandrel and pressure-roller meshing together, and means substantially as described for operating the mandrel and roller, as and for the purpose specified.

5. A collapsible mandrel consisting of disks, tubular shafts attached to said disks, curved and tapered body-sections hinged to said disks, holes or cavities in said sections, leaves hinged in said cavities, cross-grooves in the peripheries of the disks, central shafts supported in the tubular shafts, hubs on the inner ends of said central shafts, links connecting the hubs with the sections, in combination with a pressure-roller mounted on a shaft over said mandrel, blades on the roller adapted to mesh with the cavities in the mandrel, and cutting-blades on said roller, gears on the mandrel and pressure-roller, a cam-wheel mounted on the frame A, a swiveled head on end of central shaft, a pin on said head, a lever fulcrumed on the frame A, a sliding rod supported in bearings in the base A connected with said lever, an arm on opposite end of said rod connected with the opposite central shaft, all constructed and adapted to operate substantially as described.

708,747. CAR-COUPLING. GEORGE WESTINGHOUSE, Pittsburg, Pa. Filed Mar. 25, 1901. Serial No. 52,669. (No model.)



Claim.—1. In an automatic car-coupling, the combination of a coupler-head, flexibly connected with a car-frame, and adapted, by movement about a pivot, to be automatically engaged with a counterpart on another vehicle, and means for permitting a vertical movement of the coupler-head, a lock, automatically operable in and by the engagement of the coupler-head with a counterpart, for retaining said coupler-head in substantially rigid engagement with its counterpart.

2. In an automatic car-coupling, the combination of a coupler-head flexibly connected with a car-frame, and having a fixed vertical coupling member adapted to be engaged with and disengaged from a corresponding member on a counterpart head, by lateral movement, means for permitting vertical movement of the coupler-head, and a lock, automatically operable in and by the engagement of the coupler-head with a counterpart, for retaining said coupling member in engagement with that of a counterpart coupler-head.

3. In an automatic car-coupling, the combination of a coupler-head flexibly connected with a car-frame, a vertical coupling member fixed thereon, and having an engaging face inclined to the line of draft and adapted to be brought into contact with the corresponding engaging face of a vertical coupling member fixed on a counterpart head, by lateral movement, means for permitting vertical movement of the coupler-head, and a lock for retaining said coupling member in engagement with that of the counterpart head.

4. In an automatic car-coupler, the combination of a coupler-head flexibly connected with a car-frame, a vertical coupling member fixed thereon, and having faces which are oppositely inclined to the line of draft and adapted to be brought into contact with corresponding oppositely-inclined faces of a vertical coupling member fixed on a counterpart head, by lateral movement, means for permitting vertical movement of the coupler-head, and a lock for retaining said coupling member in engagement with that of the counterpart head.

5. In an automatic car-coupler, the combination of a coupler-head flexibly connected with a car-frame, a vertical coupling member fixed thereon and adapted to be engaged with and disengaged from a corresponding member on a counterpart head, means for permitting both vertical and lateral movement of the coupler-head, a guide opposite said coupling member, for moving a counterpart head into engagement, and a lock, automatically operable in and by the engagement of the coupling member with that of a counterpart head, for retaining said coupling member in engagement with that of said counterpart coupler-head.

6. In an automatic car-coupling, the combination of a coupler-head having a fixed vertical coupling member adapted to be engaged with and disengaged from a corresponding member on a counterpart head, by lateral movement, means for permitting vertical movement of the coupler-head, and a lock fitted on the coupler-head in position to abut against a bearing-surface on a counterpart head and automatically operable in and by the engagement of the coupling member with that of a counterpart head, to hold the coupling members in close contact when the two heads are coupled.

7. In an automatic car-coupling, the combination of a coupler-head having a fixed vertical coupling member adapted to be engaged with and disengaged from a corresponding member on a counterpart head, by lateral movement, and a lock pivoted on the coupler-head and having a face, eccentric to its pivot, which is adapted to abut against a bearing-surface on a counterpart head when the two heads are coupled.

8. In an automatic car-coupling, the combination of a coupler-head flexibly connected with a car-frame, and adapted, by lateral movement, to be automatically engaged with a counterpart on another vehicle, means for permitting vertical movement of the coupler-head, a lock for retaining said coupler-head in engagement with its counterpart, and a fluid-conduit in the head having a properly-packed end adapted to make a fluid-tight joint with that of a fluid-conduit on a counterpart head when the two heads are coupled.

9. In an automatic car-coupling, the combination of a coupler-head flexibly connected with a car-frame, and adapted, by lateral movement, to be automatically engaged with a counterpart on another vehicle, means for permitting vertical movement of the coupler-head, a lock for retaining said coupler-head in engagement with its counterpart, and an electric conductor in the head, having a terminal adapted to make contact with the terminal of an electric conductor in a counterpart head when the two heads are coupled.

10. In an automatic car-coupling, the combination of a coupler-head flexibly connected with a car-frame, and adapted, by lateral movement, to be automatically engaged with a counterpart on another vehicle, means for permitting vertical movement of the coupler-head, a lock for retaining said coupler-head in engagement with its counterpart, a fluid-conduit in the head having a properly-packed end adapted to make a fluid-tight joint with that of a fluid-conduit on a counterpart head when the two heads are coupled, and a cock fitted in the coupler-head and controlling the fluid-conduit.

11. In an automatic car-coupling, the combination of a coupler-head flexibly connected with a car-frame, and adapted, by lateral movement, to be automatically engaged with a counterpart on another vehicle, a lock for retaining said coupler-head in engagement with its counterpart, a fluid-conduit in the head having a properly-packed end adapted to make a fluid-tight joint with that of a fluid-conduit on a counterpart head when the two heads are coupled, a cock fitted in the coupler-head and controlling the fluid-conduit, and means for releasing the lock and operating the cock which are operable at a distance from the coupler-head sufficient to obviate necessity of going between and below cars.

12. In an automatic car-coupling, the combination of a coupler-head flexibly connected with a car-frame, and adapted, by lateral movement, to be automatically engaged with a counterpart on another vehicle, a lock for retaining said coupler-head in engagement with its counterpart, a fluid-conduit in the head having a properly-packed end adapted to make a fluid-tight joint with that of a fluid-conduit on a counterpart head when the two heads are coupled, a cock fitted in the coupler-head and controlling the fluid-conduit, and means, operable from the side of a car, for releasing the lock and operating the cock.

13. In an automatic car-coupling, the combination of a coupler-head flexibly connected with a car-frame and adapted, by lateral movement, to be automatically engaged with a counterpart on another vehicle, means for permitting vertical movement of the coupler-head, a lock for retaining said coupler-head in engagement with its counterpart, a plurality of fluid-conduits in the head, each having a properly-packed end adapted to make a fluid-tight joint with that of a fluid-conduit on a counterpart head when the two heads are coupled, and a cock fitted in the coupler-head and controlling the several fluid-conduits.

14. In an automatic car-coupling, the combination of a coupler-head flexibly connected with a car-frame, and adapted, by lateral movement, to be automatically engaged with a counterpart on another vehicle, a lock for retaining said coupler-head in engagement with its counterpart, a fluid-conduit in the head having a properly-packed end adapted to make a fluid-tight joint with that of a fluid-conduit on a counterpart head when the two heads are coupled, a cock fitted in the coupler-head and controlling the fluid-conduit, an unlocking-shaft journaled transversely on a car-frame and operable from the side of the car, and intermediate connections for releasing the lock and operating the cock by movement of the unlocking-shaft.

15. In an automatic car-coupling, the combination of a coupler-head flexibly connected with a car-frame, and adapted, by lateral movement, to be automatically engaged with a counterpart on another vehicle, a lock for retaining said coupler-head in engagement with its counterpart, a fluid-conduit in the head having a properly-packed end adapted to make a fluid-tight joint with that of a fluid-conduit on a counterpart head when the two heads are coupled, a cock fitted in the coupler-head and controlling the fluid-conduit, an electric conductor in the head, having a terminal adapted to make contact with the terminal of an electric conductor in a counterpart head when the two heads are coupled, and means for releasing the lock and operating the cock which are operable at a distance from the coupler-head sufficient to obviate necessity of going between and below cars.

16. In an automatic car-coupling, the combination of a coupler-head flexibly connected with a car-frame, and having a vertical coupling member, adapted to be engaged with and disengaged from a corresponding member on a counterpart head, by lateral movement, a lock fitted in the coupler-head and adapted to maintain its coupling member in engagement with that of a counterpart head, a fluid-conduit section having a packed end on a face of the head which is adapted to abut against, and make a fluid-tight joint with, the end of a fluid-conduit on a counterpart head, a shell or casing fixed to the coupler-head, within a recess by the walls of which it is protected, a second fluid-conduit section, opening into said casing and flexibly connected to a pipe-line on the car, a cock fitting in the casing and controlling communication between the fluid-conduit sections, and means for releasing the lock and operating the cock.

17. In an automatic car-coupling, the combination of a coupler-head flexibly connected with a car-frame, and having a fixed vertical coupling member, adapted to be engaged with and disengaged from a corresponding member on a counterpart head, by lateral movement, means for permitting vertical movement of the coupler-head, a lock fitted in the coupler-head and adapted to maintain its coupling member in engagement with that of a counterpart head, an electric conductor in the head, having a terminal adapted to make contact with the terminal of an electric conductor in a counterpart head when the two heads are coupled, and flexibly connected to an electric conductor on the car, and means for releasing the lock for uncoupling the heads and electric conductors.

18. In an automatic car-coupling, the combination of a coupler-head flexibly connected with a car-frame, and adapted, by lateral movement, to be automatically engaged with a counterpart on another vehicle, a lock for retaining said coupler-head in engagement with its counterpart, a fluid-conduit in the head having a properly-packed end adapted to make a fluid-tight joint with that of a fluid-conduit on a counterpart head when the two heads are coupled, a cock fitted in the coupler-head and controlling the fluid-conduit, an operating-shaft journaled in the head, connections through which movement is imparted from said shaft to the lock, and vice versa, and connections from the operating-shaft to the cock, provided with means for permitting a determined degree of traverse of the operating-shaft and lock without imparting movement to the cock.

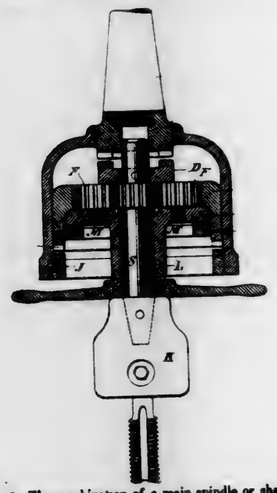
19. In an automatic car-coupling, the combination of a coupler-head flexibly connected with a car-frame, and adapted, by lateral movement, to be automatically engaged with a counterpart on another vehicle, a locking-arm, fitted with the capacity of a limited degree of independent movement on a shaft journaled in the coupler-head, and adapted to retain said head in engagement with its counterpart, a fluid-conduit in the head having a properly-packed end adapted to make a fluid-tight joint with that of a fluid-conduit on a counterpart head, a cock fitted in the coupler-head and controlling the fluid-conduit, an operating-shaft journaled in the head, connections through which movement is imparted from said shaft to the locking-arm, and vice versa, and connections from the operating-shaft to the cock, provided with means for permitting a determined degree of traverse of the operating-shaft and locking-arm without imparting movement to the cock.

20. In an automatic car-coupling, the combination of a coupler-head flexibly connected with a car-frame, and adapted, by lateral movement, to be automatically engaged with a counterpart on another vehicle, a lock for retaining said coupler-head in engagement with its counterpart, a fluid-conduit in the head having a properly-packed end adapted to make a fluid-tight joint with that of a fluid-conduit on a counterpart head when the

two heads are coupled, a cock fitted in the coupler-head and controlling the fluid-conduit, an operating-shaft journaled in the head, connections through which movement is imparted from said shaft to the lock and vice versa, a connecting-arm fitting freely on said shaft and having a segmental recess adjoining its hub, an arm fixed to said shaft and adapted to abut against the ends of said recess, an arm fixed to the cock, a link coupled to said arm and having a longitudinal slot adjoining its opposite end, and a pin fixed to the connecting-arm and traversing in the slot of the link.

21. In an automatic car-coupling, the combination of a coupler-head having a fixed vertical coupling member adapted to be engaged with and disengaged from a corresponding member on a counterpart head, by lateral movement, a ball or spherical projection on the inner end of the coupler-head, having a vertical central passage, a draw-bar or coupler-shank having a recess in its outer end which receives the ball of the coupler-head, and a connecting-pin extending through the walls of the socket and the passage of the ball and being reduced in diameter from its middle portion, which substantially fits said passage, to each of its ends.

708,748. **REVERSING TAP-HOLDER.** HARRY WHARTON, Loughborough, England. Filed May 19, 1902. Serial No. 107,927. (No model.)



Claim.—1. The combination of a main spindle or shank, a bell or casing attached thereto, a clutch member within said casing or bell, a second spindle or shank in line with the first and movable independently thereof, a clutch member on the second shank adapted to coact with the first-named clutch member to connect the spindles or shanks directly, an independently-movable annulus within said casing or bell, a clutch for connecting casing and annulus, gears interposed between and connecting said annulus and the second-named shank or spindle, and means whereby certain of said interposed gears may be held against motion of translation.

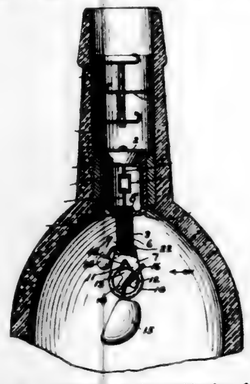
2. The combination of a rotary main spindle or shank, a bell or casing fast thereto, a second spindle in line with the first-named spindle and movable independently thereof, a clutch within said casing or bell for connecting said spindles to drive the second directly from the first, a reverse-motion gearing independent of said casing or bell, a clutch for connecting said gearing and said casing to drive one member of said gearing from said casing, and means whereby part of said gearing may be held against motion of translation, substantially as described.

3. The combination of alined independently-revolable spindles or shanks, two clutch members rigidly connected with the driver shank or spindle, a clutch member and a gear attached to the second shank or spindle, a rotatory internal gear having a clutch member, gears interposed between and meshing with said spindle-gear and said internal gear, and a rotatory carrier for the interposed gears, said carrier being capable of being stopped at any time.

4. The combination of a main spindle, a casing or shell attached thereto, a clutch member within said casing, a tap-spindle axially in line with the main spindle and movable independently thereof, a clutch member on said tap-spindle adapted to engage with the first-named clutch member to connect said spindles directly, an independently-movable toothed annulus within the casing or shell, an independent clutch for connecting said casing and said annulus, a sleeve surrounding the tap-spindle, a pinion on the tap-spindle, and pinions carried by said sleeve and meshing with the tap-pinion and the toothed annulus, substantially as described.

5. The combination of a main spindle, a casing or shell attached thereto, a tap-spindle axially in line with the main spindle and movable independently thereof, a pinion fast on the tap-spindle, a clutch within the casing for connecting said spindles directly, a sleeve on the tap-spindle, a flange on said sleeve underneath the pinion on the tap-spindle, an annulus within the casing and movable independently thereof, an internally-toothed ring on said annulus, pinions meshing with said toothed ring and the tap-spindle pinion, and a clutch at the mouth of the casing or shell for connecting the annulus and casing when the first-mentioned clutch is disengaged, substantially as described.

708,749. **BOTTLE-STOPPER.** MARGARET C. WILSON, Chicago, Ill. Filed Jan. 20, 1902. Serial No. 90,518. (No model.)



Claim.—1. In a bottle-stopper, the combination of a center casing secured to the neck of the bottle, a valve seating on said casing, a slotted loop connected to said casing, a rotatable key mounted in said loop and having a tongue for entering the slot in said loop, a valve-rod consisting of two parts, whereof one is connected to said key and the other is connected to said valve; and a telescoping swivel connecting the parts of said rod.

2. In a bottle-stopper, the combination of a center casing secured to the neck of the bottle, a valve seating in said casing, a loop connected to said casing, said loop being circular except at one side thereof where there is formed a slot extending outward from the center of said loop; a rotatable key having a cylindrical portion fitting the circular portion of said loop, and said key having a tongue adapted to enter the slot in said loop to thereby permit a movement in a radial direction of said key in said loop, a weight attached to said key whereby gravity may operate said key, and connections between said key and said valve for controlling the latter.

3. In a bottle-stopper, the combination of a hollow center casing secured in the neck of the bottle; a valve-seat at the upper extremity of said casing; passages for liquid at the lower extremity of said casing; a sleeve formed at the lower extremity of said casing; a slotted loop; a stem formed on said loop and revolubly mounted within said sleeve; a rotatable key mounted in said loop and having a tongue for entering the slot in said loop; a valve seating upon said center casing, and connections between said key and said valve whereby said key controls said valve.

4. In a bottle-stopper, the combination of a center casing secured in the neck of the bottle; a valve for closing the said casing; a sleeve formed at the lower extremity of said casing, a slotted loop, a stem formed on said loop and revolubly mounted within said sleeve; a gravity-operated rotatable key mounted in said loop and having a tongue for entering the slot in said loop; keepers for retaining said key within said loop; and connections between said key and said valves for operating the latter.

5. In a bottle-stopper, the combination of a center casing secured within the neck of the bottle a valve for closing the passage through said casing, a sleeve formed at the lower extremity of said casing; a slotted loop, a stem formed on said loop and revolubly mounted in said sleeve, a rotatable key having a slot for entering said loop, connections between said key and the valve for operating the latter; a weight for operating said key, and a guard slidingly mounted on said sleeve for limiting the motion of said weight in operating said key.

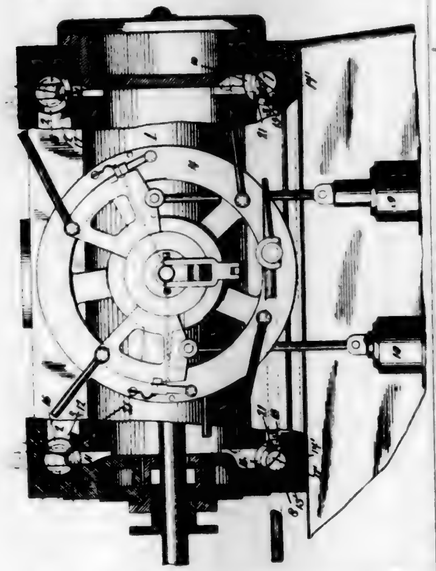
6. In a bottle-stopper, the combination of a center casing secured to the neck of the bottle, a valve seating in said casing; a loop connected to said casing, said loop being circular except at the side thereof where there is formed a slot extending outward from the center of said loop; a rotatable key having a cylindrical portion fitting the circular portion of said loop, and said key having a tongue adapted to enter the slot in said loop to thereby permit a movement in a radial direction of said key in said loop; connections between said key and said valve for operating the latter, and a series of shelves or diaphragms extending partially across the neck of the bottle above said valve for preventing the access of appliances for disturbing the same.

7. In a bottle-stopper, the combination of a valve seating within the neck of the bottle, a slotted loop mounted within said bottle, a rotatable key in said loop having a tongue for entering the slot in said loop, and a valve-rod connected to said key and to said valve, whereby said valve is controlled by said key.

8. In a bottle-stopper, the combination of a valve seating within the neck of the bottle, a slotted loop fixed within said bottle, a rotatable key in said loop, said key having a tongue for entering the slot in said loop, and connections between said key and said valve for controlling said valve.

9. In a bottle-stopper, the combination of a center casing secured to the neck of the bottle, a valve seating on said casing, a slotted loop connected to said casing, a rotatable key mounted in said loop and having a tongue for entering the slot in said loop, and a valve-rod connected to said key and to said valve for operating the latter.

708,750. **VALVE FOR STEAM-ENGINES.** WILLIAM WRIGHT, Brooklyn, N. Y., assignor, by mesne assignments, to Mary E. Wright, Brooklyn, N. Y. Filed Jan. 4, 1899. Renewed May 17, 1902. Serial No. 107,844. (No model.)



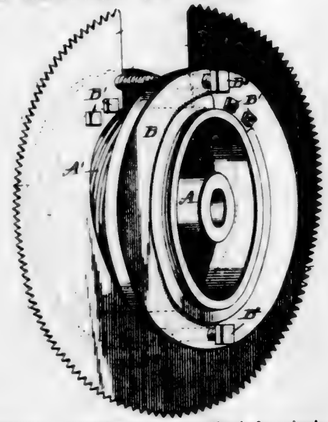
Claim.—1. The combination of a valve-seat, valve, and stationary port-closer, the valve and valve-seat having coacting ports adapted to permit the passage of fluid past the port-closer in one position of the valve, and the port-closer adapted to close a valve-port in one position of the valve, and having a port communicating with said valve-port and arranged to be opened by the valve when the latter moves to its open position, whereby the port in the port-closer forms an additional channel for the passage of fluid.

2. The combination of a cylindrical valve-chamber, a hollow cylindrical valve within the same, and a stationary port-closer within the valve, said valve and valve-chamber having coacting ports adapted to permit the passage of fluid past the port-closer in one position of the valve, and the port closer adapted to close a valve-port in one position of the valve, and having a port communicating with said valve-port and arranged to be opened by the valve when the latter moves to its open position, whereby the port in the port-closer forms an additional channel for the passage of fluid.

3. The combination of a valve-seat, valve, and stationary port-closer, the valve and valve-seat having coacting ports adapted to permit the passage of fluid past the port-closer in one position of the valve, and the port-closer adapted to close a valve-port in one position of the valve, and having a recess which communicates with said port and spans a portion of the valve on one side of said port when the valve moves to its open position, thereby affording an additional channel for the passage of fluid.

4. The combination of a cylindrical valve-chamber having admission and exit ports, a hollow cylindrical valve within said chamber likewise having admission and exit ports, and a stationary port-closer within said valve adapted to close one of the ports thereof in one position of the valve, and having a recess which communicates with said port so closed and spans the space between the ports of the valve when said valve moves to its open position, thereby affording an additional channel for the passage of fluid.

708,751. **DADO-CUTTER.** CAPELLE H. ARCHER, Richmond, Va., assignor of one-half to H. S. Winston, Richmond, Va. Filed Apr. 21, 1902. Serial No. 104,009. (No model.)



Claim.—1. In a dado-cutter, a supporting-body, a circular saw having separated end portions secured to said support on opposite sides of a diametrically opposite point of the saw, and means for adjusting said end portions toward and from each other; substantially as specified.

2. In a dado-cutter, a support provided with adjustable flanges thereon, a circular saw having its body centrally held by said flanges, and separated end portions secured to said flanges on opposite sides of the holding-point of said body; substantially as specified.

3. In a dado-cutter, a supporting-collar, a spirally-disposed saw carried on the periphery of said collar, and means engaging the free ends of the saw to adjust the same toward and from each other; substantially as specified.

4. In a dado-cutter, a supporting-collar, a spirally-disposed saw carried on the periphery of said collar, adjustable flanges secured to said collar, and means carried thereby for securing the saw between said flanges; substantially as specified.

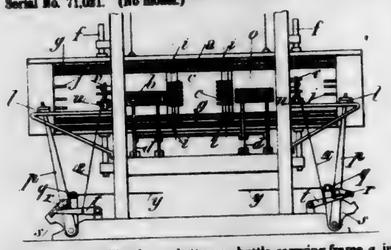
5. In a dado-cutter, a supporting-collar having oppositely-extending threads upon its periphery, flanges oppositely threaded upon said periphery, and a circular saw disposed centrally between said flanges at one point, and having supporting ends secured to said flanges at an opposite point; substantially as specified.

6. In a dado-cutter, a supporting-collar having oppositely-extending threads upon its periphery, flanges oppositely threaded upon said periphery, a circular saw disposed centrally between said flanges at one point and having supporting ends secured to said flanges at an opposite point, opposite adjusting-screws carried by said flanges to engage the saw-body located centrally between the same, and securing means passing through said flanges to hold the free ends of the saw in contact therewith; substantially as specified.

7. A dado-cutter having a supporting-body, opposite adjustable flanges threaded upon said body, and a saw extending circumferentially thereof and having its free ends secured to said flanges in planes parallel to each other; substantially as specified.

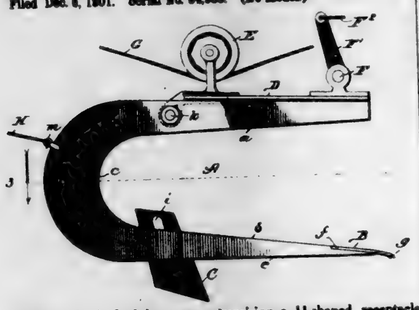
8. A dado-cutter having a supporting-body, a saw extending circumferentially thereof having its free ends secured in planes parallel to each other, and holding means for the free ends of said saw adapted to adjust the same toward and from each other; substantially as specified.

708,752. APPARATUS FOR OPERATING GUIDED SHUTTLES IN LOOMS. ALEXANDRE BARNIER, Lyons, France. Filed Aug. 6, 1901. Serial No. 71,031. (No model.)



Claim.—In combination, a batten, a shuttle-carrying frame *a*, independent of the batten, means for giving said frame a rising-and-falling movement, rows of shuttles arranged to move on said frame, racks *g* carried by the frame, pinions *i* and *c* of differential diameter driven by said racks and in turn driving the shuttles, runners *j* moving on the frame and situated at the same height as the shuttles corresponding with them, means connecting the runners with the racks, pickers *l*, picker-sticks *p* for operating the pickers, said pickers being arranged to push the runners which are at their level and locking means for preventing the picker-sticks from operating, said locking means being controlled by the runner which has just been driven, substantially as described.

708,753. DREDGING-SCOOP. HENRY G. BUTLER, Danville, Ill. Filed Dec. 6, 1901. Serial No. 84,933. (No model.)



Claim.—1. A dredging-scoop comprising a U-shaped receptacle open at its opposite sides and having a base provided with a scraping edge, substantially as and for the purpose set forth.

2. A dredging-scoop comprising a U-shaped receptacle open at its opposite sides and formed with a series of reinforcing-ribs extending along its top and rear portion, and with a base having a forward scraping edge, substantially as and for the purpose set forth.

3. A dredging-scoop comprising a U-shaped receptacle open at its opposite sides and formed with a series of reinforcing-ribs extending along its top and rear portions, and with a hollow base having a forward scraping edge.

4. A dredging-scoop comprising a U-shaped receptacle, having a top wall *a* and rear wall *c* provided on the outer side with strengthening-ribs, an inclined inner bottom wall *b* and a base *e*, and a scraping-blade B secured thereto, substantially as described.

5. In a dredging-scoop, a U-shaped receptacle formed with a series of reinforcing-ribs extending along its top and rear portions and with a base having a forward scraping edge, a support to which the scoop is hinged at its upper rear portion, an engaging and releasing catch on the support for the forward end portion of the scoop, and a supporting-cable-engaging sheave on said support, substantially as and for the purpose set forth.

6. A dredging-scoop provided with a scraping edge and a rigid downward-projecting plow-point in rear of said edge in the plowing movement of the scoop, substantially as and for the purpose set forth.

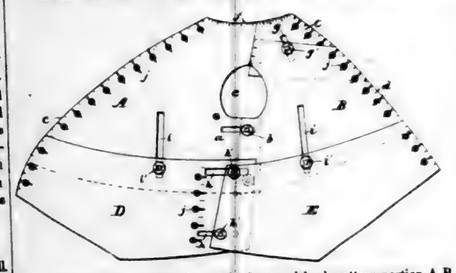
7. A dredging-scoop provided with a scraping edge and a series of rigid downward-projecting plow-points in rear of said edge in the plowing movement of the scoop, substantially as and for the purpose set forth.

8. A dredging-scoop having a base formed with a plow-point-receiving socket, a scraping edge at the lower forward end of the scoop, and a downward-projecting plow-point in said socket, substantially as and for the purpose set forth.

9. A dredging-scoop comprising a U-shaped receptacle formed with a series of reinforcing-ribs extending along the top and rear portions, and with a hollow base provided with a plow-point-receiving socket and having a forward scraping edge, substantially as and for the purpose set forth.

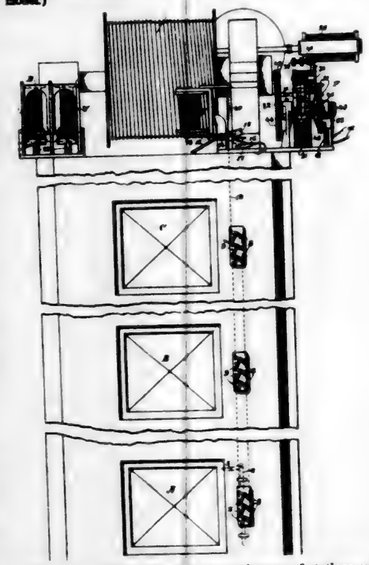
10. In a dredging-scoop, the combination of a support, a sheave on said support, a U-shaped receptacle hinged at its rear upper portion to the said support, catch mechanism on the support for engaging and releasing the forward end of the receptacle, a scraping-blade on the lower forward edge of the receptacle, and a downward-flaring plow-point on the base of the receptacle in rear of said scraping-blade, substantially as and for the purpose set forth.

708,754. ADJUSTABLE CHART. HELEN S. CHANDLER, Dover N. H. Filed Mar. 3, 1896. Serial No. 672,344. (No model.)



Claim.—The combination of the front and back pattern portion A B having the arm-eye partly formed in each and extensible on each other, with the shoulder pattern C independently adjustable on said back portion B, and the lower portions D E extensible on each other and on said portions A B, substantially as set forth.

708,755. ELEVATOR. MILTON A. CLEMAN, San Francisco, Cal., assignor to Cahill & Hall Elevator Company, San Francisco, Cal., a Corporation of California. Filed Jan. 28, 1901. Serial No. 44,773. (No model.)



Claim.—1. The combination in an elevator of stations or floors; a cage suspended and movable between said floors; a motor and mechanism by which the cage is operated; independently-operated mechanism including controlling-switches, circuit-closing devices for each floor and connected together in sets and detents for the circuit-closing devices; and electric circuits and mechanism energized thereby to determine the direction and distance of movement of the cage.

2. The combination in an elevator of stations or floors, a cage suspended and movable between said floors, a motor and mechanism by which said cage is raised and lowered, and mechanisms comprising direction and floor switches, manually-operated circuit-closing devices and detents therefor, said circuit-closers for each floor being connected together in sets so that the mechanism for either floor may be operated from any of the floors, and electric circuits and mechanism energized thereby to determine the direction and distance of movement of the cage.

3. The combination in an elevator of stations or floors, a cage suspended and movable between said floors, a motor and mechanism by which said cage is raised and lowered, levers connected in sets to be operated in unison from either floor, independent electrical contacts each adapted to be closed or opened by the operation of one of said sets of levers, circuits controlled thereby and mechanism operated by the closing and opening of said circuits whereby the direction of movement of the cage is determined and effected.

4. The combination in an elevator of stations or floors, a cage suspended and movable between said floors, a motor and mechanism by which said cage is raised and lowered, levers connected in sets to be operated in unison from either floor, independent electrical contacts each adapted to be closed or opened by the operation of one of said series of levers, and an electromagnet energized by the closing of said circuit, an armature and lever actuated by said electromagnet whereby the first-named circuit remains closed until the electromagnet is deënergized.

5. An elevator-cage, a motor and mechanism by which said cage is raised or lowered, levers connected in sets, one of which is located at each floor or station and capable of being operated in unison from either floor, independent electrical circuits each adapted to be closed or opened by the operation of one of said series of levers, an electromagnet and movable armature controlling the circuit-closer, a locking device consisting of a movable slide having diagonal slots into which the armature is moved by the closing of the circuit which it controls, and the movement of any other armature and closing of its circuit are prevented.

6. An elevator-cage, a motor and mechanism by which said cage is raised or lowered, levers located at each floor and connected in sets of one for each floor, electrical circuit-closing devices operated in unison with the movement of either series of levers, and locking devices operated by the movement of either of the series of levers whereby the movement of one series of levers, prevents the operation of all the other series.

7. An elevator-cage, a motor and mechanism by which the cage is moved up or down, a series of slides corresponding with the number of floors and having segmental grooves in the edges, fulcrumed levers connecting with the slides and operated by the opening and closing of the doors, levers connected in sets for each floor and electrical circuits, each opened or closed by the operation of one of said series of levers, segments turnable in unison with the levers and adapted to engage the grooves and the slides whereby the movement of one lever locks and prevents movement of all the doors.

8. An elevator-cage, a motor and mechanism by which the cage is moved up or down, electrical circuits and mechanism including sets of levers located at each floor and connected together by which either circuit is closable from any of a number of floors or stations, a direction-switch actuated by the closing of such circuits whereby the movement of the cage up or down is determined.

9. An elevator-cage, a motor, a mechanism by which it is moved up or down, electrical circuits and mechanism including sets of levers located at each floor and connected together by which either circuit is closable from any of a number of floors or stations, a direction-switch actuated by the closing of such circuits whereby the movement of the cage up or down is determined, said switch consisting of insulated pins, and wires connecting said pins, so that electrical currents may be transmitted to the motor in reverse directions, contact-plates and a solenoid by which said plates are moved into contact with the pins when the solenoid is energized.

10. An elevator-cage, a motor, mechanism by which it is moved up or down, sets of levers at each floor connected together in sets so that either set can be operated from any floor, a direction-switch consisting of pins, connecting-wires therefor whereby currents in reverse directions may be transmitted to a motor, solenoids with movable cores, fulcrumed lever-arms connected with and movable by said cores when the solenoids are energized, and insulated contact-plates carried by the levers and capable of connecting either set of pins to give direction to the motor and the cage.

11. An elevator-cage, a motor, mechanism by which the cage is raised or lowered, levers connected in sets, either set of which may be operated from any floor, electrical circuits controlled by the movements of said levers, a direction-switch and an electrical circuit whereby the direction of motion of the cage is determined and a floor-switch and electrical controlling-circuit whereby the floor at which the cage should stop is determined.

12. An elevator-cage, a motor or mechanism by which it is raised or lowered, levers connected in sets, either set capable of being operated from either floor, independent electrical circuits, either of which is closed by the operation of one of the sets of levers, a floor-switch and electrical circuits controlled by the levers whereby the operation of any set of levers belonging to a floor sets the floor-switch to stop the cage at the desired floor or station.

13. The combination with a vertically-movable elevator of levers connected in sets and operated from either floor or station, independent electrical circuits closed by the operation of either set of levers, a motor and direction-switch actuated by the closing of said circuit to determine the direction of motion of the elevator, a floor-switch consisting of circular metallic insulated rings, fulcrumed levers carrying corresponding contacts, a disk revolvable in unison with the movements of the motor and elevator-cage, said disk having a notch in its periphery into which the contact-carrying lever drops, and breaks the electrical circuit when the cage has arrived at the desired floor.

14. A floor or station switch for vertically-movable elevator-cages consisting of stationary, insulated metallic rings, spring-pressed lever-arms fulcrumed at intervals and corresponding in number with the floors or stations, a disk mounted upon a shaft concentric with the rings, and intermediate mechanism whereby it is turnable in unison with the movements of the motor and cage and in either direction, said disk being mounted in line with the inner ends of the lever-arms which travel upon the periphery of the disk, contacts carried by the outer ends of said arms and caused to press upon the peripheries of the rings, conducting-wires connecting the said rings to which electrical circuits are completed by said contact, a notch formed in the periphery of the revolvable disk into which the inner end of either arm drops to break the contact between its outer end and the rings when the notch arrives in line with said arm and the cage at the corresponding floor or station.

15. A vertically-movable elevator-cage, a motor and mechanism by which said cage is moved in either direction, a switch by which the floor or station at which the cage is to stop is determined, said switch consisting of stationary insulated conducting-rings, each having one wire of an electrical circuit connected therewith, lever-arms corresponding with the number of stations fulcrumed with relation to said rings having contact-pieces upon the outer ends, a revolvable disk mounted upon the shaft concentric with the rings and turnable in unison with the movements of the motor and cage, rollers upon the inner ends of the lever-arms adapted to rest upon the periphery of the disk whereby the contacts at the outer ends are pressed against the rings to complete the circuits, controlling devices at each floor or station whereby an electrical circuit is completed through the arm corresponding with the station at which the cage is to stop, a notch formed in the periphery of the movable disk, a spring acting upon the lever whereby the inner end of the lever drops into the notch when the latter arrives in line with the lever whereby the contact between the outer end of the lever and the rings is broken and the cage-actuated mechanism is stopped.

16. The combination in a floor or station switch of an elevator-cage, of stationary insulated conducting-rings having the two wires of an electrical motor-actuating circuit connected therewith, lever-arms fulcrumed at intervals with relation to the rings corresponding with the stations, and carrying upon the outer ends contact-pieces, a disk, a shaft upon which it is mounted concentric with the rings and revolvable in unison with the movement of the motor and cage, rollers upon the inner ends of the lever-arms resting upon the periphery of said disk whereby the contacts of the outer ends are maintained, a notch in the periphery of said disk which passes beneath the inner ends of the arms, a supplemental disk contiguous to the movable one having a notch made in its periphery, and a lug entering the notch of the movable disk having a less diameter than that of the first notch whereby the inner ends of the arms drop into the notch of the loose disk, and an independent movement of the two disks is permitted whereby the cage is caused to stop at approximately the floor-level when moving in either direction.

17. An elevator-cage, a motor and mechanism by which the cage is movable, an electrically-actuated mechanism including controlling-switches and circuit-closing devices, said devices being arranged in sets at each floor by which the direction of movement of the cage is determined, and a detent by which said mechanism is maintained in operation until the cage has reached its destination.

18. An elevator-cage, a motor and mechanism by which the cage is movable, an electrically-actuated mechanism including controlling-switches and circuit-closing devices, said devices being arranged in sets at each floor by which the direction of movement of the cage is determined, an electrically-actuated detent by which said mechanism is maintained in operation, and a circuit closing and opening device actuated in unison with the movements of the cage.

19. An elevator-cage, a motor and mechanism by which the cage is movable, an electrically-actuated mechanism including controlling-switches

and circuit-closing devices, said devices being arranged in sets at each floor by which the direction of movement is determined, a second mechanism with connections by which it is driven in unison with the movements of the cage, and an electric-motor-actuating circuit controlled by said second mechanism to determine the distance to which the cage moves.

20. An elevator-cage, a motor and mechanism intermediate of the motor and the cage, a series of independent electrical circuits and connected mechanism including sets of levers located at each floor and connected together whereby the direction and destination of the cage are determined, an electrical motor-driving circuit, and means for closing said circuit to start the cage in its predetermined direction, in combination with a mechanism and connections by which it is driven in unison with the motor and cage, said mechanism acting to automatically open the motor-circuit when the cage has reached its destination.

21. The combination with an elevator-cage and an electrically driven motor therefor, of a rotary notched disk driven in unison with the motor and cage, lever-arms by which the electrical circuit of the motor is kept closed by the arms resting upon the rim of the disk, and springs by which any arm arriving at the notch in the disk is moved to break the contact controlled by it, and open the corresponding motor-circuit.

22. The combination with an electrically-driven elevator-motor of a disk turnable in unison with the motor, spring-pressed levers resting upon the periphery of the disk while closing the motor-circuit, a notch in the disk into which the levers fall when passing whereby the circuit is opened and the motor stopped.

23. The combination with an electrically-driven elevator-motor, of a disk turnable in unison with the motor, spring-pressed lever-arms, each controlling an electrical circuit through the motor, electrical contacts which are closed when the levers rest upon the periphery of the disk, a notch in said disk into which the levers drop upon reaching it, to open their electrical circuits, and a concentric loosely-turnable and correspondingly-notched disk of slightly smaller diameter, having a lug to engage the main disk, and limit the independent movement of the second disk.

24. The combination with an electrically-driven elevator-motor of two concentric disks, one turnable in unison with the motor and having a wide notch in its periphery, and the other turnable loosely and having a lug projecting to engage the first-named disk and permit a small independent movement, spring-pressed lever-arms fulcrumed with one end resting upon the first disk, and the other acting to close a motor-circuit, and a notch in the loose disk into which the lever-arms are forced by their springs to open their controlled circuits and by which a sudden independent movement of the second disk is effected.

25. The combination in an electric-motor circuit-breaking device, of a disk revoluble in unison with the motor and having a radial notch in its periphery, a second concentrically-mounted, loose disk of smaller diameter having a narrower notch in its periphery and a lug projecting into the notch of the first disk and allowing a small independent movement, contacts through which the motor-circuit passes, spring-pressed fulcrumed levers beneath one end of which the disks revolve, to cause the opposite ends to close the motor-circuits, each lever falling into the notches of the disks when they register and opening its circuit.

26. The combination in an electric-motor circuit-breaking device of concentrically-revolvable notched disks, and spring-pressed fulcrumed levers with one end resting upon the periphery of the disks so as to fall into the notches when they register, electrical motor-circuits and means carried by the outer ends of the levers to close said circuits while the levers rest upon the disks, and to open the circuits when the levers fall into the notches, and an independent circuit-closing plate, and pins carried by the disk and acting to move the plate and open the circuit if the levers fail to act.

27. The combination with an elevator and an electrically-driven motor therefor, of electrical circuits and mechanism including controlling-switches and circuit-closing devices, said devices being arranged in sets at each floor by which the direction of movement of the cage is controlled, a motor-circuit and means by which it is closed to energize the motor in unison with the directing device, and a mechanism driven in unison with the motor and acting to automatically open the motor-circuit and stop the elevator-cage at any station.

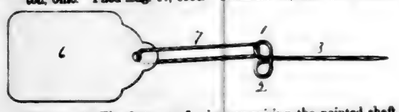
28. The combination with an elevator and an electrically-driven motor therefor, of electrical circuits and mechanism including controlling-switches and circuit-closing devices, said devices being arranged in sets at each floor by which the direction of movement of the cage is controlled, means including a disk and lever-arms contacting with the same by which the motor-circuit is closed, in unison with the direction device, a mechanism by which the motor-circuit is automatically opened when the cage reaches the desired station, electrical circuits by which the previously-described circuits are closed, and means connecting each floor or station with the last-named circuits whereby either one may be closed and the cage set in motion and its direction and its terminal station fixed.

29. The combination with an elevator-cage, an electric motor, an intermediate mechanism, and electrical circuits closable to energize the motor, of a direction-switch consisting of double set of contact-plates carried by a single arm, and pins so connected thereby as to produce a double break of field-circuit and quadruple breaks of the armature-circuit.

30. The combination with an elevator-cage and motor, and floors or stations between which the cage is movable, of mechanism by which the motor-circuit is energized and controlling devices at each floor, slides movable to lock or unlock said devices, levers having one end connected with a slide, and a notched plate fixed to and movable with the slidable door, and engaging the opposite end of a lever, whereby the slides are moved in unison with the movements of the doors.

31. The combination with an electrically-operated elevator, devices located at each floor whereby the controlling-circuits are energized, locking-slides and fulcrumed levers connected therewith, of slidable doors with notched plates fixed thereto and engaging the levers, said plates having the upper part projecting over the notches to insure the engagement of the levers during the closing movement of the doors.

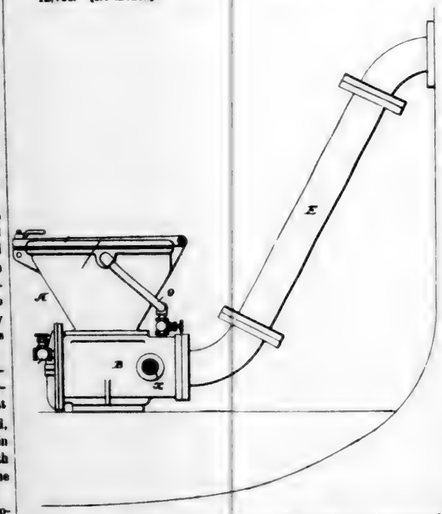
708,756. STRING-TICKET FASTENER. SIMON DABCTGER, Dayton, Ohio. Filed Aug. 17, 1901. Serial No. 72,362. (No model.)



Claim.—1. The fastener of wire comprising the pointed shaft, the like loops 1 and 2 forming the head, the former loop crossing said shaft and the end of the latter terminating contiguously to the former, substantially as described.

2. The fastener of wire comprising the pointed shaft with point bent at a right angle, the loops 1 and 2 forming the head, the former loop crossing said shaft and the end of the latter terminating contiguously to the former, substantially as described.

708,757. EJECTOR APPARATUS. MARSHALL T. DAVIDSON and WILLIAM A. DREWETT, Brooklyn, N. Y. Filed Apr. 13, 1900. Serial No. 12,766. (No model.)



Claim.—1. An ejector apparatus provided with an ejector-nozzle and means for supplying fluid under pressure thereto, and a receptacle communicating with the nozzle and arranged to permit the contents to pass by gravity to the rear end of the nozzle and means for supplying fluid to mix with said contents, substantially as set forth.

2. An ejector apparatus including a receptacle having a hopper for the solid material to be ejected, and an ejector-nozzle having a central passage communicating at its rear end with the receptacle and with a surrounding annular passage to deliver an annular stream of fluid into the discharge-orifice thereof, substantially as set forth.

3. The combination in an ejector apparatus of a receptacle and means for supplying fluid thereto, an ejector having a central passage arranged to receive at the rear end the contents of the receptacle passing by gravity thereto, and a surrounding annular passage and means for supplying the latter with fluid under pressure, substantially as set forth.

4. An ejector apparatus including a receptacle for the material to be ejected, an ejector-nozzle located at the delivery end of the receptacle and below the top thereof to receive the material at the rear of the nozzle and constructed to deliver an annular stream of fluid into the discharge-orifice, and means for supplying fluid thereto under pressure, substantially as described.

5. In an ejector apparatus, the combination with a receptacle comprising a body portion and a hopper portion communicating therewith, of an ejector-nozzle located at the delivery end of the body portion of the receptacle, means for supplying fluid under pressure to the nozzle, and connections for supplying fluid to the body portion of the receptacle and to the hopper, substantially as described.

6. In an ejector apparatus, the combination with a receptacle comprising a body portion and a hopper portion communicating therewith, of an ejector-nozzle located at the delivery end of the receptacle and provided with an annular orifice, a chamber communicating with said orifice means for supplying said chamber with fluid under pressure, and connections from the chamber to the body portion and hopper portion of the receptacle for supplying a stream of fluid thereto, substantially as described.

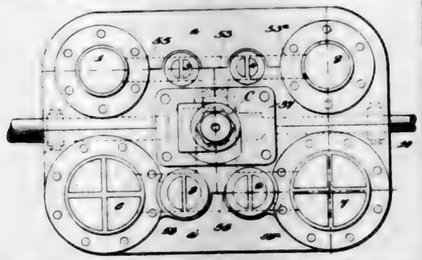
7. In combination with a vessel and with an ash-ejector of the type wherein ashes are ejected overboard by means of a water-jet traversing a discharge-conduit, a separate branch conduit adapted to deliver bilge-water to the discharge-conduit and communicating directly with the bilge of said vessel and with said discharge-conduit to deliver bilge-water to the same between the points of inlet to said discharge-conduit of the ashes and the water-jet, substantially as described.

8. In combination with a vessel, a discharge-conduit leading overboard, means for producing a water-jet directed outwardly through said conduit, a supply-conduit connecting said discharge-conduit with a receptacle for ashes and a separate conduit adapted to conduct bilge-water to said discharge-conduit and connecting with the bilge of said vessel, substantially as described.

9. The combination with the hopper and discharge-pipe of an ash-ejector, of a source of fluid-supply to the ejector and means for connecting the hopper and discharge-pipe with the bilge independently of the said source of fluid-supply, substantially as set forth.

10. The combination with the hopper and discharge-pipe of an ash-ejector, of a pump adapted to pump water from the bilge and force it through the ejector and discharge-pipe, and an independent connection leading from the bilge to the hopper and discharge-pipe and through which water may be sucked by the action of the ejector and discharged through said discharge-pipe, substantially as set forth.

708,758. STEAM-MOTOR. IRVING S. DAVIS, Scranton, Pa. Filed Nov. 2, 1901. Serial No. 80,919. (No model.)



Claim.—1. A steam-motor comprising a pair of crank-shafts suitably geared to revolve in unison, a pair of steam-cylinders opposite each crank-shaft, pistons within said cylinders, connecting-rods connecting each crank-shaft with the pistons in the opposing pair of cylinders, a valve for each steam-cylinder adapted to control the inlet and outlet of steam thereto, and an adjustable controlling-valve and ports leading therefrom to the several cylinders, said controlling-valve and ports being arranged to cause the motor to operate either simple or compound according to the position of the controlling-valve.

2. A steam-motor comprising two pairs of cylinders, a crank-shaft opposite each pair of cylinders, said shafts being suitably geared to revolve in unison, pistons within the cylinders, connecting-rods connecting each crank-shaft with the pistons in the opposing cylinders, a valve for each cylinder adapted to control the inlet and outlet of steam thereto, a controlling-valve casing removably secured within the cylinder-frame, a controlling-valve adjustable within said casing and ports in the cylinder-frame leading from the several cylinders to ports in the controlling-valve casing, said valve and ports being arranged to cause the motor to move in either direction and to operate either simple or compound, according to the position of the controlling-valve.

3. A steam-motor comprising a cylinder-frame having two pairs of cylinders, a crank-shaft opposite each pair of cylinders, said shafts being suitably geared to revolve in unison, pistons within the cylinders, connecting-rods connecting each crank-shaft with the pistons in the opposing cylinders, a valve for each cylinder adapted to control the inlet and outlet of steam thereto, a controlling-valve casing removably secured within the cylinder-frame, a controlling-valve adjustable within said casing and ports in the cylinder-frame leading from the several cylinders to ports in the controlling-valve casing, said valve and ports being arranged to cause the motor to move in either direction and to operate either simple or compound, according to the position of the controlling-valve.

4. A steam-motor comprising high-pressure and low-pressure cylinders, a valve for each cylinder arranged to control the inlet and outlet of steam thereto, a controlling-valve and passage-ways leading therefrom to the cylinder-valves, said controlling-valve and passage-ways being so arranged as to cause the motor to operate simple or compound, according to the position of the controlling-valve.

5. A steam-motor comprising high-pressure and low-pressure cylinders, a valve for each cylinder arranged to control the inlet and outlet of steam thereto, a controlling-valve and passage-ways leading therefrom to the cylinder-valves, said controlling-valve and passage-ways being so arranged as to cause the motor to run in either direction and to operate simple or compound, according to the position of the controlling-valve.

6. In a steam-motor, the combination with two pairs of cylinders, pistons within the cylinders, a crank-shaft opposite each pair of cylinders and connecting-rods connecting each pair of pistons to the opposing crank-shaft, of a controlling-valve arranged between the two pairs of cylinders, ports leading from said valve to the several cylinders, said valve being arranged to control the direction of the steam through the cylinders whereby the motor may be operated either simple or compound and in either direction.

7. In a steam-motor, two high-pressure cylinders, two low-pressure cylinders, a separate valve-cylinder and a slide-valve therein for each steam-cylinder, a controlling-valve cylinder having a central steam-inlet and exhaust passage-ways leading from its opposite ends, two passage-ways leading from said controlling-valve cylinder to the slide-valves of the high-pressure cylinders, two passage-ways leading from said controlling-valve cylinder to the slide-valves of the low-pressure cylinders, and a controlling-valve within the controlling-valve cylinder arranged to direct the steam through said passage-ways to operate the engine simple or compound and in either direction.

8. In a steam-motor, the combination with a pair of high-pressure cylinders, a pair of low-pressure cylinders, and separate valves arranged to control the admission of steam to said cylinders, of a controlling-valve cylinder having exhaust-ports at either end, a central steam-inlet, two ports on either side of the steam-inlet leading to the high-pressure-cylinder valves and two ports leading to the low-pressure-cylinder valves and a hollow cylindrical controlling-valve within said controlling-valve cylinder, said controlling-valve having heads at either end, ports extending through its walls adjacent to the heads, and an intermediate portion opposite the steam-inlet of less diameter than the heads.

9. A steam-motor comprising two shafts geared to turn in unison, each shaft having two diametrically opposite cranks and the cranks of the two shafts being relatively ninety degrees apart, a pair of steam-cylinders opposite each crank-shaft, pistons within said cylinders, connecting-rods connecting said pistons with the cranks on the opposing shaft, a slide-valve for each cylinder and a pair of eccentrics on each shaft arranged to operate the valves of the opposing cylinders.

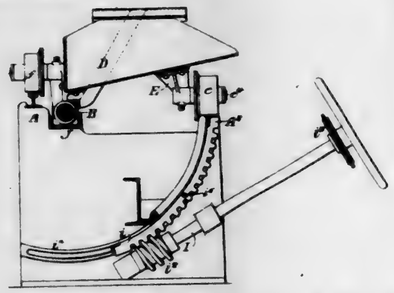
10. A steam-motor comprising two shafts geared to turn in unison, each shaft having two diametrically opposite cranks, a pair of steam-cylinders opposite each crank-shaft, pistons within said cylinders, connecting-rods connecting said pistons with the cranks on the opposing shaft, a slide-valve for each cylinder and a pair of eccentrics on each shaft arranged to operate the valves of the opposing cylinders.

708,759. ENDLESS CONVEYER. JAMES M. DODGE, Philadelphia, Pa., assignor to the Link Belt Engineering Company, Philadelphia, Pa., a Corporation of Pennsylvania. Filed Dec. 17, 1900. Serial No. 40,207. (No model.)

Claim.—1. The combination in an endless-chain horizontal conveyer, of a chain, means for driving said chain, carriers pivoted thereto, the pivot of each carrier being longitudinal, and means for allowing the carriers to swing on their pivots below the carrying level to discharge their loads, substantially as described.

2. The combination of a chain, means for driving said chain, a se-

ries of carriers pivoted thereto, the pivot of each carrier being longitudinal, two rails, one rail supporting the inner side of the carrier and the other the outer side thereof, with means for depressing the outer supporting-rail to allow the carriers to turn on their pivots to discharge, substantially as described.



3. The combination of a chain, means for driving said chain, an inner and an outer rail, one on each side of the chain, a series of carriers pivoted to the chain, the pivot of each carrier being longitudinal, two wheels on each carrier arranged to travel on the two rails respectively, and means for deflecting the outer rail so as to cause the carrier to tilt, the chain acting as the pivot, substantially as described.

4. The combination in an endless-chain conveyer, of an endless chain, means for driving said chain, a series of carriers pivoted to the chain, the pivot of each carrier being longitudinal, a wheel mounted on each carrier, a rail for supporting said carrier in its normal position, said rail being interrupted at the discharge-point, and a movable rail forming a continuation of the carrying-rail so that when it is desired to discharge the carriers said movable rail is moved out of line to allow the carriers to tilt, substantially as described.

5. The combination in a conveyer, of an endless chain, carriers pivoted thereto, the pivot of each carrier being longitudinal so that the carriers can be tipped laterally to discharge, with hoods secured to the chain and overlapping the adjoining edges of the carriers, substantially as and for the purpose set forth.

6. The combination in a conveyer of an endless chain, means for driving said chain, carriers pivoted to the chain, a rail supporting the outer end of each carrier, means for lowering the support at the discharge-point, and a hood carried by the chain and overlapping the edges of the carrier, substantially as described.

7. The combination of an endless chain, a carrier having ends and an inner side, said carrier being pivoted to the chain at the inner side, the pivot being longitudinal, two wheels on each carrier, rails for supporting the wheels, one of said rails being interrupted, a movable rail inserted in the interrupted portion, and a curved rail at the interrupted portion over which the carriers travel when discharging, substantially as described.

8. The combination in a conveyer, of a series of carriers having inclined bottoms, a bracket secured to the inner side of each carrier, a drive-chain to which the bracket is pivoted, the pivot of each carrier being longitudinal, a bracket secured to the bottom of each carrier, a wheel on said bracket, and a rail supporting the wheel, substantially as described.

9. The combination of an endless chain, a series of carriers pivoted to the chain so as to be moved up or down, a rail supporting the outer ends of said carriers, a curved rail-section forming a continuation of the main rail-section and arranged to support the carriers when tilted to discharge the material, a movable rail-section, a segment on said rail-section, a shaft, and a worm on the shaft engaging the segment, so that when the worm-shaft is turned the movable rail will be raised or lowered, substantially as described.

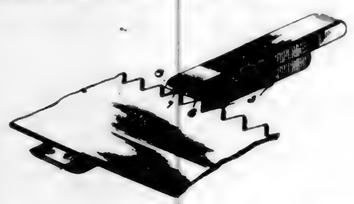
708,760. MANUFACTURE OF VISCOSE. ARTHUR FIELDEN, Salford, England. Filed Nov. 5, 1901. Serial No. 81,250. (No specimens.)

Claim.—The herein-described process consisting of the admixture of a suitable bisulfite with viscose (cellulose sulfocarbonate) and the incorporation of the mixture with fibrous pulp in the manufacture of paper, and subsequent drying and steaming to complete the decolorization and fixation of the viscose.

708,761. PROCESS OF FIXING VISCOSE ON TEXTILES, &c. ARTHUR FIELDEN, Salford, England. Filed Feb. 18, 1902. Serial No. 94,687. (No specimens.)

Claim.—The herein-described process of fixing viscose on goods said process consisting of the impregnation of the goods with viscose, drying the goods, and fixing the viscose by means of steaming.

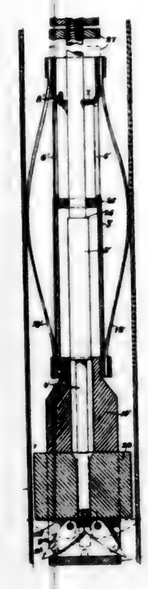
708,762. SAW-SET. AXEL M. GILBE, Dickinson Center, N. Y. Filed Feb. 24, 1902. Serial No. 95,416. (No model.)



Claim.—1. A saw-set comprising a bed, a gage 4 adjustable with relation to the bed having its working face adapted to move a greater or less distance from the plane of the surface of the same, a die having an inclined end forming an acute angle with the bed, said inclined end being about on a line with the aforementioned inner end of the gage, the die being longitudinally adjustable in elongated openings in the bed and means for clamping the said die in an adjusted position, substantially as set forth.

2. A saw-set comprising a bed, a die longitudinally adjustable in elongated openings upon the bed and having an inclined end forming an acute angle with the bed, the inclined end being grooved, an adjustable gage 4 located in the angle aforementioned about in line with the inclined end of the die and having its working face adapted to move a greater or less distance from the plane of the surface of the bed to receive the impinge and thereby regulate the set of the saw-teeth, and corrugations upon the meeting sides of the die and bed to prevent slipping of the former upon the latter, substantially as and for the purpose set forth.

708,763. MACHINE FOR PERFORATING PIPES. EDWIN R. GRAHAM, Bakersfield, Cal. Filed Jan. 7, 1902. Serial No. 88,756. (No model.)



Claim.—1. The combination of a rod adapted to be reciprocated within the well-casing, a mandrel or spreader carried on said rod, a block having a series of radially-operating knives or punches disposed in relation to said mandrel, means by which said block may be supported at any desired point in the casing and means by which the mandrel may be supported out of contact with the knives.

2. The combination of a rod adapted to be reciprocated within the well-casing, a head or block in which are carried a series of punches or perforators, spring-guides by which said head is supported at any desired point in the well, a mandrel on said rod adapted to operate said perforators to drive them outwardly against the casing, and means by which the perforators are automatically retracted.

3. The combination of a head adapted to be moved in a well-casing, a series of radially-disposed knives or perforators on said head, a mandrel or spreader by which said knives or punches are operated to perforate the casing, a section or sleeve in which said mandrel is slidable, longitudinal slots in said sleeve, a radial projection on said mandrel slidable in said slots, and notches formed in the walls of said slots with which said projections may engage whereby the mandrel may be held out of contact with the perforators.

4. The combination of a rod adapted to be reciprocated in a well-casing, a sleeve slidable upon the lower end of said rod, means by which said sleeve is retained on the rod and means by which the slidable movement of the two members in relation to each other is limited, a head carried by said sleeve, knives pivoted in said head, means by which said head is held at any suitable point in the casing, and a prolongation of said rod adapted to engage said knives to drive them outwardly to perforate the casing.

5. The combination of a head adapted to be moved within a well-casing, radial slots in said head, knives movable in said slots, said knives having a pivoted socket portion and a removable knife-point portion removably fitting the sockets of said pivoted portions, means for supporting said head at any desired point in the well and means by which said knives are operated to perforate the casing.

6. The combination of perforating means, a radially-slotted head, knives pivoted in said slots, said head having an axial bore, a mandrel movable in said bore and adapted to operate said knives, and means adapted to suspend the head at any point in the well-casing.

7. The combination of perforating means, a radially-slotted head, knives pivoted in said slots, projections or shoulders upon the adjacent inner ends of said knives, a mandrel adapted to engage said shoulders to force the knives outward against the casing, means by which the movement of said knives in either direction is limited, and means capable of suspending the head at any point in the well-casing.

8. The combination, of a rod adapted to extend into the casing, a mandrel or spreader carried at the end of said rod, a sleeve in which said mandrel is slidable, longitudinal slots in said sleeve, projections on said mandrel extending into said slots, a head in connection with said sleeve, radially-operating knives carried by said head, said mandrel adapted to engage said knives to force the latter outwardly against the casing, means for holding the head at any desired point in the casing, and a collar carried by the mandrel and adapted to contact with the end of the sleeve when the mandrel engages the knives, whereby the movement of the mandrel through the head and sleeve may be limited.

9. The combination of a mandrel, a sleeve in which said mandrel has a limited reciprocating movement, means by which the withdrawal of the mandrel from the sleeve is prevented, a head carried on the lower end of said sleeve, said head having an axial bore in which the mandrel is movable, transverse slots in said head, knives pivoted in said slots, the inner adjacent ends of said knives projecting into the path of the mandrel and adapted to be engaged by the latter whereby the knives are operated, a plate by which the upward movement of the knives is limited, and spring members secured upon said sleeve whereby the device may be centered and held at any desired point in the casing.

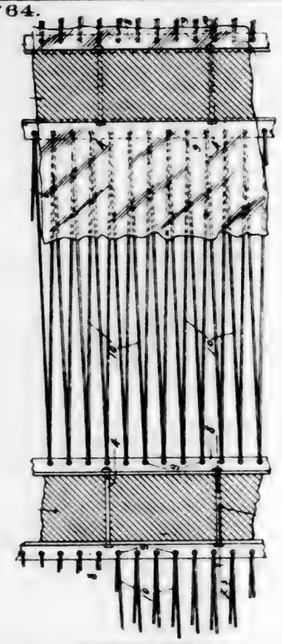
708,764. FIREPROOF FLOORING. CHARLES F. HASLIN, Minneapolis, Minn. Filed May 23, 1901. Serial No. 61,457. (No model.)

Claim.—1. The combination with a wall and the concrete body of a floor, of parallel flanged beams on the opposite sides of said wall, bolts or rods passed through said wall and through the bodies of said floor-beams, which floor-beams have laterally-projecting flanges, and floor-wires anchored to said projecting flanges and embedded in the concrete floor-body, substantially as described.

2. The combination with a wall and the concrete body of a floor, of a flanged beam secured to said wall, and floor-wires bent upon themselves and threaded over and over through perforations in the flange of said beam, which wires are embeded in the concrete body of the floor, substantially as described.

3. The combination with laterally-spaced walls and the concrete body of a floor extending between said walls, of flanged beams secured to said walls and provided with laterally-projecting flanges, and floor-wires bent successively in one direction and then in the other and threaded over and over through perforations in the projecting flanges of said two beams, which wires are embedded in the said concrete floor-body, substantially as described.

708,764.



708,765. ORGAN. WILLIAM E. HASKELL and CHARLES S. HASKELL, Philadelphia, Pa. Filed Apr. 29, 1901. Serial No. 58,071. (No model.)

Claim.—1. In an organ, the combination with a register-stop: of an oscillatory stop-digital; means operatively connecting said stop-digital with said register-stop; an oscillatory detent arranged to engage the stop-digital in operative position; a lever-arm upon said detent; an auxiliary digital mounted independently of said stop-digital; and means operatively connecting said auxiliary digital with the arm of said detent, whereby the stop-digital may be released, substantially as set forth.

2. In an organ, the combination with a register-stop; of an oscillatory stop-digital; means operatively connecting the stop-digital with said register-stop; an auxiliary digital provided with a stud; an oscillatory detent arranged to engage said stop-digital in operative position; and an arm upon said detent operatively connected with the auxiliary digital, by said stud, whereby the stop-digital may be released, substantially as set forth.

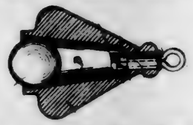
3. In an organ, the combination with a register-stop; of an oscillatory stop-digital; means operatively connecting said stop-digital with said register-stop; an auxiliary digital mounted to oscillate at one side of said stop-digital and independently thereof; an oscillatory detent; and means operatively connecting said auxiliary digital with said detent; whereby said stop-digital may be engaged or released, substantially as set forth.

4. In an organ, the combination with a register-stop; of an oscillatory stop-digital; means operatively connecting said stop-digital with said register-stop; an auxiliary digital mounted to oscillate at one side of said stop-digital; an oscillatory detent; and an arm operatively connecting said auxiliary digital with said detent, whereby said stop-digital may be engaged or released, substantially as set forth.

5. In an organ, the combination with a series of register-stops; of a series of oscillatory stop-digitals; means operatively connecting the stop-digitals with the register-stops; a corresponding series of auxiliary digitals arranged in alternation, respectively at one side of the corresponding stop-digitals; a corresponding series of oscillatory detents; and arms op-

noting the auxiliary digitals with the detents, whereby the stop-digitals may be engaged or released, substantially as set forth.

708,766. SPINNING-TOP. Howard Harlehurst, Chicago, Ill. Filed Dec. 26, 1901. Serial No. 87,219. (No model.)



Claim.—1. In a spinning-top, the combination with a hollow top-body, of a closure for the upper end thereof constituting a projectile and means in the lower portion thereof for exploding a charge of fulminate by the impact of the top with the floor or ground in spinning, substantially as described.

2. In a spinning-top, the combination with a top-body having a chamber formed therein, of a closure for the upper end thereof constituting a projectile, a fixed seat or anvil in the lower end of said chamber, and a longitudinally-slidable spindle the upper end of which constitutes a hammer to explode a charge of fulminate against the anvil on the impact of the top with the floor or ground in spinning, substantially as described.

3. In a spinning-top, the combination with a top-body having a chamber formed therein and a closure therefor constituting a projectile, of a bushing fixed in the lower end of the top and entering the lower end of said chamber, said bushing being closed at its inner end to form an anvil and having a lateral aperture communicating with said chamber, and a removable spindle longitudinally slidable in said bushing, the upper end of which constitutes a hammer to explode a charge of fulminate against the anvil on the impact of the top with the floor or ground in spinning, substantially as described.

4. In a spinning-top, the combination with a top-body longitudinally chambered and apertured and a closure therefor constituting a projectile, of a fixed seat or anvil in the lower end of said chamber, and a spindle adapted to be inserted and withdrawn through the lower end of the top-body for the application of a charge of fulminate, the upper end of said spindle serving as a hammer to explode the charge against said anvil when the top is thrown to the floor or ground, substantially as described.

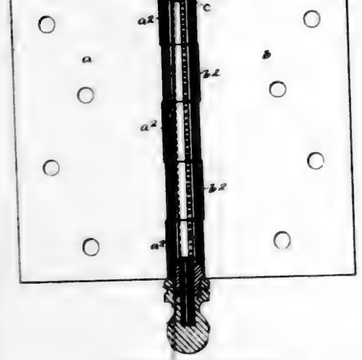
5. In a spinning-top, the combination with a top-body longitudinally chambered and apertured, of a fixed seat or anvil in the lower end of said chamber, and a longitudinally-split spindle the divided shank or stem of which is adapted to be inserted and withdrawn through the lower end of the top-body for the application of a charge of fulminate, the two sections of said shank at their upper ends constituting a hammer to explode a charge of fulminate against the anvil and at their lower ends being united by an elastic connection, substantially as described.

6. In a spinning-top, the combination with a top-body having a chamber formed therein, of a laterally-apertured bushing having a closed inner end constituting an anvil fixed in the lower end of the top and communicating with said chamber, and a longitudinally-split elastic spindle slidably and removably engaging said bushing for the application, retention and explosion of a charge of fulminate between the inner end of the spindle and the anvil of the bushing, substantially as described.

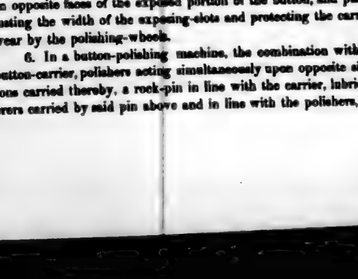
7. A detonating top adapted also as a receptacle for merchandise in small quantities, comprising in combination a top-body having a chamber formed therein, a laterally-apertured bushing having a closed inner end constituting an anvil passed through the lower end of the top-body and communicating with said chamber, a longitudinally-split elastic spindle slidably and removably engaging said bushing for the application, retention and explosion of a charge of fulminate between the inner end of the spindle and the anvil of the bushing, and a closure for the upper end of said chamber which also constitutes a projectile, substantially as described.

708,767. HINGE. Abbot H. Easterbrook, Jersey City, N. J. Filed Apr. 16, 1902. Serial No. 103,128. (No model.)

Claim.—A hinge, the wings or plates of which are provided with



708,768. BUTTON-POLISHING MACHINE. John Hornby, Woonsocket, R. I. Filed Apr. 4, 1902. Serial No. 101,439. (No model.)



Claim.—1. In a button-polishing machine, the combination with a circular rotating button-carrier constructed to expose substantially half of a button beyond its periphery, of a wheel mounted on a shaft at a right angle to that of the carrier, provided with a peripheral polishing-surface and arranged to bear upon the exposed portion of a button in the carrier.

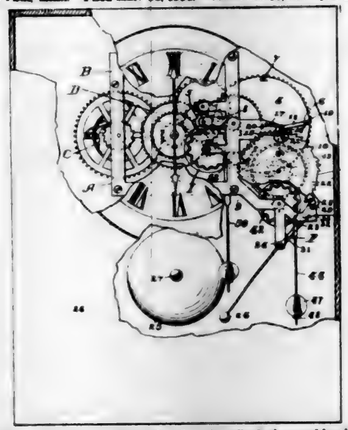
2. In a button-polishing machine, the combination with a rotating button-carrier, and guides on opposite sides thereof provided with exposing-slots, of polishing-wheels mounted on shafts at right angles to that of the carrier and arranged to meet in said exposing-slots.

3. In a button-polishing machine, the combination with a rotatable button-carrier provided in its periphery with substantially semicircular button-seats, of polishing-wheels rotating in planes at right angles to the plane of the carrier and bearing upon opposite sides of buttons on portions thereof which project beyond the seat in the carrier.

4. In a button-polishing machine, the combination with a button-carrier, provided with peripheral seats arranged to expose one-half of the buttons beyond its periphery, and polishing-wheels rotating in opposite directions and bearing simultaneously upon the opposite faces of the exposed portions of the buttons.

5. In a button-polishing machine, the combination with a button-carrier provided with peripheral seats arranged to project one-half of a button beyond its periphery, guides for the carrier slotted to expose the projected portion of a button, polishing-wheels acting through said slots on opposite faces of the exposed portion of the button, and plates for adjusting the width of the exposing-slots and protecting the carrier against wear by the polishing-wheels.

6. In a button-polishing machine, the combination with a rotating button-carrier, polishers acting simultaneously upon opposite sides of buttons carried thereby, a rock-pin in line with the carrier, lubricator-delivverers carried by said pin above and in line with the polishers, and means



Claim.—1. In a device of the class described, the combination of a twenty-four-hour gear meshing with a time mechanism and carrying tapering trips, of a switch in the path of said trips having a stop-jaw, a stop adapted to impinge against said jaw, a toothed disk, a drive-spring; said stop, disk and spring connected to a shaft, a pivoted hammer having an arm impinging against said teeth, and a bell adjoining said hammer.

2. A clock, consisting in combination with its time-gearing and a supporting-frame of a twenty-four-hour gear, meshing with said time-gearing and having trips disposed upon its face; a spring-controlled toothed disk, journaled upon said frame and having a stop; a spring-controlled dog, in engagement with said stop and having a lever extending so as to release the stop from the dog as the trips revolve, said dog being adapted to check the disk at each revolution; a pivoted lever-hammer adjoining a sounder and having an operating-arm impinging against the teeth of the disk and adapted to communicate a racking motion to the hammer and strike the sounder as the disk revolves, and an escapement connected to said disk whereby the speed of the striking mechanism is governed.

3. In a device of the class described, the combination with the time mechanism, of tapering trips revolubly connected therewith, and striking mechanism, consisting of a spring, a toothed disk, a spring-controlled pivoted dog with a stop-jaw in the path of the trips, and a stop carried by the striking mechanism with which the dog connects; said dog being operated to engage the stop by the trips as they revolve.

4. In a device of the class described, the combination with the time mechanism, of the auxiliary striking mechanism, means for operating said auxiliary striking mechanism in conjunction with the time mechanism, and the escapement for the striking mechanism consisting of a journaled piece having a continuous groove in the form of a reverse curve around its center and a pivoted lever weighted on one end and carrying a pin near its opposite end, which pin projects into said groove.

708,770. PHOTOGRAPHIC-PRINTING FRAME. Stephen G. Johnson, South Orange, N. J. Filed June 25, 1902. Serial No. 113,171. (No model.)

Claim.—1. A photographic-printing frame provided with a series of laterally-adjustable matting-sheets overlapping each other within the frame and means for holding and guiding them in close contact with the negative, substantially as described.

2. A photographic-printing frame having slotted walls and laterally-adjustable matting-sheets passing through said slotted walls, substantially as described.

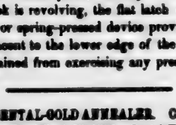
3. A photographic-printing frame provided with slotted walls, a clear-glass front, and a series of laterally-adjustable matting-sheets passing

4. A photographic-printing frame provided with a series of laterally-adjustable matting-sheets of flexible material, overlapping each other within the frame and rollers on which the portions of the sheets beyond the edges of the frame can be wound up.

5. A photographic-printing frame, provided with slotted walls, and adjacent rollers carrying flexible matting-sheets projecting into the frame through the slotted walls.

6. A photographic-printing frame, provided with slotted walls and adjacent rollers carrying flexible matting-sheets projecting into the frame through the slotted walls and bearings in which the rollers are frictionally mounted.

708,771. LOCK-STITCH SEWING-MACHINE. Karl S. Klogel, New York, N. Y. Filed Sept. 12, 1899. Serial No. 730,278. (No model.)



Claim.—1. In a sewing-machine a revolving hook having a loop-seizing beak provided with a laterally enlarged or broadened base and an outside guard or thread-guide connected to the base of the beak and extending toward its point, the said hook having also an axially-projecting rim forming a cavity and which rim is provided with a notch or recess in the rear of the loop-seizing beak.

2. In a sewing-machine a revolving hook having a loop-seizing beak provided with a laterally enlarged or broadened base and an outside guard or thread-guide connected to the base of the beak and extending toward its point, the said hook having also an axially-projecting rim forming a cavity and which rim is provided with a notch or recess in the rear of the beak, and with another notch or recess diametrically opposite the beak or nearly so, through which the loop of needle-thread is withdrawn.

3. In a sewing-machine, the combination with a revolving hook having a loop-seizing beak, and an axially-projecting rim forming a cavity, of a bobbin-case located in the cavity of the hook and having an open front face, a radially-projecting circumferential rim on the front face, a central post for the reception of a bobbin and a bobbin-retaining latch consisting of a cross-piece mounted upon a spring-pressed pin or pivot in the circumferential rim, the said cross-piece extending one end to the central post in the bobbin-case and provided with a stud or nipple fitting into a hole in the outer end of the central post and the other end toward the throat-plate of the machine and means, substantially as set forth, engaging the said bobbin-retaining latch or cross-piece, whereby the bobbin-case is held stationary.

4. In a sewing-machine, the combination of a revolving hook having a loop-seizing beak, an axially-projecting rim forming a cavity, a bobbin-case located in the cavity of the hook and having an open front face, a bobbin-retaining latch or cross-piece pivoted on its front face and extending one end upward or toward the throat-plate of the machine, with a bobbin-case holder or flat latch provided with a slot engaging the bobbin-retaining latch or cross-piece, whereby the bobbin-case is held stationary while the hook is revolving, the flat latch or bobbin-case holder having also a spring or spring-pressed device provided with a projecting curvature that is adjacent to the lower edge of the front opening in the bobbin-case but restrained from exercising any pressure thereon.

708,772. DENTAL-GOLD ANNEALER. Chapin F. Lauderdale, Milwaukee, Wis. Filed Sept. 23, 1901. Serial No. 76,167. (No model.)

Claim.—1. An annealing or heating attachment for dental lamps, comprising a bowl having an open-bottom portion and provided with an

annealing-plate, a flame-shield arranged below said annealing-plate, a burner socket or clip, and means for connecting the same to said bowl.

2. An annealing or heating attachment for dental lamps, comprising a bowl having an annealing-plate and terminating in a contracted neck, a flame-guard arranged below said bowl, a burner socket or clip, and means for connecting the socket or clip to the flame-guard and the bowl.

3. An annealing or heating attachment for dental lamps, comprising a bowl having a lower neck portion, an annealing-plate carried by said bowl, a shield or guard arranged within the bowl at a point below the annealing-plate, a cylindrical flame-guard disposed below said bowl, a burner socket or clip, and means for connecting the same to the cylindrical flame-guard and the bowl.

4. An annealing or heating attachment for dental lamps, comprising a bowl having a lower neck portion, an annealing-plate carried by the bowl, a guard or shield arranged within the bowl at a point below the annealing-plate, a carrying-clip for said shield, a cylindrical flame-guard arranged below and surrounding the neck portion of the bowl, and a spring ring or socket having integral arms bent outwardly and upwardly and secured to the cylindrical guard and to the neck portion of the bowl.

708,778. CORSET. JULIUS LEBDAUER, Paris, France. Filed Sept. 30, 1901. Serial No. 77,074. (No model.)

Claim.—A corset comprising a main part A of substantially the usual height adapted to pass around the body except in front, provided with whalebones for the whole of its height and formed of two sections connected by a lacing, in combination with a downwardly-widened part B of less height than the main part arranged at the front of the corset and covering only the abdomen to slightly above the waist, said part B being formed of two symmetrical sections provided only with busks at their free adjacent edges for securing the corset in place, and being seamed to the main part A, substantially as and for the purpose set forth.

708,774. COMPOSITION OF MATTER. EDWARD L. LIVINGSTON, New York, and WILBUR A. VANDERCOOK, Brooklyn, N. Y. Filed Jan. 15, 1902. Serial No. 89,877. (No specimens.)

Claim.—1. The herein-described composition of matter comprising a permanganate and chlorid of sodium, substantially as and for the purpose specified.

2. The herein-described composition of matter comprising a permanganate, chlorid of sodium, and dioxid of manganese, substantially as and for the purpose specified.

3. The herein-described composition of matter comprising a permanganate, chlorid of sodium, and peroxid of hydrogen, substantially as and for the purpose specified.

4. The herein-described composition of matter comprising a permanganate, chlorid of sodium, peroxid of hydrogen, and dioxid of manganese, substantially as and for the purpose herein specified.

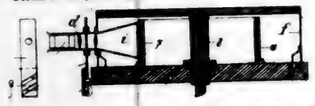
5. The herein-described composition of matter comprising a permanganate, chlorid of sodium, peroxid of hydrogen, dioxid of manganese, and water, substantially as and for the purpose herein specified.

6. The herein-described composition of matter comprising a permanganate, chlorid of sodium, and water, substantially as and for the purpose herein specified.

7. The herein-described composition of matter comprising a permanganate, chlorid of sodium, dioxid of manganese, and water, substantially as and for the purpose herein specified.

8. The herein-described composition of matter comprising a permanganate, chlorid of sodium, peroxid of hydrogen, and water, substantially as and for the purpose herein specified.

708,775. PANORAMIC PHOTOGRAPHIC APPARATUS. AUGUSTE LUMIÈRE and LOUIS LUMIÈRE, Lyon-Monplaisir, France. Filed Mar. 20, 1901. Serial No. 52,077. (No model.)



Claim.—1. In a panoramic camera, the combination with the rotating case, of means for supporting a sensitive surface therein in circular position, a lens and shutter carried by the outer periphery of said case, and means for deflecting the rays of light prior to their entering said lens, substantially as described.

2. In a panoramic camera, the combination with a circular rotating case, of means for supporting a film therein in a vertical position concentric with the case, an objective in the outer peripheral wall of said case having a suitable shutter, a screen within the case limiting the range of the light-rays, and deflecting means for deflecting the rays of light prior to their entering the objective, substantially as described.

3. In a panoramic camera, the combination with a rotating case having means for supporting a sensitive surface in circular position within the case, of a lens and shutter carried by said case and adapted to swing around said sensitive surface in a path concentric therewith, and means for deflecting the rays of light in a plane parallel with the line of movement of the lens, substantially as described.

4. In a panoramic camera, the combination with the case having means for supporting a sensitive surface therein in circular position, of a lens swinging concentric with said circular surface, a swinging light-confining screen extending from the lens toward the sensitive surface and terminating in a narrow slit in proximity to said surface, said slit being arranged at right angles to the line of movement of said screen, and light-deflecting means in proximity to said lens arranged to deflect the light which enters said lens in a plane at right angles to said narrow slit, substantially as described.

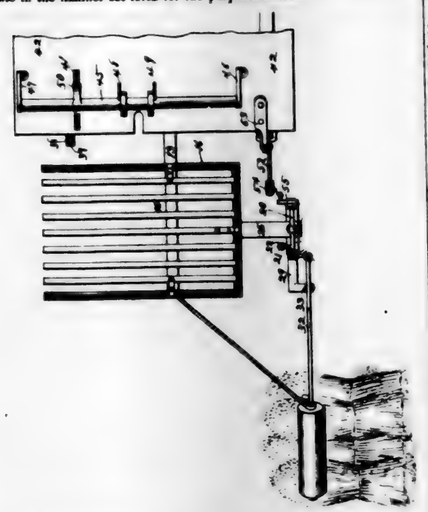
708,776. AUTOMATIC BUNDLE-CARRIER FOR HARVESTERS. WILLIAM MARTENS, Ackley, Iowa. Filed May 21, 1900. Serial No. 17,357. (No model.)

Claim.—1. In a bundle-carrier for harvesters, a frame adapted to be fixed to a harvester, a bundle-carrier pivotally connected to said frame, a lever extended stubbleward from the bundle-carrier having a traveler on its end adapted for running on the ground and trip mechanism for detachably connecting the lever with the pivoted bundle-carrier, arranged and combined to operate in the manner set forth.

2. A frame for supporting a bundle-carrier, a bundle-carrier pivoted to the frame, a rock-shaft mounted on the frame an arm extending from the rock-shaft for holding the bundle-carrier, a lever extended stubbleward from the bundle-carrier, an arm on the end of the rock-shaft connected with said lever, and a traveler adapted for running on the ground on the free end of the lever, arranged and combined to operate in the manner set forth for the purposes stated.

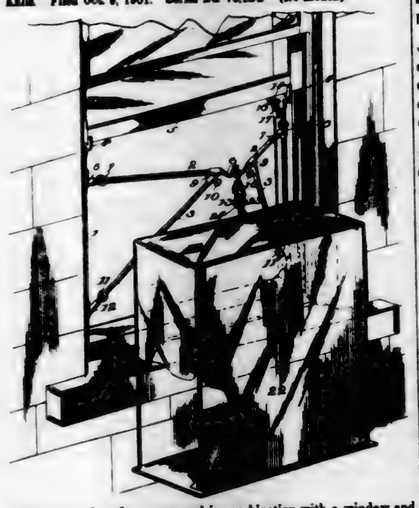
3. A frame for supporting a bundle-carrier, a bundle-carrier pivoted to the frame and provided with an arm, a rock-shaft mounted on the frame and provided with an arm for engaging the arm of the bundle-carrier, an arm on the end of the rock-shaft, a lever extending stubbleward from the bundle-carrier, pivoted to the frame and connected with the arm on the end of the rock-shaft and a traveler on the free end of the lever adapted for running on the ground, arranged and combined to operate in the manner set forth for the purposes stated.

4. A harvester-frame, the carrier hinged for rearward tilting, the rock-shaft, the arm on the rock-shaft engaging said carrier, a trigger pivoted to the frame and means for attaching the trigger to said rock-shaft, the crank-shaft formed with a crank arranged to engage said trigger, the lever connected with a crank on the end of the rock-shaft projecting stubbleward and provided with a traveler on its free end to run on the ground, the counter-shaft, the star-wheel thereon, the clearer-bar arranged for rotation, the arm on the clearer-bar arranged for engagement with successive teeth of the star-wheel and the sprocket-wheel and chain connection between the crank-shaft and counter-shaft, arranged and combined to operate in the manner set forth for the purposes stated.



5. In a device of the class described the rock-shaft, means for oscillating said rock-shaft in one direction, the crank-arm on said rock-shaft, the bundle-carrier arranged for tilting, the arm on the bundle-carrier and arranged to be engaged by the crank-arm on the rock-shaft, the retractile coil-spring attached to the rock-shaft and means for securing said spring whereby the rock-shaft may be returned to a given position.

708,777. FIRE-ESCAPE. ALEXANDER MCCUTCHEON, Emporia, Kans. Filed Oct. 9, 1901. Serial No. 78,194. (No model.)

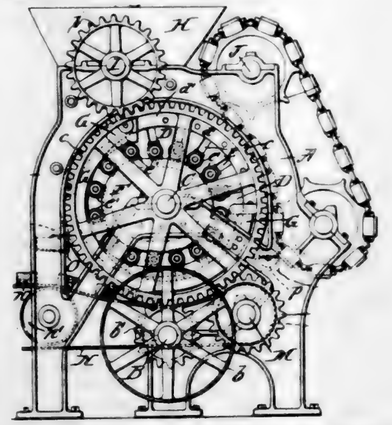


Claim.—1. In a fire-escape and in combination with a window and hoisting mechanism, a post stopped upon the window-sill and having a U-shaped head to receive the lower rail of a sash, and a jib and a brace connected to each other and to the post, substantially as described.

2. In a fire-escape and in combination with a window and hoisting mechanism, a post stopped upon the window-sill, a U-shaped head at the upper end of the post to embrace the sides of the lower rail of a sash, a T-fitting near the upper end and a Y-fitting near the lower end of the post, a jib pivoted to the T-fitting, a Y-fitting at the outer end of the jib, and a brace pivoted to the Y-fitting of the post and adapted to make detachable connection with the Y-fitting at the outer end of the jib, substantially as specified.

3. In a fire-escape, the combination with a window, a crane, an iron having a loop, a second iron having a hook at one end and having its opposite end bent to pass through the said loop, a screw coöperating with the loop and bent ends of the irons to clamp a portion of the window-casement, and a connection between the crane and the bent end of the iron, substantially as set forth.

708,778. BRICK-PRESS. JOSEPH J. HIETERS, St. Louis, Mo. Filed May 20, 1901. Serial No. 61,102. (No model.)



Claim.—1. In a brick-press, the combination with a hopper, of a mold-wheel provided with pockets in its periphery, plungers arranged in the bottoms of said pockets, and a cam for holding said plungers in their outermost position when they enter the hopper and for permitting said plungers to occupy their innermost position as they leave the hopper; substantially as described.

2. In a brick-press, the combination with a hopper, of a mold-wheel provided with pockets across its periphery, flange-rings forming the side walls of said pockets, plungers arranged in the bottoms of the pockets, said plungers having laterally-extending arms carrying rollers, and cams on each side of the mold-wheel for coöperating with said rollers; substantially as described.

3. In a brick-press, the combination with a mold-wheel formed with pockets in its periphery, of a traveling carrier provided with presser-shoes, at least two of which coöperate with the pockets of the mold-wheel at all times by being received therein; substantially as described.

4. In a brick-press, the combination with a mold-wheel formed with pockets in its periphery, of an endless chain carrying presser-shoes, and removable face-plates on said presser-shoes, at least two of which coöperate with the pockets of the mold-wheel at all times by being received therein; substantially as described.

5. In a brick-press, the combination with the mold-wheel formed with pockets in its periphery, of an endless chain, presser-shoes carried by said endless chain, face-plates on said presser-shoes for entering the pockets of the mold-wheel, and an eccentric line of antifriction-rollers coöperating with said presser-shoes; substantially as described.

6. In a brick-press, the combination with a mold-wheel formed with pockets in its periphery, of plungers arranged in the bottoms of said pockets, an endless chain carrying presser-shoes which coöperate with the outer portions of the pockets, devices for coöperating with said presser-shoes and moving the same inwardly when in engagement with the mold-wheel, and cams for forcing the plungers outwardly when opposite the presser-shoes; substantially as described.

7. In a brick-press, the combination with the hopper, of a mold-wheel formed with pockets in its periphery, plungers in the bottoms of said pockets, a scraping-blade arranged on the back wall of the hopper, an endless chain carrying presser-shoes, face-plates on said presser-shoes for entering the pockets, a series of eccentrically-arranged antifriction-rollers *l*, and cams F for forcing the plungers outwardly to compress the material therebetween and the face-plates; substantially as described.

8. In a brick-press, the combination with a mold-wheel formed with pockets in its periphery, of an endless chain carrying presser-shoes, face-plates on said presser-shoes which are designed to be received by the pockets in the mold-wheel, and a lubricating device for said face-plates; substantially as described.

708,779. BOWLING-ALLEY. CHARLES J. GLOSE, Chicago, Ill., assignor of one-half to Elvin Bush, Chicago, Ill. Filed Oct. 11, 1900. Serial No. 32,674. (No model.)

Claim.—1. In a bowling-alley, the pin-deck, having sockets for the pins, in combination with plungers in such sockets; means for guiding them at their lower part; shafts extending under the rows of sockets having projections which engage the downward extensions of the plungers respectively when the shafts are rocked or rotated in direction to carry said shaft projections upward.

2. In a bowling-alley, the pin-deck, having sockets for the pins, in combination with plungers in such sockets having downward extensions, and shafts extending under the rows of sockets and plungers, having eccentric abutments or crank-wrists which engage the downward extensions of the plungers respectively when the shafts are rocked or rotated in direction to carry said abutments upward.

3. In a bowling-alley, the pin-deck, having sockets for the pins, in combination with plungers in such sockets having downward extensions; shafts extending under the rows of sockets and plungers, having eccentric abutments or crank-wrists within the downward extensions of the plungers respectively abutting thereon both upwardly and downwardly, and thereby actuating them positively upward and downward as the shafts are rotated.

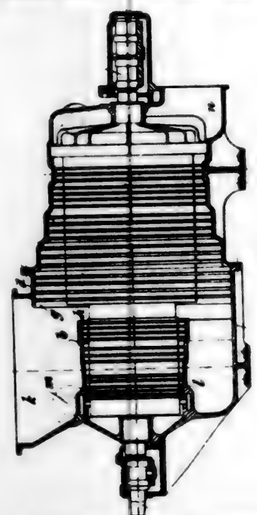
4. In a bowling-alley, the pin-deck, having devices for centering the pins on their respective spots; means for disengaging the pins from such centering devices at will; a fixed indicator denoting one of said positions of the disengaging means; and a movable indicator connected to the disengaging means and moved thereby into position obstructing the display of the fixed indicator.

5. In a bowling-alley, the pin-deck, having sockets for the pins, in combination with plungers in such sockets respectively, and means for raising and depressing the plungers at will; a fixed indicator, indicating one of the positions of the plungers, and a movable indicator connected to the plunger-operating mechanism and moved thereby into and out of display position, obstructing and disclosing the fixed indicator.

6. In a bowling-alley, the pin-deck, having sockets for the pins, in combination with plungers in such sockets; rock-shafts extended underneath the rows of sockets and plungers having eccentric abutments arranged to actuate the plungers as the shafts are rocked; lever-arms on the rock-shafts respectively; a bar connecting said lever-arms, whereby all the lever-arms may be actuated simultaneously by the same means; a cable connected to said bar; a guide-pulley for the same beyond said connection, said cable extending from its connection and from the guide-pulley in two plies to the entrance end of the alley; and suitable means at said entrance end connected to the two plies for actuating the bar in either direction at will.

7. In a bowling-alley, the pin-deck, having sockets for the pins, in combination with plungers in such sockets having downward extensions, shafts extending under the rows of sockets and plungers, comprising enlarged journals and wrists eccentric with respect to the journals and connecting the same, and fixed bearings for the journals, the plungers having horizontally-elongated wrist-bearings at which said eccentric wrists are engaged therewith.

708,780. STEAM-TURBINE. CHARLES A. PARSONS, Newcastle-upon-Tyne, England. Filed Feb. 13, 1900. Serial No. 5,060. (No model.)



Claim.—1. In parallel-flow turbines, in combination, a complete main turbine having its own casing and its own drum and having a plurality of rings of blades supported from said casing and a plurality of interspaced rings of blades supported from said drum, an exhaust-passage leading from said main turbine, a complete reversing-turbine having its own casing and drum and having a plurality of rings of blades carried by the casing and a plurality of interspaced rings of blades supported from the drum, said turbines being mounted on the same shaft, and the exhaust end of the reversing-turbine being connected with the said exhaust-passage from the main turbine inside the main turbine-casing substantially as described.

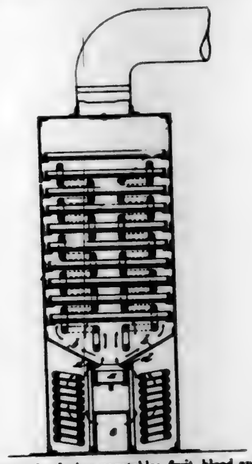
2. In combination, a complete main turbine having a plurality of rings of blades supported from an outside casing interspaced between a plurality of rings of blades supported from an inside drum and a complete reversing-turbine having a plurality of rings of blades supported from an outside casing interspaced between a plurality of rings of blades supported from an inside drum, the said reversing-turbine being telescoped within the said main turbine to reduce longitudinal space occupied, substantially as described.

3. In combination, a main turbine having a plurality of rings of blades supported from an outside fixed casing interspaced between a plurality of rings of blades supported from an inside revolving drum and a reversing-turbine having a plurality of rings of blades supported from an outside revolving casing interspaced between a plurality of rings of blades supported from an inside fixed drum, the said reversing-turbine being telescoped within the said main turbine, substantially as described.

4. In combination, a main turbine having a plurality of rings of blades supported from an outside fixed casing interspaced between a plurality of rings of blades supported from an inside revolving drum and a reversing-turbine having a plurality of rings of blades supported from an outside revolving casing interspaced between a plurality of rings of blades supported from an inner fixed drum, the said reversing-turbine being telescoped within the said main turbine and the outer casing of the reversing-turbine being made in one part with the inner drum of the main turbine, substantially as described.

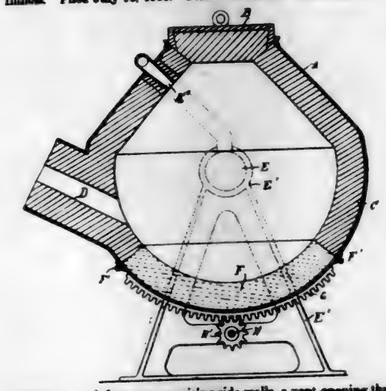
708,781. APPARATUS FOR DRYING VEGETABLES, FRUITS, &c. AUGUST PRAWATZ, Dresden, Germany. Filed Oct. 16, 1901. Serial No. 78,288. (No model.)

Claim.—1. In apparatus for drying vegetables, fruit, blood, and the like, the combination with a chamber having a bottom provided with an opening through which material may pass from the chamber and air may pass into the chamber, of a collecting-box supported below said opening to receive material passing therethrough, and means for moving said box to control the admission of air through said opening, substantially as set forth.



2. In apparatus for drying vegetables, fruit, blood and the like, the combination of a drying-chamber having a bottom formed of inclined plates and provided with an opening through which material may pass from the chamber, and air may pass into it, of a collecting-box hinged at one end and arranged below said opening to receive material passing therethrough, and means for moving the free end of said box to control the admission of air through said opening into the chamber, substantially as set forth.

708,782. MELTING-FURNACE. EDWARD H. SCHWARTZ, Chicago, Ill., assignor, by direct and mesne assignments, of two-thirds to the Hawley Down Draft Furnace Company, Chicago, Ill., a Corporation of Illinois. Filed July 14, 1900. Serial No. 23,770. (No model.)



Claim.—1. A furnace comprising side walls, a vent-opening through one wall, and a burner discharging into the furnace through an opening distinct from the vent-opening, the side walls being arranged to cause the flame to sweep downwardly and thence across the hearth or bottom of the furnace and out through the vent-opening; substantially as described.

2. A furnace comprising side walls, one of which has a downwardly-curved inner surface, a vent-opening through the other side wall, and a separate burner also extending through the second side wall, above the vent-opening, and arranged to project flame across the furnace directly upon said curved wall; substantially as described.

3. A furnace comprising side walls, one of which has a downwardly-curved inner surface, a vent-opening through the other side wall, and a separate burner also extending through the second side wall, above the vent-opening, and arranged to project flame downwardly and across the furnace directly upon said curved wall; substantially as described.

4. A furnace comprising side walls, a vent-opening through one wall, and a plurality of burners, each discharging into the furnace through an opening distinct from the vent-opening and arranged to project converging flames across the furnace, the side walls being arranged to cause the flame to sweep downwardly and thence across the hearth or bottom of the furnace and out through the vent-opening; substantially as described.

5. A furnace comprising side walls, one of which has a curved inner surface, a vent-opening through the other side wall; and a plurality of burners extending through the second side wall, above the vent-opening, and arranged to project converging flames across the furnace directly upon said curved wall; substantially as described.

6. A furnace comprising a substantially spherical body, a vent-opening through one side, and a burner also extending through the side above the vent-opening and arranged to project flame directly across the furnace upon the curved wall opposite; substantially as described.

7. A furnace comprising a substantially spherical body, a vent-opening through one side, and a plurality of burners also extending through the side above the vent-opening and arranged to project converging flames directly across the furnace upon the curved wall opposite; substantially as described.

8. A furnace comprising walls of refractory material and a hearth for holding molten metal, means for throwing a flame across the furnace-chamber and directly upon a portion of the inner wall above the hearth, and means for shifting the furnace and thereby moving the heated portion of the wall beneath the molten metal lying on the hearth; substantially as described.

9. A furnace comprising walls of refractory material, a hearth for holding molten metal, a vent-opening through one side and above the hearth, a burner above the vent-opening, arranged to project flame across the furnace and directly upon a portion of the inner wall above the hearth, and means for shifting the furnace and thereby moving the heated portion of the wall beneath the molten metal lying on the hearth; substantially as described.

10. A furnace comprising walls of refractory material, a hearth for holding molten metal, a vent-opening through one side and above the hearth, a plurality of burners above the vent-opening, arranged to project converging flames across the furnace and directly upon a portion of the inner wall above the hearth, and means for shifting the furnace and thereby moving the heated portion of the wall beneath the molten metal lying on the hearth; substantially as described.

11. A furnace provided with a vent-opening and suitable burners at one side of the furnace, said burners being arranged to direct converging flames directly toward the opposite wall of the furnace; substantially as described.

12. A furnace provided with a vent-opening and suitable burners at one side of the furnace, said burners being arranged to direct converging flames downwardly and directly toward the opposite wall of the furnace; substantially as described.

13. A melting-furnace for the purpose described, consisting of a closed tiltable body having its inner walls curved in the horizontal plane, a burner entering said closed body and adapted to project a flame directly therein upon the curved inner walls and upon the exposed body of metal contained in the furnace, and means for rocking said body on its supports to expose different portions of the inner walls thereof to the direct heat of said flame, whereby the metal may be melted in said furnace in an open and exposed condition without the use of a crucible; substantially as described.

14. A melting-furnace for the purpose described, consisting of a closed tiltable body mounted on trunnions and having its inner walls curved in the horizontal plane, a burner entering said closed body through one of the trunnions and adapted to project a flame directly therein upon the curved walls, and upon the exposed body of metal contained in the furnace, and means for rocking said body on its trunnions to expose different portions of the inner walls thereof to the direct heat of said flame, whereby the metal may be melted in said furnace in an open and exposed condition without the use of a crucible; substantially as described.

15. A melting-furnace for the purpose described, consisting of a closed tiltable body provided with a discharge-outlet for molten metal near its base and with removable top or cover and having its inner walls curved in the horizontal plane, a burner entering said closed body and adapted to project a flame directly therein upon the curved inner walls and upon the exposed body of metal contained in the furnace, and means for rocking said body on its supports to expose different portions of the inner walls thereof to the direct heat of said flame, whereby the metal may be melted in said furnace in an open and exposed condition without the use of a crucible; substantially as described.

16. In a melting-furnace, the combination of a furnace-chamber proper, a plurality of burners arranged to discharge flame-jets and entering one side only of the furnace, and arranged to focus substantially at the central axis of the furnace and strike the opposite wall of the furnace.

17. In a melting-furnace, the combination of a furnace proper, having curved interior walls, and a plurality of burners arranged to discharge flame-jets and entering one wall only of the furnace and arranged to focus substantially centrally of the furnace, said flame-jets being deflected downward by the opposite wall of the furnace.

18. In a melting-furnace, the combination of a furnace proper having curved interior walls, and a plurality of burners arranged to discharge flame-jets and entering one wall only of the furnace and arranged to focus substantially centrally of the furnace, said burners being directed transversely and downwardly in the furnace.

19. A furnace provided with a lateral vent-opening and suitable burners in the upper portion of the furnace at one side only thereof, and above the vent-opening, said burners being directed convergingly toward the opposite side or wall of the furnace, the jets from said burners focusing before reaching said opposite wall.

20. A furnace, provided with a lateral vent-opening, and suitable burners in the upper portion, and on one side only of the furnace above the vent-opening directed convergingly toward the wall of the furnace opposite the vent-opening.

21. In a furnace, provided with an upwardly-inclined lateral vent-opening, a charging-door in the upper portion of the furnace, burners arranged at one side only of the furnace and located between the vent-opening and the charging-door, and directed toward the wall of the furnace opposite the vent-opening.

22. A furnace provided with an upwardly-inclined lateral vent-opening, and one or more burners arranged at one side only of the furnace and located at a higher level than the vent-opening, and directed downwardly toward the opposite interior wall of the furnace.

23. The combination of a furnace substantially spherical in form provided with a top charging-door B and a lateral vent D upwardly inclined from toward the bottom of the furnace and a plurality of burners located at one side of the furnace toward the top thereof, and directed downwardly and convergingly toward the opposite side or wall of the furnace and arranged to focus flame-jets near the central vertical axis of the furnace, which jets, by striking said opposite wall, obtain a rotary whirling motion.

24. A furnace formed with a charging-door at its upper end, a lateral vent-opening, burners located in the furnace between the vent-opening and the charging-door, and directed convergingly toward the interior wall opposite the burners, and a supporting-frame on which said furnace is pivotally mounted.

25. A furnace formed with a charging-door at its upper end, a lateral vent-opening, burners located in the furnace between the vent-opening and the charging-door, and directed toward the interior wall opposite the burners, a supporting-frame on which said furnace is pivotally mounted, and means for tilting the furnace to discharge the molten metal through the vent-opening.

26. A furnace formed with a charging-door at its upper end, a lateral vent-opening, burners located in the furnace between the vent-opening and the charging-door, and directed toward the interior wall opposite the burners, a supporting-frame on which said furnace is pivotally mounted, a sector-shaped rack-bar located on the lower portion of the furnace, and a pinion mounted in said frame upon a supporting-shaft, whereby the furnace may be tilted on its pivotal support.

27. A furnace pivotally mounted on supporting-trunnions, a recess in the outer ends of said trunnions, an air-blast pipe leading to said recess, a fuel-supply pipe communicating with the interior of said air-blast pipe, a valve located in said fuel-supply pipe, and gas-supply-pipe connections leading from the recessed trunnions to a point in the upper portion of said furnace.

28. A furnace provided with an upwardly-inclined lateral opening forming a combined vent and tap and burners arranged in one side only of the upper part of the furnace and arranged to discharge flame-jets into the furnace.

29. A furnace provided with an upwardly-inclined lateral opening forming a combined vent and tap and a plurality of burners passing through one side only of the furnace, being the side provided with said opening, and directly converging toward the opposite side or wall of the furnace.

30. A substantially spherical furnace having an upwardly-inclined opening D forming a combined vent and tap and a plurality of downwardly-directed and convergingly-pointed burners arranged to discharge flame-jets into the furnace, in combination with a supporting-frame on which the furnace is pivotally mounted.

31. A substantially spherical furnace having a charging-door B at the top and an upwardly-extending opening D forming a vent and tap, and also having trunnions, a frame receiving said trunnions whereby the furnace is pivotally supported, and burners K located above the said opening D and arranged to focus flame-jets substantially at the central vertical axis of the furnace, whereby the combined jets strike the wall of the furnace opposite the vent-opening.

32. A furnace comprising a tiltable body provided with a vent-opening, and a burner entering said furnace through an opening distinct from the vent-opening but in proximity thereto, substantially as described.

33. A melting-furnace comprising a tiltable body having an opening in position to act as a combined vent and tap, and a burner entering said furnace through an opening distinct from the vent and tap opening but in proximity thereto, substantially as described.

34. A furnace comprising a tiltable body having a vent-opening, and a burner entering said furnace through an opening distinct from the vent-opening but in proximity to and in substantially the same vertical plane as the said vent-opening, substantially as described.

35. A furnace comprising a tiltable body having in its side an outlet for products of combustion, and a burner entering said furnace through an opening distinct from but adjacent to said outlet, substantially as described.

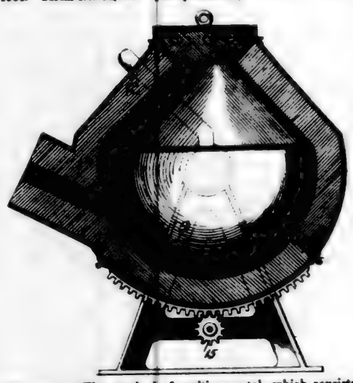
36. A furnace comprising a tiltable body with a curved inner surface, an outlet for products of combustion, and a burner entering said furnace through an opening distinct from said outlet and arranged to discharge a flame upon said curved surface, substantially as described.

37. A furnace having a curved inner surface, an outlet for products of combustion, and a plurality of burners entering said furnace through an opening or openings distinct from said outlet, and arranged to discharge converging flames upon said furnace, substantially as described.

38. A furnace comprising a tiltable body having a curved inner surface, a vent-opening, and a plurality of burners entering said furnace through an opening or openings distinct from said vent-opening and arranged to discharge converging flames which impinge upon said curved surface, substantially as described.

39. A melting-furnace comprising a tiltable body mounted on trunnions and having in its side an opening for products of combustion, and a burner entering the body through one of the trunnions, substantially as described.

708,783. METHOD OF MELTING AND TREATING METALS. EDWARD H. SCHWARTZ, Chicago, Ill., assignor to The Hawley Down Draft Furnace Company, Chicago, Ill., a Corporation of Illinois. Filed June 13, 1901. Serial No. 64,370. (No specimens.)



Claim.—1. The method of melting metals which consists in combining a plurality of flame-jets into a single flame, giving this flame a whirling movement and bringing it into contact with the metal to be melted; substantially as described.

2. The method of melting metals which consists in introducing into a melting-chamber from one side only thereof and at a point above the metal a plurality of downwardly-directed flame-jets which meet and combine into a single flame, and causing the flame to rotate in a vertical plane and in contact with the metal; substantially as described.

3. The method of melting metals which consists in combining a plurality of flames into a single flame and causing this flame to move downwardly and thence forwardly over and in contact with the metal; substantially as described.

4. The method of melting metals which consists in causing a flame to move rearwardly above the metal, thence downwardly and forwardly over and in contact with the metal and then to sweep a second time rearwardly, downwardly and forwardly over and in contact with the metal and thence out from the furnace; substantially as described.

5. The method of melting metals which consists in causing a flame to move laterally over and in contact with the surface of the metal, thereby melting it, and then changing the direction of movement of the flame relative to the metal and causing it to impinge directly upon and penetrate into the body of molten metal; substantially as described.

6. The method of melting metals which consists in causing a flame to move laterally over and in contact with the surface of the metal, thereby melting it, and then bringing the molten metal directly into the path of the flame and causing the flame to impinge directly upon and penetrate into the body of molten metal; substantially as described.

7. The method of melting metals which consists in causing a flame to rotate downwardly upon and thence forwardly over and in contact with the surface of the metal, thereby melting it, and then changing the direction of movement of the flame relative to the metal and causing it to impinge directly upon and penetrate into the body of molten metal; substantially as described.

8. The method of melting metals which consists in causing a hydrocarbon-flame to rotate downwardly upon and thence forwardly over and in contact with the surface of the metal, thereby melting it, and then changing the direction of movement of the flame relative to the metal and causing it to impinge directly upon and penetrate into the body of molten metal; substantially as described.

9. The method of melting metals which consists in combining a plurality of flames into a single flame, causing such flame to move laterally over and in contact with the surface of the metal, thereby melting it, and then causing such flame to impinge directly upon and penetrate into the body of molten metal; substantially as described.

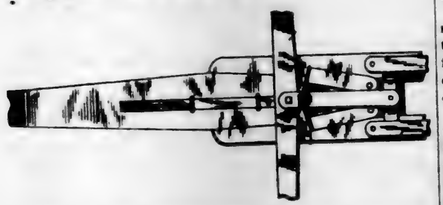
10. The method of melting metals which consists in causing a flame to enter a furnace-chamber containing the metal and move rearwardly above the metal and thence downwardly and forwardly over and in contact with the metal, and removing the products of combustion from the furnace at such a point that they do not come in contact with the entering flame at a point below that of entrance of fuel into the furnace; substantially as described.

11. The method of melting metals which consists in combining a plurality of flames into a single flame and causing this flame to move downwardly and thence forwardly over and in contact with the metal, and removing the products of combustion from the furnace at a point below that of entrance of fuel into the furnace; substantially as described.

12. The method of melting brass which consists in applying to the brass to be melted a flame which at its first application contains a certain excess of carbon and subsequently an increased excess of carbon; substantially as described.

13. The method of melting brass which consists in applying to the brass to be melted a flame having a certain excess of carbon, then a flame having an increased excess and finally a flame similar to the one first applied; substantially as described.

708,784. CARRIAGE-POLE. JOSEPH SIMS, Allegheny, Pa. Filed July 7, 1902. Serial No. 114,863. (No model.)



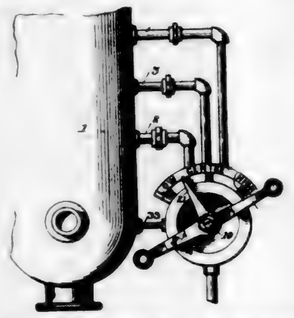
Claim.—A device of the type set forth, consisting of a wagon-tongue having spring-pressed pawls pivoted in proximity to its rear end, a tongue-support having a recess formed therein extending through the forward end thereof, the rear end of the recess on each side thereof being enlarged to form shoulders for engagement with the free ends of the pawls, said tongue having a longitudinal recess formed therein, with a bar slidably mounted in the last-named recess, and links pivoted to the rear end of the bar and to said pawls, whereby said pawls may be moved inwardly.

708,785. GAGE-COCK. WERNER I. STAAF, Pittsburg, Pa. Filed Nov. 19, 1901. Serial No. 83,288. (No model.)

Claim.—1. In a three-way gage-cock, a casing having ports for registration with a series of blow-off pipes, and a rotary valve-disk having a single discharge-port adapted on rotation to register with the respective blow-off pipes, substantially as described.

2. A gage-cock having a series of ports, and adapted for connection to a series of blow-off pipes, a disk valve having a single discharge-port, means connected to the stem of said valve for rotating the same, and means for adjusting the tension on said disk valve, substantially as described.

3. In a gage-cock, the combination of a casing having a series of ports and adapted for connection to a series of blow-off pipes, a rotatable valve disk mounted in the casing and having a single port through which all of the blow-off pipes discharge, and means for operating said valve, substantially as described.



4. In a gage-cock, a casing having a series of ports and adapted for connection to a series of blow-off pipes, of means for controlling the ports in the casing whereby each of the blow-off pipes discharges through a common port.

5. A three-way gage-cock having three inlet-ports and one discharge-port and adapted for connection to three blow-off pipes, and means for controlling said ports whereby the discharge from the blow-off pipes is through a port common to all.

6. In a gage-cock, a casing having a chamber and a series of inlet-ports to said chamber, disk valve having a single orifice or port common to all of the inlet-ports in the casing, a lever connected to the stem of the casing and provided with a pointer, a single discharge-port in the casing, means in the chamber of the casing for holding the disk valve seated, and means for adjusting the tension on said disk valve, substantially as described.

7. In a gage-cock, a casing having a series of inlet-ports and a single discharge-port, and a valve mounted in the casing and controlling each of the inlet-ports, substantially as described.

8. In a gage-cock, a casing having a series of inlet-ports and a single discharge-port, and a valve operative to close all the ports and to open one port independently of the other ports, substantially as described.

9. In a gage-cock, a casing having two or more inlet-ports, and a single discharge-port, and a valve operative to close the ports and to open each port independently of the other ports, substantially as described.

10. In a gage-cock, a casing having inlet-ports registering with separate blow-off ports, and a single discharge-port, a disk valve mounted in the casing and provided with a single port, means connected to said valve for operating same to close the inlet-ports and to open the same independently to the discharge-port, and adjustable means for holding said valve on its seat, substantially as described.

11. In a gage-cock, a casing having an indicating-plate adapted to receive indicating-marks, said casing having a series of inlet-ports each in communication with a separate blow-off pipe, and a single discharge-port, a valve operative to close the inlet-ports and to open one port to the discharge independently of the others, a lever connected to the stem of said valve for operating the same, and a pointer carried by said lever to indicate by the inscriptions on said indicating-plate the position of said valve, substantially as described.

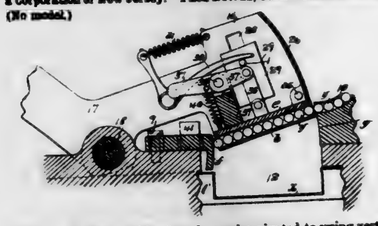
708,786. KNITTING-MACHINE. EMMANUEL STOLL, Routlingen, Germany, assignor to National Knitting Co., Milwaukee, Wis. Filed Nov. 4, 1901. Serial No. 81,143. (No model.)

Claim.—1. In a knitting-machine, the combination with a needle-bed having a needle-channel, of a double-end needle movable in said channel, a jack arranged to operate said needle, and means operated by the jack for limiting the movement of the needle.

2. In a knitting-machine, the combination with a needle-bed having a needle-channel, of a double-end needle movable in said channel, a jack arranged to operate said needle, and a lever arranged to be operated by the jack to limit the movement of the needle.

3. In a knitting-machine, the combination with a needle-bed having a needle-channel, of a needle movable in said channel, and a lever pivoted to the bed and having arms arranged to alternately project into the path of the needle and into the path of the jack respectively.

708,787. **PACKING MECHANISM.** OLIN TYBERG, New York, N. Y., assignor to the American Tobacco Company, New York, N. Y., a Corporation of New Jersey. Filed Nov. 23, 1898. Serial No. 697,123. (No model.)



Claim.—1. The combination of a carrier pivoted to swing vertically between its receiving and delivering positions and adapted to receive a row of cigarettes or similar articles on a surface inclined in the direction of movement of the cigarettes into the carrier, supports for the cigarettes in the carrier, and means for withdrawing said supports to deliver the cigarettes, substantially as described.

2. The combination of a carrier pivoted to swing vertically between its receiving and delivering positions and adapted to receive a row of cigarettes or similar articles on a surface inclined in the direction of movement of the cigarettes into the carrier, supports in the carrier having a withdrawal movement substantially parallel to the delivering plane of the cigarettes, and means for actuating said supports, substantially as described.

3. The combination of a carrier pivoted to swing vertically between its receiving and delivering positions and adapted to receive a row of cigarettes or similar articles on a surface inclined in the direction of movement of the cigarettes into the carrier, supports in the carrier having a withdrawal movement substantially parallel to the surface on which the cigarettes are delivered, a presser-plate in the carrier, and means for actuating said supports and giving said carrier a further movement toward the cigarettes after the supports are withdrawn, substantially as described.

4. The combination of a carrier pivoted to swing vertically between its receiving and delivering positions and adapted to receive a row of cigarettes or similar articles on a surface inclined in the direction of movement of the cigarettes into the carrier, supports in the carrier having a withdrawal movement substantially parallel to the surface on which the cigarettes are delivered, means for actuating said supports and giving said carrier a further movement independently of the supports after the latter are withdrawn, and a presser-plate pivoted in said carrier and having a movement independently of the carrier to bring the presser-plate into position parallel with the delivered cigarettes, substantially as described.

5. The combination of a carrier pivoted to swing vertically between its receiving and delivering positions and adapted to receive a row of cigarettes or similar articles on a surface inclined in the direction of movement of the cigarettes into the carrier, supports in the carrier having a withdrawal movement substantially parallel to the surface on which the cigarettes are delivered, a presser-plate pivoted in the carrier, and means for swinging the presser-plate independently of the carrier to bring the presser-plate into position parallel with the delivered cigarettes, substantially as described.

6. The combination with a carrier pivoted to swing vertically between its receiving and delivering positions and adapted to receive a row of cigarettes or similar articles on a surface inclined in the direction of movement of the cigarettes into the carrier, of means for actuating said carrier with long and short movements to deliver superposed rows of cigarettes, supports in the carrier for the cigarettes, means for withdrawing said supports to deliver the cigarettes, and a presser-plate having a movement independently of the carrier to bring the presser-plate into position parallel with the delivered cigarettes, substantially as described.

7. The combination with a carrier pivoted to swing vertically between its receiving and delivering positions and adapted to receive a row of cigarettes or similar articles on a surface inclined in the direction of movement of the cigarettes into the carrier, of means for actuating said carrier with long and short movements to deliver superposed rows of cigarettes, supports in the carrier for the cigarettes, means for withdrawing said supports to deliver the cigarettes, means for giving the carrier a further movement toward the cigarettes independently of the supports after the latter are withdrawn, and a presser-plate in the carrier having a movement independently of the carrier to bring the presser-plate into position parallel with the delivered cigarettes, substantially as described.

8. The combination with a carrier pivoted to swing vertically between its receiving and delivering positions and adapted to receive a row of cigarettes or similar articles on a surface inclined in the direction of movement of the cigarettes into the carrier, of means for actuating said carrier with long and short movements to deliver superposed rows of cigarettes, supports in the carrier for the cigarettes, means for withdrawing said supports to deliver the cigarettes, a presser-plate pivoted in the carrier, and means for moving the carrier and presser-plate independently of the supports after the latter are withdrawn and rocking the presser-plate on its pivot in the carrier to bring the presser-plate into position parallel with and pressing upon the delivered cigarettes, substantially as described.

9. The combination with a carrier pivoted to swing vertically between its receiving and delivering positions and adapted to receive a row of cigarettes or similar articles, of means for actuating said carrier with long and short movements to superpose rows of cigarettes, supports for the cigarettes in the carrier, means for withdrawing said supports to deliver the cigarettes, a presser-plate pivotally mounted in the carrier, and means for moving said presser-plate independently of the supports after the latter are withdrawn to bring the presser-plate into a position parallel with and pressing upon the delivered cigarettes, substantially as described.

10. The combination with a carrier having an inclined receiving-surface for cigarettes or similar articles, of a raceway adapted to secure the feed of the cigarettes to the carrier by gravity and having the bottom surface of its lower end curved to substantially a horizontal plane from which the cigarettes are delivered to the inclined receiving-surface, substantially as described.

11. The combination with a carrier having an inclined receiving-surface for cigarettes or similar articles and pivoted to oscillate vertically, of a raceway adapted to secure the feed of the cigarettes to the carrier by gravity and having the bottom surface of its lower end carved to substantially a horizontal plane from which the cigarettes are delivered to the inclined receiving-surface, substantially as described.

12. The combination with a carrier having an inclined receiving-surface for cigarettes or similar articles, of a raceway adapted to secure the feed of the cigarettes to the carrier by gravity and having the bottom surface of its lower end curved to substantially a horizontal plane from which the cigarettes are delivered to the inclined receiving-surface, and a guard-plate on the carrier for closing the raceway during the movement of the carrier, substantially as described.

13. The combination with a carrier having an inclined receiving-surface for cigarettes or similar articles and pivoted to oscillate vertically, of a raceway adapted to secure the feed of the cigarettes to the carrier by gravity and having the bottom surface of its lower end curved to substantially a horizontal plane from which the cigarettes are delivered to the inclined receiving-surface, and a curved guard-plate on the carrier for closing the raceway during the movement of the carrier, substantially as described.

14. The combination with a carrier adapted to receive a row of cigarettes or similar articles on an inclined surface, and an inclined raceway for feeding cigarettes or similar articles to the carrier by gravity, of a roller pressing against the cigarettes in the raceway and acting to support the cigarettes in the upper part of the raceway, substantially as described.

15. The combination with an inclined way for feeding cigarettes or similar articles, of a roller pressing against the cigarettes as they pass down the way, substantially as described.

16. The combination with an inclined way for feeding cigarettes or similar articles, of a spring-pressed roller pressing against the cigarettes as they pass down the way, substantially as described.

17. The combination of a packing-carrier having supports carried thereby and moving therewith for the material or articles to be packed extending beneath the material or articles in the carrier when in supporting position and having a delivery movement substantially parallel with the surface on which the material or articles are delivered, and means for withdrawing said supports for delivery, substantially as described.

18. The combination of a packing-carrier having supports carried thereby and moving therewith for the material or articles to be packed extending beneath the material or articles in the carrier when in supporting position and pivoted to secure a delivery movement substantially parallel with the surface on which the material or articles are delivered, and means for withdrawing said supports for delivery, substantially as described.

19. The combination of a packing-carrier having pivoted supports carried thereby and moving therewith and extending beneath the material or articles in the carrier when in supporting position and having their axis transverse to the line of movement of the carrier and mounted to swing in an arc of such radius as to secure a delivery movement of the supports substantially parallel with the surface on which the material or articles are delivered, and means for withdrawing said supports for delivery, substantially as described.

20. The combination of a packing-carrier provided with supports for the material or articles to be packed, means for withdrawing said supports for delivery, and means for giving the carrier a further movement independently of the supports after the supports are withdrawn, substantially as described.

21. The combination of a packing-carrier provided with supports for the material or articles to be packed, means for withdrawing said supports for delivery, and a presser-plate for the material or articles having a further movement independently of the supports after the supports are withdrawn, substantially as described.

22. The combination of a packing-carrier provided with supports for the material or articles to be packed, means for withdrawing said supports for delivery, a presser-plate mounted in the carrier, and means for giving the carrier a further movement independently of the supports after the supports are withdrawn and moving said presser-plate independently of the carrier to position it relatively to the surface on which the material or articles are delivered, substantially as described.

23. The combination of a packing-carrier pivoted to swing vertically between its receiving and delivering positions and provided with supports for the material or articles to be packed, means for withdrawing said supports for delivery, a presser-plate pivoted in the carrier, and means for giving said presser-plate a further movement after the supports are withdrawn and swinging said presser-plate on its pivot in the carrier to bring the presser-plate into position parallel with and pressing upon the delivered material or articles, substantially as described.

24. The combination with a carrier, of slides mounted in the carrier, supports pivotally mounted on said slides to swing transversely to the direction of movement of the carrier and spring-pressed into supporting position, and fixed abutments for moving the supports against the spring-pressure for delivery and holding the slides stationary while the carrier completes its delivering movement, substantially as described.

25. The combination with a carrier, of slides mounted in the carrier, supports pivotally mounted on said slides to swing transversely to the direction of movement of the carrier and spring-pressed into supporting position, fixed abutments for moving the supports against the spring-pressure for delivery and holding the slides stationary while the carrier completes its delivering movement, catches carried by the slides for holding the supports withdrawn during the further movement of the carrier, and means for tripping said catches to release the supports, substantially as described.

26. The combination with a carrier, of slides mounted in the carrier, supports pivotally mounted on said slides to swing transversely to the direction of movement of the carrier and substantially parallel with the delivery-surface, and spring-pressed into supporting position, fixed abutments for moving the supports against the spring-pressure for delivery and holding the slides stationary while the carrier completes its delivering movement, catches carried by the slides and acting to hold the supports withdrawn, and means for tripping the catches for the return of the supports to supporting position after the return movement of the carrier has moved the supports out of position to engage the delivered material or articles, substantially as described.

27. The combination with the carrier D pivoted to swing vertically, and slides 29 mounted in the carrier and spring-pressed in the direction of the delivery movement of the carrier, of supports carried by said slides and pivoted to swing transversely to the line of movement of the carrier, and fixed abutments for withdrawing the supports and holding the supports and slides stationary during the latter part of the delivering movement of the carrier, substantially as described.

28. The combination with the carrier D pivoted to swing vertically, and slides 29 mounted in the carrier and spring-pressed in the direction of the delivery movement of the carrier, of supports carried by said slides and mounted to swing transversely to the line of movement of the carrier, fixed abutments for withdrawing the supports and holding the supports and slides stationary during the latter part of the delivering movement of the carrier, presser-plate *e* pivoted in the carrier, and means for swinging said presser-plate in the carrier, substantially as described.

29. The combination with the carrier D pivoted to swing vertically and slides 29 mounted in the carrier, of supports mounted in said slides to swing transversely to the line of movement of the carrier, fixed abutments for withdrawing the supports and holding the supports and slides stationary during the latter part of the delivering movement of the carrier, presser-plate *e* pivoted in the carrier, lever 37 mounted in the carrier and connected to the presser-plate, and a fixed abutment engaging said lever 37 during the latter part of the delivering movement of the carrier to swing the presser-plate in the carrier, substantially as described.

30. The combination of the carrier D pivoted to swing vertically, means for actuating said carrier with long and short strokes to superpose articles successively delivered by the carrier, supports in the carrier for the articles, means for withdrawing the same, a presser-plate pivoted in the carrier, and means for swinging the presser-plate in the carrier to bring the presser-plate into position parallel with the articles delivered at successive movements of the carrier, substantially as described.

31. The combination with a box-support, of a depositing-plunger, supporting devices upon which the articles rest carried by the plunger, means for moving the plunger toward the box, and means for moving the supporting devices to cause them to deliver the articles, substantially as described.

32. The combination with a box-support, of a depositing-plunger, supports upon which the articles rest carried thereby, means for delivering articles to the supports in the plunger, means for moving the plunger toward the box, and means for moving the supports to cause them to deliver the articles, substantially as described.

33. The combination with a box-support, of a plunger, movable supports carried by the plunger, means for giving the plunger different amounts of movement toward the box in order to enable it to deposit the articles in layers therein, and means for moving the supports out of the way for each movement of the plunger toward the box, substantially as described.

34. The combination of a packing-carrier having a support, as *b*, mounted on the carrier to swing on an axis transverse to the line of movement of the carrier, a receiving-surface onto which the material or articles to be packed is delivered by the carrier, means for moving the carrier toward the receiving-surface, and means for withdrawing the supports when the carrier has been moved to carry the material or articles to the delivery position, substantially as described.

35. In a packing-carrier for delivering the material or articles to be packed onto a suitable receiving-surface, a support, as *b*, carried by an arm or arms mounted to swing on an axis transversely to the line of movement of the carrier, the arm being of such length as to secure a delivery movement of the support substantially parallel with the delivery-surface, substantially as described.

36. The combination with a carrier for delivering the material or articles carried onto a suitable receiving-surface, which carrier is provided with supports for the material or articles carried extending beneath the material or articles in the carrier when in supporting position, and means for actuating the carrier and withdrawing the supports for delivery, of catches for holding the supports withdrawn and tripped for the return of the supports, substantially as described.

37. The combination with a carrier for delivering the material or articles carried onto a suitable receiving-surface, which carrier is provided with supports for the material or articles carried extending beneath the material or articles in the carrier when in supporting position, of means for actuating said carrier and withdrawing said supports, and means for holding said supports withdrawn during the return movement of the carrier until the supports are moved beyond the delivered material or articles, substantially as described.

38. The combination with a carrier for delivering the material or articles carried onto a suitable receiving-surface, which carrier is provided with supports for the material or articles carried extending beneath the material or articles in the carrier when in supporting position and mounted to move during withdrawal substantially parallel with the surface on which the material or articles are delivered, of means for actuating said carrier and withdrawing said supports, and means for holding said supports withdrawn during the return movement of the carrier until the supports are moved beyond the delivered material or articles, substantially as described.

39. The combination with a vertically-moving carrier for delivering the material or articles carried onto a suitable receiving-surface, which carrier is provided with supports for the material or articles to be carried extending beneath the material or articles in the carrier when in supporting position, of means for actuating said carrier and withdrawing said supports for delivery, substantially as described.

40. The combination with a vertically-moving carrier having a pressing-surface and provided with supports for the material or articles to be carried, of means for withdrawing said supports for delivery and giving said carrier a further movement independently of the supports after the latter are withdrawn to bring the pressing-surface into action, substantially as described.

41. Carrier D having the side plates 16 provided with slots 28, slides 29 mounted to move in said slots, spring-pressed arms 32 pivoted in said slides and carrying supports *b*, and abutments for withdrawing said supports, substantially as described.

42. Carrier D having the side plates 16 provided with slots 28, slides 29 mounted to move in said slots, spring-pressed arms 32 pivoted in said slides and carrying supports *b*, spring-pressed catches *d* for holding the supports when withdrawn, and abutments for withdrawing said supports and tripping said catches to permit the return of the supports, substantially as described.

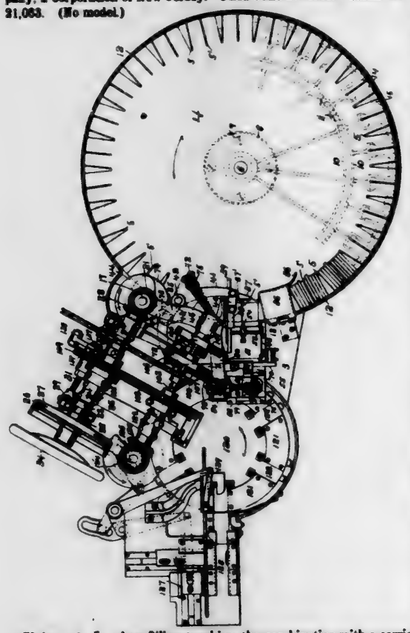
43. A packing-carrier having pivoted arms 32 on opposite sides of the carrier, said arms carrying inwardly-extending supports *b* and side plates *c* extending upward from the supports, substantially as described.

44. A packing-carrier having plates *a* forming portions of opposite side walls of the receiving-chamber and pivoted arms 32 on the sides of the carrier having the plates *a*, said arms carrying inwardly-extending supports *b* and side plates *c* extending upward from the supports, substantially as described.

708,788. PROCESS OF COATING METALS PREPARATORY TO BEING HEATED. HEINRICH WACHWITZ, Hersbruck, Germany, assignor of one-half to MORITZ DÜNKELSBÜHLER, Nuremberg, Bavaria, Germany. Filed Oct. 28, 1901. Serial No. 80,236. (Specimens.)

Claim.—The process of welding metals, which consists in rubbing the surface of the metals with metallic aluminium, so as to cause a thin coating of the same to adhere to such metals and thereby prevent their oxidation, during the subsequent heating, and then suitably heating and welding together said metals, substantially as described.

708,789. MACHINE FOR BOXING LITTLE CIGARS. GEORGE M. WILLIAMS, Baltimore, Md., assignor to the American Tobacco Company, a Corporation of New Jersey. Filed June 21, 1900. Serial No. 21,063. (No model.)



Claim.—1. In a box-filling machine, the combination with a carrier constructed to support on one of its surfaces and to successively forward predetermined quantities of the articles to be boxed, of a box-presenting mechanism operating to successively bring boxes into position to receive the articles from the carrier, and transferring means, said transferring means operating to cause the quantities of the article to move across the surface of the carrier and to the boxes as they are successively presented, substantially as described.

2. In a box-filling machine, the combination with a rotating carrier constructed to support on one of its surfaces and to successively forward predetermined quantities of the article to be boxed, of a box-presenting mechanism operating to successively bring boxes into position to receive the articles from the carrier, and transferring means, said transferring means operating to cause the quantities of the article to move across the surface of the carrier and to the boxes as they are successively presented, substantially as described.

3. In a box-filling machine, the combination with a rotating carrier constructed to support on one of its surfaces and to successively forward predetermined quantities of the article to be boxed, of a rotating box-presenting mechanism operating to successively bring boxes into position to receive the articles from the carrier, and transferring means, said transferring means operating to cause the quantities of the article to move across the surface of the carrier and to the boxes as they are successively presented, substantially as described.

4. In a box-filling machine, the combination with a carrier, one of the surfaces of which is provided at its edge with a series of pockets whereby it is adapted to successively forward predetermined quantities of the articles to be boxed, of an interior support capacitated to sustain a large number of the articles, a box-presenting mechanism operating to successively bring boxes into position to receive the articles from the carrier, and transferring means, said transferring means operating to cause the quantities of the article to move across the surface of the carrier and to the boxes as they are successively presented, substantially as described.

5. In a box-filling machine, the combination with a carrier consisting of a rotating table, one of the surfaces of which is provided at its edge with a series of pockets whereby it is adapted to successively forward predetermined quantities of the articles to be boxed, that part of the table inside the pockets being capacitated to support a large number of the articles, of a box-presenting mechanism operating to successively bring boxes into position to receive the articles from the carrier, and transferring means, said transferring means operating to cause the quantities of the article to move across the surface of the carrier and to the boxes as they are successively presented, substantially as described.

6. In a box-filling machine, the combination with a rotating carrier, one of the surfaces of which is provided at its edge with a series of pockets whereby it is adapted to successively forward predetermined quantities of the articles to be boxed, of an interior support capacitated to sustain a large number of the articles, a rotating box-presenting mechanism operating to successively bring boxes into position to receive the articles from the carrier, and transferring means, said transferring means operating to cause the quantities of the article to move across the surface of the carrier and to the boxes as they are successively presented, substantially as described.

7. In a box-filling machine, the combination with a carrier consisting of a rotating table, one of the surfaces of which is provided at its edge with a series of pockets whereby it is adapted to successively forward predetermined quantities of the articles to be boxed, that part of the table inside the pockets being capacitated to support a large number of the articles, of a rotating box-presenting mechanism operating to successively bring boxes into position to receive the articles from the carrier, and transferring means, said transferring means operating to cause the quantities of the article to move across the surface of the carrier and to the boxes as they are successively presented, substantially as described.

8. The combination with a carrier constructed to successively forward predetermined quantities of the article to be boxed, of means for separating the predetermined quantity so that it may be packed in the box in layers, box-presenting means, depositing mechanism, and transferring means operating between the carrier and the depositing mechanism, substantially as described.

9. The combination with a rotating carrier constructed to successively forward predetermined quantities of the article to be boxed, of means for separating the predetermined quantity so that it may be packed in the box in layers, box-presenting means, depositing mechanism, and transferring means operating between the carrier and the depositing mechanism, substantially as described.

10. The combination with a carrier constructed to successively forward predetermined quantities of the article to be boxed, of a box-presenting mechanism, depositing mechanism, transferring mechanism between the carrier and the depositing mechanism, separating means operating to divide the predetermined quantity into bunches, and spacing means for keeping said bunches separate as they are forwarded by the transferring mechanism, substantially as described.

11. The combination with a rotating carrier constructed to successively forward predetermined quantities of the article to be boxed, of a box-presenting mechanism, depositing mechanism, transferring mechanism between the carrier and the depositing mechanism, separating means operating to divide the predetermined quantity into bunches, and spacing means for keeping said bunches separate as they are forwarded by the transferring mechanism, substantially as described.

12. The combination with a rotating carrier constructed to successively forward predetermined quantities of the article to be boxed, of a rotating box-presenting mechanism, depositing mechanism, transferring mechanism between the carrier and the depositing mechanism, and separating means operating to divide the predetermined quantity into bunches, and spacing means for keeping said bunches separate as they are forwarded by the transferring mechanism, substantially as described.

13. The combination with a carrier constructed to successively forward predetermined quantities of the article to be boxed, of a box-presenting mechanism, depositing mechanism operating to deliver the articles to be boxed to the boxes in layers, a forwarding device, means for transferring the predetermined quantities to the forwarding device divided to form layers, and means for operating the forwarding device, substantially as described.

14. The combination with a rotating carrier constructed to successively forward predetermined quantities of the article to be boxed, of a box-presenting mechanism, depositing mechanism operating to deliver the articles to be boxed to the boxes in layers, a forwarding device, means for transferring the predetermined quantities to the forwarding device divided to form layers, and means for operating the forwarding device, substantially as described.

15. The combination with a rotating table having ribs which divide it into pockets, of spacing devices in the pockets, a stationary rim having a delivery-opening within which the table rotates, and means for delivering the articles from the pockets, substantially as described.

16. The combination with a rotating table having ribs which divide it into pockets, of a stationary rim having a delivery-opening within which the table rotates, an evening device, and means for delivering the articles from the pockets, substantially as described.

17. The combination with a rotating table having ribs which divide it into pockets, of spacing devices in the pockets, a stationary rim having a delivery-opening within which the table rotates, an evening device, and means for delivering the articles from the pockets, substantially as described.

18. The combination with a rotating table having ribs which divide it into pockets, of a stationary rim having a delivery-opening within which the table rotates, an evening-plate having a curved guide connected thereto, a delivery-slide, and means for operating the slide, substantially as described.

19. The combination with a rotating table having ribs which divide it into pockets, of spacing devices in the pockets, a stationary rim having a delivery-opening within which the table rotates, an evening-plate having a curved guide connected thereto, a delivery-slide, and means for operating the slide, substantially as described.

20. The combination with a carrier constructed to successively forward predetermined quantities of the articles to be boxed, a delivery-table provided with spacing means, and means for transferring the predetermined quantities from the carrier to the delivery-table, substantially as described.

21. The combination with a table having a spacing-rib, of means for delivering articles to the table in predetermined quantities and in the direction of the length of the rib whereby the rib subdivides the quantities, substantially as described.

22. The combination with a table, of a cover-plate therefor, a spacing-rib having its forward end beveled off, and means for delivering articles to the table in predetermined quantities, substantially as described.

23. The combination with a table, of a cover-plate therefor, a spacing-rib having its forward end beveled off and its sides inclined, and means for delivering articles to the table in predetermined quantities, substantially as described.

24. The combination with a delivery-table operating to support a plurality of cigars or similar articles, of a table to which said delivery-table delivers the article, and means for moving the delivery-table toward the other table as the delivery operation is effected and away from the other table after the delivery operation is completed so as to obtain clearance, substantially as described.

25. The combination with a delivery-table provided with a spacing-rib, of a slide for delivering articles thereto, a table to which said table delivers, and means whereby the slide moves the delivery-table toward the other table as the delivery operation is effected, substantially as described.

26. The combination with a delivery-table provided with a spacing-rib, of a slide for delivering articles thereto, a table to which said table delivers, means whereby the slide moves the delivery-table toward the other table as the delivery operation is effected, and a spring for returning the delivery-table, substantially as described.

27. The combination with a delivery-table having a spacing-rib, of a second table to which it delivers, a slide for delivering articles to the delivery-table, adjustable means between the delivery-table and the slide, whereby the slide moves the table, and means for returning the table, substantially as described.

28. The combination with a delivery-table having a spacing-rib, of a second table to which said table delivers, a cover-plate for said delivery-table, a bracket also carried by said table, a screw carried by the bracket, the end of which is adapted to be struck by the slide to move the delivery-table, and a spring for returning the table, substantially as described.

29. The combination with a carrier for forwarding articles such as cigars, of the receiving-table to which the cigars are to be delivered, an intermediate table operating to support a plurality of cigars, and means for giving the intermediate table a movement toward the receiving-table, as the delivery operation is effected and away from said table after the operation is completed, so as to obtain clearance, substantially as described.

30. The combination with a carrier for forwarding articles, of a receiving-table to which they are to be delivered, and an intermediate movable table between the carrier and the receiving-table, said table having a choked mouth, substantially as described.

31. The combination with a rotating carrier for forwarding articles, of a receiving-table to which they are to be delivered, an intermediate table between the carrier and the receiving-table and means for giving the intermediate table a bodily movement from the carrier to the receiving-table, substantially as described.

32. The combination with a rotating carrier for forwarding articles, of a receiving-table to which they are to be delivered, and an intermediate movable table between the carrier and the receiving-table, said table having a choked mouth, substantially as described.

33. The combination with a rotating carrier operating to forward articles in predetermined quantities, of means for delivering articles therefrom, a receiving-table to which the articles are to be delivered, and a movable table intermediate the carrier and the receiving-table, said table being operated by the delivering means, substantially as described.

34. The combination with a rotating carrier operating to forward articles in predetermined quantities, of means for delivering articles therefrom, a receiving-table to which the articles are to be delivered, and a movable table having a choked mouth intermediate the carrier and the receiving-table, said table being operated by the delivering means, substantially as described.

35. The combination with a rotating carrier operating to forward articles in predetermined quantities, of a slide for delivering articles therefrom, a receiving-table to which the articles are to be delivered, and a movable table intermediate the carrier and the receiving-table, said table being operated by the slide, substantially as described.

36. The combination with a rotating carrier operating to forward articles in predetermined quantities, of a slide for delivering articles therefrom, a receiving-table to which the articles are to be delivered, and a movable table having a choked mouth intermediate the carrier and the receiving-table, said table being operated by the slide, substantially as described.

37. The combination with a table, of a forwarding device having a plurality of operating-faces arranged tandem, and means operating to deliver articles to the table in position to be acted on by each of the operating-faces, substantially as described.

38. The combination with a table, of a forwarding-slide having a plurality of operating-faces arranged tandem, and means for delivering articles to the table in front of each of the faces, substantially as described.

39. The combination with a table, of a forwarding-slide having two operating-faces, one lying in front of the other, means for giving the slide two forward movements, means for moving the forward operating-face out of the path of the slide between the forward movements of the slide, and means for returning the slide, substantially as described.

40. The combination with a carrier constructed to forward articles in predetermined quantities, of a table, a slide having a plurality of operating-faces, and means for successively transferring the predetermined quantities of articles from the carrier to the table, a part of each predetermined quantity lying in front of each operating-face of the slide, and means for operating the slide, substantially as described.

41. The combination with a carrier constructed to successively forward articles in predetermined quantities, of a table having a spacing-rib, a second table, a forwarding device having a plurality of operating-faces coacting with said second table, and a delivery device operating to deliver the articles from the carrier to the first table, the tables being arranged sufficiently close to each other so that the articles forwarded by the delivery device to the first table operate to push the articles from the first table onto the second table, substantially as described.

42. The combination with a carrier constructed to successively forward articles in predetermined quantities, of a movable table having a choked mouth, a delivery-slide operating to transfer the articles from the carrier to the table, a second table to which the articles are delivered from the movable table, and a second slide having a plurality of operating-faces coacting with said second table, substantially as described.

43. The combination with a carrier constructed to successively forward articles in predetermined quantities, of a movable table having a choked mouth, a delivery-slide operating to transfer the articles from the carrier to the table, a second table to which the articles are delivered from the movable table, a second slide having two operating-faces, one lying in front of the other, means for giving this slide two forward movements, means for moving the forward operating-face out of the path of the slide, and means for returning the slide, substantially as described.

44. The combination with a receiving-table, of a slide having two operating-faces, a box-support, a depositing mechanism to which the slide delivers, means for giving the slide successive forward movements to enable each operating-face to deliver to the depositing mechanism, and means for moving the operating-face which is nearer the depositing mechanism out of the path of the slide after it has delivered to the depositing mechanism, substantially as described.

45. The combination with a box-support, of a depositing mechanism, a table, a slide having a plurality of operating-faces, means for moving the slide, and means for moving the operating-face which is nearest the depositing mechanism out of the path of the slide after it has delivered to the depositing mechanism, substantially as described.

46. The combination with a box-support, of a depositing mechanism, a table, a slide moving thereover, said slide having an operating-face, an arm pivoted to the slide and also having an operating-face which is in front of the operating-face on the slide, means for moving the slide toward the depositing mechanism, and means for moving the arm so as to move its face out of the path of the slide after said face has delivered to the depositing mechanism, substantially as described.

47. The combination with a box-support, of a depositing mechanism, a table, a slide having an operating-face, an arm pivoted to the slide and also having an operating-face which lies in front of the operating-face on the slide, means for giving the slide successive forward movements, and means for moving the arm to cause it to move its operating-face out of the path of the slide between successive forward movements of the slide, substantially as described.

48. The combination with a box-support, of a depositing mechanism, a table, a slide moving thereover and having an operating-face, an arm pivoted to the slide and also having an operating-face which lies in front of the operating-face on the slide, a rock-arm, connections between the two arms, and means for operating the rock-arm as the slide is moved forward, substantially as described.

49. The combination with a box-support, of a depositing-plunger carrying supporting devices, means for delivering articles, and positioning devices adapted to be moved out of the way by the articles as they are delivered to the supporting devices, substantially as described.

50. The combination with a depositing-plunger, of supporting devices carried thereby, a slide for delivering articles to the supporting devices, and positioning devices operating against the articles which are moved forward by the slide, substantially as described.

51. The combination with a depositing-plunger, of supporting-flanges carried by the plunger, pivoted positioning-arms normally lying in the space between the supporting-flanges, and means for delivering articles to the flanges, the articles as they are delivered to the flanges operating to move the positioning-arms out of the way, substantially as described.

52. The combination with a depositing-plunger, of supporting-flanges carried by the plunger, carved pivoted positioning-arms normally lying in the space between the supporting-flanges, and means for delivering the articles to the flanges, the articles as they are delivered to the flanges operating to move the positioning-arms out of the way, substantially as described.

53. The combination with a box-support, of a depositing-plunger, sliding members carried by the plunger, said sliding members having supports secured thereto, means for moving the plunger toward the box, and means for moving the sliding members to move the supports and cause them to deliver the articles, substantially as described.

54. The combination with a box-support, of a depositing-plunger, supports carried by the plunger, a second plunger, means for moving the two plungers toward the box, and means whereby the movement of the second plunger operates to move the supports carried by the first plunger so as to cause them to deliver the articles carried by them, substantially as described.

55. The combination with a box-support, of a plunger, supports carried by the plunger, a second plunger, a packing device, means for moving the two plungers toward the box, and means whereby the movement of the second plunger operates to move the supports and the packing device, substantially as described.

56. The combination with a box-support, of a plunger, sliding members carried thereby, supports mounted on the members, a second plunger having a cam-head for operating the sliding members, and means for moving the two plungers toward the box, substantially as described.

57. The combination with a box-support, of a plunger, sliding members carried thereby, supports secured to the members, a second plunger having a cam-head working through the first plunger, a spring-mounted packing device, and means for moving the two plungers toward the box, the movement of the second plunger operating the sliding members and the spring-mounted packing device, substantially as described.

58. The combination with a box-support, of a depositing-plunger sliding members carried thereby, supports secured to the members, a second plunger working through the first plunger and having a cam-head which operates the sliding members, a packing device carried by the first plunger, means for giving the two plungers different degrees of movement toward the box, the movement of the second plunger operating the sliding members and the packing device, substantially as described.

59. The combination with a box-support, of a depositing-plunger, supports carried by the plunger, a slide having a plurality of operating-faces, each face operating to insert a layer of articles in the plunger, means for giving the plunger different amounts of movement toward the box after each layer is inserted therein, and means for moving the supports to cause them to deliver the articles for each movement of the plunger toward the box, substantially as described.

60. In a machine for boxing articles, the combination with a rotating carrier having pockets thereon, of a receiving-table, means for transferring the articles from the carrier to the receiving-table, a forwarding-slide having two operating-faces working over the receiving-table, a box-support, a depositing-plunger having supporting means for the articles, means for giving the forwarding-slide successive forward movement, means for lifting one of the operating-faces out of the path of the slide between the movements, means for giving the depositing-plunger varying degrees of movement toward the box in order to enable it to insert the layers of articles in the box which are delivered to it by the successive movements of the slide, and means for moving the supporting means on the plunger to cause them to deliver the articles, substantially as described.

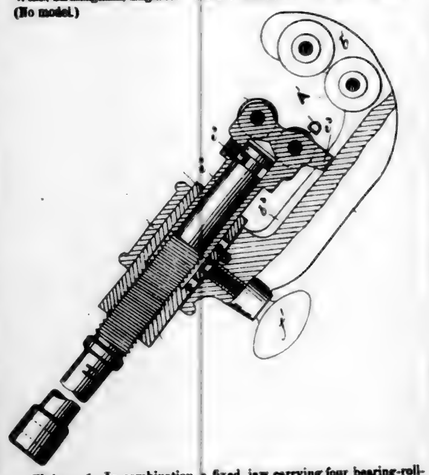
61. In a machine for boxing articles, the combination with a rotating carrier having pockets thereon, of a receiving-table, means for transferring the articles from the carrier to the receiving-table, a forwarding-slide having two operating-faces working over the receiving-table, a rotating box-support, a depositing-plunger having supporting means for the articles, means for giving the forwarding-slide successive forward movements, means for lifting one of the operating-faces out of the path of the slide between the movements, means for giving the depositing-plunger varying degrees of movement toward the box in order to enable it to insert the layers of articles in the box which are delivered to it by the successive movements of the slide, means for moving the supporting means on the plunger to cause them to deliver the articles, a raceway, means for delivering sheaths or covers to the raceway, and means for inserting the filled boxes in the sheaths, substantially as described.

62. In a mechanism for inserting boxes into sheaths, the combination with a raceway constructed to maintain the sides of the boxes in formed position, of means for forwarding boxes through the raceway, and a warped turner-guide on each side of the raceway positioned to act upon the side wings of the top flange of the box, substantially as described.

63. The combination with a carrier, of a shaft by which it is driven, a counter-shaft, clutch-controlled driving means between the two shafts, a box-support driven from the counter-shaft, and transferring devices between the carrier and the support, whereby both the carrier and the support may be caused to operate together or the carrier may be caused to operate without operating the support, substantially as described.

64. The combination with a rotating carrier, of a shaft from which it is driven, a power mechanism, a clutch between said shaft and the power mechanism, delivery devices driven from said shaft, a second shaft, clutch-controlled driving mechanism between the two shafts, a box-support, and a depositing mechanism driven from the second shaft, substantially as described.

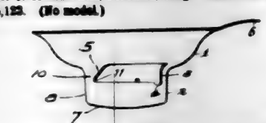
708,790. APPARATUS FOR CUTTING PIPES, RODS, &c. PHILIP WIER, Birmingham, England. Filed Oct. 25, 1901. Serial No. 79,930. (No model.)



Claim.—1. In combination, a fixed jaw carrying four bearing-rollers, a sleeve movable toward and from the rollers with means for clamping it in any desired position, a movable jaw guided by said sleeve and means for operating the movable jaw, substantially as described.

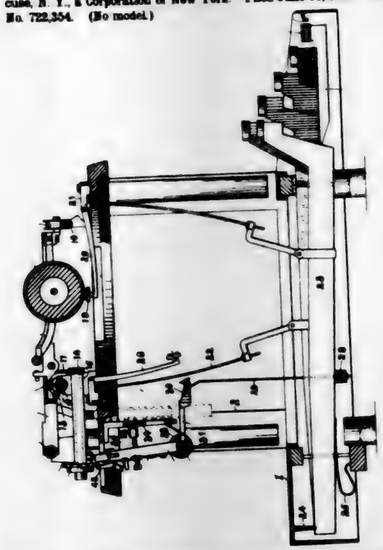
2. In combination, the fixed jaw having bearing-rollers at one end and a tubular portion at the other, a sleeve slidably mounted in said tubular portion, means for clamping it adjustably in the tubular portion, a movable jaw having a tubular shank extending into the sleeve and a projection engaging a groove in the fixed jaw, a cutter carried by the movable jaw and a screw threaded through the sleeve and having its end rotatably secured within the tubular portion of the movable jaw, substantially as described.

708,791. EGG-SEPARATOR. MARY R. ABRAHAMS, St. Louis, Mo., assignor to Martha Bell, Portland, Oreg. Filed Feb. 21, 1902. Serial No. 95,123. (No model.)



Claim.—As an article of manufacture, an egg-separator comprising a flaring upper portion 1; and the lower portion 2 having a substantially flat bottom and a substantially vertical wall connecting the bottom to the flaring portion 1, there being discharge-openings 3 formed through the upper part of the wall 8 and the lower part of the flaring portion 1, thus leaving the solid portions 9 and 10 connecting the wall 8 to the portion 1, and there being notches 4 at the ends of the openings 3 on each side of the solid portion 9 to serve as spouts, and said openings 3 being pointed at their lower forward ends; and the portion 10 being of sufficient width to conduct the yolk of an egg out of the portion 2; substantially as specified.

708,792. TYPE-WRITING MACHINE. WALTER J. BARRON, Brooklyn, N. Y., assignor to the Densmore Typewriter Company, Syracuse, N. Y., a Corporation of New York. Filed June 30, 1899. Serial No. 722,354. (No model.)



Claim.—1. In a type-writing machine, the combination of a power-driven carriage, a rack, a dog normally out of engagement with the rack and the rack and dog being arranged to provide a "drop" and one of said rack-and-dog elements being connected to and controlling a letter-space movement of the carriage, and means for preventing rebound of the carriage when engagement of the rack and dog occurs; substantially as set forth.

2. In a type-writing machine, the combination of a power-driven carriage, a rack, a dog normally out of engagement with the rack and the two being arranged to provide a "drop" and one of said rack-and-dog elements being connected to and controlling a letter-space movement of the carriage, and a notch adapted to coact with a rack-teeth; substantially as set forth.

3. In a type-writing machine, the combination of a power-driven carriage, a rack, a dog normally out of engagement with the rack and the two being arranged to provide a "drop" and one of said rack-and-dog elements being connected to and controlling a letter-space movement of the carriage, and a notch adjacent the dog and adapted to embrace a rack-tooth; substantially as set forth.

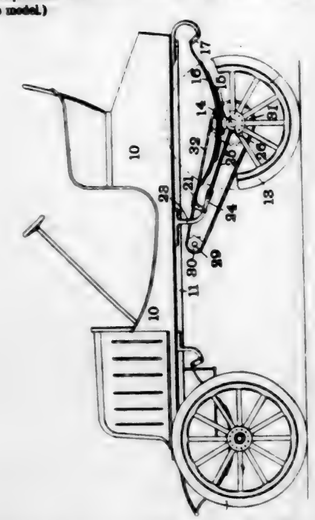
4. In a type-writing machine, the combination of a rack, a carrier, said rack and carrier having relative motion transversely of the rack, a bolding-dog moving relatively to said carrier transversely of the rack, a notched block carrying said dog and adapted to arrest and hold said dog in engagement with the rack while the rack and carrier have further relative motion, and a spring offering no resistance to the relative motion of the carrier and the rack until the dog is arrested by said block and thereafter opposing a gradually-increasing resistance to the said further relative motion; substantially as set forth.

5. In a type-writing machine and in an escapement mechanism, the combination of a power-driven carriage, a rack connected therewith, a dog-carrier movable at right angles to the plane of the rack, and a spring-pressed block provided with an adjacent notch and pivoted directly to said carrier on an axis parallel with the plane of said rack; substantially as set forth.

6. In a type-writing machine and in an escapement mechanism, the combination of a power-driven carriage, a rack, a vibratory dog-carrier, and a dog bolder or block pivoted on said carrier and spring-pressed toward the rack, and provided with a notch, one wall 57 of which is inclined to match the shape of the rack-teeth; substantially as set forth.

7. In a type-writing machine and in an escapement mechanism, the combination of a carriage, a rack, a vibratory dog-carrier, a dog block or bolder pivoted thereon and spring-pressed toward said rack, whereby the dog may be arrested while the rocker continues its forward movement, and means on said dog-bolder for positively grasping the rack-tooth and holding the rack stationary while the dog-carrier is moving forwardly as aforesaid, whereby the carriage is held firmly during the moment of impact of the types and at the same time the finger-key is cushioned; substantially as set forth.

708,798. MOTOR-VEHICLE. HENRY F. BORBEIN, St. Louis, Mo., assignor to Gus V. Brecht Butchers' Supply Company, St. Louis, Mo., a Corporation of Missouri. Filed July 24, 1902. Serial No. 116,802. (No model.)

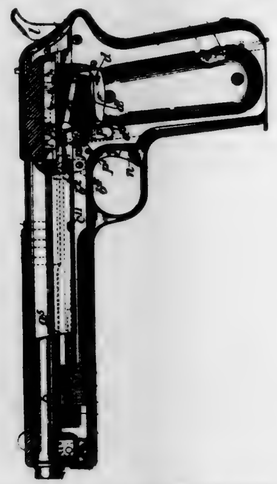


Claim.—1. In a motor-vehicle, the combination with a frame adapted to support the body, of a spring, a bearing for the driving-axle secured to said spring, a strut-rod secured to said bearing, a link pivoted at one end to said strut-rod and at the other to said spring, and means for supporting said strut-rod.

2. In a motor-vehicle, the combination with a frame for supporting the body, of a spring, a bearing carried by said spring, a strut-rod secured to said bearing, a link pivoted at one end to said strut-rod and at the other to said spring, and a hanger secured to said frame and supporting said strut-rod and link.

3. In a motor vehicle, the combination with a frame for supporting the body, of a bearing for the driving-axle, a strut-rod attached to said bearing, a bifurcated end piece adjustably secured to said rod, and a hanger secured to said frame and pivoted to said bifurcated end piece.

708,794. AUTOMATIC FIREARM. JOHN M. BROWNING, Ogden, Utah. Filed Nov. 7, 1901. Serial No. 81,361. (No model.)



Claim.—1. In a firearm, the combination with a frame, a reaction-spring mounted in the frame, and a breech-slide formed to engage the frame and slide thereon, of an abutment for said spring carried by the breech-slide and a plug having a limited movement in the frame and adapted to coöperate with said spring to press the same back and release the abutment, substantially as shown and described.

2. In a firearm, the combination with a frame having a chamber, a reaction-spring mounted in said chamber, and a breech-slide formed to engage the frame and slide thereon, of a key carried by the breech-slide and traveling in a slot in the frame to couple said slide and frame and form an abutment for said spring, and a plug having a limited movement in the end of said chamber and adapted to coöperate with said spring to press the same back and release the key, substantially as shown and described.

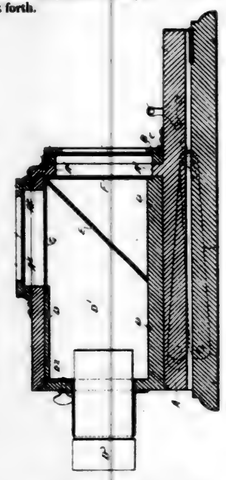
3. In a firearm, the combination with a frame, a breech-slide formed to slide on the frame, and a magazine having a spring-actuated follower, of a latch mounted to slide in the frame, said latch having a locking-nose to engage the breech-slide and having a projection in the path of said follower whereby when the magazine is empty the latch is raised to engage the breech-slide and hold the same in its rearward position, substantially as shown and described.

4. In a firearm, the combination with a frame having a slot in its side, a breech-slide formed to slide on the frame and a magazine having a spring-actuated follower, of a latch mounted to slide in the slot in the frame, said latch having a locking-nose to engage the breech slide and having a projection in the path of said follower, whereby when the magazine is empty the latch is raised to engage the breech-slide and hold the same in its rearward position, substantially as shown and described.

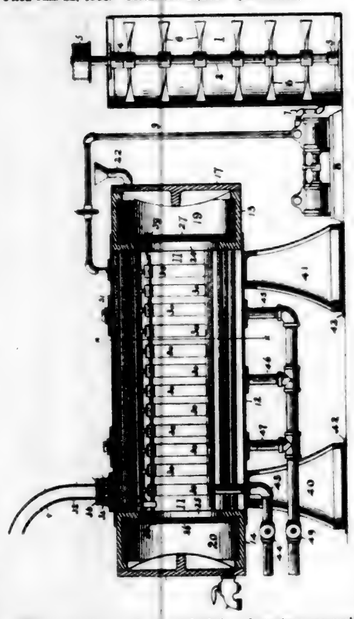
708,795. PHOTOGRAPHIC CAMERA FOR PRODUCING AND VIEWING IMAGES IN NATURAL COLORS. EDWIN T. BUTLER, Cambuslang, near Glasgow, Scotland. Filed Dec. 7, 1900. Serial No. 39,022. (No model.)

Claim.—1. In a stereoscopic camera fitted with a slide in the usual orifice at the rear end of the camera-body and adapted to carry a sensitive sheet, the combination therewith of a slide placed in an orifice in the roof of the camera-body and carrying a sensitive sheet, colored screens combining all the colors of the spectrum in due proportion, interposed between the lenses and the sensitive sheets, and reflectors inclined at forty-five degrees to said screens an end for the purpose set forth.

2. In a stereoscopic camera fitted with a slide in the usual orifice at the rear end of the camera-body and adapted to carry a sensitive sheet, the combination therewith of a slide placed in an orifice in the roof of the camera-body and carrying a sensitive sheet, colored screens interposed between the lenses and the upper sensitive sheet, and inclined transparent colored plates interposed between the lenses and the rear sensitive sheet, said inclined plates serving as reflectors and screens as and for the purpose set forth.



708,796. BLEACHING APPARATUS. CHAUNCEY C. CLARK, Philadelphia, Pa., assignor of one-half to James G. Carson, Philadelphia, Pa. Filed Jan. 22, 1901. Serial No. 44,273. (No model.)



Claim.—1. In an apparatus for brine electrolysis, an inclosed cylindrical decomposing-receptacle, a series of electrodes in double rows therein, having electrical connections thereto, and within the receptacle means for the circulation of cooling material therethrough, from end to end of the cylinder.

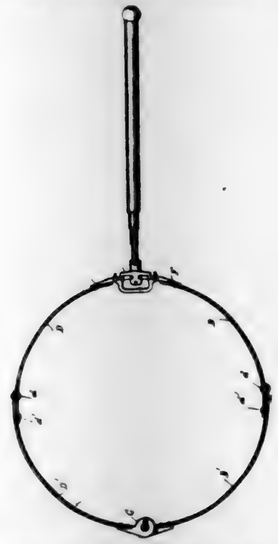
2. In an electrolytic apparatus, a mixing-tank, an inclosed receptacle for the electrolyte, a series of electrodes in the receptacle and means for their electric energizing; chambers at the ends of the receptacle, a liquid-inlet to one of the chambers, a liquid-outlet for the other chamber, tubes connecting the chambers and passing through the receptacle, and means to withdraw the electrolyte after its electrolysis.

3. In a chlorin-manufacturing apparatus, an inclosed receptacle having chambers at the ends with inlet and outlet passages and tubes from chamber to chamber through the receptacle, tube-sheets in the chambers to which the tubes are expansively secured, openings in the tube-sheets, removable covers for the openings, and bus-bars secured to the tube-sheets for expansion and insulation and having anodes and cathodes secured thereto.

4. In an electrolytic apparatus, an inclosed cylindrical horizontal electrolyte-receptacle, electrodes removably suspended in the receptacle and having conductors therefor and electrical contact therewith, tube-sheets and chambers at the ends of the receptacle, means to cool the electrolyte by a series of independent tubes having expansion connections to the tube-sheets and adapted for the receipt and discharge of cooling liquid and its passing through the electrolyte and its receptacle, means for the discharge of the product of electrolysis, and its settled impurities and means to afford access to the receptacle for its cleansing.

5. In apparatus for the purpose described, a tightly-closed receptacle, heads forming the ends of the receptacle and removable covers thereon, tube-sheets formed on the heads, and chambers inclosed by the head formations, tubes secured to the tube-sheets, extending from sheet to sheet, connecting the chambers through the receptacle; openings in the tube-sheets, covers for the openings, bus-rods carried by the covers, a series of electrodes secured to and in contact with the bus-rods, and electrical conductors secured to the bus-rods, and passing outward from the receptacle through insulated and liquid-retaining stuffing-boxes to a source of electrical energy.

708,797. LANDING-NET. THADDEUS S. COFFIN, Revere, Mass. Filed Jan. 11, 1902. Serial No. 89,259. (No model.)



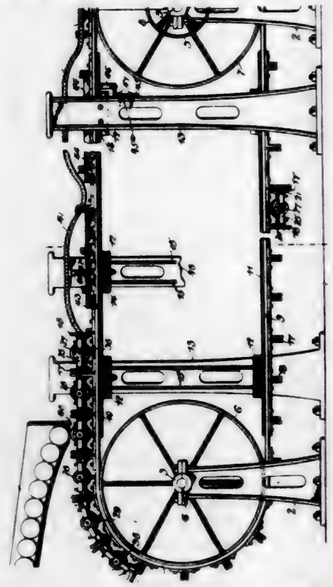
Claim.—1. In a landing-net, the combination, with a handle, and a forked bracket secured thereto and provided with guide-spaces and hooked catches; of a foldable frame formed of pivotally-connected spring-bars provided with arms which slide in the said forked bracket and have projections for engaging with the said guide-spaces and catches, substantially as set forth.

2. In a landing-net, the combination, with a handle, and a forked bracket secured thereto and provided with guide-spaces and hooked catches; of a support for the net provided with arms which slide in the fork of the said bracket and have projections for engaging with the said guide-spaces and catches, substantially as set forth.

3. In a landing-net, the combination, with a handle, and a forked bracket secured thereto and provided with a stop at its middle part, and having also guide-spaces arranged at each side of and above the stop, and catches at its ends; of a support for the net provided with arms which slide in the fork of the said bracket and have projections which engage with the said guide-spaces, stop and catches, substantially as set forth.

4. In a landing-net, the combination, with a handle, a forked bracket formed of two similar half-brackets, and means for securing the said half-brackets together and to the handle, said forked bracket being provided with guide-spaces and hooked catches; of a support for the net provided with arms which slide in the fork between the said half-brackets and have projections which engage with the said guide-spaces and catches, substantially as set forth.

708,798. CAN-SOLDERING MACHINE. BERNARD COLL, Baltimore, Md. Filed Nov. 22, 1901. Serial No. 83,254. (No model.)



Claim.—1. In a can-soldering machine, the combination of a belt, belt-pulleys, a belt-guide, the said belt passing along the guide and around the pulleys, the said guide being arranged tangentially to the pulleys and constructed to maintain and guide the belt flatwise horizontally between the pulleys, can-carrier mechanism adapted to be rotated and tilted, and devices fashioned and disposed to rotate and tilt the said can-carrier mechanism, the said can-carrier mechanism being borne by the belt, the said guide being adjustable laterally whereby the said belt and can-carrier mechanism are correspondingly moved, and means for supporting the guide and for clamping it in position.

2. In a can-soldering machine, the combination of a belt, belt-pulleys, and can-carrier mechanism comprising twin posts secured to the belt, a carrier-frame having jointed ends, pivot-pins projecting from the posts, the said frame being pivotally supported and movable laterally on the said pins, a trough arranged to receive a can, the said trough being adjustably connected to the carrier-frame, spring-clamps adapted to hold a can within the said frame, revolubie and longitudinally-movable shafts attached to the said clamps, and means for rotating the shafts and tilting the can-carrier mechanism, substantially as described.

3. In a can-soldering machine, the combination of the belt, upper and lower belt-guides consisting of plates having their sides bent upwardly and inwardly to cover the edges of the belt leaving a space lengthwise in the middle of the belt uncovered, belt-pulleys, the said guides being arranged flatwise and tangentially between the tops and bottoms of the pulleys, devices adapted for adjusting the guides laterally, can-carrier mechanism secured to the middle of the belt, and means for rotating and tilting the can-carriers, substantially as described.

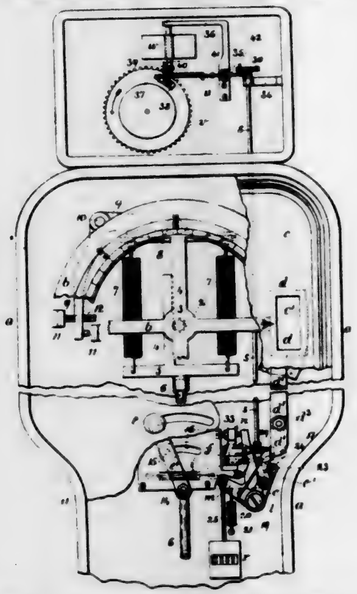
4. In a can-soldering machine, geared racks arranged at the sides of the machine, devices for supporting the said racks and constructed to effect the adjustment of the racks vertically and horizontally, and means carried by the vertical support whereby the said racks may be adjusted rotatively, substantially as described.

5. In a can-soldering machine, the combination of a belt, belt-pulleys, and can-carrier mechanism comprising twin posts secured to the belt, a carrier-frame, pivot-pins projecting from the posts, the said frame be-

ing pivotally supported and movable laterally on the said pins, a trough arranged to receive a can, the said trough being adjustably connected to the carrier-frame, vertically-adjustable devices secured to the belt beneath the said trough and attached pivotally to the trough, spring-operated clamping-plates, revoluble and longitudinally-movable shafts secured to the clamping-plates, and means for rotating the shafts and tilting the carrier mechanism, substantially as described.

6. In a can-soldering machine, the combination of a belt, belt-pulleys, and can-carrier mechanism comprising twin posts secured to the belt, a carrier-frame having jointed ends, pivot-pins projecting from the posts, the said frame being pivotally supported and movable laterally on the said pins, an adjustable trough arranged to receive a can, the said trough being adjustably connected to the carrier-frame, spring-operated clamping-plates, revoluble and longitudinally-movable shafts secured to the clamping-plates, pinions fixed upon the shafts, geared racks arranged at the sides of the machine, the racks being oppositely elevated and depressed whereby the engagement of the pinions rotates the clamping-plates and tilts the carriers, and spreaders adapted to separate the pinions for the purpose of receiving and discharging cans, substantially as described.

708,799. WEIGHING-MACHINE. EDGAR H. COOK, Brooklyn, N. Y. Filed June 6, 1901. Serial No. 63,367. (No model.)



Claim.—1. In a weighing-machine, the combination with the weighing mechanism, a face covering the indicator-dial thereof and having an opening therein, and a shutter for normally covering the opening, and a hand-operated mechanism for effecting the movement of the shutter, of a rod extending from a registering mechanism, a lever device to which said rod is connected and which lever device is set in motion by the hand-operated mechanism simultaneously with the shutter mechanism for effecting the registration of the number of times the machine has been used, and a spring-actuated adjustable device connected with the lever mechanism and which may be set in proportion to the movement required of the rod extending to the registering mechanism, substantially as set forth.

2. In a weighing-machine, the combination with the weighing mechanism, a face covering the indicator-dial thereof and having an opening therein, and a shutter for normally covering the opening, and a hand-operated mechanism for effecting the movement of the shutter, of a lever mechanism comprising the arms *m n* and *o*, a hub upon which the same are mounted, a stop for limiting their movement, and a spring for holding the same in a normal position of rest, a spring-actuated adjustable device connected to said lever mechanism, a spring-actuated tooth connected to the arm *n*, and devices set in motion by the lever mechanism for effecting the release and permitting the movement of a music-box mechanism, substantially as set forth.

3. In a weighing-machine, the combination with the weighing mechanism, a face covering the indicator-dial thereof and having an opening therein, and a shutter for normally covering the opening, and a hand-operated mechanism for effecting the movement of the shutter, of a lever mechanism comprising the arms *m n* and *o*, a hub upon which the same are mounted, a stop for limiting their movement and a spring for holding the same in a normal position of rest, an auxiliary arm *o'* pivoted to the arm *o*, an eccentric device upon the free end of the arm *o*, a pin on the auxiliary arm and a spring for holding the said auxiliary arm against the eccentric device, a hollow hub on the arm *n*, and a spring-actuated non-rotatable tooth in said hub, and devices, substantially as set forth and adapted to be set in operation by the spring-actuated tooth of the arm *n* for releasing said mechanism and permitting the movement of a music-box mechanism, substantially as set forth.

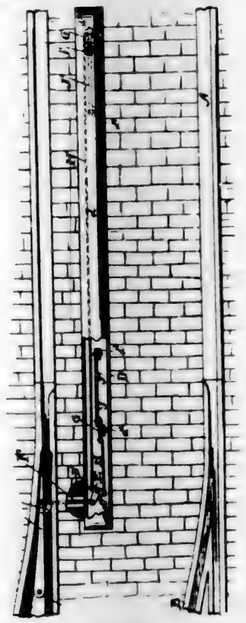
4. In a weighing-machine, the combination with the weighing mechanism, a face covering the indicator-dial thereof and having an opening therein and a shutter for normally covering the opening, and a hand-operated mechanism for effecting the movement of the shutter, of a lever mechanism comprising the arms *m n* and *o*, a hub upon which the same are mounted, a stop for limiting their movement, and a spring for holding the same in a normal position of rest, an auxiliary arm *o'* pivoted to the arm *o*, an eccentric device upon the free end of the arm *o*, a pin on the auxiliary arm and a spring for holding the said auxiliary arm against the eccentric device, a hollow hub on the arm *n*, and a spring-actuated non-rotatable tooth in said hub, a rod *s* extending vertically from the case of a music-box mechanism through the case of the weighing-machine upon which the mechanism is superposed, supports therefor, a toothed wheel on the lower end of said rod adapted to be engaged by the tooth 27, a star-wheel on the upper end of said rod, a pivoted lever *u* having a pin engaged by the star-wheel, a finger 37 on the free end of the said lever and an arm 39 connected to said lever, means connected to the governor of the music-box mechanism and adapted to engage the said arm 39, a spring-actuated slide in the toothed wheel of the said music-box mechanism moving through a mortise in said wheel and which parts are engaged by the finger of said lever, substantially as set forth.

5. In a weighing-machine, the combination with the weighing mechanism, a face covering the indicator-dial thereof and having an opening therein and a shutter for normally covering the opening, and a hand-operated mechanism for effecting the movement of the shutter, of a case for a music-box mechanism superposed upon the case of the weighing-machine, an arm projecting from the shaft of the governor thereof, a spring-actuated slide movable in a mortise in the toothed wheel thereof, a pivoted lever *u* having a finger on one end adapted to engage said spring-actuated slide and enter the mortise in the toothed wheel, an arm 39 connected to said lever and adapted to engage the arm of the governor-shaft, a pin upon the other end of said lever *u*, a vertical shaft *s* extending through the case of the music-box mechanism into the case of the weighing-machine, a star-wheel 30 on its upper end engaging the pin of said lever, a toothed wheel 29 on its lower end, bearings for said vertical rod *s*, and devices, substantially as herein shown and described and operated by the hand-operated mechanism simultaneously with its operation of the shutter device for releasing and setting in motion the music-box mechanism, substantially as described.

6. In a weighing-machine, the combination with the weighing mechanism, a face covering the indicator-dial thereof and having an opening therein, and a shutter for normally covering the opening, and a hand-operated mechanism for effecting the movement of the shutter, of a case for a music-box mechanism superposed upon the case of the weighing-machine, an arm projecting from the shaft of the governor thereof, a spring-actuated slide movable in a mortise in the toothed wheel thereof, a pivoted lever *u* having a finger on one end adapted to engage said spring-actuated slide and enter the mortise in the toothed wheel, an arm 39 connected to said lever and adapted to engage the arm of the governor-shaft, a pin upon the other end of said lever *u*, a vertical shaft *s* extending through the case of the music-box mechanism into the case of the weighing-machine, a star-wheel 30 on its upper end engaging the pin of said lever, a toothed wheel 29 on its lower end, bearings for said vertical rod *s*, and a lever mechanism comprising the arms *m n* and *o*, the adjustable spring-actuated auxiliary arm *o'*, the spring 21, and a spring-actuated tooth 27, said lever mechanism being set in motion by the hand-operated mechanism simultaneously with its movement of the shutter mechanism and a tooth 27 upon the return movement engaging the toothed wheel 29 to release the devices actuated by the rod *s* to permit the operation of the music-box mechanism, substantially as set forth.

708,800. RAILWAY-SWITCH-OPERATING MECHANISM. REUBEN CRAPPER, Jr., Akron, Ohio, assignor of one-half to John A. Black, Akron, Ohio. Filed Oct. 22, 1901. Serial No. 79,540. (No model.)

Claim.—1. In a switch-operating mechanism, the combination of a pair of levers located along the track, a pair of bell-cranks connected with and operated by said levers, a three-arm lever located adjacent to the switch-point, a link connecting one arm of the same with the switch-point, and a pair of links connecting the other arms thereof with said bell-cranks, substantially as described.



2. In a switch-operating mechanism, the combination of a switch-point, mechanism located along the track for throwing the same, a link connected with said mechanism and extending beneath the switch-point, said link being connected with the under side of the point, there being a slot through the rail-base within which such point moves, and a pivoted plate covering such slot and having a hole through which said pin projects, substantially as described.

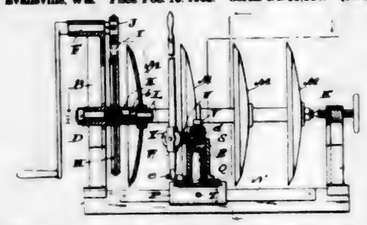
3. In a switch-operating mechanism, the combination of a switch-point, a rail-base in which said point seats, said base having a slot through it, a plate covering said slot above the rail-base, and below the switch-point, said plate being pivoted to said rail-base adjacent to the slot therein, said plate having a slot through it adapted to overlap the slot in the rail-base, a rod shifting said switch-point beneath said rail-base said rod having a pin extending up through both said overlapping slots into the switch-point, substantially as described.

708,801. CAN-OPENER. CLERK T. COUTES, Great Cacapon, W. Va. Filed Jan. 23, 1902. Serial No. 90,782. (No model.)

Claim.—1. In combination with the shank of the can-opener having a bent point which serves as a fulcrum and pivot, a puncturing device and a cutting device independently movable longitudinally on said shank in order that the said puncturing device may be set at any desired distance from the said point and the said cutting device afterward moved into the hole or slot made by said puncturing device, for the purpose of continuing the said slot in a circular path substantially as set forth.

2. A can-opener shank B provided with a handle A, the bent point C and a forward shoulder or stock *b'* in combination with an arrow-head-form puncturing-blade D having a point *d'* and edges *d³ d³* and a cutting-disk E, both the said blade and the said disk being loosely sleeved on the said shank, permitting them to be independently adjusted longitudinally of the same or to turn around it substantially as and for the purpose described.

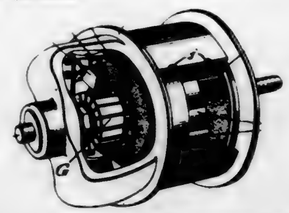
708,802. HARROW-DISK SHARPENER. AUGUSTUS R. DURBER, Evansville, Wis. Filed Feb. 10, 1902. Serial No. 93,307. (No model.)



Claim.—1. A harrow-disk sharpener comprising a frame, means for chucking and rotating a shaft with a series of harrow-disks thereon between standards of the frame, a slide straddling a longitudinal frame-beam in hook connection therewith, a plate guided on the slide in a direction transversely of said frame, means for regulating adjustment of the plate, a post in swivel connection with said plate, a sleeve on the post, a cutting-tool having a shank engaging a vertical post-slot and sleeve-notches, a set-screw in the upper end of said post opposing the tool-shank, a hand-lever for which the aforesaid plate is provided with a step, and an anti-friction-roller carried by the lever opposite the cutting-tool.

2. A harrow-disk sharpener comprising a frame, means for chucking and rotating a shaft with a series of harrow-disks thereon between frame-standards, a slide straddling a longitudinal frame-beam in hook connection therewith, a plate guided on the slide in a direction transversely of said frame, an adjusting-screw having a journal end in said slide and its threaded portion engaging an ear of the plate, a post in swivel connection with the aforesaid plate, a sleeve on the post, a cutting-tool having a shank engaging a vertical post-slot and sleeve-notches, a set-screw in the upper end of said post opposing the tool-shank, a hand-lever for which the aforesaid plate is provided with a step, and an antifriction-roller carried by the lever opposite the cutting-tool.

708,803. DYNAMO AND MAGNETO-ELECTRIC MACHINE. NATHAN H. EDGERTON, Philadelphia, Pa. Filed Aug. 22, 1901. Serial No. 72,866. (No model.)



Claim.—1. In an electric machine, the combination of an armature, an annular frame, spacing devices secured to the inner periphery thereof at diametrically opposite points and having beveled edges which contact with the ends of the curved magnet-strips, the latter being retained in position by their contact with said spacing devices, said strips being concentric with and within the plane of rotation of the armature.

2. In an electric machine, the combination of an armature, an annular frame, spacing devices secured to the inner periphery of said frame at diametrically opposite points, and having beveled edges which contact with the ends of curved magnet-strips, the latter being retained in position by their frictional contact with said spacing devices, said strips being placed in sections concentric with and within the plane of rotation of the armature, so as to form an inductive field.

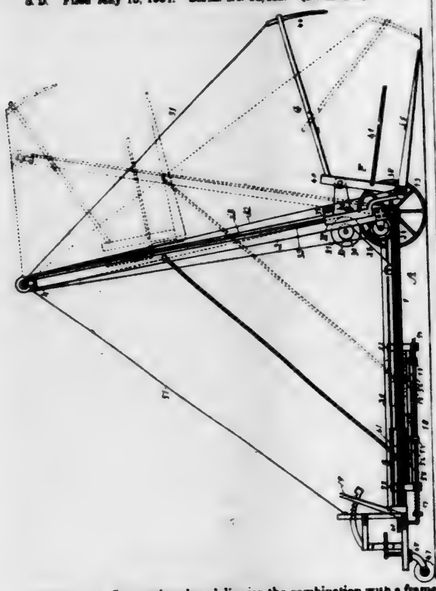
3. In an electric machine, the combination of an armature, having its windings parallel with its shaft, and an annular frame, of retaining-bars upon the inner faces of said frame upon diametrically opposite sides and having beveled edges, and curved laminated soft-iron magnets forming the field of the machine disposed within said frame with their ends abutting against the beveled edges of said retaining-bars.

4. In an electric machine, the combination of an armature, having its windings parallel with its shaft and an annular frame inclosing said armature, of retaining-bars upon the inner faces of said frame, and hav-

ing beveled edges, curved laminated soft-iron magnets forming the field of the machine with their ends abutting against the beveled edges of the said bars, and plates of diamagnetic material secured to the inner faces of said bars.

5. In an electric machine, the combination of an armature, having its windings parallel with its shaft, and an annular frame inclosing said armature, of retaining-bars on the inner face of said frame and having beveled edges, curved laminated soft-iron magnets forming the field of the machine disposed within said frame in a plane concentric with the armature and having their ends abutting against said bars, and plates of diamagnetic material secured to the inner face of said bars and overlapping the adjacent ends of said magnets.

708,804. **GRAIN OR HAY DELIVERER.** HENRY C. ESSE, Bowdle, S. D. Filed May 15, 1901. Serial No. 60,412. (No model.)



Claim.—1. In a grain or hay deliverer, the combination with a frame having a tubular longitudinal beam, a tubular transverse beam affixed thereto, uprights adjustably affixed to the said transverse beam, and a tie-beam connecting the said uprights; of an axle rotatable in boxes affixed in the said transverse beam; a toothed pinion rigidly affixed to the said axle; carriers affixed to, and longitudinally movable upon the said uprights; a fork hinged to, and movable with the said carriers; a grain or hay packer hinged to and movable with the said fork; a counter-shaft rotatable in boxes affixed to the said transverse beam; ropes or cables affixed to the said carriers, thence carried under and around sheave-wheels in the said fork, thence under and around other sheave-wheels affixed to the said carriers, thence over and around still other sheave-wheels supported by the said uprights, thence to and affixed in spools mounted upon the said counter-shaft; a toothed wheel loosely journaled upon the said counter-shaft, the teeth of which engage those of the toothed pinion affixed to the said axle; a clutch keyed upon, rotatable with and longitudinally movable upon the said counter-shaft; a spring operating to throw the said clutch into engagement with the said loosely-journaled toothed wheel, thereby locking it on the said counter-shaft; a lever operating to release, and to hold the said clutch out of engagement with the said loosely-journaled wheel; a ratchet-wheel and pawl, operating to lock the said counter-shaft to hold the said fork in its elevated position; a "wheel and axle" rotatable in boxes affixed to the said uprights; a spring affixed in and incased by the said longitudinal beam; a cable affixed in the periphery of the wheel of the said "wheel and axle" and extending to and over a sheave-wheel supported by the said tie-beam, thence to, and affixed in the said fork; and a similar cable affixed to the periphery of the axle of the said "wheel and axle" and connected with the said incased spring, all substantially as shown and for the purposes specified.

2. In a grain and hay deliverer, the combination with the frame, having a longitudinal beam and a transverse beam affixed thereto; of uprights pivotally affixed to the said transverse beam, a tie-beam connecting the said uprights; an axle rotatable in boxes affixed to the said transverse beam, carriers longitudinally movable upon the said uprights; a fork hinged to the said carriers; a packer affixed to the said fork; elevating-ropes affixed to the said carriers, connected with the said fork and wound upon spools rotated by the said axle; an operating-rope affixed to the said packer and extending to the driver's stand; a spring affixed to the said longitudinal beam; a "wheel and axle" mounted upon the said uprights; a cable extending from the said spring to the axle of the said "wheel and axle;" a similar cable extending from the wheel of the said "wheel and axle" to the said fork; and means for locking the said uprights in their forwardly-inclined position as when gathering, or in their rearwardly-inclined position as when conveying the grain or hay to the stacking-ground, substantially as shown and described.

3. In a grain and hay deliverer, the combination with the frame having a tubular longitudinal beam, a tubular transverse beam affixed thereto; an axle rotatable within the transverse beam; uprights adjustably affixed to the transverse beam; and a horizontal tie-beam affixed to said uprights; of carriers adjustably affixed to and longitudinally movable upon the said uprights; a fork having a horizontal beam to which are attached horizontal tines and guards, said fork being hinged to the said carriers and suspended in front of the said frame, said fork being carried by ropes or cables affixed to the said carriers, thence passing under and around sheave-wheels affixed in the said fork, thence extending under and around sheave-wheels affixed to the said carriers, thence over and around similar sheave-wheels supported by the said tie-beam or the said uprights, and thence to and around spools mounted upon a horizontal counter-shaft, said counter-shaft being revolved by the axle within the said tubular transverse beam, all substantially as shown and for the purposes specified.

4. In a grain and hay deliverer, the combination of the frame having a longitudinal beam, a transverse beam affixed thereto; inclinable uprights supported by the said transverse beam, a longitudinally-movable coupling mounted upon the said longitudinal beam; braces connecting the said uprights with the said coupling; a locking device for holding the said coupling, both in its forward and rearward positions; carriers mounted upon and longitudinally movable upon the said uprights; a fork hinged to the said carriers; an axle; carrying-wheels, both rotatable thereon and rotatable therewith; spools rotated by the said axle; and elevating-ropes affixed to the said carriers, connected with the said fork and wound upon the said spools, substantially as shown and for the purposes specified.

5. In a grain and hay deliverer, the combination with the frame having inclinable uprights, of an axle and carrying-wheels therefor; carriers mounted and longitudinally movable upon the said inclinable uprights; a spool rotated by the said axle; a fork hinged to the said carriers; ropes affixed to the said carriers, extending to and engaging with the said fork, thence to and wound upon the said spools, whereby when the said spools are rotated the fork will be elevated by the carriers, substantially as shown and for the purposes specified.

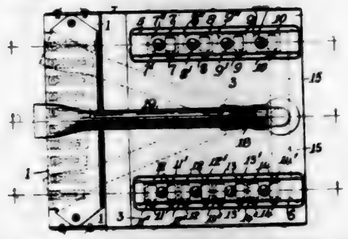
6. In a grain and hay deliverer, the combination with the frame mounted upon suitable wheels; of the adjustably-attached uprights, adapted to be inclined forward or rearward thereon; carriers sliding upward and downward upon the said uprights; a fork hinged to the lower end of the said carriers; a packer affixed to the said forks; cables for raising and lowering the said carriers and fork; a rope for operating the said packer, and means for winding the said cables to elevate the said fork, all substantially as shown and for the purposes specified.

7. In the frame of a grain and hay deliverer, the combination of the longitudinal beam to which the horses are attached; a transverse beam affixed thereto; inclinable uprights affixed to and supported by the said transverse beam; a tie-beam affixed to and connecting the said uprights; a longitudinally-movable coupling mounted upon the said longitudinal beam; braces connecting the said up-rights and the said movable coupling, and means for locking the said coupling and for supporting the said uprights in their inclined positions, substantially as shown and for the purposes specified.

708,805. **MOUTH-ORGAN.** ROBERT FIELD and ALBERT HARMON, Huddersfield, England. Filed Feb. 24, 1902. Serial No. 95,422. (No model.)

Claim.—1. The combination with a solo-harmonica, of an accompaniment-harmonica secured thereto, and a movable blow-tube connected to the accompaniment-harmonica and provided with a mouthpiece which slides opposite the blow-openings of the said solo-harmonica, so that both harmonicas are played simultaneously, substantially as set forth.

2. The combination, with a solo-harmonica, of two accompaniment-harmonicas secured at the rear of the solo-harmonica, and a movable blow-tube common to the two said accompaniment-harmonicas and provided with a mouthpiece which is normally arranged opposite the middle part of the said solo-harmonica and which slides opposite all its blow-openings, so that the three harmonicas are played simultaneously, substantially as set forth.

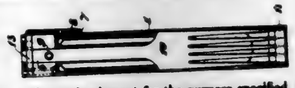


3. The combination, with a base-board provided with projecting arms, and a solo-harmonica detachably connected to the said arms; of an accompaniment-harmonica carried by the said base-board, and a movable blow-tube connected to the accompaniment-harmonica and provided with a mouthpiece which slides opposite the blow-openings of the said solo-harmonica, so that both harmonicas are played simultaneously, substantially as set forth.

4. The combination, with a solo-harmonica, of an accompaniment-harmonica secured thereto, a blow-tube provided with a mouthpiece which slides opposite the blow-openings of the said solo-harmonica so that both harmonicas are played simultaneously, and a pipe-joint of flexible material connecting the said blow-tube with the air-channel of the said accompaniment-harmonica, substantially as set forth.

5. The combination, with two harmonicas secured together, of a movable blow-tube connected to the main air-channel of one of the said harmonicas and provided with a mouthpiece which slides opposite the blow-openings of the other said harmonicas, so that both harmonicas are played simultaneously, substantially as set forth.

708,806. **KNIFE AND FORK.** GIOVANNI GARDA, Turin, Italy. Filed June 13, 1902. Serial No. 111,483. (No model.)



Claim.—1. In an implement for the purpose specified, the combination with the bellow handle, of a plurality of blades pivoted therein on a pivotal axis in common, the hinged locking-band adapted to fold transversely across the blades near their hinging-points, and means for securing said band in its locking position.

2. In an implement for the purpose specified, the combination with the knife, provided with a pocket 11 in its handle to receive the tines of the fork, a locking-band 13 to engage a tenon on the fork, and means for securing said band, of the folding fork, substantially as set forth.

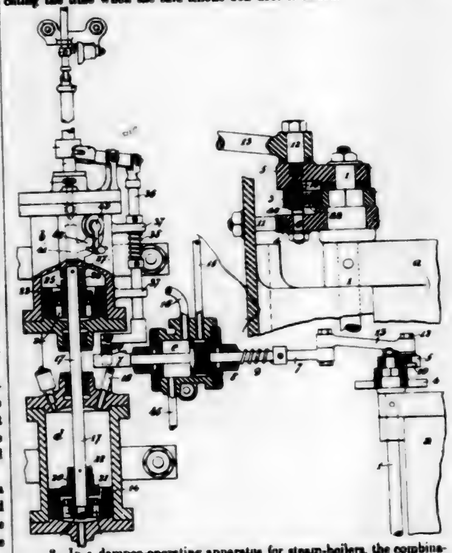
3. The combination with the knife, having folding blades and means for locking them when closed, of the fork, comprising the bifurcated portion and the handle portion, hinged together for folding, and a locking-slide 15 on said fork for locking the hinge against flexure, substantially as set forth.

4. The combination with a knife having a plurality of blades spaced or distanced and arranged abreast, with a fork having tines spaced to enter between the said blades, whereby viands may be cut into bits at one stroke of the knife.

708,807. **DAMPER-OPERATING APPARATUS.** GEORGES GROBET and CHARLES BERNASCONI, Vallorbe, Switzerland. Filed Mar. 24, 1902. Serial No. 99,261. (No model.)

Claim.—1. In a damper-operating device for steam-boilers, the combination with a fire-box door and a smoke-box door, of a steam-distributer, a steam-cylinder, a brake-cylinder for automatically closing the smoke-box door and arranged in tandem with the said steam-cylinder, a piston-rod common to both cylinders, means for connecting the said fire-box door to the said piston-rod and means connected to the spindle of the fire-box door and to the said steam-distributer, whereby the smoke-box door is opened every time the fire-box door is opened and closed, and means for regulating the time in which the smoke-box door is automatically closed.

2. In a damper-operating apparatus for steam-boilers, the combination with a fire-box door and a smoke-box door, of a steam-distributer, a steam-cylinder, a brake-cylinder for automatically closing the smoke-box door and arranged in tandem with the said steam-cylinder, a piston-rod common to both cylinders, means for connecting the said fire-box door to the said piston-rod and means connected to the spindle of the fire-box door and to the said steam-distributer, whereby the smoke-box door is opened every time the fire-box door is opened and closed, and means for audibly indicating the time when the said smoke-box door is closed.



3. In a damper-operating apparatus for steam-boilers, the combination with a fire-box door and a smoke-box door, of a steam-distributer, a steam-cylinder, a brake-cylinder for automatically closing the smoke-box door and arranged in tandem with the said steam-cylinder, a piston-rod common to both cylinders, means for connecting the said fire-box door to the said piston-rod, means connected to the spindle of the fire-box door and to the said steam-distributer, whereby the smoke-box door is opened every time the fire-box door is opened and closed, and means independent of the time consumed in closing the fire-box door, for supplying steam to the steam-cylinder by way of the distributer until the smoke-box door is fully opened.

4. In a damper-operating apparatus, the combination with a fire-box door and a smoke-box door, of a steam-distributer, a steam-cylinder, a brake-cylinder, for automatically closing the smoke-box door and arranged in tandem with the said steam-cylinder, a piston-rod common to both cylinders, means for connecting the said fire-box door to the said piston-rod, means connected to the spindle of the fire-box door and to the said steam-distributer, whereby the smoke-box door is opened every time the fire-box door is opened and closed, means independent of the time consumed in closing the fire-box door for supplying steam to the steam-cylinder by way of the distributer until the smoke-box is fully opened, and means for automatically shutting off the steam-supply as soon as the fire-box door is fully open.

5. In a damper operating device, the combination with a fire-box door and a smoke-box door, of a steam-distributer, a steam-cylinder, a brake-cylinder for automatically closing the smoke-box door and arranged in tandem with the said steam-cylinder, a piston-rod common to both cylinders, means for connecting the said fire-box door to the said piston-rod, means connected to the spindle of the fire-box door and to the said steam-distributer, whereby the smoke-box door is opened every time the fire-box door is opened and closed, and means for regulating the time in which the smoke-box door is automatically closed.

6. In a damper-operating device, the combination with a fire-box door and a smoke-box door, of a steam-distributer, a steam-cylinder, a brake-cylinder arranged in tandem with said steam-cylinder, a piston-rod common to both of said cylinders, connections between said smoke-box door and said piston-rod, means controlled by the opening and closing of the fire-box door for actuating the said distributer to supply steam to the steam-cylinder to move the piston-rod to open the smoke-box door and means for regulating the time in which the smoke-box door is automatically closed by the brake-cylinder.

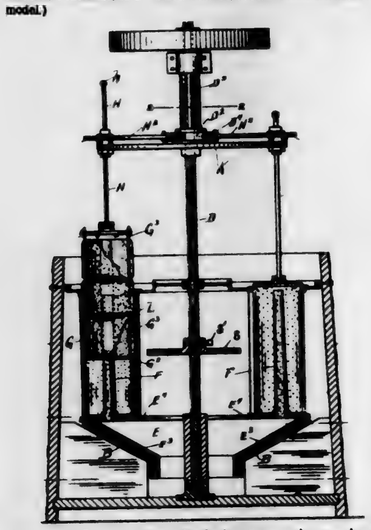
7. In a damper-operating device, the combination with a fire-box door and a smoke-box door, of a steam-distributer, a steam-cylinder, a brake-cylinder arranged in tandem with said steam-cylinder, a piston-rod common to both of said cylinders, connections between said smoke-box door and said piston-rod, means controlled by the opening and closing of the fire-box door for actuating the said distributer to supply steam to the

steam-cylinder to move the rod to open the smoke-box door, means for shutting off the steam-supply when the smoke-box door is fully open, and means for regulating the time in which the smoke-box door is automatically closed by the brake-cylinder.

8. In a damper-operating device, the combination with a fire-box door and a smoke-box door, of a steam-distributer, a steam-cylinder, a brake-cylinder arranged in tandem with said steam-cylinder, a piston-rod common to both said cylinders, connections between said smoke-box door and said piston-rod, means controlled by the opening and closing of the fire-box door for actuating the said distributer to supply steam to the steam-cylinder to move the rod to open the smoke-box door, means for shutting off the steam-supply when the smoke-box door is fully open, means for audibly indicating that the smoke-box door is closed, and means for regulating the time in which the smoke-box door is automatically closed by the brake-cylinder

---

708,808. APPARATUS FOR DYEING SLIVERS. CHARLES M. HARSON, Peacedale, R. I. Filed Dec. 14, 1901. Serial No. 85,917. (No model.)



Claim.—1. In an apparatus for dyeing tops or cheeses, the combination of a tank, a shaft within the tank and means for rotating it, a series of perforated cans to contain the tops to be dyed mounted upon the shaft to substantially constitute the periphery of an extractor, and means within the tank to stop the rotation of the dye liquor after being thrown out through the perforated cans and return it to the center of the apparatus.

2. In an apparatus for dyeing tops or cheeses, the combination of a tank, a wheel within and near the bottom of the tank which has an open center and which does not extend to the walls of the tank, means for rotating the wheel, a series of perforated cans to contain the tops mounted upon the wheel, and rigid strips or wings under the wheel, the whole arranged so that the dye liquor will be thrown out through the perforated cans by the rotation of the wheel and return under the wheel to the center of the apparatus.

3. In an apparatus for dyeing tops or cheeses, the combination of a tank with a partial floor near its bottom having an opening in the center of the floor and between it and the walls of the tank, strips under the partial floor extending from the walls of the tank to the open center, a wheel with an open center to rotate above the partial floor, means for rotating the wheel, and a series of perforated cans to contain the tops mounted upon the wheel, the whole arranged so that the dye liquor will be thrown out through the perforated cans by the rotation of the wheel and return under the floor to the center of the apparatus.

4. In an apparatus for dyeing tops or cheeses, the combination of a tank, a wheel within and near the bottom of the tank and means for rotating it, a series of perforated cans to contain the tops to be dyed mounted upon the wheel and constituting substantially the periphery of an extractor, means for rotating the cans upon their centers, plates between the cans to prevent the dye liquor from passing out between them, and means for returning the dye liquor to the center of the apparatus after being thrown out through the perforated cans.

5. In an apparatus for dyeing tops or cheeses, the combination of a tank, a wheel within and near the bottom of the tank which has an open center and which does not extend to the walls of the tank, means for rotating the wheel, rigid strips or wings under the wheel, a series of perforated cans to contain the tops to be dyed mounted upon the wheel and constituting substantially the periphery of an extractor, means for rotating the cans about their axes, and plates between the cans to prevent the dye liquor from passing out between them.

6. In an apparatus for dyeing tops or cheeses, the combination of a tank, a wheel within and near the bottom of the tank with an opening in its center and between it and the walls of the tank, and constructed with a pocket or pockets extending outwardly from the open center, means for rotating the wheel, a series of perforated cans to contain the tops to be dyed mounted upon the wheel and constituting substantially the periphery of an extractor, means for rotating the cans about their axes, a hollow perforated tube in each can, with their interiors connected with the pockets of the wheel, plates between the cans to prevent the dye liquor from passing out between the cans; and means for returning the liquor to the center of the wheel.

7. In an apparatus for dyeing tops or cheeses, the combination of a tank, a wheel in the tank near its bottom with an opening in its center and between it and the walls of the tank, and constructed with a pocket or pockets extending outwardly from the open center, rigid strips under the wheel to prevent any circular motion of the liquor at that point, a series of perforated cans to contain the tops to be dyed mounted upon the wheel and constituting substantially the periphery of an extractor, means for rotating the cans about their axes, a hollow perforated tube in each can with their interiors connected with the pockets of the wheel, and plates between the cans to prevent the dye liquor from passing out between them.

8. In an apparatus for dyeing tops or cheeses, the combination of a tank, a wheel in the tank near its bottom with an opening in its center and between it and the walls of the tank and constructed with a pocket or pockets extending outwardly from the open center, rigid strips under the wheel to prevent any circular motion of the liquor at that point, means for rotating the wheel, a series of perforated cans to contain the tops to be dyed mounted upon the wheel and constituting substantially the periphery of an extractor, means for rotating the cans about their axes, a hollow perforated tube in each can with their interiors connected with the pockets of the wheel, and plates extending about half-way over the portion of the can next to the center of the apparatus and covering that portion of the can turning toward the center, and plates between the cans to prevent the dye liquor from passing out between them.

9. In an apparatus for dyeing tops or cheeses, the combination of a tank, a wheel within and near the bottom of the tank constructed with an opening in its center toward the bottom of the apparatus and with a pocket or pockets extending outwardly from its open center, means for rotating the wheel, a series of hollow perforated tubes mounted upon the wheel with their interiors connected with the pockets of the wheel, and means to return the liquor under and to the center of the wheel after being thrown out from the perforated tubes, substantially as described.

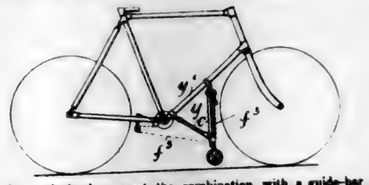
10. In an apparatus for dyeing tops or cheeses, the combination of a tank, a wheel within and near the bottom of the tank constructed with an opening in its center toward the bottom of the apparatus and with a pocket or pockets extending outwardly from the open center, means for rotating the wheel, a series of hollow perforated tubes mounted upon the wheel with their interiors connected with the pockets of the wheel, a series of perforated cans surrounding the tubes, means for rotating the cans and tubes upon their axes, and means for returning the liquor under and to the center of the wheel after being thrown from the perforated tubes, substantially as described.

11. In an apparatus for dyeing tops or cheeses, the combination of a tank, a wheel within and near the bottom of the tank constructed with an opening in its center on the side toward the bottom of the tank and with upper and lower coverings, the latter being inclined upward from the open center toward the outer circumference, means for rotating the wheel, and a series of hollow perforated tubes mounted upon the wheel with their interiors connected with the space or spaces between the coverings of the wheel, substantially as described.

12. In an apparatus for dyeing tops or cheeses, the combination of a tank, a wheel within the tank, a series of perforated cans to contain the tops mounted upon the wheel, a false bottom for the several cans, means for lifting the bottoms from the cans, means for rotating the wheel, and means within the tank to stop the rotation of the dye liquor after being thrown out through the perforated cans and return it to the center of the apparatus.

708,809. VELOCIPEDE OR THE LIKE. WALTER H. HAYES, London, England. Filed Feb. 18, 1902. Serial No. 94,584. (No model.)

Claim.—1. In a velocipede-support, the combination, with a guide-bar secured to the machine-frame, of a slidable piece mounted on the said guide-bar, two legs provided with rollers at their lower ends and having their upper ends pivoted to the said slidable piece, arms pivotally connecting the middle parts of the said legs with the lower part of the said bar, a spring for holding the said slidable piece in its raised position, and a spring which moves the said legs toward each other automatically when the said slidable piece is raised, substantially as set forth.



2. In a velocipede-support, the combination, with a guide-bar secured to the machine-frame and provided with a toothed rack, of a slidable piece mounted on the said guide-bar, a pawl pivoted to the said slidable piece, a laterally-movable spring carried by the said bar and holding the said pawl in or out of engagement with the said toothed rack as required, two legs provided with rollers at their lower ends and having their upper ends pivoted to the said slidable piece, arms pivotally connecting the middle parts of the said legs with the lower part of the said bar, a spring for holding the said slidable piece in its raised position, and a spring which moves the said legs toward each other automatically when the said slidable piece is raised, substantially as set forth.

3. In a velocipede-support, the combination, with a guide-bar secured to the machine-frame, a brake-ring which is moved in one direction when the crank-shaft is back-pedaled, and a roller carried by the said brake-ring; of a slidable piece mounted on the said guide-bar, two legs provided with rollers at their lower ends and having their upper ends pivoted to the said slidable piece, arms pivotally connecting the middle parts of the said legs with the lower part of the said bar, springs normally holding the said legs raised and near together, guide-rollers carried by the said bar and the machine-frame, and a flexible connection passing over all the said rollers and having its ends attached to the machine-frame and to the slidable piece respectively, whereby the said legs are moved downward and apart when the crank-shaft is back-pedaled, substantially as set forth.

708,810. HORN FOR TALKING-MACHINES. EDWIN A. HEYL, Philadelphia, Pa. Filed July 11, 1900. Renewed Aug. 4, 1902. Serial No. 118,333. (No model.)

Claim.—1. A horn of the character stated having a sound-non-producing palate of flexible material in the interior thereof.

2. A horn of the character stated having on the interior thereof a plate of reticulated material and a flexible palate of sound-non-producing material adjacent thereto.

3. A horn of the character stated having therein a plate of reticulated material, a sound-non-producing palate of flexible material, and separated wings, said palate being forward of said plate and said wings forward of said palate.

4. A horn of the character stated having therein separated blades which engage at their backs with the interior surface of the horn and extend in the longitudinal direction thereof.

5. In a horn of the character specified, a plurality of longitudinal blades, a support for one end of said blades, and a plurality of wings carried by said support.

6. A horn of the character stated having therein separated blades which engage at their backs with the interior surface of the horn in the longitudinal direction thereof, and an annulus connected with said blades and horn.

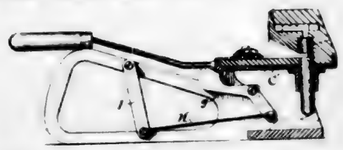
7. A horn of the character specified, provided with a reticulated plate at its small end, a flexible palate secured against said plate, wings secured within the small end portion of the horn, a cone in the rear of said wings, blades extending from said cone longitudinally along the interior face of the horn and provided with enlarged outer ends, and a sounding-plate secured within the large end of the horn and against the outer enlarged ends of said blades.

8. In a horn of the character specified, a plurality of longitudinal blades secured therein and provided with enlarged inwardly-extending ends.

9. In a horn of the character specified, a plurality of longitudinal blades, one of the ends of which is enlarged, and the other ends being deflected.

10. In a horn of the character specified, longitudinal blades extending along the inner face of the horn, one of the ends of which is enlarged, and the other ends being deflected inwardly and suitably supported.

708,811. MACHINE FOR FORCIBLY CASTING DENTAL BRIDGES. MERRILL W. HOLLINGSWORTH, Philadelphia, Pa. Filed May 19, 1902. Serial No. 107,901. (No model.)



Claim.—1. In a machine for casting dental bridges, the combination, with a normally substantially horizontal melting-pan, of a mold having a casting-chamber and a normally upwardly extending passage beneath and communicating with said casting-chamber, a plunger beneath and adapted to said passage, there being an opening into said passage adjacent to said plunger and communicating with said melting-pan, whereby by the tilting of said pan the melted metal is passed into said passage, and means to force said plunger into said passage, thereby injecting the melted metal into the casting-chamber.

2. In a machine for casting dental bridges, the combination, with a normally horizontal melting-pan, of a mold having a casting-chamber and a passage communicating with said casting-chamber, a plunger adapted to said passage, there being an opening into said passage adjacent to and communicating with said melting-pan, whereby by the tilting of said pan the melted metal is passed into said opening, and means to force said plunger into said passage, thereby injecting the melted metal into the casting-chamber.

3. In a machine for casting dental bridges, the combination with the mold having a casting-chamber and a passage leading thereto, of a normally horizontal melting-pan, an opening into said passage adjacent to and communicating with said melting-pan, a plunger adapted to said passage, and means to successively tilt said pan toward said opening and force said plunger into said passage, thereby successively passing the melted metal into said passage and forcibly injecting it into the casting-chamber.

4. In a machine for casting dental bridges, the combination, with the mold having a casting-chamber and a passage leading thereto, of a normally horizontal melting-pan, an opening into said passage adjacent to said passage, and means for successively tilting said pan and then simultaneously further tilting said pan and forcing said plunger into said passage.

5. In a machine for casting dental bridges, the combination, with the mold having a casting-chamber and a passage leading thereto, of a table containing said mold and having an orifice therein coinciding with said passage, a plunger in said orifice adapted to said passage, means for simultaneously tilting said table and forcing said plunger into said passage.

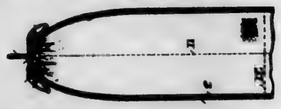
6. In a machine for casting dental bridges, the combination, with the melting-table having an orifice, a plunger adapted to said orifice, a frame on which said table is pivoted, and means for tilting the table relatively to said frame, and simultaneously forcing said plunger upwardly.

7. In a machine for casting dental bridges, the combination, with the mold having a casting-chamber, a passage leading thereto and an opening into said passage, of a supporting-frame, a table having pivoted thereto a melting-pan on said table adjacent to said opening, said table having an orifice coinciding with said passage, a plunger in said orifice and extending beneath the same and adapted to said passage, a cam on said frame beneath said plunger and means for tilting said table relatively to said frame, thereby moving said plunger along said cam, whereby said cam forces said plunger into said passage.

8. In a machine for casting dental bridges, the combination, with the mold having a casting-chamber, a passage leading thereto and an opening into said passage, of a supporting-frame, a table pivoted thereto, a melting-pan on said table adjacent to said opening, said table having an orifice coinciding with said passage, a plunger in said orifice and extending beneath the same and adapted to said passage, a cam on said frame beneath said plunger, a lever pivoted to said frame and engaging said table, a second lever pivoted to said frame, and a link engaging said lever, whereby said table is tilted relatively to said frame, thereby moving said plunger along said cam and causing said plunger to be forced into said passage.

9. In a machine for casting dental bridges, the combination, with the casting-table having an orifice, a plunger adapted to project upwardly through and above said orifice and to sustain the pattern, and a separate rod adapted to engage the lower end of said plunger, whereby the plunger may be withdrawn after the formation of the mold.

708,812. MANTLE FOR INCANDESCENT GAS-LAMPS. OTTO KAUFMANN, Elmhurst, N. Y., assignor of one-half to David Ottenheimer, New York, N. Y. Filed Jan. 4, 1902. Serial No. 88,434. (No model.)



Claim.—1. A mantle for incandescent gas-lamps, comprising a plurality of hoods joined together and inserted one within the other, said hoods being composed one of finely-knitted fabric treated with a mineral and refractory substance, the other of more coarsely-knitted fabric likewise treated, as and for the purposes set forth.

2. An article of manufacture comprising a plurality of hoods joined together and inserted one within the other, the exterior hood comprising a relatively coarse and heavy knit fabric, and the interior hood a finely and loosely knit fabric, and a thread passing through folds formed in the upper ends of said hoods securing the same together.

3. An article of the class described, comprising a plurality of hoods inserted one within the other, the edge of the outer hood being overlapped upon the upper edge of the inner hood, and a thread passing through said overlapped portion and the upper edge of the inner hood, securing said hoods together.

4. An article of the class described, comprising a plurality of hoods one inserted within the other, one of said hoods comprising a knitted fabric having rows of thickened ribs and intervening rows of larger loops, the other hood being composed of a knitted fabric comprising smaller loops of thinner thread.

5. An article of the class described, comprising a plurality of hoods inserted one within the other, one of their upper edges overlapping the other, and both edges being drawn together by a securing-thread passing through both mantles.

6. An article of the class described, comprising a plurality of hoods inserted one within the other, the upper edge of the inner hood being lapped over the upper edge of the outer hood, both hoods being secured together by passing a thread through said overlap of the outer hood.

7. An article of the class described, comprising a plurality of hoods inserted one within the other, the upper edge of the interior hood overlapping the upper edge of the exterior hood, and securing-thread passed through folds or crimps in said upper edges by drawing said thread tightly.

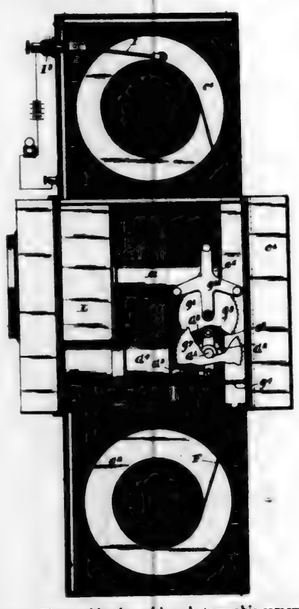
8. An article of the class described, comprising a plurality of hoods inserted one within the other, and secured at their upper edges, and additional means for securing the hoods together in the direction of their length.

9. An article of the class described, comprising a plurality of hoods inserted one within the other and secured together at their upper edges, and a thread running longitudinally of the hood and securing them together.

10. An article of the class described, comprising a plurality of hoods inserted one within the other, and secured together at their upper edges, means for securing said hoods together in the direction of their length, and means for securing them together adjacent their lower edges.

11. An article of the class described, comprising a plurality of hoods inserted one within the other, and secured together at their upper edges, means for securing said hoods together in the direction of their length, and a thread disposed concentrically with the hoods adjacent their lower edges and securing the hoods together.

708,818. AUTOMATIC PHOTOGRAPHIC RECORDING APPARATUS. ACHILLES DE KHOTINSKY, Chicago, Ill., assignor to Thomas Jansen, Chicago, Ill. Filed Nov. 8, 1901. Serial No. 81,568. (No model.)



Claim.—1. The combination with a photographic camera, of means for feeding a sensitized strip step by step, a shutter mechanism, a movable holder for the papers to be recorded, a power-driven part normally independent of the holder and means operated by said power-driven part for effecting the operations of said strip-feeding device, the shutter and the holder.

2. The combination with a photographic camera, of means for feeding a sensitized strip step by step, a shutter mechanism, a movable holder for the papers to be recorded, electrically-actuated devices for operating said strip-feeding and shutter mechanisms and the holder, and circuit-controlling means embracing a switch for starting one of said parts, the operation of the other parts being automatically accomplished in sequence.

3. The combination with a photographic camera, of means for feeding a sensitized strip step by step, a shutter mechanism, a movable holder for the papers to be recorded, a power-driven part, electrically-operated actuating devices for operating said strip-feeding mechanism, the shutter mechanism and the holder, and circuit-controlling means actuated by said power-driven part for bringing into operation said actuating devices.

4. The combination with a photographic camera, of means for feeding a sensitized strip step by step, a shutter mechanism, a movable holder for the papers to be recorded, a power-driven shaft, electrically-actuated operating devices for operating said strip-feeding mechanism, the shutter mechanism and holder, and circuit-controlling means, embracing cams on said shaft, for bringing into operation said actuating devices.

5. The combination with a photographic camera, of means for feeding a sensitized strip step by step, a shutter mechanism, a movable holder for the papers to be recorded, a shaft with which said holder rotates, a power-driven shaft, an electromagnetic clutch for locking said power-driven shaft to the holder-shaft, electrically-operated actuating devices for said strip-feeding and clutch mechanisms and circuit-controlling means operated by said shafts for bringing into operation said clutch and said actuating devices.

6. The combination with a photographic camera, of means for feeding a sensitized strip step by step, a shutter mechanism, a movable holder for the papers to be recorded, a shaft with which said holder rotates, a power-driven shaft, electrically-operated actuating devices for the strip-feeding and shutter mechanism, an electromagnetic clutch for locking said holder-shaft to the power-driven shaft, and circuit-controlling means, embracing cams on said shafts, for bringing into operation said clutch and actuating devices.

7. The combination with a photographic camera, of means for feeding a sensitized strip step by step, a shutter mechanism, a movable holder for the papers to be recorded, a shaft with which said holder rotates, a power-driven shaft, electrically-operated actuating devices for the strip-feeding and shutter mechanisms, an electromagnetic clutch for locking said holder-shaft to the power-driven shaft, a group of cams which rotate with the holder-shaft, groups of cams loosely mounted on the power-driven shaft, an electromagnetic clutch for locking each of said last-mentioned groups of cams to said power-driven shaft, and circuit-controlling devices operated by said cams for bringing into operation said strip-feeding and shutter mechanisms and said clutches.

8. The combination with a photographic camera, of means for feeding a sensitized strip step by step, a shutter mechanism, a rotary holder for the papers to be recorded, a shaft with which said holder rotates, a power-driven shaft, an electromagnet-clutch for locking said power-driven shaft to the holder-shaft, electrically-actuated operating devices for said strip feeding and clutch mechanisms, circuit-controlling devices operated by said shafts for bringing into operation said actuating devices for the strip-feeding and shutter mechanisms, and means actuated by the strip-feeding mechanism for controlling the circuit through the holder-clutch.

9. The combination with a photographic camera, of means for feeding a sensitized strip step by step, a shutter mechanism, a movable holder for the papers to be recorded, a power-driven shaft, electrically-actuated devices for operating said strip-feeding mechanism, the shutter mechanism, and holder, circuit-controlling means on said shaft for bringing into operation said actuating devices for effecting the operations to photograph one side of the paper, and circuit-controlling means actuated by the shutter mechanism for effecting a repetition of the operations of the several mechanisms to photograph the other side of the paper.

10. The combination with a photographic camera, of means for feeding a sensitized strip step by step, a shutter mechanism, a movable holder for the papers to be recorded, a power-driven shaft, electrically-actuated devices for operating said strip-feeding mechanism, the shutter mechanism and holder, circuit-controlling means on said shaft for bringing into operation the said actuating devices for effecting the operations to photograph one side of the paper, means actuated by the shutter mechanism for effecting a repetition of the operation of the several mechanisms to photograph the other side of the paper, and circuit-controlling means operated by said shaft for operating the holder-actuating devices to turn the holder from its second-exposure position to a horizontal position.

11. The combination with a photographic camera, of means for feeding a sensitized strip step by step, a shutter mechanism embracing a rotary disk provided with peripheral teeth or projections, an actuating-solenoid, a pawl-and-ratchet mechanism connected with the core of said solenoid for rotating said shutter-disk, and a stop-arm connected with said core and provided at its free end with a stop projection adapted, when the core is drawn inwardly, to rotate the cam and to be brought into the path of one of said teeth or projections.

12. The combination with a photographic camera, of means for feeding a sensitized strip step by step, and a rotative holder embracing two leaves hinged together at one margin thereof and provided with locking means at the other margin thereof, and means for automatically opening said holder at a point in its rotation.

13. The combination with a photographic camera, of a holder for the papers to be recorded comprising two leaves which rotate on a horizontal axis, a hinge joining said leaves at one side of the holder, means for detachably locking the leaves together, means for stopping said holder in two vertical positions, and in a horizontal position, and means for automatically opening said holder as it approaches its horizontal position or point of rest.

14. The combination with a photographic camera, of a holder for the papers to be recorded comprising two leaves which rotate on a horizontal axis, a hinge joining said leaves at one side of the holder, a spring applied to separate or open said leaves, means for detachably locking said leaves together, comprising a latch pivoted to one of said leaves, and a lug on the other leaf adapted for interlocking engagement with said latch, means for stopping said holder in two vertical positions and in a horizontal position, and a cam for releasing said latch when the holder reaches its horizontal position or point of rest.

15. The combination with a photographic camera, of a holder for the papers to be recorded comprising two leaves which rotate in a horizontal axis, a hinge joining said leaves at one side of the holder, a spring applied to separate or open said leaves, means for detachably locking the leaves together comprising a latch pivoted to one of said leaves, and a lug on the other leaf adapted for interlocking engagement with said latch, and a cam for releasing said latch when the holder completes its rotation to permit the holder to open under the influence of its opening-spring.

16. The combination with a photographic camera, of means for feeding a sensitized strip step by step, a shutter mechanism, a movable holder for the papers to be recorded, electrically-actuated means for operating said strip-feeding and shutter mechanisms and the holder, circuit-controlling means embracing a switch for starting one of said parts, the operation of the other parts being automatically accomplished in sequence, and a friction-brake for arresting the movement of the holder.

17. The combination with a photographic camera, of means for feeding a sensitized strip step by step, a movable paper-holder, shutter mechanism, electrically-operated actuating devices for operating said strip-feeding mechanism, the holder and the shutter mechanism, circuit-controlling means for bringing into operation the actuating devices for the strip-feeding, shutter and holder actuating mechanisms, and means controlling the movement of the holder, embracing a relay-magnet, and a switch in the relay-magnet circuit which is closed and opened by the movement of the strip-feeding mechanism.

18. The combination with a photographic camera, of means for feeding a sensitized strip step by step, a movable paper-holder, shutter mechanism embracing a rotative disk, electrically-operated actuating devices for operating said strip-feeding mechanism, the holder and the shutter-disk, circuit-controlling means for bringing into operation the actuating devices for effecting the apparatus to photograph one side of the paper, and means for effecting a repetition of the operation of said several mechanisms for photographing the other side of the paper comprising a relay-magnet, a switch in the relay-magnet circuit and pins carried by the disk and acting on said switch.

708,814. MOLD OPENING OR CLOSING DEVICE. WILLIAM F. KOEPPEL, Marion, Ind. Filed Dec. 2, 1901. Serial No. 84,433. (No model.)

Claim.—1. In a mold opening and closing device, a pair of mold-sections, a guide for the lateral movement thereof in opposite directions, pins extending from said molds, and an oscillatory plate with slots therein into which said pins loosely extend, said slots being so arranged that when the plate is oscillated it will cause one of said mold-sections to be moved in advance of the other.

2. In a mold opening and closing device, a pair of mold-sections, a stationary plate beneath the mold-sections with slots therein in line with each other and with the center of the mold, pins connected with the mold-sections and extending down through the slots in the stationary plate, and an oscillatory plate below the stationary plate with slots therein for receiving the lower ends of said pins, said slots being so arranged that when the plate is oscillated it will cause one of said mold-sections to be moved from the center in advance of the other.

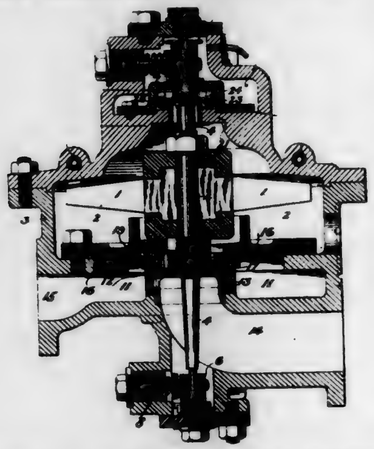
3. In a mold opening and closing device, a pair of mold-sections, a guide for the movement thereof, a plate mounted concentric with the mold-sections when closed having a concentric slot on one side of its center and an eccentric slot opposite thereto, the inner end of the eccentric slot being diametrically opposite the inner end of the concentric slot and equidistant from the center of said plate, and means extending loosely through said slots and rigidly connected with said mold-section for moving the latter when said plate is moved.

4. In a mold opening and closing device, a pair of mold-sections, a guide for the mold-sections, a plate mounted concentric with the mold when closed having on one side of the center a slot that is concentric at its inner end and concentric at its outer end, and an eccentric slot on the other side of the center of said plate with its inner end diametrically opposite the inner end and at the same distance from the center of the plate as the concentric portion of the first-mentioned slot, means for giving said plate rotary movement, and means extending loosely through said slots and rigidly connected with said mold-sections.

5. In a mold opening and closing device, a stand having openings in it, a straight guideway, plates slidable on the stand and controlled by said guideway, mold-sections secured to said sliding plates, a plate rotatably mounted under the stand and concentric with the mold when closed, means for oscillating said plate, a pair of slots in said plate on opposite sides of the center, one slot having its inner portion concentric and its outer portion eccentric with the center of the disk, and the other slot having its inner portion correspondingly eccentric and at its outer portion

concentric with the center of said disk, and belts extending down from the sliding plate through the openings in the stand and through said slots.

708,815. STEAM-TURBINE. ALBERT KRAUS, Warkaus Jorois, Russia. Filed Nov. 19, 1901. Serial No. 83,837. (No model.)



Claim.—1. In steam-jet turbines, the combination with an inclosing casing, a rotary shaft passing through the interior of the casing, bearing boxes located at each end of the casing to receive the ends of the shaft, means for supporting and permitting the bearing-boxes to have motions in directions parallel with the axis of the shaft, spring-actuated devices for normally maintaining the bearing-boxes coincident with the axis of the casing, a steam-jet turbine wheel fixed on the said shaft, a chamber in the casing within which chamber the wheel is located, jet-nozzles entering the turbine-wheel chamber to deliver the steam-jets to the vanes of the wheel, and a steam-exhaust aperture to the said wheel-chamber; of a second chamber within the casing through which also the turbine-shaft passes, a dividing-wall between the chambers, devices for preventing intercommunication of the contents of the chambers by leakage around the shaft and for permitting the elastically-held rigid shaft to have automatic lateral adjustment so that it may assume its natural axis of rotation, a centrifugal pump-disk fixed on the shaft within the second chamber, a fluid-supply passage to the centrifugal pump-disk by which fluid is pumped into the second chamber and maintained at pressure therein, and an exit-pipe from the second chamber by which the pressure fluid is conveyed for either direct utilization or for driving secondary machinery, substantially as set forth.

2. In steam-jet turbines, the combination with an inclosing casing, a rotary rigid shaft passing through the interior of the casing, bearing-boxes located at each end of the casing to receive the ends of the shaft, means for supporting the bearing-boxes and permitting them to have motions in directions parallel with the axis of the shaft, radially-arranged plungers to act laterally against the laterally-movable bearing-boxes, sleeve-ferrules in the casing to carry and guide the plungers, helical springs around the plungers to force the same against the bearing-boxes to normally maintain the latter in a resilient manner coincident with the axis of the casing, a steam-jet turbine wheel fixed on the shaft, a chamber in the casing within which chamber the wheel is located, jet-nozzles entering the turbine-wheel chamber to deliver the steam-jet to the vanes of the wheel and a steam-exhaust aperture to the said wheel-chamber; of a second chamber within the casing through which also the turbine-shaft passes, a dividing-wall between the chambers, devices for preventing intercommunication of the contents of the chambers by leakage around the shaft and for permitting the elastically-held rigid shaft to be capable of automatic lateral adjustment for assuming its natural axis of rotation, a centrifugal pump-disk fixed on the shaft within the second chamber, a fluid-supply passage to the centrifugal pump-disk by which fluid is pumped into the second chamber and maintained at pressure therein, and an exit-pipe from the second chamber by which the pressure fluid is conveyed for either direct utilization or for driving secondary machinery, substantially as set forth.

3. In steam-jet turbines, the combination with an inclosing casing, a rotary shaft passing through the interior of the casing, bearing-boxes located and supported within the casing to receive the ends of the shaft, fluid-supply passages to the portions of the casing carrying the bearing-boxes for effecting the liquid lubrication of the bearings, means for holding the bearing-boxes and permitting them to have motions in directions parallel with the axis of the shaft, spring-actuated devices for normally maintaining the bearing-boxes coincident with the axis of the casing, a steam-jet turbine wheel fixed on the said shaft, a chamber in the casing within which chamber the wheel is located, jet-nozzles entering the turbine-wheel chamber to deliver the steam-jet to the vanes of the wheel, and a steam-exhaust aperture to the said wheel-chamber; of a second chamber within the casing through which also the turbine-shaft passes, a dividing-wall between the chambers, devices for preventing intercommunication of the contents of the chambers by leakage around the shaft and for permitting the elastically-held rigid shaft being capable of automatic lateral adjustment for assuming its natural axis of rotation, a centrifugal pump-disk fixed on the shaft within the second chamber, a fluid-supply passage to the centrifugal pump-disk by which fluid is pumped into the second chamber and maintained at pressure therein, and an exit-pipe from the second chamber by which the pressure-fluid is conveyed for either direct utilization or for driving secondary machinery, substantially as set forth.

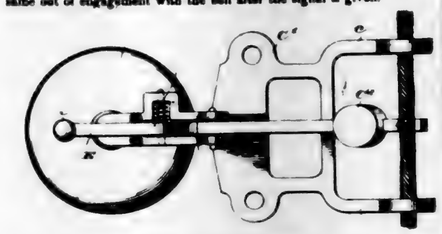
4. In steam-jet turbines, the combination with an inclosing casing, a rotary shaft in the interior of the casing, bearing-boxes located and supported within the casing to receive the ends of the shaft, means for holding the bearing-boxes and permitting them to have motions in directions parallel with the axis of the shaft, spring-actuated devices for normally maintaining the bearing-boxes coincident with the axis of the casing a steam-jet turbine wheel fixed on the rotary shaft, a chamber in the casing in which chamber the turbine wheel is located, steam-jet nozzles to deliver steam to the vanes of the turbine wheel, and a steam-exhaust aperture from the said chamber; of a second chamber within the casing through which also the turbine-shaft passes, a dividing-wall between the chambers, a disk fixed on the shaft adjacent to the dividing-wall, centrifugal pump-vanes formed on one side of the disk, and a fluid-supply pipe to the pump through which fluid is pumped into the second chamber and maintained at a pressure therein, and exit-pipe from the second chamber for the delivery of the pressure fluid for use, radial ribs formed on the side of the pump-disk which is in contact with the dividing-wall of the chambers, the ribs being calculated to act with greater force than the pump-vanes on the other side of the disk to produce an overbalance of pressure and prevent intercommunication of fluids between the first and second chambers, while the aperture in the dividing-partition through which the shaft passes is greater than the diameter of the shaft so as to permit the shaft to be self-centering, substantially as set forth

5. In steam-jet turbines, the combination with a rotary shaft, a steam-jet turbine wheel fixed on the said shaft, a chamber within which the wheel is located, jet-nozzles entering the chamber to deliver the steam-jet to the vanes of the wheel, a steam-exhaust aperture from the said chamber, a second chamber within the casing through which the turbine-shaft passes, a centrifugal pump-disk fixed on the shaft within the said second chamber, a fluid-supply passage to the centrifugal pump-disk, and an exit-pipe from the said chamber, centrifugally-acting vanes to prevent the fluid from the pressure-chamber entering the steam-chamber formed upon the upper side of the centrifugal pump-disk which is adjacent and in contact with the dividing-partition between the first and second chambers, the said upper surface of the pump-disk covering the aperture through which the turbine-shaft passes, which aperture is of larger diameter than the shaft to allow the freely-carried shaft to assume its natural axis of rotation, elastically-carried bearing-boxes in the casing to receive the ends of the shaft, supply-passages for liquid lubricant to chambers containing the bearing-boxes, a disk having radial vanes, mounted on the turbine-shaft adjacent to the partition of the compartment which contains that bearing-box upon the exterior side of a turbine-wheel compartment, and operating by centrifugal action to prevent entry of lubricating fluid from the bearing-box chamber to the turbine-wheel chamber, substantially as set forth.

708,816. AUTOMATIC ALARM. JOHN F. LAIRD, Fallriver, Wis. Filed Mar. 13, 1901. Serial No. 50,930. (No model.)

Claim.—1. In a device of the class described, the combination with a plate provided with arms adapted to engage a cord under tension, of a bell, a hammer pivoted on the plate, a weighted lever adapted to be supported normally at its outer end on the cord between said arms, and at its inner end to positively actuate the hammer when the tension of the cord is reduced thereby giving a signal on the bell.

2. In a device of the class described, the combination with a bell, of a hammer pivoted in operative relation thereto, arms over which a cord under tension engages, a lever pivoted adjacent to the bell and supported at its outer end on the cord, and normally sustained by the tension of the cord, said lever at its inner end extending in operative relation with the hammer and adapted to actuate the same when the tension of the cord is reduced, and a spring engaged on the hammer and acting to throw the same out of engagement with the bell after the signal is given.



708,817. FLASK FOR TREATING WHEELS. JAMES P. S. LAWRENCE, U. S. Navy, assignor of one-half to Thomas Burd Zell, Reading Pa. Original application filed Apr. 10, 1901, Serial No. 55,123. Divided and this application filed June 5, 1901. Serial No. 63,279. (No model.)

Claim.—1. A device for case-hardening cast-steel wheels, consisting of a receptacle adapted to support the wheel, and having an open top and bottom.

2. A device for case-hardening cast-steel wheels, consisting of a receptacle adapted to support the wheel, and having an open bottom, and an annular cover for said receptacle.

3. A device for case-hardening cast-steel wheels, consisting of a receptacle adapted to support the wheel, and having an open bottom, and an annular cover for said receptacle having a depending peripheral flange surrounding the walls of the same.

4. A device for case-hardening cast-steel wheels, consisting of a casing having feet, and an interior annular flange extending inwardly from the side walls of the casing above said feet and adapted to support a wheel under treatment therein.

5. In combination with a device for case-hardening cast-steel wheels, having side walls, and an interior annular flange adapted to support a wheel under treatment therein, an annular cover therefor adapted to rest upon the upper end of said device.

6. A device for case-hardening cast-steel wheels after the same have been cast, consisting of a casing provided with an interior annular flange, adapted to support a wheel under treatment therein and a refractory lining upon the inner walls of said casing and upon the upper side of said flange.

7. A device for case-hardening cast-steel wheels having side walls, an interior annular flange adapted to support a wheel under treatment therein, and an annular cover adapted to rest upon the upper end of the flask, said interior annular flange extending inwardly to a greater extent than the annular cover.

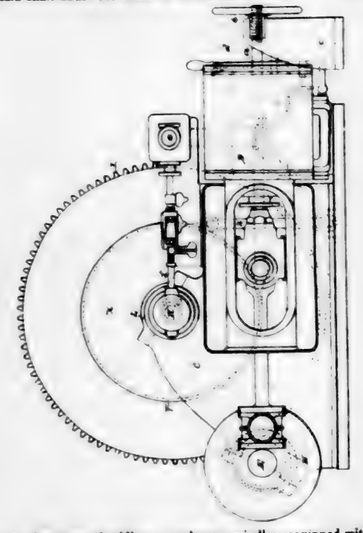
8. A device for case-hardening cast-steel wheels after same have been cast, consisting of a casing provided with an interior annular flange adapted to support a wheel under treatment therein, a refractory lining upon the inner walls of said casing and upon the upper side of said flange, and an annular cover for said casing provided with a refractory lining on its lower face.

9. A device for case-hardening cast-steel wheels, consisting of a receptacle adapted to support the wheel having an open top and bottom, said receptacle having a refractory lining.

708,818. WINDLASS. FRANK S. MANTON, Providence, R. I. Filed Dec. 15, 1899. Serial No. 740,470. (No model.)

Claim.—1. An automatic riding or anchorage windlass equipped with surge-relieving mechanism and comprising a main shaft serving as a valve-actuating shaft, an engine, an engine-shaft geared to the main or valve-actuating shaft, a pressure-valve having means controllable by said valve-actuating shaft to vary the fluid-pressure in the engine, a wildcat or chain-wheel mounted directly and loosely on the valve-actuating shaft and capable of turning freely thereon in paying out the anchor-chain, and a clutch for making said wildcat fast directly to the valve-actuating shaft and causing the latter to directly transmit the strain to the engines and to actuate the pressure-valve.

2. An automatic riding or anchorage windlass equipped with surge-relieving mechanism and comprising a main or valve-actuating shaft, an engine, an engine-shaft geared to the first-named shaft, a pressure-valve controllable by said main or valve-actuating shaft, a wildcat or chain-wheel mounted loosely and directly on the main or valve-actuating shaft and free to rotate idly thereon in paying out the anchor-chain, a clutch for making the wildcat fast with said shaft, and a brake operatively related to the wildcat and adapted to control the latter when free from the valve-actuating shaft; said clutch and the brake being operable separately, and the clutch remaining in service with the wildcat when the latter turns the main shaft under the strain on the anchor-chain.



3. An automatic riding or anchorage windlass equipped with surge-relieving mechanism and comprising a main or valve-actuating shaft, an engine-shaft geared to said first-named shaft, the engines, a pressure-regulating valve controlled by said main shaft, the port and starboard wildcats mounted individually and loosely on the valve-actuating shaft and each adapted to turn idly thereon in paying out an anchor-chain, separate clutches operatively related to the main shaft and the wildcats and adapted to individually make the latter fast to said shaft, and separate brake devices in operative relation to the individual wildcats to control the latter when free from said valve-actuating shaft.

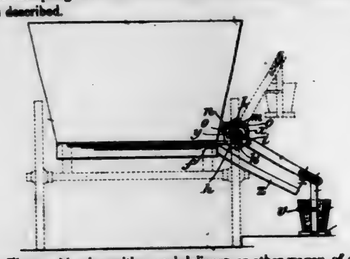
4. An automatic riding or anchoring windlass equipped with surge-relieving mechanism and comprising a main or valve-actuating shaft, the engines, an engine-shaft driven by said engines, the centrally-disposed gears on said shafts, a pressure-regulating valve controllable by said valve-actuating shaft, the port and starboard wildcats independently and loosely mounted on said valve-actuating shaft and disposed on opposite sides of the gearing, each wildcat adapted to turn freely on said shaft, clutches fast with said valve-actuated shaft and having operative relation to the individual wildcats for individually making the latter fast with said shaft, and separate brake devices operatively fitted to the separate wildcats and arranged to retard or arrest the latter when unclutched from said valve-actuating shaft.

5. An automatic riding or anchorage windlass equipped with surge-relieving mechanism and comprising a main or valve-actuating shaft, the engines, an engine-shaft having a central pinion meshing with a like gear on the main shaft, a pressure-regulating valve controllable by the valve-actuating shaft, the port and starboard anchor wildcats fitted loosely on the valve-actuating shaft on opposite sides of the gear thereon, each wildcat provided on one side with a brake-surface and on its opposite side with clutch-faces, movable brake elements operatively related to the brake-surfaces of the wildcats and arranged to separately control the same, and clutch devices mounted on the valve-actuating shaft between the gear thereon and the separate wildcats, each clutch device having movable dogs arranged to engage the clutch-faces of the wildcats and to individually make the latter fast with the valve-actuating shaft.

708,819. LIFTING DEVICE FOR COAL-WAGONS, &c. GEORGE B. MARX, New York, N. Y. Filed Feb. 6, 1902. Serial No. 92,761 (No model.)

Claim.—1. The combination with a coal-delivery or other wagon, of a lifter secured to said wagon and comprising a spring, a lever con

nected to the spring, and means on the lever to engage a load, substantially as described.



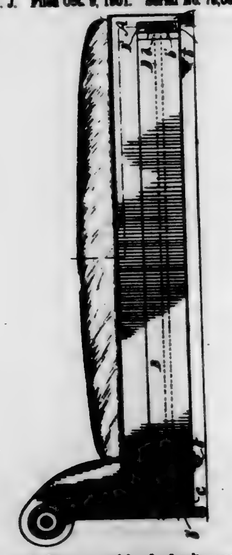
2. The combination with a coal-delivery or other wagon, of a lifter secured to said wagon and comprising a fixed bracket or support, a coiled spring one end of which is secured to said bracket, a lever to which the other end of the spring is secured, and means on the lever to engage a load, substantially as described.

3. In a lifter, the combination with a lever adapted to engage the load, and a spring in operative connection with said lever, of a ratchet-wheel secured to said lever at its fulcrum and a double-acting pawl in operative relation with said ratchet-wheel, substantially as described.

4. The combination with a coal-delivery or other wagon, of a lifter secured to said wagon and comprising a fixed bracket or support, a coiled spring one end of which is secured to said bracket, a lever to which the other end of the spring is secured, a ratchet-wheel secured to said lever at its fulcrum and a double-acting pawl in operative relation with said ratchet-wheel, substantially as described.

5. The combination with a coal-delivery or other wagon, of a lifter detachably secured to said wagon and consisting of a fixed bracket or support, a coiled spring at each end of said bracket the inner end of each of said springs being secured to the same, housings for said springs loosely mounted on said brackets and to which the outer ends of said springs are attached, levers rigidly secured to said housings, means on the levers to engage a load, a ratchet-wheel secured to each of said levers at the fulcrum thereof, and a double-acting pawl in operative relation with each of said ratchet-wheels.

708,820. **DRAWER FOR FURNITURE, &c.** CORNELIUS MAYER, Trenton, N. J. Filed Oct. 9, 1901. Serial No. 78,069. (No model.)



Claim.—1. In drawer provision for furniture and similar structures, the combination with a drawer and parts forming its recess, of rollers *b'*, located on said drawer contiguous to the front thereof; parallel side rails located in said drawer-recess, having end inclines over which said rollers ride for effecting the raising and lowering of the drawer during the movements; and an outer bottom-support connected with the drawer.

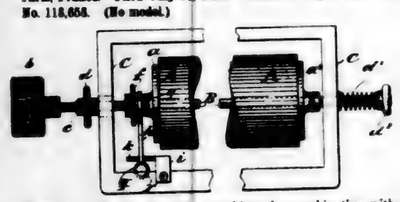
2. In drawer provision for furniture and similar structures, the combination with a drawer and parts forming its recess; of notched parallel side rails located on the parts forming the recess of said drawer; and sprocket-wheels located upon the drawer and provided with teeth correspondingly engaging the said rails, rollers *b'*, mounted on said drawer, contiguous to the front thereof; the parallel side rails having end inclines over which said rollers ride; and an outer bottom-support connected with said drawer.

3. In drawer provision for furniture and similar structures, the combination with a drawer and parts forming its recess; of notched parallel rails secured within the latter, at the sides thereof; a shaft revolubly extending through the drawer sides and having sprocket-wheels secured thereon; the teeth of which correspondingly engage the rail-notches; rollers *b'*, mounted on the drawer sides, contiguous to the front thereof; the rails having end inclines over which the rollers ride to effect the raising and lowering movements of the drawer with the shaft as a shifting fulcrum; and an outer bottom-support connected with said drawer.

4. In drawer provision for furniture and similar structures, the combination of a drawer, and parts forming its recess, with both front and rear drawer-openings, and an interchangeable section adapted to close either opening, and means for detachably securing said section in position.

5. In drawer provision for furniture and similar structures, the combination of a drawer, and parts forming its recess with both front and rear drawer-openings and including front and rear frame-ledges with dowel-recesses, and notched parts, and an interchangeable section A', having dowels located on the upper edge thereof, and pivoted dogs, mounted on the inner faces of said sections, the latter for engaging the notched parts.

708,821. **TYPE-WRITING MACHINE.** SIDNEY L. W. MERLIN, Paris, France. Filed July 26, 1900. Renewed Aug. 6, 1902. Serial No. 118,653. (No model.)



Claim.—1. In a type-writing machine, the combination with the frame, and the platen-roller, its boss, and its spindle mounted rotatively in said frame, of an arm mounted on and adapted to swing about said boss, stops to limit the swing of said arm, and means for clamping said arm to the platen-roller, substantially as set forth.

2. In a type-writing machine, the combination with the frame C, the spindle B mounted rotatably therein, the cylinder A, mounted on said spindle and provided with a screw *e*, and the boss of said cylinder, of the clamp-nut *f* on said screw, the arm *h*, hung on the boss of the cylinder and adapted to be clamped fast thereto by the nut *f*, the bracket *i k*, and the screw *q* in said arm *h*, substantially as and for the purpose set forth.

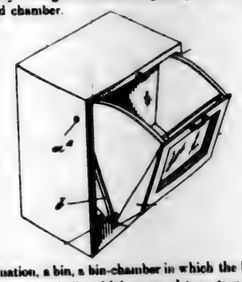
3. In a type-writing machine, the combination with the frame C, and the platen-roller A, mounted rotatively therein and slidable longitudinally, of means for moving the said roller endwise with precision, and means for limiting the extent of its rotation for spacing purposes, said means comprising an arm mounted to swing about the axis of the roller A, means for clamping it fast to the roller, and means for limiting the extent of its movement when so clamped fast, substantially as set forth.

4. In a type-writing machine, the combination with the frame C, the spindle B, mounted slidably and rotatively therein, the platen-roller A fixed on said spindle, and means for shifting said roller endwise in the frame, of the arm *h*, adapted to swing about the axis of the platen-roller, the nut for clamping said arm to the roller, the screw *q* in said arm, and stops for limiting the extent of swing of said arm when clamped to the roller, substantially as set forth.

708,822. **GROCER'S MIX.** ALEXANDER H. MILLER and FRANK A. ENGLAND, Philadelphia, Pa. Filed Jan. 6, 1902. Serial No. 88,543. (No model.)

Claim.—1. The combination of a bin having a counterbalanced front, with a bin-chamber and straps or links each pivoted at one end to the sides of the chamber and at the other end to the front of the base of the bin so that said links lie in a plane in front of the center of gravity of the bin, said straps or links constituting the sole means of support for the bin in said bin-chamber.

2. In combination, a bin having a counterbalanced front and flat base, a bin-chamber, the floor whereof is located parallel with but below the flat base of the bin, and two links or straps each pivoted at the upper end to a side of the bin-chamber and at the lower end to the base of the bin adjacent to the counterbalanced front, said straps or links constituting the sole means for supporting the bin within the bin-chamber and above the floor of said bin-chamber, and said straps or links arranged in a plane substantially through the center of gravity of the bin, when said bin is tilted in said chamber.



3. In combination, a bin, a bin-chamber in which the bin may swing or from which it may be wholly withdrawn and two straps or links constituting the sole means of support and connection between the bin and bin-chamber, said links swinging at their upper ends upon pivots projecting from the sides of the bin-chamber, and said bin swinging in pivots at the lower ends of said links, and both sets of pivots arranged normally in a plane in front of the center of gravity of the bin, when said bin is in its chamber.

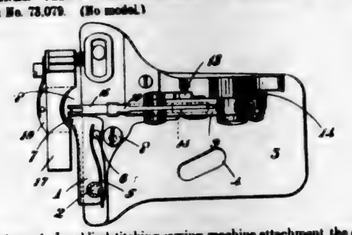
708,823. **PROCESS OF PREPARING AND TREATING RUBBER-COATED MATERIALS.** JOHANN MIESER, Pinsterita, Germany, assignor to Oxylin-Werke Actien-Gesellschaft, Pinsterita, near Wittenberg, Germany. Filed Nov. 27, 1901. Serial No. 83,915. (No specimens.)

Claim.—1. The process herein described of preparing or treating rubber-coated materials in order to give the coating the properties described, which consists in passing the said material through a bath of heated heavy hydrocarbon and subsequently allowing the material to dry.

2. The process of preparing or treating rubber-coated materials, which consists in first coating a textile or other material with a mixture of india-rubber, loading and coloring substances and heavy hydrocarbon, subsequently drying and vulcanizing such coating on the said material, passing the latter through a bath of heated heavy hydrocarbon, and again allowing it to dry, substantially as and for the purposes described.

3. The rubber-coated material treated in a bath of heated heavy hydrocarbon and subsequently allowed to dry, substantially as and for the purpose described.

708,824. **OVERSEAMING ATTACHMENT FOR SEWING-MACHINES.** JESU C. MOORE, Brooklyn, N. Y. Filed Aug. 23, 1901. Serial No. 73,079. (No model.)



Claim.—1. In a blindstitching sewing-machine attachment, the combination of a base-plate adapted to be attached to a sewing-machine, a member movably mounted on the base-plate, means connected with said member and adapted to be operated by engagement with a reciprocating part of the sewing-machine to actuate said member to move the fabric being sewed out of the path of the needle for the formation of an overedge-stitch, and an adjustable spring-pressed guide mounted in proximity to the base-plate and forming a stop in proximity to the path of the needle, against which stop the outer surface of the folded edge of the fabric bears when the fabric has returned into the path of the needle for the formation of a blind stitch, and an adjustable stop against which the spring-pressed guide is adapted normally to bear and by which the normal position of said guide can be adjusted.

2. In a blindstitching sewing-machine attachment, the combination of a base-plate adapted to be attached to a sewing-machine, a member movably mounted on the base-plate, means connected with said member and adapted to be operated by engagement with a reciprocating part of the sewing-machine to actuate said member to move the fabric being sewed out of the path of the needle for the formation of an overedge-stitch, and a guide adjustably mounted in proximity to the base-plate, said guide being in the form of a bent metallic plate having the plane of the greater part of one portion parallel to and at a short distance from the plane of the front edge of the attachment along which the fabric is fed and the plane of the other portion parallel to the bed-plate of the sewing-machine, the former portion having a projection in close proximity to the path of the needle so as to form a stop, against which the outer surface of the folded edge of the fabric bears when the fabric has returned into the path of the needle for the formation of a blind stitch.

3. In a blindstitching sewing-machine attachment, the combination of a base-plate adapted to be attached to a sewing-machine, a member movably mounted on the base-plate, means connected with said member and adapted to be operated by engagement with a reciprocating part of the sewing-machine to actuate said member to move the fabric being sewed out of the path of the needle for the formation of an overedge-stitch, and a guide adjustably mounted in proximity to the base-plate, said guide being in the form of a bent spring-pressed pivoted metallic plate having the plane of the greater part of one portion parallel to and at a short distance from the plane of the front edge of the attachment along which the fabric is fed and the plane of the other portion parallel to the bed-plate of the sewing-machine, the former portion having a projection in close proximity to the path of the needle so as to form a stop, against which the outer surface of the folded edge of the fabric bears when the fabric has returned into the path of the needle for the formation of a blind stitch, and an adjustable stop against which the spring-pressed plate is adapted normally to bear and by which the normal position of the said plate can be adjusted.

4. In a blindstitching, sewing-machine attachment, the combination of a base-plate adapted to be attached to a sewing-machine, a member movably mounted on the base-plate, means connected with said member and adapted to be operated by engagement with a reciprocating part of the sewing-machine to actuate said member to move the fabric being sewed out of the path of the needle for the formation of an overedge-stitch, and a guide adjustably mounted in proximity to the base-plate, said guide being in the form of a bent metallic plate 1 having the plane of the greater part of one portion parallel to and at a short distance from the plane of the front edge of the attachment along which the fabric is fed and the plane of the other portion parallel to the bed-plate of the sewing-machine, the former portion having a projection 7 in close proximity to the path of the needle so as to form a stop, against which the outer surface of the folded edge of the fabric bears when the fabric has returned into the path of the needle for the formation of a blind stitch, and an adjustable eccentric stop 8 against which the spring-pressed plate 1 is adapted normally to bear and by which the normal position of said guide can be adjusted.

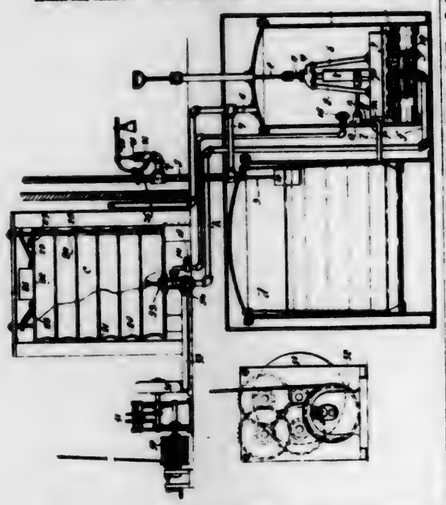
708,825. **FIRE-ESCAPE.** BENJAMIN V. MURRAY, Maud, Pa. Filed Oct. 3, 1901. Serial No. 77,395. (No model.)

Claim.—1. In a fire-escape apparatus, a board secured above the window upon the interior of the room, a rope or cable secured at one end to said board, the other end of said rope or cable adapted to be normally wound upon a spool, and said spool suspended from the board, a friction-sleeve through which the rope or cable passes longitudinally, an opening formed in one side of said friction-sleeve, a lever I pivoted at one end in said opening, a recess formed in the rear face of said lever, a series of friction-rollers journaled in said recess, a series of notches formed upon the outside of the lower end of the lever, eyes formed upon each side of the friction-sleeve, a seat, a rope, each end of which after passing through the eyes is secured to said seat, the loop of said rope passing around the lever and held in position by one of the notches an opening formed in the lower end of the sleeve, a lever O pivoted at its upper end in said opening, a frictional surface formed upon the inner face of said lever and adapted to be brought in contact with the rope or cable, an eye R formed upon the sleeve, a strap or belt S adapted to be passed through said eye, automatic means for returning the friction-sleeve to the window after the weight of the person descending has been removed from the same, substantially as and for the purpose specified.

2. In a fire-escape, a suspended rope or cable, a friction-sleeve through which the rope or cable passes, an opening formed in one side of said friction-sleeve, a lever I pivoted at one end in said opening, a recess formed in the rear face of said lever, a series of friction-rollers journaled in said

rocess and adapted to be brought in contact with the rope or cable, a series of notches formed upon the outside of the lower end of the lever, eyes formed upon each side of the friction-sleeve, a seat, a rope, each end of which, after passing through the eyes, is secured to said seat, the loop of said rope passing around the lever and held in position by one of the notches, an opening formed in the lower end of the sleeve, a lever O pivoted at its upper end in said opening, a frictional surface formed upon the inner face of said lever and adapted to be brought into contact with the rope or cable, an eye R formed with the sleeve, a strap or bolt S adapted to be passed through said eye and around the body of the person descending underneath the arms, substantially as and for the purpose set forth.

708,826. **CARBURETER.** FRASER PAUL, Jr., and ALBERT F. GUNDLACH, Sorel, Canada, assignors of one-half to Walter Tyler Ross, Montreal, Canada. Filed Oct. 28, 1901. Serial No. 80,309. (No model.)



Claim.—1. A gas-generator comprising a carbureter containing a body of hydrocarbonaceous substance; a main air-supply and branch supplies leading therefrom, said branch supplies being immersed at different levels in said hydrocarbonaceous substance for supplying air thereto below the surface thereof; a float supporting said branches; and valvular means for varying said supply to flow through one or all of said branches; and means for collecting the carbonized air, for the purpose set forth.

2. A gas-generator comprising a carbureter containing a body of hydrocarbonaceous substance; a main air-supply and branch supplies leading therefrom said branch supplies being immersed at different levels in said hydrocarbonaceous substance for supplying air thereto below the surface thereof, a float supporting said branches; and valvular means for varying said supply to flow through one or all of said branches; means for collecting the carburized air, and means for varying the density of said carburized air, for the purpose set forth.

3. A carbureter comprising a tank containing a body of carburizing liquid; a pipe projecting upwardly through said carburizing liquid for conducting the fluid to be carburized; a tubular cap fitting loosely over said pipe; and a float supporting said cap with its lower end a short distance below the surface of said liquid; substantially as described and for the purpose set forth.

4. A carbureter comprising a tank containing a body of carburizing liquid; a pipe projecting upwardly through said carburizing liquid for conducting the fluid to be carburized; a tubular cap fitting loosely over said pipe; a float supporting said cap with its lower end a short distance below the surface of said liquid; and a perforated flared plate depending from and extending around the periphery of the under side of said float with its lower edge as low as the lower edge of said cap, substantially as described and for the purpose set forth.

5. A carbureter comprising a tank containing a body of carburizing liquid; a pipe projecting upwardly through said carburizing liquid for conducting the fluid to be carburized; a tubular cap fitting loosely over said pipe; a float supporting said cap with its lower end a short distance below the surface of said liquid; and a perforated flared plate depending from and extending around the periphery of the under side of said float with its lower edge as low as the lower edge of said cap; a fluid-distributer located below the level of the lower end of said cap; a fluid-conductor communicating at its upper end with the interior of said cap, and at its other end with said distributer; and a valve controlling the communication between the upper end of said conductor and the interior of said cap, substantially as described and for the purpose set forth.

6. A carbureter comprising a tank containing a body of carburizing liquid; a pipe projecting upwardly through said carburizing liquid for conducting the fluid to be carburized; a tubular cap fitting loosely over said pipe; a float supporting said cap with its lower end a short distance below the surface of said liquid; and a perforated flared plate depending from and extending around the periphery of the under side of said float with its lower edge as low as the lower edge of said cap; a branch pipe leading from first-mentioned pipe to a point within the carburetor above the level of said carburizing liquid; an atomizer upon the inner end of said branch pipe; and a valve for controlling said branch pipe, substantially as described, and for the purpose set forth.

7. A carbureter comprising a tank containing a body of carburizing liquid; a pipe projecting upwardly through said carburizing liquid for conducting the fluid to be carburized; a tubular cap fitting loosely over said pipe; a float supporting said cap with its lower end a short distance below the surface of said liquid; and a perforated flared plate depending from and extending around the periphery of the under side of said float with its lower edge as low as the lower edge of said cap; a fluid-distributer located below the level of the lower end of said cap; a fluid-conductor communicating at its upper end with the interior of said cap, and at its other end with said distributer; and a valve controlling the communication between the upper end of said conductor and the interior of said cap; and a valve-operating device extending from the outside of said carbureter to the inside thereof and adapted to be moved into engagement with said last-mentioned valves, substantially as described, and for the purpose set forth.

8. A gas-generating plant comprising a carbureter; a tank containing a hydrocarbonaceous fluid; a pipe leading from said tank to said carbureter; a valve controlling said pipe; a part moving with said fluid as the level thereof changes within said carbureter; means actuated by said movable part for opening and closing said valve; and a gas-exhaust from said carbureter, substantially as described and for the purpose set forth.

9. The combination with a carbureter containing a body of hydrocarbonaceous liquid means for supplying thereto the fluid to be carburized consisting of a tank having a rigid top and collapsible walls; a weight supported upon said top; a fluid-conductor leading from said tank to a point within said carbureter below the level of said hydrocarbonaceous liquid; and a gas-exhaust from said carbureter, substantially as described and for the purpose set forth.

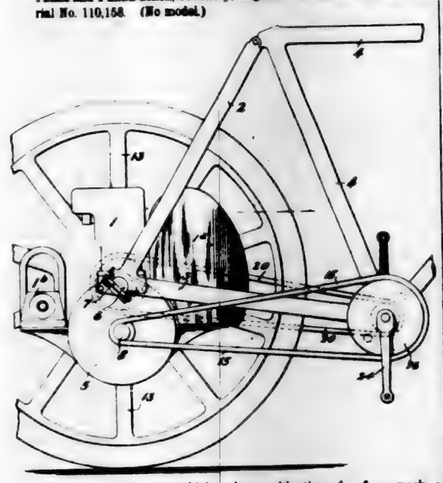
10. The combination with a carbureter containing a body of hydrocarbonaceous liquid means for supplying thereto the fluid to be carburized consisting of a tank having a rigid top and collapsible walls; a weight supported upon said top; a fluid-conductor leading from said tank to a point within said carbureter below the level of said hydrocarbonaceous liquid; a gas-exhaust from said carbureter, a branch pipe leading from said conductor to a point within the carbureter above the level of the hydrocarbonaceous liquid therein, substantially as described and for the purpose set forth.

11. The combination with a carbureter of a tank containing a hydrocarbonaceous liquid; a pipe leading from said tank to said carbureter; a vertical pipe communicating at its lower end with said tank; a transparent elongated tubular cap upon the upper end of and communicating with said pipe; a branch pipe communicating at one end with said pipe; a blow-off valve upon the other end of said branch-pipe; a float within said tank; and an indicator-rod resting upon said float and projecting through said vertical pipe into said transparent elongated cap, substantially as described and for the purpose set forth.

12. The combination with a carbureter of a tank containing a hydrocarbonaceous liquid; a pipe leading from said tank to said carbureter; a vertical pipe communicating at its lower end with said tank; a transparent elongated tubular cap upon the upper end of and communicating with said pipe; a branch pipe communicating at one end with said pipe; a blow-off valve upon the other end of said branch pipe; a float within said tank; an indicator-rod resting upon said float and projecting through said vertical pipe into said transparent elongated cap, a residuum-pan upon the bottom of said tank, and means for removing said pan, substantially as described and for the purpose set forth.

13. The combination with a gas-generating plant of an automatic air-supplying device consisting of an air-blower, a collapsible tank, a pipe communicating at one end with the generator of said gas-generating plant, a branch pipe communicating at one end with said first-mentioned pipe and at its other end with said collapsible tank, a one-way valve controlling the communication between said branch pipe and collapsible tank, a pipe leading from said blower to said branch pipe, a one-way valve controlling said last-mentioned pipe, substantially as and for the purpose set forth.

708,827. **MOTOR MECHANISM FOR ROAD-VEHICLES.** EDWIN PERRY and FRANK BIRCH, Coventry, England. Filed June 4, 1902. Serial No. 110,158. (No model.)



Claim.—1. In motor-vehicles, the combination of a framework, a motor-engine, trunnions projecting laterally from the casing of the engine eccentric to and parallel with the driving-shaft of same, means for rigidly fixing the trunnions to the framework of the vehicle to support the motor, a revoluble wheel-hub carried in bearings upon one of the motor-trunnions, a road-wheel felly surrounding and located in the vertical central plane of the motor-engine, concave spokes connecting the hub and the wheel-felly so that the motor-engine is partly contained within the dished wheel, and means for transmitting the motion of the engine crank-shaft to the road-wheel to rotate the latter, substantially as set forth.

2. In motor-vehicles, the combination with a framework, a motor-engine, trunnions laterally projecting from the engine-casing parallel with and eccentric to the motor-shaft, and means for rigidly fixing the first trunnion upon one side of the engine to the frame of the vehicle; of a revoluble wheel-hub mounted upon the second trunnion, a bearing-ring carried by the frame of the vehicle and encircling the wheel-hub to support the second trunnion, a wheel-felly surrounding and located in the central vertical plane of the motor-engine, concave spokes connecting the wheel-hub and felly so that the motor is partly contained within the dished wheel, and means for transferring the motion of the engine crank-shaft to the road-wheel to rotate the latter, substantially as set forth.

3. In motor-vehicles, the combination with a framework, an explosion-engine, trunnions laterally projecting from the engine-casing parallel with and eccentric to the driving-shaft of the engine, a supply-tank, a carbureter and electric ignition device carried by the motor-casing, and means for connecting the first trunnion upon one side of the motor to the frame of the vehicle; of a revoluble wheel-hub mounted upon the second trunnion, a bearing-ring carried by the frame of the vehicle and encircling the wheel-hub to support the second trunnion, a wheel-felly surrounding and located in the central vertical plane of the motor-engine concave spokes connecting the wheel-hub and felly so that the motor is partly contained within the dished wheel, and means for transferring the motion of the engine crank-shaft to the road-wheel to rotate the latter, substantially as set forth.

4. In motor-vehicles, the combination with a framework, a fork upon the framework, a motor-engine located between the fork members, a non-circular trunnion projecting laterally from the engine-casing upon one side parallel with and eccentric to the motor-shaft, and a socket in the adjacent member of the fork within which the non-circular trunnion can be rigidly fixed to support one side of the engine and hold it stationary relatively to the frame; of a trunnion projecting from the other side of the engine-casing coaxial with the first trunnion, ball-bearings upon the second trunnion, a wheel-hub mounted and revoluble upon the said ball-bearings a bearing-ring fixed to the second member of the fork-frame and surrounding the wheel-hub externally, and by which the second engine-trunnion is supported, and ball-bearings between the said ring and the wheel-hub, a flange upon the wheel-hub adjacent to the motor, concave spokes proceeding from the flange, and a wheel-felly connected to the spokes located centrally between the fork member of the frame and surrounding the motor, and means for transferring motion from the motor-shaft to the road-wheel to rotate the latter, substantially as set forth.

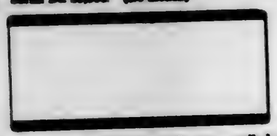
5. In motor-vehicles, the combination of a framework, a motor-engine, trunnions projecting laterally from the casing of the engine eccentric to and parallel with the driving-shaft of same, means for rigidly fixing the trunnions to the framework of the vehicle to support the motor, a revoluble wheel-hub carried in bearings upon one of the motor-trunnions, a road-wheel felly surrounding and located in the vertical central plane of the motor-engine, and concave spokes connecting the hub and the wheel-felly so that the motor-engine is partly contained within the dished wheel; of a counter-shaft carried in bearings upon the framework, means for transmitting the motion of the motor-shaft to the counter-shaft to drive the latter at a reduced speed and for driving the road-wheel from the counter-shaft at a still further reduced speed, a pedal-driven shaft to drive the counter-shaft and with it the road-wheel and the motor for starting the latter, and an overrunning clutch located between the pedal-shaft and the counter-shaft to permit of the latter overrunning the pedal-shaft when the motor is at work, substantially as set forth.

6. In motor-vehicles, the combination with a framework, a motor-engine having trunnions projecting laterally from its casing upon each side thereof parallel with and eccentric to the motor-shaft, means for rigidly connecting the trunnions upon one side of the engine to the frame of the vehicle to hold the engine stationary relatively to the said frame, a dished wheel revolubly mounted upon the second trunnion and partly containing the engine within its concavity, the felly of the wheel surrounding and being located in the central vertical plane of the engine, and a bearing carried by the framework and encircling the wheel-hub to support that side of the motor; of a counter-shaft carried in bearings upon the framework, sprocket-wheels on the motor-shaft and the counter-shaft, a driving-chain connecting the said sprocket-wheels to rotate the counter-shaft at a reduced speed, a second sprocket-wheel upon the counter-shaft and a sprocket-wheel upon the road-wheel hub, an overrunning clutch connecting the hub and its sprocket-wheel to allow the road-wheel hub to overrun its sprocket-wheel, and a driving-chain connecting the sprocket-wheels on the hub and counter-shaft for driving the road-wheels, substantially as set forth.

7. In motor-vehicles, the combination with a framework, a motor-engine having trunnions projecting laterally from its casing upon each side thereof parallel with and eccentric to the motor-shaft, means for rigidly connecting the trunnion upon one side of the engine to the frame of the vehicle to hold the engine stationary relatively to the said frame, a dished wheel revolubly mounted upon the second trunnion and partly containing the engine within its concavity, the felly of the wheel surrounding and being located in the central vertical plane of the engine, and a bearing carried by the framework and encircling the wheel-hub to support that side of the motor; of a counter-shaft carried in bearings upon the framework, sprocket-wheels on the motor-shaft and the counter-shaft, a driving-chain connecting the said sprocket-wheels to rotate the counter-shaft at a reduced speed, a second sprocket-wheel upon the counter-shaft and a sprocket-wheel upon the road-wheel hub, an overrunning clutch connecting the hub and its sprocket-wheel to allow the road-wheel hub to overrun its sprocket-wheel, and a driving-chain connecting the sprocket-wheels on the hub and counter-shaft for driving the road-wheel, a pedal-driven revoluble shaft for driving the counter-shaft to start the motor, and an overrunning clutch between the pedal-shaft and the counter-shaft to permit the latter overrunning the pedal-shaft when the motor is at work, substantially as set forth.

8. In motor-vehicles, the combination with a framework, a motor-engine having trunnions projecting laterally from its casing upon each side thereof parallel with and eccentric to the motor-shaft, means for rigidly connecting the trunnion upon one side of the engine to the frame of the vehicle to hold the engine stationary relatively to the said frame, a dished wheel revolubly mounted upon the second trunnion and partly containing the engine within its concavity, and a bearing carried by the framework and encircling the wheel-hub to support that side of the motor; of a tubular counter-shaft carried in bearings upon the framework, sprocket-wheels on the motor and counter shafts and a driving-chain connecting the said sprocket-wheels to rotate the counter-shaft at a reduced speed, a second sprocket-wheel upon the counter-shaft and a sprocket-wheel upon the road-wheel hub, an overrunning clutch connecting the hub and its sprocket-wheel to allow the road-wheel to overrun its sprocket, and a driving-chain connecting the hub sprocket-wheel with that of the counter-shaft to drive the road-wheel, a pedal-shaft passing through and carried in bearings within the tubular counter-shaft, and gearing connecting the pedal-shaft and the sleeve-shaft by which the latter may be driven by the pedals to start the motor, and an overrunning clutch in the gearing between the counter-shaft and the pedal-shaft to permit of the counter-shaft overrunning the pedal-shaft when the motor is at work, substantially as described.

708,828. SOUND-RECORD OF CELLULOID. ARTHUR H. PRITT, Newark, N. J., assignor to the International Phonograph and Indestructible Record Company, Limited, Liverpool, England. Filed July 30, 1900. Serial No. 25,203. (No model.)

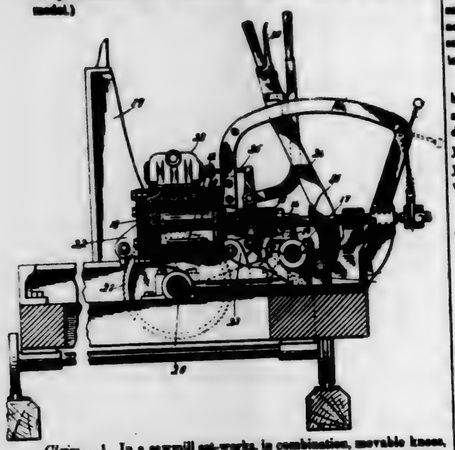


Claim.—1. As a new article of manufacture, a cylinder of celluloid having thereon an engraved sound-record.

2. As a new article of manufacture, a cylinder of celluloid having a prepared surface and a sound-record engraved thereon.

3. As a new article of manufacture, a celluloid tablet having engraved thereon a record of sound.

708,829. SWAGE SET-WORKS FOR SAWMILLS. DE WITT C. PRESCOTT, Chicago, Ill., assignor to Reuben P. Barker and Mitchell Garry, Harlowton, Wis. Filed July 2, 1901. Serial No. 66,069. (No model.)



Claim.—1. In a sawmill set-works, in combination, movable knees, a motor operatively connected with the knees, a positive set-stop in the path of a movable part of such mechanism, and an adjusting-stop movable into and out of the path of a part of such mechanism within the range provided by the set-stop, for the purpose specified.

2. In a sawmill set-works, in combination, movable knees, a motor operatively connected with the knees, a positive set-stop in the path of a movable part of such mechanism, and an adjusting-stop normally out of but movable into the path of a part of such mechanism within the range provided by the set-stop, for the purpose specified.

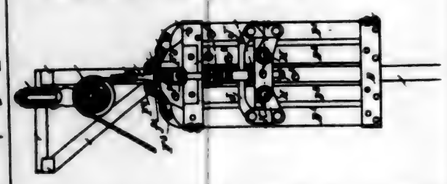
3. In a sawmill set-works, in combination, a set-shaft, a reciprocating engine for driving the set-shaft, an adjustable stop for varying the movement of the engine, a block supported in the path of the piston of the engine and having an aperture through which the piston reciprocates, a movable plate, a slot in the block in which the plate moves and which crosses the piston-aperture, and means for moving the plate into the slot.

4. In a sawmill set-works, in combination, a set-shaft, power mechanism, pawl-and-ratchet mechanism driven by the power mechanism and driving the set-shaft, the feed throw of such power mechanism being sufficient to advance the set-shaft several teeth, an adjustable stop for varying the movement of the power mechanism through wide ranges, and an independent auxiliary stop movable into the path of an adjunct of the power mechanism and thereby limiting its movement to one tooth of the ratchet mechanism.

5. In a sawmill set-works, in combination, a set-shaft, a reciprocating engine, pawl-and-ratchet mechanism driven by the engine and driving the set-shaft, an adjustable stop for varying the setting movement of the set-shaft, an adjustable stop for varying the stroke of the engine, a movable stop, and means for moving the stop into the path of an adjunct of the engine for limiting its movement to one tooth of the ratchet mechanism.

6. In sawmill set-works, the combination with the set-shaft, of a cylinder, a piston fitted to work in said cylinder and having a pawl-and-ratchet-wheel connection with the set-shaft, an adjustable stop for limiting the movement of said piston in one direction at different points, and another movable stop adapted when in abnormal position, to so limit the movement of said piston that it will, for each single stroke, turn said ratchet-wheel an interval corresponding with one tooth, substantially as described.

708,880. ELEVATOR. FREDERICK PELWITT, Springfield, Ill. Filed Dec. 7, 1901. Serial No. 85,111. (No model.)



Claim.—1. In an elevator, the combination of a cage, guides on said cage, posts on which said guides travel, brackets secured in said cage, rods detachably connected with said brackets, a yoke mounted to slide on said rods, arms mounted on said rods, springs inclosing said rods and acting against said arms, levers mounted on said cage, links connecting said levers with said arms and jaws operative by said levers and adapted to engage said posts, as set forth.

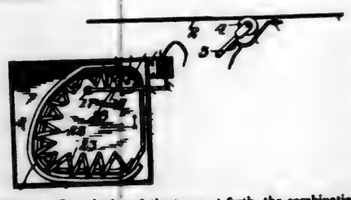
2. In an elevator, the combination of a cage having vertical rails, bolts having square parts and mounted to turn in holes in said rails, levers and dogs fitting on the square parts of said bolts, washers separating said dogs from said rails, nuts retaining said levers and dogs on said bolts, a yoke in operative connection with said levers, a cable connected with said yoke, guides on said cage, and posts on which said guides travel, and with which said dogs engage, substantially as set forth.

708,881. GUARD FOR OPTICAL INSTRUMENTS. PHILIP S. REID, Lonsdale, R. I. Filed Mar. 16, 1901. Serial No. 51,498. (No model.)

Claim.—1. In an opthalmoscope, a frame having an operative portion, a guard of non-corrosive material lying against the outer face of said portion and having a portion embracing the edge of the upper part thereof, means for securing the guard to said portion and an arm secured on the rear face of the upper portion by the same means that retains the guard in position.

2. In an opthalmoscope, a frame having an operative portion, a flat thin guard of non-corrosive material lying against the outer face of said portion and having a right-angled flange embracing the edge of the upper portion of the operative part, an arm and a single means for securing both the guard and arm to said portion.

708,882. STREET-INDICATOR FOR STREET-CARS. JOHN F. RICHARDSON, Pittsburg, Pa. Filed Feb. 21, 1902. Serial No. 95,114. (No model.)



Claim.—1. In a device of the type set forth, the combination of a casing having guides arranged on its interior at the ends thereof, said guides being of an approximately U form with the lower end of the U curved upwardly, a shaft carrying sprocket-wheels mounted in the casing beneath the upper end of the U, a sprocket-chain carrying display-cards operating over said sprocket-wheels and received within said guides, said chain and cards after engaging said sprocket-wheels extending in a vertical plane between the ends of the U, said casing having an opening therein intermediate its top and bottom, and means for operating the shaft, substantially as described.

2. In a device of the type set forth, the combination of a casing having guides on its interior of an approximately U form, sprocket-wheels

mounted in the casing, with a chain engaging over the sprocket-wheels and carrying display-cards, said chain adapted to travel in a vertical plane between the ends of the U and supported in that position by said sprocket-wheels, means for operating the sprocket-wheels, the casing having an aperture therein, substantially as described.

708,883. SAFETY DEVICE FOR SHELL-FUSES. WILHELM RUDOLF, Düsseldorf, Germany. Filed Sept. 26, 1901. Serial No. 76,099. (No model.)

Claim.—1. In a safety device for fuses, the combination with a bolt-sleeve carrying a mass of combustible material and a percussion-bolt, said sleeve provided with a partition interposed between the said material and bolt, of a longitudinally-extending locking-pin mounted within said partition and adapted to engage said bolt and material to prevent the movement of said bolt until the said material is burned away.

2. In a safety device for fuses, the combination with a bolt sleeve having a mass of combustible material and a percussion-bolt mounted therein, and a partition interposed between the said combustible material and bolt and provided with a longitudinally-extending opening of two different diameters, of a locking-pin extending through the said opening, and a collar carried by the said pin and operating in that portion of the opening of larger diameter, said pin adapted to engage said bolt and material to prevent the movement of said bolt until the said material is burned away.

3. In a safety device for fuses, the combination with a bolt-sleeve carrying a mass of combustible material and a percussion-bolt, and a partition interposed between said material and bolt and provided with a longitudinally-extending opening of two different diameters, of a locking-pin extending through the said opening, a washer mounted in that portion of the opening of larger diameter, and a collar carried by said pin and adapted to engage the said washer, said pin adapted to engage said bolt and material to prevent the movement of said bolt until the said mass of combustible material is burned away.

4. In a safety device for fuses, the combination of a bolt-sleeve provided with a partition having a longitudinally-extending opening, a mass of combustible material carried by the sleeve above the said partition, a percussion-bolt carried by the sleeve below the said partition, and a locking-pin mounted in the said opening and engaging with said bolt and said material to prevent the longitudinal displacement of said bolt until the mass of combustible material is burned away.

5. In a safety device for fuses, the combination of a rotatable sleeve, a priming-bolt mounted therein, means for locking and releasing the bolt according to the adjustment of said rotatable sleeve, a percussion-bolt carried by the sleeve, a mass of combustible material carried by said sleeve, a locking-pin interposed between the said combustible material and said percussion-bolt, whereby the movement of the latter is prevented until the former is burned away, and means for igniting said mass.

6. A safety device for fuses, comprising in its construction a casing, a rotatable bolt-sleeve mounted therein, a priming-bolt carried by the sleeve, a percussion-bolt mounted in the sleeve, means for locking or releasing the priming-bolt according to the adjustment of said rotatable sleeve, and a means for locking said percussion-bolt for safety and release it for action.

7. A safety device for fuses, comprising in its construction a bolt-sleeve having a longitudinally-extending opening, a longitudinally-extending locking-pin operating through said opening, a percussion-bolt mounted in one end of said sleeve and arranged at the rear of and engaged by said pin for locking said bolt in safety position, and means carried by the other end of the bolt-sleeve and arranged at the front of the locking-pin for releasing said pin from engagement with said bolt to permit of the operation of the latter.

8. In a safety device for fuses, the combination with a percussion-bolt and a mass of combustible material, a longitudinally-extending locking-pin interposed between said material and bolt and adapted to lock the latter in a safety position until the material is burned away, and means arranged at the front of said material for igniting the same.

9. In a safety device for fuses, the combination of a percussion-bolt and a mass of combustible material at the front thereof, of a longitudinally-extending locking-pin interposed between said material and bolt and adapted to lock the latter in a safety position until the material is burned away, means arranged at the front of said material for igniting the same, a priming-bolt for igniting said means, and means for locking the said priming-bolt.

10. In a safety device for fuses, the combination with a rotatable bolt-sleeve, provided with a partition having a longitudinally-extending opening, of a percussion-bolt carried by the said sleeve below said partition, a spring carried by the sleeve and engaging the bolt, a ring of combustible material carried by the said sleeve above said partition, means for igniting said ring, and a locking device mounted in the opening of said partition and adapted to prevent the movement of said bolt until the said ring is burned away.

11. In a safety device for fuses, the combination with a sleeve provided with a partition having an opening extending therethrough and a percussion-bolt mounted in the said sleeve, of means arranged in the said opening and engaging the bolt for preventing longitudinal displacement thereof, a mass of combustible material carried by the sleeve and engaged by said means and adapted when burned away to permit of the longitudinal displacement of said means and bolt, and means carried by said sleeve for igniting the mass of combustible material.

12. In a safety device for fuses, a casing, a bolt-sleeve carried thereby and provided with a partition having an opening therethrough, a percussion-bolt mounted in the said sleeve at the rear of said partition, a combustible mass carried by the said sleeve at the front of the partition, means carried by the sleeve for igniting the said mass, a locking device mounted in the sleeve and adapted to engage said mass and bolt to prevent longitudinal displacement of said bolt until the said mass is burned away, a spring engaging the bolt, a bridge mounted in the casing and provided with a firing-pin, and an ignition-pellet carried by the percussion-bolt and adapted to be engaged by the firing-pin when said bolt is released by the burning away of the said mass.

13. In a safety device for fuses, the combination with a percussion-bolt and a ring of combustible material mounted at the front thereof, of a locking-pin interposed between said ring and bolt and adapted to lock the latter in safety position to prevent the longitudinal displacement thereof until said ring is burned away, and means at the front of the said ring of combustible material for igniting the same.

14. In a safety device for fuses, the combination with a bolt-sleeve provided with a partition forming a front and a rear chamber, said partition having an opening extending therethrough, of a socket-piece mounted in the front chamber, a mass of combustible material carried by the socket-piece, a priming-bolt extending in the socket-piece for igniting the mass of combustible material, a percussion-bolt mounted in the rear chamber of the said sleeve, a locking-pin arranged in the opening of the partition and interposed between the mass of combustible material and said bolt, said locking-pin adapted to engage the percussion-bolt to prevent the longitudinal displacement thereof until said mass is burned away, an ignition-pellet carried by the percussion-bolt, and means for igniting the said pellet.

15. In a safety device for fuses, the combination of a bolt-sleeve, a percussion-bolt carried thereby, a priming-bolt carried thereby, a mass of combustible material arranged within the said sleeve above the said percussion-bolt and adapted to be ignited by the said priming-bolt, means for locking said priming-bolt in a safety position, a locking-pin interposed between said percussion-bolt and said mass of combustible material, said locking-pin adapted to engage the said percussion-bolt to prevent longitudinal displacement thereof until said mass of combustible material is burned away, an ignition-pellet carried by the percussion-bolt, a firing-pin adapted to engage the pellet for igniting it, and a spring interposed between the said bolt and sleeve, said spring adapted to prevent the striking and ignition of the pellet by the firing-pin until the projectile on impact causes the percussion-bolt to overcome the spring and to drive the pellet upon the firing-pin.

16. In a safety device for fuses, the combination with a bolt-sleeve, a percussion-bolt carried thereby and a locking device for said bolt to prevent the longitudinal displacement thereof, of a mass of combustible material arranged within the said sleeve and at the front of the said locking device and adapted when burned away to release the locking-pin to permit of the movement of the bolt, and means at the front of said mass of combustible material for igniting it.

17. In a safety device for fuses, a casing, a spring-pressed percussion-bolt carried thereby, a mass of combustible material arranged within the casing at the front of the percussion-bolt, means carried by the casing for igniting said mass and communicating therewith by a fuse-channel, means interposed between the mass of combustible material and the said bolt and engaging the latter to prevent the longitudinal displacement thereof until the said mass is burned away, an ignition-pellet carried by the said bolt, and means carried by the casing for igniting said pellet.

18. In a safety device for fuses, a longitudinally-extending percussion-bolt, a longitudinally-extending locking-pin arranged at the front of said bolt and adapted to engage it and prevent the longitudinal displacement thereof, and a mass of combustible material arranged at the front of the head of said pin and adapted when burned away to release the pin to permit of the displacement of the said bolt.

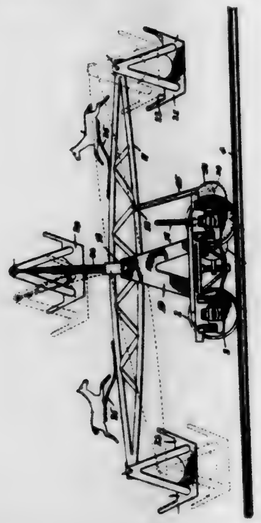
19. In a safety device for fuses, a percussion-bolt, a locking-pin arranged at the front of said bolt and adapted to engage it to prevent the longitudinal displacement thereof, a mass of combustible material arranged at the front of said pin and adapted when burned away to permit of the longitudinal movement of said pin and allow of longitudinal displacement of said bolt, means at the front of said mass of combustible material for suitably igniting it, and means for locking the said igniting means to safety position.

20. In combination, a casing, a rotatable bolt-sleeve mounted therein and provided with a partition having a longitudinally-extending opening, said partition dividing said bolt-sleeve into a front and a rear chamber, a socket-piece mounted in the said front chamber, a mass of combustible material carried by the socket-piece and arranged above the opening in the partition of the said sleeve, a priming-bolt carried by the socket-piece and provided with an ignition-pellet for igniting the said mass of combustible material, means carried by the casing to lock said priming-bolt to safety position, a percussion-bolt mounted in the said rear chamber of the sleeve, a locking-pin arranged in the opening of the partition between the said mass of combustible material and said bolt and adapted to prevent the longitudinal displacement of the latter until the mass of combustible material is burned away, an ignition-pellet carried by said bolt, and means carried by the casing for igniting said pellet.

21. In a safety device for fuses, the combination with a longitudinally-extending percussion-bolt, a mass of combustible material and a longitudinally-extending means interposed between the said mass and bolt to prevent the displacement of the bolt until the mass of combustible material is burned away, of an ignition-pellet, means for igniting said pellet, and an adjustable means for locking said ignition means to safety position.

708,834. AMUSEMENT OR ROUNDABOUT APPARATUS.

GEORGE W. SCHOFIELD, Brooklyn, N. Y. Filed Jan. 27, 1902. Serial No. 91,493. (No model.)



Claim.—1. An apparatus for recreation consisting in the combination of an oscillating member or beam, and one or more swings hung from said member or beam, a suitable carrier or car upon which said member or beam is mounted, and means for moving said carrier or car, substantially as and for the purpose set forth.

2. An apparatus for recreation consisting in the combination of an oscillating member or beam adapted to carry persons thereon, means for oscillating said member or beam, and a carrier or car having means for moving the same and upon which is mounted said oscillating member or beam, substantially as and for the purpose set forth.

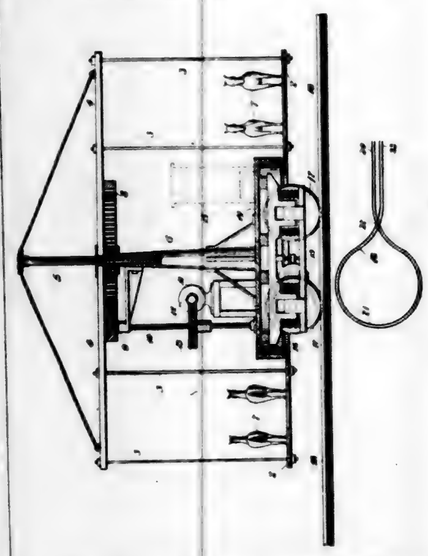
3. An apparatus for recreation consisting in the combination of a suitable carrier or car provided with means for moving the same, an oscillating member or beam mounted upon said carrier or car and adapted to carry persons thereon, and mechanism mounted upon said carrier or car for oscillating said member or beam, substantially as and for the purpose set forth.

4. An apparatus for recreation consisting in the combination of a suitable carrier or car and means for moving the same, an oscillating member or beam mounted at about its center of length upon said carrier or car and adapted to oscillate thereon and means for oscillating it, and a swing suspended from each end of said member or beam, substantially as and for the purpose set forth.

5. An apparatus for recreation consisting in the combination of an oscillating member or beam, an upright support or frame oscillated by said member and adapted to yield in the plane of oscillation, and a swing hung upon said frame and the momentum of which causes said support or frame to move or yield in the plane of oscillation, a suitable carrier or car upon which said member or beam is mounted, and means for moving said carrier or car, substantially as and for the purpose set forth.

708,885. MERRY-GO-ROUND.

GEORGE W. SCHOFIELD, Brooklyn, N. Y. Filed Jan. 27, 1902. Serial No. 91,494. (No model.)



Claim.—1. The combination of a merry-go-round, rotating in a horizontal plane, a traveling carrier or vehicle upon which the merry-go-round is mounted and operated, and means for moving said carrier or vehicle while the merry-go-round is in operation, substantially as and for the purpose set forth.

2. The combination of a carrier or vehicle and means for moving the same, a merry-go-round mounted upon said carrier or vehicle and rotating thereon in a horizontal plane, and driving mechanism located upon said carrier or vehicle for actuating the merry-go-round, substantially as and for the purpose set forth.

3. The combination of a carrier or vehicle, a track or way along which said carrier or vehicle travels and means for moving the same along the track or way, a merry-go-round mounted upon said carrier or vehicle and rotating thereon in a horizontal plane, and driving mechanism located upon said carrier or vehicle for actuating the merry-go-round, substantially as and for the purpose set forth.

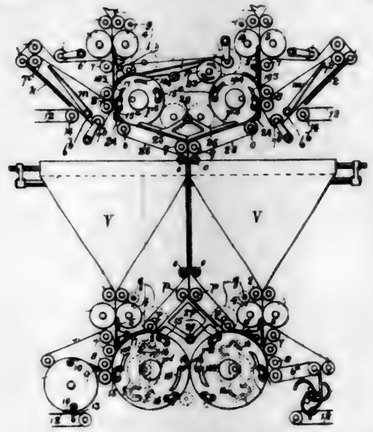
4. A self-propelled carrier or vehicle and a merry-go-round mounted upon the same and rotating thereon in a horizontal plane, and driving mechanism mounted upon said carrier or vehicle for actuating said merry-go-round, substantially as and for the purpose set forth.

5. A self-propelled vehicle or car and a track upon which the same runs, a merry-go-round mounted upon said vehicle or car and rotating thereon in a horizontal plane, and driving mechanism located upon the car for actuating said merry-go-round, substantially as and for the purpose set forth.

708,886. DELIVERY MECHANISM.

WALTER SCOTT, Plainfield, N. J. Filed Sept. 24, 1896. Serial No. 606,808. (No model.)

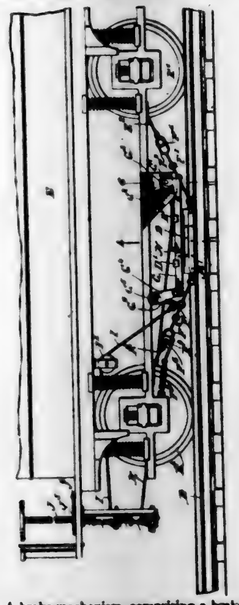
Claim.—1. The combination with a plurality of double-width presses arranged one above another, of four longitudinally-folding and transversely-cutting mechanisms arranged by pairs on different levels or planes and in the same vertical zone, a delivery for each of said mechanisms, and means whereby the cuts from the upper cutting mechanisms may be associated and delivered with the cuts from either or both of the lower folders, substantially as described.



2. The combination with a plurality of double-width presses arranged one above another, of four longitudinally-folding and transversely cutting and folding mechanisms arranged by pairs on different levels and in the same vertical zone, a delivery for each of said mechanisms, and means whereby the cuts from the upper cutting mechanisms may be associated folded transversely and delivered with the cuts from either or both the lower folders, substantially as described.

708,887. BRAKE MECHANISM.

DANIEL S. SHEPHERD, Wallace, Idaho, assignor of one-half to Peter Bernier, Wallace, Idaho. Filed May 24, 1902. Serial No. 108,808. (No model.)



Claim.—1. A brake mechanism, comprising a brake-beam adapted to be raised and lowered, and a pair of brake-shoes on the said brake-beam, adapted to slide toward and from each other to engage a rail at opposite sides of its head, at the time the brake-beam is in a lowermost position, as set forth.

2. A brake mechanism, comprising a brake-beam adapted to be raised and lowered, a pair of brake-shoes on the said brake-beam, adapted to slide toward and from each other to engage a rail at opposite sides of its head, at the time the brake-beam is in a lowermost position, and an operating mechanism connected with the said brake-beam and the said brake-shoes, to simultaneously lower the brake-beam and to move the shoes toward each other, to clamp the rail, as set forth.

3. A brake mechanism, comprising a brake-beam adapted to be raised and lowered, a pair of brake-shoes on the said brake-beam, adapted to slide toward and from each other to engage a rail at opposite sides of its head, at the time the brake-beam is in a lowermost position, and an operating mechanism connected with the said brake-beam and the said brake-shoes, to simultaneously lower the brake-beam, move the shoes toward each other, to clamp the rail, and to raise the brake-beam, to allow the shoes to open, as set forth.

4. A brake mechanism, comprising a brake-beam adapted to be raised and lowered, a pair of brake-shoes on the said brake-beam, adapted to slide toward and from each other to engage a rail at opposite sides of its head, at the time the brake-beam is in a lowermost position, a spring between the shoes to normally hold the same open, an operating device for moving the shoes toward each other, to clamp the rail, and a brake-beam-actuating device for moving the brake-beam down and up, as set forth.

5. A brake mechanism, comprising a brake-beam adapted to be raised and lowered, a pair of brake-shoes on the said brake-beam, adapted to slide toward and from each other to engage a rail at opposite sides of its head, at the time the brake-beam is in a lowermost position, a spring between the shoes to normally hold the same open, an operating device for moving the shoes toward each other, to clamp the rail, and a brake-beam-actuating device for moving the brake-beam down and up, the said devices being actuated simultaneously, as set forth.

6. A brake mechanism, comprising a brake-beam adapted to be raised and lowered, a pair of brake-shoes on the said brake-beam, adapted to slide toward and from each other to engage a rail at opposite sides of its head, at the time the brake-beam is in a lowermost position, a spring between the shoes to normally hold the same open, an operating device for moving the shoes toward each other, to clamp the rail, a brake-beam-actuating device for moving the brake-beam down and up, and a brake-staff common to both devices, to actuate the latter simultaneously, as set forth.

7. A brake mechanism, comprising a brake-beam, means for lowering and raising the same, a pair of brake-shoes mounted to slide on the said brake-beam, toward and from each other, a cam mechanism mounted on the brake-beam and connected with the said shoes, to move the same toward and from each other, means under the control of the operator for operating the said cam device, and springs between the brake-shoes, to hold the same normally open, as set forth.

8. A brake mechanism, comprising a brake-beam adapted to be raised and lowered, pairs of brake-shoes mounted on the said brake-beam, springs for holding the brake-shoes of each pair normally apart, a cam-shaft having an operating-arm under the control of the operator, the said cam-shaft being mounted to turn in the said brake-beam, cams held on the said cam-shaft, and means actuated by the said cams and rigidly connected with the brake-shoes, so as to move the shoes of each pair toward each other on turning the cam-shaft in one direction, as set forth.

9. A brake mechanism, comprising a brake-beam carrying brake-shoes for engaging rails, guideways on the said brake-beam, bars engaging the said guideways, a shaft carrying crank-arms connected with the said bars at one end thereof, and fixed inclined guideways engaged by friction-rollers on the other ends of the said bars, as set forth.

10. A brake mechanism, comprising a brake-beam carrying brake-shoes for engaging rails, guideways on the said brake-beam, bars engaging the said guideways, a shaft carrying crank-arms connected with the said bars at one end thereof, and fixed inclined guideways engaged by friction-rollers on the other ends of the said bars, the said guideways having horizontal extensions at their lower ends, as set forth.

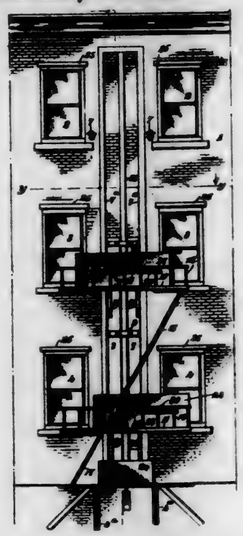
11. A brake mechanism, comprising a brake-beam, shoes mounted to slide thereon, a cam mechanism for operating the said shoes, mounted on the said brake-beam, a brake-staff, drums mounted on the said brake-staff, ropes engaging the said drums in such a manner that one rope winds up while the other unwinds on turning the brake-staff in one direction, and means connecting the said ropes with mechanism for raising and lowering the brake-beam and actuating the said cam device, as set forth.

708,888. FIRE-ESCAPE.

ALFONSO SPERLONGA, New York, N. Y. Filed May 20, 1902. Serial No. 108,186. (No model.)

Claim.—A fire-escape, comprising a track connected with a building, a scaffold slidably mounted upon said track, mechanism for raising and lowering said scaffold, shields mounted upon said scaffold for protect-

ing the occupants thereof from heat, and means for adjusting the positions of said shields relatively to said scaffold.



708,889. GAME APPARATUS. DANIEL SMITH, Griffin Corners, N. Y. Filed Jan. 3, 1902. Serial No. 88,263. (No model.)

Claim.—1. The combination of a gun, mounted to swing, a target-trap, and a connection between the two to operate the trap from the gun.

2. The combination of a gun, mounted to swing, a target-trap capable of throwing the target across the range of the gun, and a connection between the trap and the gun to operate the trap from the gun.

3. The combination of a target-trap, a turning gun-carriage, a gun thereon, and a connection between the trap and the gun-carriage to operate the trap upon the movement of the gun-carriage.

4. The combination of a gun, two oppositely-disposed target-traps capable of throwing a target from one to the other, and connections between the gun and the traps to operate the traps upon the movement of the gun.

5. The combination of two oppositely-disposed target-traps capable of throwing a target from one to the other, a gun mounted to swing, connections between the gun and the traps, said connections including rods with lateral projections, and parts connected with the gun alternately to engage the said projections as the gun swings.

6. The combination of a sector-like table having a target-path extending along its peripheral edge, a target-trap for projecting a target along said path, and a gun located at the center or axial portion of the table and mounted to swing so as to command the entire length of the said path on the peripheral edge of the table.

7. The combination of a sector-like table, a target-trap for projecting a target along the outer or peripheral edge thereof, a gun arranged at the outer or axial end of the table, and a connection between the gun and target to operate the target upon the movement of the gun.

8. The combination of a sector-like table, a target-trap for projecting a target along the outer or peripheral edge thereof, a gun arranged at the outer or axial end of the table, and means for returning the target and projectile from the outer or peripheral end of the table to the inner or axial end.

9. The combination of a sector-like table, an abutment arranged adjacent to but separated from the outer peripheral end thereof, a means forming a passage from the outer end of the table under the same to the inner or axial end, and devices for projecting objects over the table, said devices comprising a gun and a target-trap.

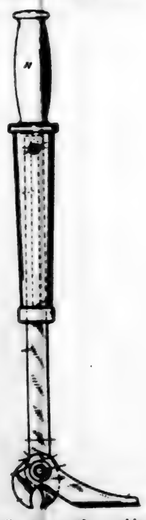
10. The combination of a sector-like table having a runway on its upper face adjacent to and following its outer or peripheral edge, means for projecting a target along said runway, and a gun arranged at the inner or axial end of the table and adapted to swing so as to throw a projectile toward any point on the peripheral or outer edge of the table.

11. The combination of a sector-like table having a runway on its upper face adjacent to and following its outer or peripheral edge, means for projecting a target along said runway, a gun arranged at the inner or axial end of the table and adapted to swing so as to throw a projectile toward any point on the peripheral or outer edge of the table, and a connection between the gun and the means for projecting the target.

708,840. PROCESS OF RENDERING ALUMINIUM CAPABLE OF BEING WELDED OR SOLDERED. CHRISTEN P. SØRENSEN, Copenhagen, Denmark. Filed Sept. 24, 1901. Serial No. 76,432. (No specimens.)

Claim.—A process for rendering aluminium capable of being soldered, which consists in first heating the metal to about 300° centigrade, then subjecting it to the action of concentrated soda-lye, and finally rinsing with cold water.

708,841. NAIL-EXTRACTOR. ELLIS H. SPERRY, Bridgeport, Conn., assignor, by mesne assignments, to the Bridgeport Hardware Manufacturing Company, Bridgeport, Conn., a Corporation of Connecticut. Filed June 3, 1902. Serial No. 110,073. (No model.)



Claim.—1. In a nail-extractor the combination with a shank carrying a fixed jaw, of a movable jaw and jaw-lever formed integral from a blank of sheet metal having a central opening and folded longitudinally to place the sides parallel but separated, one end of the blank when folded forming a U-shaped jaw-lever and the plies of metal at the other end being closed together to form the movable jaw, the fixed jaw in assembling being passed through the opening.

2. In a nail-extractor the combination with a shank carrying a fixed jaw and having recesses on opposite sides terminating in arc-shaped shoulders, of a movable jaw and jaw-lever formed integral from a blank of sheet metal having a central opening and folded longitudinally to place the sides parallel but separated, one end of the blank when folded forming a U-shaped jaw-lever, the metal on opposite sides of the opening forming side pieces adapted to lie in the recesses and having curved edges corresponding with the arc-shaped shoulders and the plies of metal at the end opposite to the jaw-lever being closed together to form the movable jaw.

3. The integral jaw and jaw-lever formed from a blank of sheet metal having a central opening and folded longitudinally to place the sides parallel but separated, one end of said folded blank forming a U-shaped jaw-lever and the plies at the other end being closed together to form the jaw.

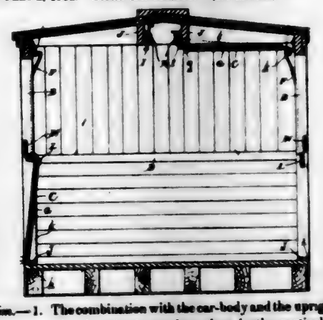
4. In a nail-extractor the combination with a shank carrying a fixed jaw, of a movable jaw and jaw-lever formed integral from a blank of sheet metal having a central opening and folded longitudinally to form a U-shaped jaw-lever, the movable jaw being formed by closing together the two plies of metal on opposite sides of the center of the blank at the end opposite to the jaw-lever, and the fixed jaw being passed through the opening.

708,842. WOOD CARPET. CARL A. STILLE and SWAN BILLINGS, Chicago, Ill. Filed Oct. 18, 1901. Serial No. 79,097. (No model.)

Claim.—1. A sectional carpet comprising a plurality of narrow strips laid edge to edge, in combination with a plurality of flexible non-elastic ties extending in a straight line extending transversely the strips and substantially centrally located between the top and bottom planes thereof, and means for permanently fixing the position of each strip relative to its ties.

2. In a sectional carpet, a plurality of sections arranged to contact at their edges and constructed with transverse channels or grooves formed in opposing pairs to inclose a part B', and with beveled lower edges as set forth, in combination with flexible non-elastic ties arranged in said channels and connected together between the contiguous sections, substantially as described.

708,848. CAR-DOOR. FRANCIS G. SUBERBIL, Detroit, Mich. Filed June 2, 1902. Serial No. 109,868. (No model.)



Claim.—1. The combination with the car-body and the uprights forming the doorway, of a door having end portions in the vertical plane of the uprights and forming bearings to support the door in position upon the inner faces of the uprights and a main body extending between said end portions in a plane inclined thereto and set out from the plane of said end portions (at least a material part thereof at the base) and triangular offsets continuously uniting the set-out portions of the main body with the end portions in planes substantially at right angles thereto, said offsets adapted to guide the door upon the uprights in raising it.

2. The combination with the car-body and the uprights forming the door-opening, of a vertically-raisable door having a main body the lower part of which at least is shorter than the width of the doorway and sets out into the doorway in a plane inclined thereto, vertical extensions at the ends of the main body forming bearings upon the inner faces of the uprights to support the door against outward movement, and triangular offset portions between the vertical extensions and the inclined portions of the main body forming a continuous connection between the ends of the main body and the extensions thereof.

3. The combination with the car-body and the uprights forming the doorway, of a vertically-raisable door having a main body, the lower part of which at least is shorter than the width of the doorway and sets out into the doorway at an incline to the uprights whereby the lower edge is substantially on a line with the outer faces thereof, extensions at the ends of the main body in the vertical plane of the uprights and forming bearings upon the inner faces thereof to close the door upon the inside, and triangular offsets continuously uniting the ends of the inclined part of the main body with the vertical bearings of the door in planes substantially at right angles thereto.

4. The combination with the car-body and the uprights forming the doorway, of a vertically-raisable door having a main body the lower part of which at least is shorter than the width of the doorway and sets out into the doorway at an angle to the uprights whereby the lower edge is substantially on a line with the outer faces thereof, lateral extensions at the ends of the main body in the vertical plane of the uprights and forming bearings upon the inner faces thereof which close the door grain-tight upon the inside of the doorway and triangularly-shaped offsets on the ends of the door-body at right angles thereto uniting the door-body with the lateral extensions, said offsets provided with flanges arranged to receive the ends of the door-body.

5. The combination with the car-body and the uprights forming the doorway, of a vertically-raisable door composed of a main body shorter than the width of the doorway and offset extensions secured to the ends of the main body forming bearings upon the inner faces of the uprights and maintaining the main body in an outwardly-sloping position in the doorway with its upper edge substantially in the plane of the bearings and its lower edge set out therefrom substantially the depth of the doorway between the uprights.

6. The combination with the car-body and the uprights forming the doorway, of a vertically-raisable door composed of a main body shorter than the width of the doorway and offset extensions secured to the ends of the main body and forming bearings for the door upon the inner faces of the upright at an angle to that of the main body, said main body projecting freely outwardly between said bearings into the doorway with its upper edge substantially in the plane of the bearings and its lower edge set out therefrom substantially the depth of the doorway, the offset portions of the extensions being substantially in a plane at right angles to the main body and provided with parallel flanges to receive the ends of the main body.

7. The combination with the car-body and the uprights forming the doorway of a vertically-raisable door composed of a main body of trapezoidal form the upper and lower edges being parallel to each other and shorter than the width of the doorway and the ends oppositely inclined toward each other, triangular offsets at the ends extending the body inwardly and offsets from the aforesaid offsets extending the body portion laterally and forming bearings continuous with the main body adapted to support the same in position upon the inner faces of the uprights against outward pressure and at an angle thereto whereby the main body is set out with its lower edge into the space between the uprights free to tilt in raising it.

8. The combination with the car-body and the uprights forming the doorway, of a vertically-raisable door composed of a wooden main body shorter than the width of the doorway and having oppositely-inclined ends whereby one edge is shorter than the other, and metallic extensions secured to the ends of said main body each forming two offsets one being of triangular shape and extending the main body inwardly and the other extending laterally from the aforesaid offset and forming bearings continuous with the main body and at an angle thereto adapted to support the main body upon the inner faces of the uprights in a plane inclined thereto and set out into the doorway free to be tilted in raising it.

9. The combination with the car-body and the uprights forming the doorway, of a vertically-raisable door composed of a main body shorter than the width of the doorway and with the ends oppositely inclined, (one edge being shorter than the other,) triangular offsets at the ends of the door-body and extending inwardly whereby the lower edge of the door-body is set out from the upper edge substantially to the depth of the doorway and offsets extending laterally from the aforenamed offsets and forming bearings continuous with the door-body to support the same in position grain-tight upon the inner faces of the uprights free to tilt in the doorway in raising it, the lower edge of the door-body provided with a depending flange along its rear upon which the door-body is adapted to rest and forming a continuous groove in front along the lower edge of the door-body.

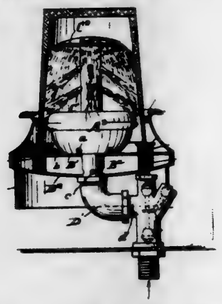
10. The combination with the car-body and the uprights forming the doorway, of a vertically-raisable door composed of a main body shorter than the width of the doorway and with the ends oppositely inclined, the lower edge being shorter than the upper edge and metallic wings secured to the ends of the door-body and forming bearings upon the inner faces of the uprights, said wings formed with outset triangular offsets provided with flanges forming rabbets to receive the ends of the main body, whereby said main body is continuously united with the bearing portion of the wings in a plane outwardly inclined into the doorway free to be tilted therein in raising it.

11. The combination with the car-body and the uprights forming the doorway, of a vertically-raisable door having end portions for supporting the door upon the inner faces of the uprights, vertical slide-rods connect-

ed to the inner sides of the wall of the car adjacent to the uprights and wholly contained within the pockets formed between the frame-timbers of the wall, brackets secured at the upper corners of the door and projecting laterally into engagement with the slide-rods (the ends of said brackets provided with slots engaging with said slide-rods) and a main body to said door of trapezoidal form, shorter than the width of the doorway and outset into the doorway between the uprights upon a plane inclined thereto (at least the lower portion of said main body) and offsets connecting the outset portions of the main body with the end portions of the door at right angles thereto, said offsets adapted to guide the door laterally in raising it upon the uprights free to tilt the door to a limited degree.

12. The combination with the car-body and the uprights forming the opening, of a door in said opening adapted to slide upward upon the inner faces of the uprights and open from below, said door having an outwardly-sloping main portion extending in the doorway between the uprights and a metallic strip secured to the lower edge of the main body and having a depending flange extending along the lower edges of the main body upon the rear face thereof and upon which the door rests in its closed position.

708,844. GLASS-RINSING DEVICE. HENRY G. SWEENEY, Chicago, Ill., assignor to Frank G. Kammerer, Chicago, Ill. Filed July 13, 1901. Serial No. 68,158. (No model.)



Claim.—1. A device for rinsing glasses comprising a receptacle having an upwardly-opening annular recess formed between two circular parts or walls for receiving the rim of a glass, a water-supply passage communicating with said recess, a valve for controlling the flow of water to said recess, and actuating means for said valve located in the recess in position to be engaged by the rim of the glass inserted in said recess.

2. A device for rinsing glasses comprising a receptacle having an upwardly-opening narrow annular recess formed between two circular parts or walls for receiving the rim of a glass, a water-supply pipe, a valve controlling said supply-pipe, and a yielding valve-actuating member located in said recess and adapted to be moved or actuated by the pressure thereon of the rim of a glass inserted in said recess.

3. A device for rinsing glasses comprising a receptacle provided with an annular upwardly-opening recess formed between two circular parts or walls, a water-supply passage, a discharge-passage, separate valves controlling said supply and discharge passages and a yielding valve-actuating member located in said recess adapted to be moved by contact of the edge of the glass therewith, said valve-actuating member being connected with and adapted to actuate both of said valves.

4. A device for rinsing glasses comprising a receptacle having an upwardly-opening annular recess for receiving the rim of a glass, a water-supply pipe, a valve in said supply-pipe, a spring-supported vertically-movable valve-actuating member located in said groove and one or more spring-supporting vertically-movable supports located in said recess in the same horizontal plane with said valve-actuating member.

5. A device for rinsing drinking-glasses comprising a receptacle provided with an annular, upwardly-opening recess for the edge of a glass, a water-supply passage, a valve controlling the supply of water from said supply-passage, a drain-passage communicating with said receptacle, a valve for closing said drain-passage and means operated by the pressure of the edge of the glass, when inserted within said recess, for operating both of said valves, the supply-passage valve and the drain-passage valve being connected in such manner that when one of the valves is opened the other is closed and vice versa.

6. A device for rinsing drinking-glasses comprising a receptacle having an annular upwardly-opening recess formed between two circular parts or walls to receive the edge of a glass, a stand-pipe rising centrally above said recess and provided with discharge-passages, a supply-pipe communicating with said recess and with said stand-pipe, a valve controlling the said supply-pipe and a yielding valve-actuating member located in said recess in position to be moved by the pressure of the edge of the glass thereon.

7. A device for rinsing drinking-glasses comprising a receptacle, a water-supply passage, a drainage-opening communicating with said passage, an inlet-valve for controlling said supply-passage, a valve for said drainage-opening connected with said inlet-valve, and a yielding actuating member for said valves located in the receptacle in position for engagement with the edge of a glass inserted therein.

8. A device for rinsing drinking-glasses comprising an upwardly-opening recess adapted to receive the edge of a glass, a supply-passage communicating with said recess, a downwardly-opening valve for controlling the flow of water through said supply-passage, a stem connected with said valve and provided at its upper end with a support for the glass located within said recess, and a spring applied to close said valve and hold said support in its elevated position.

9. A device for rinsing glasses comprising a receptacle provided with an upwardly-opening annular recess for receiving the rim of the glass and a central stand-pipe, a water-supply passage communicating with said recess and the stand-pipe, a valve controlling the flow of water to said recess and stand-pipe, a stem connected with said valve and extending upwardly into said recess, a support for the glass attached to said stem, and a spring applied to close said valve.

10. A device for rinsing glasses comprising a receptacle provided with an upwardly-opening annular recess for receiving the rim of a glass, a supply-passage communicating with said recess, a valve for controlling the flow of water to said recess, and a plurality of yielding supports located in position to be engaged by the rim of a glass, one of said supports being connected with and adapted to actuate said valve.

11. A device for rinsing glasses comprising a receptacle provided with an upwardly-opening annular recess for receiving the rim of a glass, a water-supply passage communicating with said annular recess, a valve for controlling the flow of water through said passage, a drainage-passage also communicating with the said recess, a valve for closing said drainage-passage, and a plurality of vertically-movable supports located in said recess in position for the engagement therewith of the rim of a glass, one of said supports being connected with and adapted to actuate both of said valves.

12. A device for rinsing glasses comprising a receptacle provided with an upwardly-opening annular groove for receiving the rim of a glass, a water-supply passage communicating with said annular groove, a downwardly-opening valve for controlling the flow of water through said passage, a vertical valve-stem which rises into said recess, a support for the glass connected with said valve-stem, a spring applied to hold the valve closed and the said support in its elevated position, a drainage-passage communicating with said receptacle and a valve for said drainage-passage which is connected with and operated by the said valve-stem.

13. A device for rinsing drinking-glasses comprising a receptacle, a water-supply passage communicating with a drainage-opening, a valve for controlling the water-supply passage, a movable valve-stem actuating said valve and rising into said groove, a spring acting on said valve-stem to hold the said valve closed, and a second valve movable with said valve-stem acting to close the drainage-opening.

14. A device for rinsing glasses comprising a receptacle having an annular recess adapted to receive the rim of a glass, a supply-passage through which water is conveyed to said annular recess, a valve controlling said supply-passage, a drainage-passage communicating with the said annular recess, valves controlling said water-supply and drainage passages, said valves being so connected that when one is opened the other is closed and vice versa, means for operating said valve embracing a movable part within the said annular recess adapted to be actuated by the pressure of the rim of the glass inserted within the said recess, and means for directing water both to the inner and outer sides of the rim of the glass when the valve of the water-supply passage is open.

15. A device for rinsing glasses comprising a receptacle, a central stand-pipe having exit-openings through which water is delivered for rinsing a glass, a water-supply passage, a valve for controlling said water-supply passage, and a downwardly-yielding support for the glass located in the receptacle in position to be engaged by the rim of a glass, said yielding support being connected with and actuating the said valve.

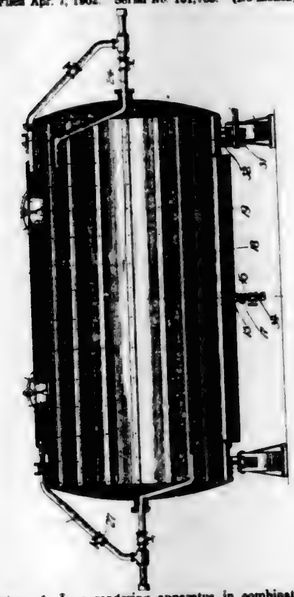
16. A device for rinsing glasses comprising a receptacle having a central stand-pipe provided with discharge-openings, a water-supply passage communicating with the said receptacle and with the stand-pipe, a valve in said supply-passage and a plurality of yielding supports located in the receptacle around the stand-pipe in position for contact of the rim of the glass therewith, one of said supports being connected with and adapted to actuate the valve.

17. A device for rinsing glasses comprising a water-receptacle, a stand-pipe thereon provided with discharge-openings, a water-supply pipe, a valve controlling said supply-pipe and a yielding valve-actuating member located in position for the action thereon of a glass placed over the stand-pipe.

18. A device for rinsing glasses comprising a water-receptacle, a stand-pipe, a water-supply passage delivering water to the stand-pipe, a drainage-opening communicating with the bottom of the receptacle, valves for controlling the water-supply passage and drainage-opening, and a yielding valve-actuating member located in position for contact of a glass therewith, and connected with and operating both of said valves.

19. A device for rinsing glasses comprising a water-receptacle, a stand-pipe, a water-supply passage supplying water to the stand-pipe, said water-supply passage having a drainage-inlet opening communicating with the bottom of the receptacle and a drainage-outlet opening, a valve in the inlet-passage for controlling the supply of water, a valve in the drainage-outlet opening, and a yielding valve-actuating member adapted for contact therewith of a glass, the said actuating member being connected with and adapted to actuate both of said valves.

708,845. RENDERING APPARATUS. CHARLES TURNER, Chicago Ill. Filed Apr. 7, 1902. Serial No. 101,708. (No model.)



Claim.—1. In a rendering apparatus, in combination, a horizontally-disposed rotatable tank having a steam-jacket, a stationary steam-supply pipe entering the tank axially thereof through one end, an exhaust-pipe leading from the opposite end of the tank, a pipe entering the steam-jacket, a rotatable connection between the said pipe and the steam-supply pipe, means for exhausting from the steam-jacket, and a valve-closed outlet for the tank.

2. In a rendering apparatus, in combination, a horizontally-disposed rotatable tank having a steam-jacket, a stationary steam-supply pipe entering the tank axially thereof through one end and extending to near the bottom thereof, an exhaust-pipe leading axially from the opposite end of the tank and extending therein in the opposite direction from the first-mentioned pipe, valves for closing the said pipes, a valve-closed pipe leading from the side of the tank, a reticulated shield located in the tank and over the mouth of the said pipe, a rotatable sleeve on each of the steam supply and exhaust pipes, the portions of the said pipes inclosed by the said sleeves being reticulated, and a pipe leading from each sleeve to the steam-jacket.

3. In a rendering apparatus, in combination, a rotatable tank having a steam-jacket, a steam-supply pipe, a pipe leading to the steam-jacket, a rotatable connection between the said pipes, and an exhaust for the jacket.

4. In a rendering apparatus, in combination, a rotatable tank having a steam-jacket, a stationary pipe leading into the tank, a second stationary pipe leading therefrom, pipes entering the jacket, and a rotatable connection between each of the latter pipes and one of the stationary pipes.

5. In a rendering apparatus, in combination, a rotatable tank having a steam-jacket, a stationary pipe leading into the tank, a second stationary pipe leading therefrom, valve-closed pipes entering the jacket, a rotatable connection between each of the latter pipes and one of the stationary pipes, and a valve in each of the stationary pipes between its rotatable connection and the tank.

6. In a rendering apparatus, in combination, a rotatable tank having a steam-jacket, a stationary steam-supply pipe entering the tank axially thereof through one end, a stationary exhaust-pipe leading axially from the opposite end of the tank, valves for closing the said pipes, a valve-closed outlet for the tank, a rotatable sleeve on each of the steam supply and exhaust pipes, the portions of the said pipes inclosed by the said sleeves being reticulated, and a valve-closed pipe leading from each sleeve to the steam-jacket.

708,846. FIRE-ESCAPE. HENRY VIERSEN, Grand Island, Nebr. Filed Oct. 4, 1901. Serial No. 77,573. (No model.)

Claim.—1. A fire-escape comprising a suitable pulley-block, annular brake members secured firmly to opposite sides of the block, a shaft concentric to said brake members and having a pulley disposed within the block and between said brake members, revolnble brake members fast with the opposite end portions of said shaft, centrifugal levers fulcrumed on the revolnble brake members to turn on axes that lie parallel to the planes of said brake members and adapted to be thrown outwardly to positions at right angles to said planes of said brake members, weights on said brake-levers, and shoes carried by said levers at points between the fulcra thereof and the weights thereon.

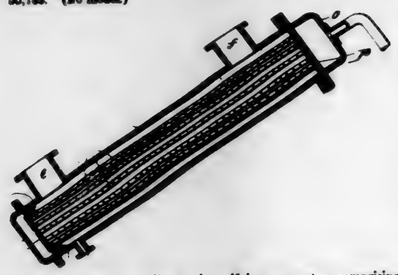
2. A fire-escape comprising a suitable pulley-block, annular brake members secured firmly to opposite sides of the pulley-block, a shaft extending through the block and said brake members and provided with a centrally-disposed pulley, revolnble brake members fast with the end portions of the shaft and each having a series of radial arms which terminate in suitable pivot-bearings, brake-levers connected to said bearings by pivots which lie parallel to the planes of the brake members and permitting said levers to extend outwardly to active positions at right angles to the revolnble members, weights on said levers, and brake-shoes actuated by the levers and adapted to engage the stationary brake members.

3. A fire-escape comprising a palley-block having a pulley and a brake mechanism to retard the pulley, a plate secured to the block below the pulley and provided with spaced eyes affording friction-surfaces, a flexible cable or member fitted around the pulley and passing through the eyes of said plate, and a pair of friction-rollers disposed between the plate and the pulley and having individual engagement with the strands of the cable or member, said rollers being grouped closer together than the space between the eyes of the plate and serving to draw the strands of the ca-

ble or member inwardly toward each other at a point between the pulley and the plate, whereby the cable is caused to hug the pulley and to have frictional engagement with the rollers and the friction-surfaces of the plate.

4. A fire-escape, comprising a block provided with a revolvable pulley and with a stationary guide-plate having friction-holes, relatively stationary brake members of annular form secured upon opposite portions of said block, revolvable members connected with said pulley and actuated thereby, longitudinal members connected with said revolvable members and free to swing when subjected to centrifugal force, weights and brake-shoes mounted upon said longitudinal members, so disposed that said weights are free to force said brake-shoes into contact with said stationary brake members and also to exert leverage upon said brake-shoes, a pair of rollers loosely mounted adjacent to said holes in said guide-plate, and a flexible cord engaging said holes, said rollers and said pulley, substantially as specified.

708,847. **AIR COOLING AND PURIFYING APPARATUS.** CARL W. VOLLMANN, Montreal, Canada. Filed Apr. 13, 1901. Serial No. 55,733. (No model.)



Claim.—1. An air cooling and purifying apparatus, comprising a closed chamber consisting of a cylinder having one end closed by a cap, and its other end closed by a hollow head; a series of perforated pipes within said cylinder and extending longitudinally thereof, and having one end of each closed and the other ends thereof rigidly secured to and communicating with the interior of said head, means for forcing brine into said hollow head; a brine-exhaust port in said closed cylinder, and an air supply to and exhaust from said cylinder, substantially as described and for the purpose set forth.

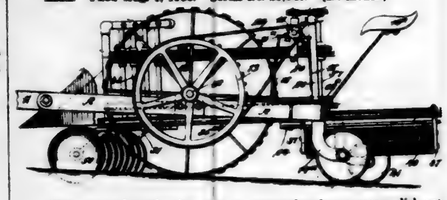
2. An air cooling and purifying apparatus consisting of a closed chamber consisting of an inclined cylinder having one end closed by a cap, and its other end closed by a hollow head; a series of perforated pipes within said cylinder and extending longitudinally thereof, and having one end of each closed and the other ends thereof rigidly secured to and communicating with the interior of said head, means for forcing brine into said hollow head; a brine-exhaust port in said closed cylinder, and an air supply to and exhaust from said cylinder, substantially as described and for the purpose set forth.

3. An air cooling and purifying apparatus comprising a closed chamber consisting of an inclined cylinder having one end closed by a cap, and its other end closed by a hollow head; a series of perforated pipes within said cylinder and extending longitudinally thereof, and having one end of each closed and the other ends thereof rigidly secured to and communicating with the interior of said head, the perforations in each of said pipes being in staggered relation to the perforations in the pipes adjacent thereto, means for forcing brine into said hollow head; a brine-exhaust port in said closed cylinder, and an air supply to and exhaust from said cylinder substantially as described and for the purpose set forth.

4. An air cooling and purifying apparatus consisting of a closed chamber consisting of an inclined cylinder having one end closed by a cap, and its other end closed by a hollow head; a series of perforated pipes within said cylinder and extending longitudinally thereof and having one end of each closed, and the other ends thereof rigidly secured to and communicating with the interior of said head, the perforations in each of said pipes being in staggered relation to the perforations in the pipes adjacent thereto, a spacing-plate supporting the closed ends of said pipes, a series of rollers mounted upon said plate and bearing upon the interior surface of said cylinder, means for forcing brine into said hollow head; a brine-exhaust port in said closed cylinder, and an air supply to and exhaust from said cylinder, substantially as described and for the purpose set forth.

5. An air cooling and purifying apparatus comprising a closed chamber consisting of an inclined cylinder having one end closed by a cap, and its other end closed by a hollow head; a series of perforated pipes within said cylinder and extending longitudinally thereof, and having one end of each closed and the other ends thereof rigidly secured to and communicating with the interior of said head, the perforations in each of said pipes being in staggered relation to the perforations in the pipes adjacent thereto, a spacing-plate supporting the closed ends of said pipes, a series of rollers mounted upon said plate and bearing upon the interior surface of said cylinder, a brine-refrigerator, a pump, a brine-pipe leading from said refrigerator to said pump, a brine-pipe leading from said pump to said hollow head, a brine-pipe leading from the lower end of said cylinder to said refrigerator, a fan, an air-pipe leading from the compartment to be cooled to said fan, an air-pipe leading from said fan to the lower end of said cylinder, and a return air-pipe leading from the upper end of said cylinder to said compartment, substantially as described and for the purpose set forth.

708,848. **FLAX-HARVESTER.** DAVID L. WELLMAN, Frazee, Minn. Filed Aug. 1, 1900. Serial No. 25,548. (No model.)



Claim.—1. In a flax-harvester, a supporting-frame, rotary disk cutters mounted on horizontal axles in arms projecting from the frame and adapted to enter the ground and loosen the roots of plants, which cutters have concaved and convexed sides, chain conveyers adapted to receive material from the said cutters, which chain conveyers are placed in close relation, and feeding devices adapted to conduct material from the disks to the spaces between adjacent members of the conveyers, as specified.

2. In a flax-harvester, a supporting-frame, a series of rotary disks, each disk being provided with a concaved outer and a convexed inner face, the disks being mounted on horizontal axles in arms projecting forwardly from the frame and adapted to enter the ground and loosen the roots of plants, pairs of conveyer-belts located adjacent to the disks, corresponding members of horizontally-opposing belts being near together, feed-wheels located at the forward end of each conveyer, and means for rotating the said wheels in direction of the space between corresponding members of horizontally-alining conveyer-belts.

3. In a flax-harvester, chain conveyers and feed-wheels at the forward portion of said conveyers, the feed-wheels serving to direct material to the spaces between the conveyers, said conveyers consisting of endless belts in horizontal pairs, one pair being placed above the other, the inner stretches of the belts of a pair being adapted to grip material closely between them, and rotary disk cutters mounted on horizontal axles and located adjacent to the forward lower portion of the lower conveyers, for the purpose described.

4. In a flax-harvester, chain conveyers, and feed-wheels at the forward portions of said conveyers, the feed-wheels serving to direct material to the spaces between the conveyers, the said conveyers consisting of sets of endless belts in horizontal pairs, one pair being above the other, the inner stretches of the belts of a pair being adapted to grip material between them, and means for moving the belts of one pair of belts at a lower speed than the belts of the other pair, as set forth.

5. In a flax-harvester, front and rear pairs of shafts, sprocket-wheels arranged in pairs on each shaft of the front pairs of shafts, a feed-wheel located between the wheels of each pair of sprocket-wheels of the said front shafts, sprocket-wheels of different sizes arranged in pairs on and mounted to turn with each shaft of the rear pairs of shafts, chain belts passed over corresponding sprocket-wheels on the front and rear shafts, the inner stretches of corresponding belts being sufficiently close to grip material between them, and means for revolving the shafts of the rear pairs of shafts in opposite directions, as set forth.

6. In a flax-harvester, a frame, forward and rear shafts mounted vertically on said frame, the forward shafts being in two series at angles to each other, each series having an inclination rearward to the center of the frame, sprocket-wheels of equal size mounted to turn on the forward shafts, a large and a small wheel mounted to turn on each of the rear shafts, feed-wheels located between the sprocket-wheels on the forward shaft, turning with said wheels, and conveyer-belts passed over corresponding sprocket-wheels on the forward and rear shafts, and means for driving the rear shafts, as and for the purpose specified.

7. In a flax-harvester, a frame, forward and rear shafts mounted vertically on the said frame, the forward shafts being in two series at angles to each other, each series having an inclination rearward to the center of the frame, sprocket-wheels of equal size mounted to turn on the forward shafts, a large and a small sprocket-wheel mounted to turn with each of the rear shafts, feed-wheels located between the sprocket-wheels on the forward shafts, turning with said wheels, conveyer-belts passed over corresponding sprocket-wheels on the forward and rear shafts, means for driving the rear shafts, forwardly-extending partitions dividing the series of forward shafts into pairs, and a series of disk cutters located below the said partitions and adapted to enter the ground and cut the roots of plants, which disks have concaved outer and convexed inner faces and are arranged in transverse alinement with the series of shafts at a point below and in advance of them, as described.

8. In a flax-harvester, the combination, with a main frame carrying a main driving and supporting wheel, a working frame having a rocking connection with the main frame, the forward portion of the working frame being inclined from its sides toward the center, and a series of disk cutters adapted to loosen the roots of plants, located in front of the working frame and connected with the forward portion thereof, of a series of shafts mounted at the forward portion of the working frame, following the inclination of the said part, sprocket-wheels of equal size loosely mounted on the said forward shafts, feed-wheels located between said sprocket-wheels and connected with one of them, a series of shafts corresponding to the forward shafts and mounted to turn at the rear of the working frame, a small and a large gear-wheel secured to each rear shaft and mounted to turn therewith, chain belts connecting corresponding sprocket-wheels with the forward and the rear shafts, the inner stretches of adjacent belts being sufficiently close together to grip material between them, driving-sprockets located at the upper portion of the rear shafts, a chain belt engaging alternately with the front and rear surfaces of the said driving-sprockets, and a driving connection between the belt engaging with the driving-sprockets and the main supporting-wheel in the main frame of the machine.

9. In a flax-harvester, the combination, with a main frame carrying a main driving and supporting wheel, a working frame having a rocking connection with the main frame, the forward portion of the working frame being inclined from its sides toward the center, and series of disk cutters adapted to loosen the roots of plants, located in front of the working frame and connected with the forward portion thereof, of a series of shafts mounted at the forward portion of the working frame, following the inclination of said part, sprocket-wheels of equal size loosely mounted on the said forward shafts, feed-wheels located between said sprocket-wheels and connected with one of them, a series of shafts corresponding to the forward shafts and mounted to turn at the rear of the working frame, a small and a large gear-wheel secured to each rear shaft and mounted to turn therewith, chain belts connecting corresponding sprocket-wheels with the forward and the rear shafts, the inner stretches of adjacent belts being sufficiently close together to grip material between them, driving-sprockets located at the upper portion of the rear shafts, a chain belt engaging alternately with the front and rear surfaces of the said driving sprocket-wheels, a driving connection between the belt engaging with the driving sprocket-wheels and the main supporting-wheel in the main frame of the machine, caster-wheels located at the rear of the main frame and rear outer portion of the working frame, and means, substantially as described, for adjusting the lower ends of the rear shafts.

10. In a flax-harvester, a wheel-supported frame, series of disks, said series being at angles to one another and extending from the center of the frame outward in opposite directions, each disk having a concaved outer and a convexed inner face, upper and lower belt conveyers arranged in pairs and extending from a point near the disks to the rear portion of the frame, the corresponding members of each pair of conveyer-belts being sufficiently close together to hold a plant, and feed-wheels mounted to revolve at the forward end of each belt conveyer, the feed-wheels of each pair of conveyers turning in direction of the space between corresponding members of the said belts, for the purpose set forth.

11. In a flax-harvester, the combination, with a frame, a series of shafts arranged on diagonal lines inclining outwardly and forwardly from the center of the said frame at the front, a second series of shafts located at the rear of the said frame, series of disks arranged correspondingly to the forward shafts in the said frame, the disks having concaved outer and convexed inner faces, and partitions separating the said forward shafts into pairs, which partitions extend over the said disks, of sprocket-wheels mounted on the forward and rear shafts, conveyer-belts carried by the said sprocket-wheels, feed-wheels attached to sundry of the said forward sprocket-wheels, and means for turning the feed-wheels of each pair of belts in direction of the space between corresponding members of said belts, for the purpose set forth.

12. In a flax-harvester, the combination with a main frame, a supporting-wheel mounted therein, and a working frame having a rocking connection with the main frame, of shafts arranged in pairs at the front and rear of the working frame, sprocket-wheels on the said shafts, chain belts passing around the sprocket-wheels, means for revolving the rear shafts of the several pairs of shafts in opposite directions from the supporting-wheel of the main frame, and rotary disk cutters mounted on horizontal axles at the forward part of the working frame and adapted to enter the ground and loosen the roots of the flax, substantially as described.

13. In a flax-harvester, the combination with a main frame, a supporting-wheel mounted therein, and a sprocket-wheel driven from the supporting-wheel, of a working frame having a rocking connection with the main frame, shafts arranged in pairs at the front and rear of the working frame, sprocket-wheels on the shafts, chain belts passing around the sprocket-wheels, a sprocket-wheel on the upper end of each rear shaft, and a sprocket-chain alternately engaging the front and rear surfaces of the sprocket-wheels of the rear shafts, said sprocket-chain passing around the sprocket-wheel of the main frame, substantially as described.

14. In a flax-harvester, a working frame having its front inclined rearwardly and inwardly from its sides toward the center, arms projecting forwardly from the frame, rotary disk cutters mounted on the arms, feed devices mounted on the frame in rear of the cutters, and endless conveyers mounted in the frame in rear of the feed devices, as set forth.

708,849. **SOUND-REPRODUCER.** HENRY G. A. I. WIEDER, London, England, assignor to Charles William Phillips, London, England. Filed Sept. 21, 1901. Serial No. 76,108. (No model.)

Claim.—1. In a device of the class described, the combination one with the other of three disks of different diameters concentrically interposed one upon the other and separated from each other by wires radiating from the common center thereof, substantially as shown and described and for the purpose set forth.

2. In a device of the class described, the combination one with the other of three disks of different diameters concentrically interposed one upon the other and separated from each other by wires radiating from the common center thereof and a recording or reproducing point secured to the outermost disk, substantially as shown and described.

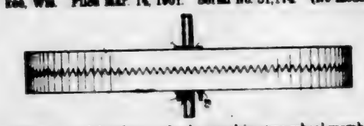
3. In a device of the class described, the combination one with the other of three disks of resilient material of different diameters concentrically interposed upon each other, and separated from each other by wires radiating from the common center thereof, and a cone provided at the point with a recording or reproducing point, the base of which cone is secured to the outer disk, substantially as shown and described.

4. In a device of the class described, the combination with three disks of resilient material interposed concentrically upon each other so that their centers are coincident, of a recording or reproducing point carried by the outermost disk, wires radiating from the common center interposed between the disks, a casing supporting the periphery of the intermost disks, and a perforated back plate securing such disk therein, substantially as shown and described.

5. In a device of the class described, the combination one with the other of a cone *a*, the concentrically-arranged glass disk *b* separated by the wires *c* and cemented thereto, the perforated vulcanite disk *e*, and the metal back *f* connected by the inclosing rim *g*, substantially as shown and described.

6. In a device of the class described, the combination one with the other of a cone *a*, the concentrically-arranged glass disks *b* of different diameters separated by the wires *c* and cemented thereto, the perforated vulcanite disk *e*, and the metal back *f* connected by the inclosing rim *g*, substantially as shown and described.

708,850. **BAND-SAW WHEEL.** THEODORE S. WILKIN, Milwaukee, Wis. Filed Mar. 14, 1901. Serial No. 51,174. (No model.)



Claim.—1. A band-saw wheel, comprising two wheel members each being a complete wheel complementary to each other the members being connected to each other adjustably so as to be adapted to be moved away from or toward each other.

2. A band-saw wheel, comprising two wheel members each being a complete wheel and having rims provided with toothed edges complementary to each other and so disposed that the members can be separated somewhat and the teeth of the two members will still overlap or extend past each other, and means for adjusting the members from and toward each other.

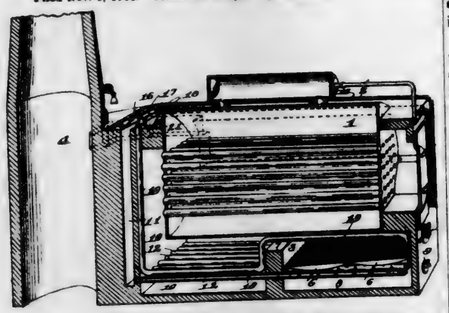
3. In combination, a shaft, a band-saw wheel comprising two wheel members each being a complete wheel, one wheel member being fixed

on the shaft and the other wheel member being loose on the shaft, and means for adjusting the loose wheel member toward and from the fixed wheel member.

4. The combination, a band-saw wheel comprising two wheel members each member being a complete wheel and provided with a rim having a serrated edge the serrated edges being complementary to each other, and bolts revoluble in the hub of one member and held thereto against movement endwise and turning by screw-thread in the hub of the other wheel member.

5. A band-saw wheel in two parts of equal diameter, each part being in form a complete wheel, and means for holding the two parts near each other adjustably.

708,851. **AIR-FEEDING APPARATUS FOR FURNACES.** HERBERT ABBOTT, Balmain, near Sydney, New South Wales, Australia. Filed Nov. 6, 1901. Serial No. 81,357. (No model.)



Claim.—1. The combination of a furnace having an upright passage opening at its upper end into the atmosphere, a pipe connected with the lower end of said passage and extending forwardly therefrom, its forward end being situated under the grate and having a series of openings, an upright pipe substantially coextensive with said passage, the lower end of the pipe being provided with a forwardly-extending portion substantially coextensive with said other pipe and its forward or delivery end being situated above the grate, and means for delivering steam into the upper ends of said upright passage and upright pipe, respectively.

2. The combination of a furnace having brickwork, said brickwork being provided with a downtake-passage opening into the atmosphere at its upper end, a plurality of pipes leading from the downtake-passage and extending forwardly therefrom, the forward ends of the pipes having openings for the discharge of air and steam at one side of the grate of said furnace, means for delivering steam into the upper open end of said downtake-passage, a pipe substantially coextensive with the downtake-passage and its upper end opening into the atmosphere, said pipe having a forwardly-extending portion, the end of which is arranged to discharge steam and air into the grate-chamber at the side of the grate opposite to that into which the air and steam from the first-mentioned pipes are delivered, and means for delivering steam into the upper open end of said pipe.

3. The combination of a furnace provided with a boiler and a steam-chamber, a vertical passage opening into the atmosphere, and having a conduit extending forwardly from the same, and arranged to deliver air and steam into the grate-chamber of said furnace, and a system of valved piping arranged to deliver steam into the upper open end of said passage, and connected with said steam-chamber.

708,852. **TOBACCO-PIPE.** NORRIS ALLISON, Hendersonville, N. C. Filed Apr. 17, 1902. Serial No. 103,318. (No model.)

Claim.—1. A tobacco-pipe comprising a bowl, a stem consisting of angled connecting branches having open ends, plugs inserted in said open ends, and valves secured to said plugs, and extending into said angled branches.

2. A tobacco-pipe comprising a bowl, a stem consisting of angled branches open at their ends and connected with said bowl and with each other and provided with valve-seats at their junction, plugs secured in the outer ends of the said branches, and pins having valves at their free ends adapted to be seated on the valve-seats in said branches.

3. A tobacco-pipe comprising a bowl, a stem consisting of vertical and horizontal branches meeting each other and provided with longitudinal passages connecting with each other, valve-seats at the junction of the several branches, plugs adjustably held in the outer end of the passages of the branches, needle-valves secured to the said plugs and projecting into the passages and adapted to engage the valve-seats within said passages.

4. In a tobacco-pipe, the combination with a bowl, of a tubular stem secured within the lower end of the bowl, said tubular stem being provided with a contracted opening at its upper end, a plug adjustably secured in the lower open end of the tubular stem, a circular pin projecting upwardly from said plug and flattened at its upper end on one or more sides, said flattened portion being adapted to enter the contracted opening in the upper part of the tubular stem.

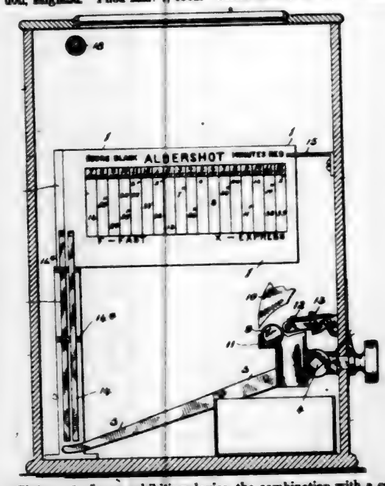
5. A tobacco-pipe comprising a bowl, a stem consisting of tubular vertical and horizontal branches, valve-seats at the junction of the branches, and needle-valves adjustably secured in the branches and adapted to engage the said valve-seats, and a mouthpiece removably secured in the rear branch of the stem.

6. In a tobacco-pipe, the combination with a bowl, a stem consisting of tubular right-angled branches, cone-shaped valve-seats at the junction of the branches, plugs removably secured in the outer ends of the said branches, and carrying pins having conical ends adapted to engage the valve-seats in the branches, and a removable pin adapted to enter the lower end of the bowl.

7. A tobacco-pipe comprising a bowl provided with a transverse partition having a central aperture, a stem removably secured in the lower end of the bowl and abutting against the central partition, said stem being provided with a central passage in register with the central aperture of the partition and communicating at its lower end with a branch smoke-passage, and a pin provided with a reduced upper end movably held in the stem and adapted to project into and through the central passage of the stem and central aperture of the partition.

8. In a tobacco-pipe the combination with a bowl, a stem consisting of tubular right-angular branches, cone-shaped valve-seats at the juncture of the branches, valve rods or pins removably held in the outer ends of the branches and provided with conical inner ends adapted to engage the cone-shaped valve-seats in the branches of the stem.

708,853. **EXHIBITING DEVICE.** AUGUSTUS C. ARGLES, Wimbledon, England. Filed Mar. 7, 1902. Serial No. 97,157. (No model.)



Claim.—1. In an exhibiting device, the combination with a casing provided with an exposure-opening, an elongated slot and a plurality of indicating-sheets arranged therein, of a rotatable rod mounted in said casing, a collar adjustable upon said rod, means operating in said slot for adjusting the said collar, an arm integral with said collar, and means engaged and operated by said arm when said rod is rotated for exposing the said sheets through the said opening.

2. In an exhibiting device, the combination with a casing provided with an exposure-opening, an elongated slot and a plurality of indicating-sheets arranged therein, of a rotatable rod mounted in said casing, a collar adjustable upon said rod, means operating in said slot for adjusting the said collar, an arm integral with said collar, means engaged and operated by said arm when said rod is rotated for exposing the said sheets through the said opening, and a handle connected to said rod.

3. In an exhibiting device, a casing provided with an exposure-opening, a series of indicating-sheets arranged therein, legs connected to each of said sheets, guides for the said sheets, a slidably-adjustable arm adapted to engage the respective leg of one of the sheets, said arm when operated adapted to move the said sheet for exposure through the said opening of the casing, and means for supporting and operating the said arm.

708,854. **APPARATUS FOR CLEANING WINDOWS.** HUGH BAIRD, Glasgow, Scotland. Filed Dec. 4, 1901. Serial No. 84,672. (No model.)

Claim.—1. In a cleaning device, the combination with a rod and a revoluble brush mounted thereon, of a slide operating on said rod, and flexible means connecting said slide and brush for revolving said brush upon operating the slide.

2. In a cleaning device, the combination with a rod and a revoluble brush thereon, of a perforated plate mounted behind said brush for cleaning the same, and a slide operating on said rod for revolving said brush.

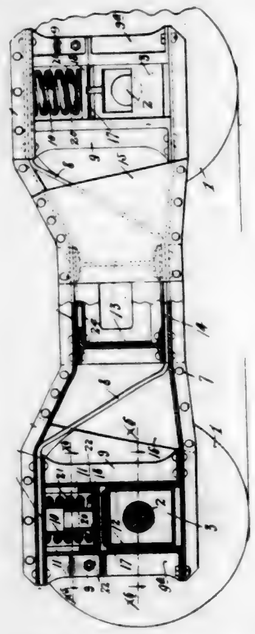
3. In a cleaning device, the combination with the rod and brush thereon, of a slide operating on said rod, guides located adjacent said rod on opposite sides of said slide, and a flexible means engaging said brush, thence reeving through said guides and secured at its ends to said slide for operating the brush upon moving the slide.

4. In a window-cleaning device, the combination with a rod and a slide operating thereon, of a revoluble brush mounted on said slide, a perforated plate carried by said slide in engagement with said brush, means for operating said slide, and means operated by said slide for revolving said brush.

5. In a window-cleaning device, the combination with a rod and a slide operating thereon, of a revoluble brush mounted on said slide, means for operating said slide, guides located adjacent said rod, above and below said slide, a flexible cord or tape secured at one end to said slide thence reeving through one of said guides to and around the axis of said brush, thence through the other of said guides and secured again to the opposite side of said slide, for operating the brush upon the upward or downward movement of the slide.

708,855. **CAR-TRUCK.** JOHN C. BARBER, St. Paul, Minn., assignor to Standard Car Truck Company, Chicago, Ill., a Corporation of New Jersey. Filed Oct. 31, 1901. Serial No. 80,612. (No model.)

Claim.—1. In a car-truck, the combination with journal-boxes mounted in the truck-frame with freedom for both vertical and lateral movements with respect thereto, of springs interposed between said journal-boxes and the truck-frame, and coöperating lateral-motion devices afforded by rollers and coöperating concave roller-seats, applied between said journal-boxes and the truck-frame, whereby said journal-boxes are yieldingly held for independent vertical and lateral movements.



2. In a car-truck, the combination with the truck-wheels and their axles, of journal-boxes in which said axles are journaled, a truck-frame having pedestals between which said journal-boxes work with freedom for limited movements transversely of the truck, concave roller-seats carried on the tops of said journal-boxes, rollers on said concave seats and roller-caps held against lateral motion with respect to the said pedestals and having concave roller-seats engaging the tops of said rollers, substantially as described.

3. In a car-truck, the combination with the truck-wheels and their axles, of journal-boxes in which said axles are journaled, a truck-frame having pedestals between which said journal-boxes work with a limited movement transversely of the truck, concave roller-seats carried on the tops of said journal-boxes, rollers on said concave seats, roller-caps free for vertical but held against lateral movements with respect to said pedestals and having concave roller-seats engaging the tops of said rollers, and springs compressed between said roller-caps and superposed portions of the truck side frames, substantially as described.

4. In a car-truck the combination with the truck-wheels and their axles, of journal-boxes in which said axles are journaled, a truck having pedestals between which said journal-boxes work with a limited movement transversely of the truck, concave roller-seats carried on the tops of said journal-boxes, rollers on said concave seats, roller-caps connected to the truck side frames by vertically-disposed telescoping thimbles or guides and springs surrounding said thimbles and compressed between said roller-caps and superposed portions of the truck side frames, substantially as described.

5. The combination with a car-truck and axle-box, of an interposed supporting-spring, a bearing cup or head supporting the lower end of said spring, a truck member on the upper surface of the axle-box, and a set of rollers interposed between said bearing-cup and the truck member and adapted to afford independent lateral movement to the axle-box, substantially as described.

6. The combination with a car-truck and an axle-box, of an interposed supporting-spring, a bearing cup or head supporting the lower end of the spring, a truck member on the upper surface of the axle-box, and a set of rollers interposed between said bearing-cup and the truck member and adapted to afford independent lateral movements to the axle-box,

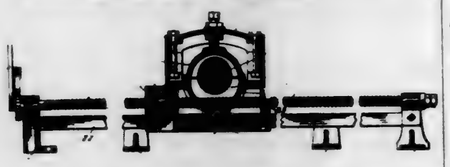
the opposed faces of the bearing-cup and the track member being formed with inclined recesses forming self-centering tracks for the rollers and individual to the same, substantially as described.

7. In a car-truck the combination with the pedestal or side frame, a supporting-spring, a support for the lower end of said spring, means for holding said support against lateral movement, an axle-box having independent lateral movement with relation to said spring-support, a track member on the upper surface of the axle-box, and a bearing roller or rollers interposed between the spring-support and said track member, substantially as set forth.

8. In a car-truck, the combination with pedestal or side frame, a supporting-spring, a support for the lower end of said spring, means for holding said support against lateral movement the same consisting of lugs or projections engaging vertical sides of the pedestal or frame, and an axle-box having independent lateral movement with relation to said spring-support, substantially as set forth.

9. In a car-truck, the combination of a pedestal or side frame, a supporting-spring, a support for the lower end of said spring, means for holding said support against lateral movement the same consisting of lugs or projections engaging the vertical sides of the pedestal-frame, and axle-box having independent lateral movement with relation to said spring-support, a track member on the upper surface of the axle-box and a bearing roller or rollers interposed between the spring-support and said track member, substantially as described.

708,856. **BELT-TIGHTENER.** WILLIAM R. BEE, Aurora, Ill., assignor to The Firm of Stephens, Adamson & Co., consisting of Wiley W Stephens, Frederick G. Adamson, and William R. Bee, Aurora, Ill. Filed Apr. 26, 1902. Serial No. 104,661. (No model.)



Claim.—1. In a belt-tightener, in combination, a guide-rail, a saddle in sliding engagement with the guide-rail and provided with apertures in the opposite sides thereof, a journal-box carried by the saddle and having an aperture alined with the apertures in the saddle, a belt-pulley shaft journaled in the box, and a screw-rod passing through the said apertures and engaging the saddle for sliding the saddle on the guide-rail.

2. In a belt-tightener, in combination, a pair of guide-rails, a saddle in sliding engagement with the guide-rails, a journal-box carried by the saddle, a bearing in each end of the journal-box, the said saddle and journal-box being provided with alined apertures between the bearings; a belt-pulley shaft journaled in the bearings, and a screw-rod passing through said apertures in close proximity to the shaft and engaging the saddle, for sliding the same on the guide-rails.

3. In a belt-tightener, in combination, a pair of guide-rails, a saddle in sliding engagement with the guide-rails, a journal-box carried by the saddle, a bearing in each end of the journal-box, a belt-pulley shaft journaled in the bearings, the said saddle and journal-box being provided with alined apertures between the bearings, a screw-rod passing through the said apertures, a block seated in a recess in the saddle and having a threaded aperture engaged by the screw-rod, a wall in the journal box at each side of the screw-rod to provide an oil-well under each bearing, and means for supplying a lubricant from the wells to the bearings.

4. In a belt tightener, in combination, a guide-rail, a saddle in sliding engagement with the guide-rail, a journal-box carried by the saddle, a belt-pulley shaft journaled in the box, and a screw-rod engaging the saddle and located parallel with the guide-rail between the latter and the shaft for sliding the saddle on the guide-rail.

5. In a belt-tightener, in combination, a guide-rail, a saddle in sliding engagement with the guide-rail, a journal-box carried by the saddle, a belt-pulley shaft journaled in the box, and a screw-rod engaging the saddle and passing through alined apertures in the saddle and the journal-box between the shaft and the guide-rail.

6. In a belt-tightener, in combination, a pair of guide-rails, a saddle having a cap and in sliding engagement with the guide-rails, a journal-box comprising an upper and a lower section carried by the saddle and adjustable thereto, a screw passing through the saddle-cap for clamping the sections together, a bearing in each end of the journal-box, a belt-pulley shaft journaled in the bearings, and a screw-rod engaging the saddle and passing through alined apertures in the saddle and the journal-box in close proximity to the belt-pulley shaft.

708,857. **COMBINED MOP AND WRINGER.** FRANK BRADEY, Jefferson City, Mo. Filed Apr. 26, 1902. Serial No. 104,727. (No model.)

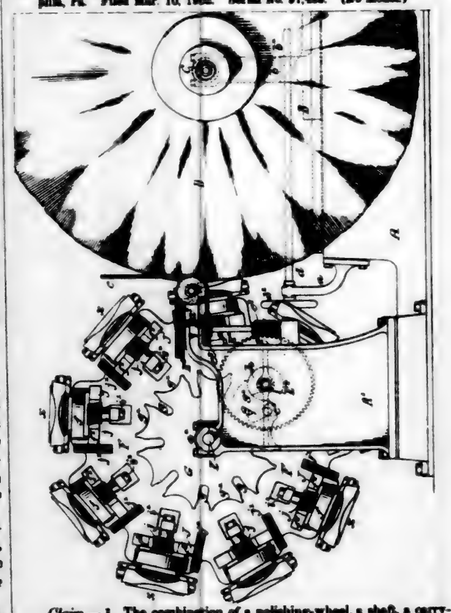
Claim.—1. The combination with the rollers and the mop; of a retractile spring secured to the upper end of the mop.

2. The combination with the rollers and the mop, of a bail secured to the upper end of the mop, and a retractile spring secured to the bail.

3. A mop and wringer comprising a frame, having slotted side arms, a roller journaled in the ends of the arms, a wringing-roller journaled in the slots of the frame, a mop between the rollers, a contractile spring to keep the upper portion of the mop stretched, and means to press the wringing-roller down on the mop.

4. A mop and wringer comprising a frame having slotted side arms, a roller journaled in the ends of the arms, a roller journaled in said slots, a mop between the rollers, a bail secured to the upper end of the mop, a retractile spring secured to the bail, threaded sleeves on the side arms of the frame, and threaded rods, in the sleeves, having forked lower ends to engage over the ends of the journals of the roller, in the slotted bearings.

708,858. **POLISHING-MACHINE.** JOHN W BROWN, Jr., Philadelphia, Pa. Filed Mar. 10, 1902. Serial No. 97,489. (No model.)



Claim.—1. The combination of a polishing-wheel, a shaft, a carrying-frame on said shaft, chucks on said carrying-frame for holding the irons or other articles to be polished, and means for intermittently rotating said frame, substantially as described.

2. The combination of a polishing-wheel, a shaft, a carrying-frame on said shaft, chucks mounted on said carrying-frame for holding irons or similar articles, a driven shaft mounted in fixed bearings, and means for connecting said driven shaft with a chuck when opposite the polishing-wheel, substantially as described.

3. The combination of a polishing-wheel, a shaft, a carrying-frame on said shaft, rotatable chucks mounted on the carrying-frame, said chucks arranged to hold an iron or similar article to be polished, a driven shaft, gearing between the driven shaft and the carrier-shaft for intermittently

turning the said carrier-frame, and a gear on the said driven shaft, a series of gears on the frame for turning the chucks, said gears being so arranged as to mesh with the gear on the driven shaft when opposite the polishing-wheel, substantially as described.

4. The combination of a polishing-wheel, a shaft, a carrying-frame on said shaft, rotatable chucks on the carrying-frame, a series of shafts mounted on the frame and each having a worm, a worm-wheel on each chuck meshing with the worm on one of the said worm-shafts, a gear on the said worm-shaft, a driven shaft mounted in fixed bearings and having a gear-wheel with which the gear-wheels on each of the worm-shafts of the carrying-frame engage when opposite the polishing-wheel, so as to rotate the chucks, and means for intermittently rotating the carrying-frame, substantially as described.

5. The combination of a polishing-wheel, a shaft, a carrying-frame mounted on said shaft, chucks on the carrying-frame for the irons or other articles to be polished, means for rotating the chucks when opposite the polishing-wheel, a star-wheel on the shaft of the carrying-frame, a stud, a wheel on said stud having a pin entering the slots of the star-wheel and having a disk for locking the star-wheel, with means for imparting motion to the said pin-wheel and disk, substantially as described.

6. The combination of a polishing-wheel, a standard, a shaft mounted thereon, a carrying-frame on said shaft, rotatable chucks mounted on said frame, a driven shaft, a worm thereon, a worm-wheel meshing with said worm, a star-wheel lock-gear through which the carrier-frame shaft is driven from the worm-wheel, and means for imparting rotary movement to each chuck from the said driving-shaft when the particular chuck is opposite the polishing-wheel, substantially as described.

7. The combination in a polishing-machine, of a carrying-frame, a socket and a bearing in said frame, a chuck mounted in the said socket and having a spindle extending through the bearing, a nut on the spindle for confining the chuck in position, a worm-wheel on the spindle, a worm-shaft, a worm on said shaft meshing with the worm-wheel, and means for turning said worm-shaft so as to rotate the chuck, substantially as described.

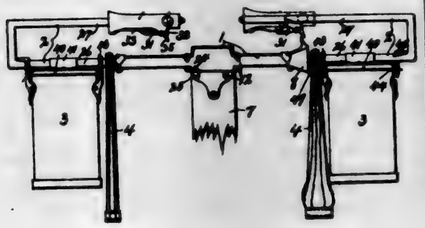
8. The combination of a polishing-wheel, a carrying-frame, a socket and a bearing, a chuck mounted in said socket and having a spindle mounted in the bearing, means for rotating said chuck, and a ring shaped to the article to be polished and secured to the chuck, substantially as described.

9. The combination of a polishing-wheel, a frame, a socket in the frame, a chuck mounted in the socket, means for rotating the chuck, a ring detachably secured to the chuck, a cross-bar, a grip on the cross-bar arranged to engage the cross-bar of the iron when placed in the socket so as to hold said iron in position, substantially as described.

10. The combination in a polishing-machine, of a fixed shaft, a gear-wheel thereon having teeth beveled at one end, a rotatable frame carrying chucks, means for revolving said chucks, a gear-wheel for driving said means, said gear-wheel having teeth beveled at one end and so arranged that when the frame F is rotated the gear-wheel on the movable frame will mesh with the gear-wheel on the fixed frame, substantially as described.

11. The combination in a polishing-machine, of the fixed frame, a vertical shaft thereon having at its upper end a gear-wheel, the teeth of which are beveled at one end, a polishing-wheel, a rotatable frame, a series of chucks carried by said frame, independent means for turning each chuck, a gear-wheel forming part of said means, the teeth of said gear-wheel being beveled at one end, with means for intermittently rotating the chuck-frame so that the wheels of the chuck mechanism will mesh with the gear-wheel mounted on the shaft having its bearings in the fixed frame, substantially as described.

708,859. **PARCEL RECEIVING AND DELIVERING DEVICE.** THEODORE L. BASSETT, Port Byron, N. Y., assignor to himself, L. H. King, F. S. Root, R. C. Smith, C. R. Westbay, J. G. Klatt, S. Peterson, Anson Tuller, and J. M. Ryan, Port Byron, N. Y. Filed May 17, 1902. Serial No. 107,808. (No model.)



Claim.—1. In a parcel receiving and delivery system, a support having a receiving-guide, a pouch-carrier inserted in the guide, and means concealed within the guide and actuated by the carrier during its insertion for locking the carrier in the guide.

2. In a parcel receiving and delivery system, a support having a delivery-guide, a pouch-carrier removably inserted in the guide, movable means locking the carrier in the guide, and a moving body having means to move the former means to release the carrier.

3. In a parcel receiving and delivery system, a support having receiving and delivery guides, a pouch-carrier removably inserted in the delivery-guide, movable means locking the carrier in the guide, a second carrier inserted in the receiving-guide and actuating the former means to release the former carrier.

4. In a parcel receiving and delivery system, a support having receiving and delivery guides, a pouch-carrier removably inserted in the delivery-guide and additional means actuated by the second carrier for automatically locking the same during its insertion into the receiving-guide.

5. In a parcel receiving and delivery system, a support having receiving and delivery guides, a pouch-carrier removably inserted in the delivery-guide, a locking member holding the carrier in the delivery-guide, and a second carrier inserted in the receiving-guide and operating said member to release the former carrier and to lock the second carrier.

6. In a parcel receiving and delivery system, a pouch having an opening and a closure for the opening, locking members on the pouch and closure, and a carrier removably engaged with said members for locking the closure in its closed position.

7. In a parcel receiving and delivery system, a pouch having an opening and a closure for the opening, locking members on the pouch and closure, and a carrier removably engaged with said members for locking the closure in its closed position, a support to receive the carrier and means to lock the carrier to the support.

8. In a parcel receiving and delivery system, a support having a guide, a pouch having one or more locking members, a carrier-arm interlocked with said members and into the guide, and means actuated by the insertion of the carrier-arm for locking the arm to the support and preventing the removal of the pouch.

9. In a parcel receiving and delivery system, a support having receiving and delivery guides, a pouch-carrier removably inserted in the delivery-guide, movable means locking the carrier in the guide and preventing removal of the pouch from the carrier, and a second pouch-carrier inserted in the receiving-guide and operating said means to release the former carrier and to lock the second carrier to the support.

10. In a parcel receiving and delivery system, a support having a guide, a carrier removably inserted in the guide, a holder for the carrier, means for locking the holder to the carrier, and additional means for unlocking the former means to release the holder from the carrier as said carrier is inserted in the guide.

11. In a parcel receiving and delivery system, a moving holder, a pouch-carrier detachably mounted on the holder, a stationary support in the path of and receiving the carrier from the holder.

12. In a parcel receiving and delivery system, a moving holder, a pouch-carrier detachably mounted on the holder, a stationary support in the path of and receiving the carrier from the holder, and means locking the carrier to the support as the carrier is inserted into the support.

13. In a parcel receiving and delivery system, a moving holder, a pouch-carrier detachably mounted on the holder, a stationary support in the path of and receiving the carrier from the holder and a locking device actuated by the carrier for locking said carrier to the support.

14. In a parcel receiving and delivery system, a stationary support having receiving and delivery guides, a pouch-carrier inserted in the delivery-guide, a movable locking member holding said carrier in the guide, a moving holder carrying a second pouch-carrier into the receiving-guide, and means for releasing the holder from the second carrier as it is engaged with the support, said locking member being operated by the second carrier to release the former carrier, and the holder engaging and withdrawing the former carrier from the support.

15. In a parcel receiving and delivery system, a stationary support having receiving and delivery guides, a pouch-carrier inserted in the delivery-guide, a movable locking member holding said carrier in the guide, a moving holder carrying a second pouch-carrier into the receiving-guide, and means for releasing the holder from the second carrier being operated by the second carrier to release the former carrier and to lock the second carrier, and the holder engaging the former carrier and withdrawing the same from the support.

16. In a parcel receiving and delivery system, a stationary support having a guide, a rocking pawl on the support, and a pouch-carrier inserted in the guide and operating said pawl to engage and lock the carrier from withdrawal.

17. In a parcel receiving and delivery system, a stationary support,

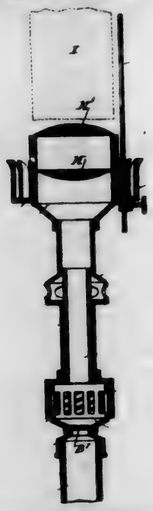
a locking-pawl on the support, a pouch-carrier locked by said pawl, and a second pouch-carrier engaged by the support and engaging said pawl to trip the same from the former carrier and simultaneously lock the second carrier to the support.

18. In a parcel receiving and delivery system, a stationary support, a locking-pawl on the support, a pouch-carrier locked by said pawl, and a second pouch-carrier engaged by the support and engaging said pawl to trip the same from the former carrier and simultaneously lock the second carrier to the support and a moving holder depositing the second carrier on the support and picking up the released carrier.

19. In a parcel receiving and delivery system, a pouch having a movable closure, the body of the pouch and closure having locking members, a carrier interlocked with said members, said carrier being removable from one of the pouch members and tilting upon the other pouch member to open the closure.

20. In a parcel receiving and delivery system, a stationary support having receiving and delivery guides, a rocking pawl on the support, a movable closure normally concealing the pawl, a pouch-carrier inserted in the delivery end of the support and engaged by said pawl, a second pouch-carrier inserted in the receiving-guide and operating said pawl to release the former carrier and to simultaneously lock the second carrier in position, a moving holder for the carriers delivering one carrier in the receiving-guide and withdrawing the other carrier from the delivery-guide.

708,860. INCANDESCENT GAS-BURNER. JAMES BUCHANAN, New York, N. Y., assignor of one-half to John B. Conover, Freehold, N. J. Filed Jan. 9, 1902. Serial No. 88,901. (No model.)



Claim.—1. An incandescent gas burner, having a preliminary mixing-chamber for the gas and air and provided in its sides with apertures, a gas-supply cap having a small aperture opening into the said mixing-chamber, a valve in the shape of a nut screwing on the outside of the chamber to close or open the apertures thereof, an outlet-pipe extending from the said mixing-chamber, an annular air-chamber around the upper end of the said outlet-pipe, to admit air to the mixture of air and gas passing up the pipe, the said air-chamber being vertically adjustable on the said pipe, and a conducting-pipe into which the outlet-pipe projects, as set forth.

2. An incandescent gas-burner, having a preliminary mixing-chamber for the gas and air and provided in its sides with apertures, a gas-supply cap having a small aperture opening into the said mixing-chamber, a valve in the shape of a nut screwing on the outside of the chamber to close or open the apertures of the said chamber, an outlet-pipe extending from the said mixing-chamber, a vertically-adjustable annular air-chamber around the upper end of the said outlet-pipe, to admit air to the mixture of air and gas passing up the pipe, a conducting-pipe leading from the said annular air-chamber concentric with the said outlet-pipe, and a main mixing-chamber on the end of the said conducting-pipe, as set forth.

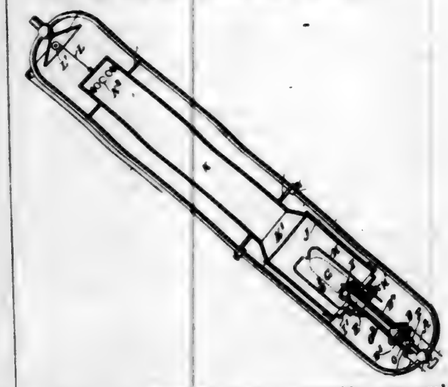
3. An incandescent gas-burner, having a preliminary mixing-chamber for the gas and air and provided in its sides with apertures, a gas-supply cap having a small aperture opening into the said mixing-chamber, a valve in the shape of a nut screwing on the outside of the chamber to close or open the apertures of the said chamber, an outlet-pipe extending from the said mixing-chamber, a vertically-adjustable annular air-chamber around the upper end of the said outlet-pipe, to admit air to the mixture of air and gas passing up the pipe, a conducting-pipe leading from the said annular air-chamber concentric with the said outlet-pipe, a main mixing-chamber on the end of the said conducting-pipe, and spaced screens in the said main mixing-chamber, as set forth.

4. In an incandescent gas-burner, the combination with a preliminary mixing-chamber having an outlet-pipe extending from its top, of a vertically-adjustable annular air-chamber mounted on the outlet-pipe and provided with a conducting-pipe extending from its top and into which the outlet-pipe of the preliminary mixing-chamber projects, and a main mixing-chamber carried by the conducting-pipe, as set forth.

5. In an incandescent gas-burner, the combination with a preliminary mixing-chamber having an outlet-pipe extending from its top, of a vertically-adjustable annular air-chamber mounted on the outlet-pipe and provided with a conducting-pipe extending from its top and into which the outlet-pipe of the preliminary mixing-chamber projects, a main mixing-chamber carried by the conducting-pipe, and spaced screens in the said chamber, one screen being convex and the other concave, as set forth.

6. In an incandescent gas-burner, the combination with a preliminary mixing-chamber having an outlet-pipe extending from its top, said pipe being provided with an inclined surface, of an annular air-chamber having a sleeve fitting on the outlet-pipe and provided with an incline surface engaging the incline surface of the pipe, and with a conducting-pipe into which the outlet-pipe projects, and a main mixing-chamber carried by the conducting-pipe, as set forth.

708,861. INCANDESCENT GAS-BURNER. JAMES BUCHANAN, New York, N. Y., assignor of one-half to John B. Conover, Freehold, N. J. Filed Jan. 9, 1902. Serial No. 88,902. (No model.)



Claim.—1. An incandescent gas-burner, comprising a gas-supply pipe, a mixing-chamber having an air-inlet and into which said supply-pipe opens, a slide-valve on the supply-pipe to regulate the amount of gas passing from the supply-pipe into the mixing-chamber, said slide-valve being mounted to slide in a bearing on the supply-pipe and having an aperture adapted to register with the outlet-opening in the supply-pipe and a recess in its under side, and a screw-rod screwing into said supply-pipe and having a collar engaging the recess in said slide-valve, as set forth.

2. An incandescent gas-burner having a valved gas-supply pipe, a mixing-chamber into which projects said supply-pipe, said mixing-chamber comprising an upper and lower section, the lower section being provided with air-inlets and the upper section separable from the lower section and formed with a conducting-tube projecting from its top, an enlarged chamber at the upper end of the conducting-tube, a screen over the top of said enlarged chamber, and a pilot-pipe made in separable parts, the lower part being attached to the supply-pipe and extending into the mixing-chamber and the upper part carried by the conducting-tube with its lower end projecting into the mixing-chamber and coupled with the lower part, the upper end extending into the enlarged chamber, as set forth.

3. An incandescent gas-burner having a valved gas-supply pipe, a mixing-chamber formed of separable parts in the shape of frustums of a cone and into which projects said supply-pipe, said mixing-chamber having its lower portion provided with air-inlets and its upper portion formed with a conducting-tube projecting from its upper end, an enlarged chamber at the upper end of the conducting-tube, a screen over the top of said enlarged chamber, and a pilot-pipe made in separable parts, and extending from the supply-pipe through the mixing-chamber up into the enlarged chamber and through said screen, as set forth.

4. An incandescent gas-burner having a mixing-chamber formed of separable sections in the form of frustums of a cone, the lower section being perforated and the upper section having a conducting-tube projecting from its top, an enlarged chamber at the upper end of the conducting-tube and provided with a screen at its upper end, a supply-pipe projecting into the mixing-chamber, a valve in the supply-pipe within the mixing-chamber, a valve in the supply-pipe below the chamber, and a pilot-pipe leading from the supply-pipe below the valve outside of the mixing-chamber and extending up through the said chamber along the outside of the conducting-tube and into the enlarged chamber and through the screen thereof, said pilot-pipe being in sections coupled together in the mixing-chamber, as set forth.

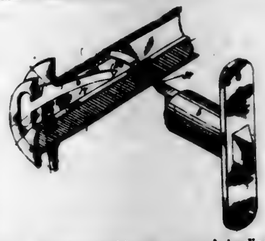
5. An incandescent gas-burner, having a mixing-chamber formed of separable sections, the lower section being perforated and the upper one having a conducting-tube projecting from its top, an enlarged chamber at the upper end of the conducting-tube and provided with a screen at its upper end, a service-pipe provided with a valve, a supply-pipe leading from the service-pipe and extending into the mixing-chamber and provided with a regulating-valve at its end within the said chamber and with a valve below the chamber, and a pilot-pipe made in sections coupled together within the mixing-chamber, the lower section being connected with the supply-pipe below the valve therein that is outside of the mixing-chamber and the upper section extending out through the mixing-chamber, along the outside of the conducting-tube and into the enlarged chamber and through the screen thereof, as set forth.

6. An incandescent gas-burner having a valved gas-supply pipe, a mixing-chamber into which opens said supply-pipe, said mixing-chamber having its lower portion provided with air-inlets and its upper portion separable from the lower portion and formed with a conducting-tube, an enlarged chamber at the upper end of the conducting-tube, a screen over the top of said enlarged chamber, a pilot-pipe made in separable parts, of which the lower part is attached to the supply-pipe and the upper part to the conducting-tube and the enlarged chamber, said pilot-pipe extending to the top of the screen, and a branch pilot-pipe extending from said pilot-pipe to the top of the mantle located above the screen, as set forth.

7. In an incandescent gas-burner, the combination with a burner proper, and a chimney therefor, of a guideway extending up above the top of the chimney, a tube having a flaring lower end adapted to rest upon the upper end of the chimney, and with laterally-projecting lugs sliding on the guideway, and means connected with the upper end of the tube for raising the same, as set forth.

8. In an incandescent gas-burner, the combination with a burner proper, and a chimney therefor, of a loop-shaped service-pipe extending above the chimney, of a tube of less diameter than the chimney and having a flaring lower end adapted to rest upon the upper end of the chimney and provided with laterally-projecting lugs adapted to slide upon the looped service-pipe, and with outlet-openings in its upper end, and adjustable stops on the looped service-pipe with which a pair of the lugs of the tube engage, as set forth.

708,862. LATCH. OSCAR H. BURDEN, Kaslo, Canada, assignor of one-half to Theodore F. Adams, Kaslo, British Columbia, Canada. Filed Jan. 3, 1902. Serial No. 88,236. (No model.)

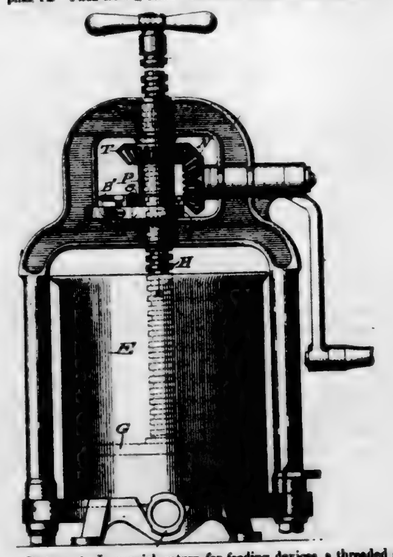


Claim.—1. A latch comprising an open-ended cylindrical casing provided near one end with a locking-aperture, an axially-adjustable cylinder fitted in the casing and provided with a longitudinal key-slot, a tumbler fitted in said slot at the rear part of the cylinder and pivoted to the latter, said tumbler extending beyond the rear end of the cylinder and the casing and provided with a locking projection arranged to enter the locking-aperture, and a spring acting against said tumbler.

2. A latch comprising a casing having locking-apertures, a slotted cylinder therein, a tumbler pivoted in the slotted part of the cylinder and having its rear portion provided with a thumb-piece which extends rearwardly beyond the casing and the cylinder, the front end of the tumbler having a key-engaging nose and said tumbler provided with a locking projection arranged to enter either aperture in the casing, means for limiting the turning movement of the cylinder within the casing, and a spring acting against the tumbler.

3. A latch comprising a slotted bolt-casing having a face-plate, a notched bolt slidable in the casing, a leaf-spring attached to the face-plate and passing through the slot in the bolt-casing and entering the notch of the bolt, a cylindrical casing having a slot 36, a cylinder in said cylindrical casing and provided with an arcuate groove 18 terminating in two shoulders, a finger attached to the slidable bolt and having a beak arranged to move in the casing-slot and to engage either shoulder of the cylinder, and a tumbler mounted in the cylinder.

708,863. QUICK RETURN FOR FEEDING DEVICES. WILLIAM J. BUSHNOER, Philadelphia, Pa., assignor to Thomas Devlin and Louis J. McGrath, copartners trading as Thomas Devlin & Company, Philadelphia, Pa. Filed Nov. 4, 1901. Serial No. 81,942. (No model.)



Claim.—1. In a quick return for feeding devices, a threaded stem, a sleeve surrounding the same, a plate having threads on its inner face adapted to engage with and be disengaged from the threads on said stem and a collar for holding said plate in position and which is operated when said plate is disengaged from the stem and means for revolving said sleeve and plate whereby the stem can be raised and lowered.

2. In a quick return for feeding devices, a stem, a sleeve surrounding the same, means for revolving said sleeve, a plate having threads on its inner face adapted to engage with the threads on said stem, a lug on said plate, and means engaging with said lug for moving said lug whereby said threads are engaged with or disengaged from said stem.

3. In a quick return for feeding devices, a threaded stem, a sleeve surrounding the same, a plate having threads on its inner face adapted to engage with said stem, means for raising and lowering said stem, means for operating said plate whereby the same engages with or is disengaged from said stem, and means on said plate which is normally disengaged from said operating means, and is engaged thereby to operate said plate.

4. In a quick return for feeding devices, a stem, a sleeve surrounding the same, means for revolving said sleeve and plate, a cut-away portion in said sleeve, a plate adapted to fit said cut-away portion and having threads on its inner face, a collar adapted to normally hold said plate in position, and means for operating said plate for moving said threads from the threads on said stem whereby the latter can be quickly raised or lowered.

5. In a quick return for feeding devices, a stem, a sleeve having a movable threaded portion, means for revolving said sleeve and threaded portion, pivoted jaws engaging said threaded portion whereby the same is moved from engagement with said stem.

6. In a quick return for feeding devices, a sleeve, an interiorly-threaded portion acting therewith, a gear on said sleeve, a lug on said threaded portion, spring-actuated jaws for holding said parts in normal position, a lever adapted to engage said threaded portion whereby the threads thereof are disengaged from the stem and the latter can be raised or lowered as desired.

7. In a quick return for feeding devices, a stem, a sleeve, a threaded portion movably connected therewith, jaws pivoted to each other and normally holding said sleeve and threaded portion together, a gear on said sleeve adapted to be operated to turn the latter whereby the same is raised and lowered, a lever adapted to engage with said threaded portion and cause the same to open said jaws whereby said threads on said portion are moved from engagement with the stem and the latter can be raised and lowered.

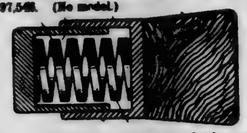
8. In a quick return for feeding devices, a stationary jaw, a spring-actuated jaw pivoted thereto, a lever pivoted to said stationary jaw, an arm having a slot therein connected with said lever, a lug on said movable jaw adapted to abut against said arm when the latter is in certain positions and adapted to pass through said slot at the proper time, a threaded stem, a sleeve surrounding said stem and having a gear thereon, and a plate having threads adapted to engage with the threads on said stem, said jaws holding said sleeve and plate and said lever being adapted to engage with said plate.

9. In a quick return for feeding devices, a stem, a sleeve surrounding the same, a plate having threads adapted to engage with the threads on said stem, means for revolving said sleeve and plate for raising and lowering said stem, a lug on said plate and means engaging with said lug for moving said plate, whereby said threads are engaged with or disengaged from said stem, and means for locking said plate in either position.

10. In a quick return for feeding devices, a sleeve, an interiorly-threaded portion acting therewith, a gear on said sleeve, a lug on said threaded portion, means for holding said parts in normal position, and a lever adapted to engage with said threaded portion, whereby the threads thereof are disengaged from the stem and the latter can be raised or lowered as desired.

11. In a quick return for feeding devices, a stem, a sleeve, an interiorly-threaded portion acting therewith, means for revolving said sleeve and threaded portion, and means normally out of the path of the movement of said threaded portion but which is adapted to be operated to engage therewith in order to remove the threads from the threads of the stem, whereby the latter can be raised or lowered.

708,864. **RESILIENT TIRE FOR VEHICLE-WHEELS.** WILLIAM E. CARMONT, Kingston-upon-Thames, England. Filed Mar. 10, 1902. Serial No. 97,548. (No model.)



Claim.—1. In combination, a rim of a wheel provided with a peripheral channel, a plurality of segments mounted in said channel and each formed with a plurality of interiorly-arranged boxes, each of the segments further provided with openings, cushions arranged in each of the boxes of the segments, and means extending through the walls of the channel and through the openings of the segments for securing the latter to the rim.

2. The combination with the rim of a wheel provided with a peripheral channel, of a plurality of segments mounted in said channel and each formed with a plurality of interiorly-arranged boxes, each of the segments further provided with openings, rubber and spring cushions suitably mounted and arranged in the boxes of the segments, and means extending through the walls of the channel and through the openings of the segments for securing the latter to the rim.

708,865. **NUT-LOCK.** CHARLES H. CRITTON, Lexington, Va. Filed Feb. 26, 1902. Serial No. 96,774. (No model.)

Claim.—1. In a nut-lock, a plate adapted to be attached to a nut, a lever-bar pivotally supported upon said plate, a pin carried by said lever-bar and adapted to enter a cavity in the bolt engaged by said nut, and means for holding said lever-bar yieldably closed, and means for forcefully actuating said lever-bar, substantially as described.

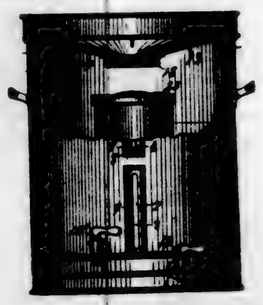
2. In a nut-lock, the nut having a transverse aperture, a cavity in the bolt registering with said aperture, a plate disposed upon said nut, a lever-bar yieldably connected to said plate, a pin supported by said lever-bar and engaging said aperture and cavity, means for retaining said lever-bar yieldably in the closed position, and means for forcefully actuating said lever-bar to release said pin, substantially as described.

3. In a nut-lock, a plate adapted to be attached to the nut and having transverse sockets in its outer ends, a spring-tongue formed centrally of said plate between said sockets, a lever-bar having lateral journals engaging said sockets and disposed to be retained yieldably closed by said spring-tongue, and a pin supported by said lever-bar and engaging a cavity in the bolt engaged by said nut, and means for forcefully actuating said lever-bar to release said pin, substantially as described.

4. In a nut-lock, a plate adapted to be attached to the nut, a lever-bar yieldably connected to said plate, a pin supported by said lever-bar and engaging an aperture in the bolt engaged by said nut, means for retaining said lever-bar yieldably in its closed position, and an extension-lever movably attached to said lever-bar and adapted to be projected therefrom to afford means for forcefully actuating said lever-bar and its pin, substantially as described.

5. In a nut-lock, a plate adapted to be attached to the nut and having its outer end formed with side members turned backward to form lateral sockets and with a central spring-tongue, said side members and tongue being integral with said plate, a lever-bar having lateral journals integral therewith and engaging said sockets and disposed to be maintained yieldably by said spring-tongue, a pin supported by said lever-bar and engaging an aperture in the bolt engaged by said nut, and means for forcefully actuating said lever-bar to release said pin, substantially as described.

708,866. **CREAM-SEPARATOR.** MYRON A. COMSTOCK, Newark, N. Y. Filed May 23, 1902. Serial No. 108,649. (No model.)



Claim.—1. A cream-separator having a subchamber and an inner upright chamber extending through the upper and lower walls of the subchamber and provided with lateral passages connecting said chambers.

2. A cream-separator comprising a receptacle having separate chambers one over the other, the upper chamber receiving the milk and the lower chamber receiving a cooling liquid, an upright tube extending centrally through the upper and lower walls of the lower chamber and separate devices for drawing off the milk and cooling liquid.

3. In a cream-separator, an outer shell having a milk-receiving chamber and a hollow bottom wall for receiving a cooling liquid, a hopper at the upper end of the receptacle provided with a screen and a central tube within the receptacle aligned with the hopper and having its lower end extended through the hollow bottom for the purpose set forth.

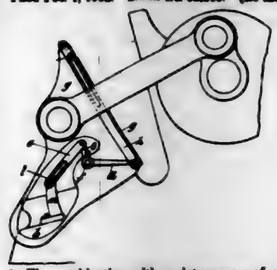
4. In a cream-separator, outer and inner upright receptacles, one for the milk and the other for a cooling liquid, the outer receptacle having a hollow bottom and the inner receptacle extending through and communicating with said hollow bottom.

5. A cream-separator comprising outer and inner upright receptacles, the outer receptacle having a subchamber surrounding and communicating with the base of the inner receptacle, an invertible hopper forming the top wall of the outer receptacle and disposed in a plane above the upper end of the inner receptacle, a screen in the apex of the hopper, and a deflector on the upper end of the inner receptacle beneath the screen when the hopper is in either position.

6. A cream-separator comprising outer and inner upright receptacles, the outer receptacle having a subchamber surrounding and communicating with the base of the inner receptacle, an invertible hopper forming the top wall of the outer receptacle and disposed in a plane above the upper end of the inner receptacle, the inner receptacle being open at both ends above and beneath the subchamber, and valved for the openings, the upper closure having a convex upper face beneath the screen when the hopper is inverted.

7. A cream-separator comprising outer and inner upright shells and a hollow bottom surrounding the base of the inner shell, the inner shell being open at both ends and having lateral openings in its base communicating with the hollow bottom, closures for said open ends, the upper closure having a convex face, a hopper in the upper end of the receptacle provided with a screened opening above the upper closure, and valved conduits leading from the interior of the hollow bottom and from a point above said hollow bottom for the purpose described.

708,867. **GUARD FOR PLATEN-PRESSES.** FREDERICK CROWE, Bristol, England, assignor to Marden, Son & Hall, Limited, Bristol, England. Filed Feb. 1, 1902. Serial No. 92,218. (No model.)



Claim.—1. The combination with a platen-press, of a guard slidably mounted on the platen member of said press, a rock-shaft carried by said member, a lever adjustably connected to said rock-shaft and pivoted at its other end to said guard, and means for operating said rock-shaft at a predetermined moment.

2. The combination with a platen-press, of a retentable member carried by the platen member of said press, lugs located adjacent the face of said platen member, a guard provided with slots engaging said lugs, a lever connected to said retentable member and pivoted at its other end to said guard, and means for operating said retentable member at a predetermined moment.

3. The combination with a platen-press, of a guard slidably mounted on the platen member of said press, a rock-shaft journaled in said member, a lever carried by said rock-shaft and pivotally secured to said guard, a yielding connection between the frame of the press and said rock-shaft, for operating said guard upwardly at a predetermined moment.

4. The combination with a platen-press, of a guard slidably mounted on the platen member of said press, a rock-shaft journaled in said member, a lever carried by said rock-shaft and pivotally secured to said guard, a drum carried by said rock-shaft, and a flexible tape secured to said drum and the frame of the press.

708,868. **HERMETIC SEALING OF TIES OR LIKE RECEPTACLES.** JOHN R. CROFT, London, England, assignor to Valves, Limited, London, England. Filed June 4, 1901. Serial No. 63,140. (No model.)

Claim.—1. A can-closing device consisting of a plurality of superposed parts having outlets, the outlets being out of line, an intermediate porous section, and a fusible seal for one of the outlets.

2. A can-closing device consisting of a plurality of superposed parts having outlets, the outlets being out of line, an intermediate porous section, and a seal of fusible metal solder for one of said outlets.

3. A can-closing device including a plurality of superposed metallic and substantially similarly concaved parts, the concavity of an upper part lying in the concavity of a lower part and the latter directly supporting the former, said parts having outlets and the outlets being out of line whereby fusible material applied to an outlet of said upper part will be arrested from downflow by said lower part.

4. A can-closing device including a plurality of superposed metallic and substantially similarly concaved parts, the concavity of an upper part lying in the concavity of a lower part and the latter directly supporting the former, said parts having outlets and the outlets being out of line whereby fusible material applied to an outlet of said upper part will be arrested from downflow by said lower part, and a piece of porous material held in place by and between said metallic parts.

5. A can-closing device including a part having a concaved portion a second part having an opening located over said concaved portion, a piece of porous material between said parts, and a fusible seal for said opening.

6. A can-closing device consisting of a plurality of superposed parts the lower one being concaved and the upper one having an opening over said concaved portion and a fusible seal for said opening.

7. A can-closing device including a part having inner and outer concaved portions and an intermediate raised portion said inner concaved portion having a hole provided with a fusible seal and a second part having a concaved portion located over the inner concaved portion and a beveled portion arranged to fit into the concaved portion of the first-mentioned part.

8. A can-closing device including a part having inner and outer concaved portions and an intermediate raised portion, a second part said parts being superposed and the upper one having a hole provided with a fusible seal having a concaved portion located over the inner concaved portion and a beveled portion arranged to fit into the concaved portion of the first-mentioned part, and a piece of porous material between said parts.

9. A can-closing device including a part having inner and outer concaved portions and an intermediate raised portion, a second part having a concaved portion located over the inner concaved portion and a beveled portion arranged to fit into the concaved portion of the first-mentioned part, a piece of porous material between the parts, the latter having non-registering openings, and a fusible seal for one of the openings.

708,869. **FOLDING COT.** JOSEPH DAVIDOFF, Brooklyn, N. Y. Filed Oct. 8, 1901. Serial No. 78,073. (No model.)

Claim.—1. A folding cot, comprising side rails for carrying a mattress, collars secured on the outer ends of the rails and having side flanges, supporting-arms for the side rails having forks at one end for engagement with the collars between the flanges, the forks having segmental flanges within which the flanges of the collars extend, as set forth.

2. A folding cot, comprising side rails each made in sections hinged together, collars secured on the sections of the side rail and having polygonal bodies and side flanges, and supporting-arms each having a fork at its outer end having its inner side walls shaped to correspond with the body of the collar, the forks being provided with segmental flanges, the flanges of the collars extending on opposite sides of the walls of the fork but within the segmental flanges on said forks, as set forth.

3. A folding cot having side rails, a mattress secured to the said side rails, collars secured on the side rails and having polygonal bodies and side flanges, and supporting-arms formed at their outer ends with forks having correspondingly-shaped side walls, walls into which fit the said collar-bodies, each fork being formed with a segmental flange the flanges of the collars extending on opposite sides of the polygonal-shaped walls of the forks but within the segmental flanges of said forks, as set forth.

4. A folding cot, comprising a reach, heads held on the ends of the reach, legs pivoted on the said heads, supporting-arms pivoted on the said heads supporting-arms pivoted on the said heads and having receiving-forks at their outer ends, side bars having collars for engaging the said forks, and a mattress carried by the said side bars, as set forth.

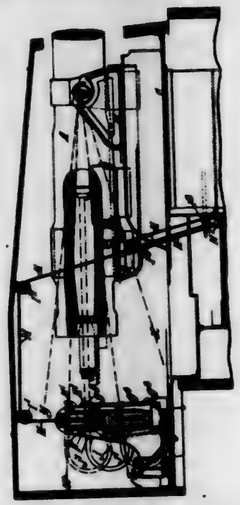
5. A folding cot comprising a sectional folding reach, heads secured on the ends of the reach, legs pivoted to the heads and extending radially outward and downward, supporting-arms pivoted on the heads and extending radially therefrom in an outward and upward direction, forks at the outer ends of the supporting-arms, side rails made in folding sections and having collars for engaging the said forks, and a mattress secured to the said side rails, as set forth.

6. A folding cot, comprising a reach, heads held on the ends of the reach, legs pivoted on the said heads, supporting-arms pivoted on the said heads, side bars, and a mattress carried by the side bars, the said supporting-arms and side bars being provided with engaging means, as set forth.

7. A folding cot, comprising a reach, heads screwing on the outer threaded end of the reach, flanges formed on the outer ends of the heads, washers mounted to turn on the reach and engaging the heads at the inner faces thereof, collars on the reach and engaging the washers, the said washers being provided with slots, legs pivoted on the heads between the flanges and the washers, supporting-arms pivoted on the heads, side bars adapted to be supported by said arms, and a mattress carried by the said side bars, the slots of the washers being adapted to register with the sup-

porting arms and legs to permit of folding the arms and legs on the reach, as set forth.

708,870. RAMMING APPARATUS FOR ORDNANCE. ARTHUR T. DAWSON, London, and JAMES HOGGE, Barrow-in-Furness, England, assignors to Vickers Sons & Maxim, Limited, Westminster, London, England. Filed Dec. 9, 1901. Serial No. 85,986. (No model.)



Claim.—1. In ramming apparatus for guns, the combination with a flexible rammer, of a slipper mounted to slide in a support independent of the gun, of a pivotal guide on said slipper for the rammer-chain, of means for controlling the position of the guide relatively to its pivot during the sliding of said slipper, of gearing interposed between the gun and slipper for causing said slipper and guide to automatically follow the movements of the gun in its elevation or depression and of means for actuating the rammer for the purpose specified.

2. In ramming apparatus for guns, the combination with a flexible rammer, of a slipper provided with a guide for the rammer and mounted to slide vertically in a support independent of the gun, of a guide for operating the rammer-guide, of a sprocket-wheel on said slipper engaging with the links of the rammer-chain, of means for imparting rotary motion to said sprocket-wheel, and of gearing connected with said slipper and actuated by the movement of the gun for causing said slipper to automatically follow the movements of the gun in its elevation or depression for the purpose specified.

3. In ramming apparatus for guns, the combination with a flexible rammer, of a slipper provided with a guide for said rammer mounted to slide vertically in a support independent of the gun, of a sprocket-wheel mounted on a shaft carried by said slipper and engaging with the links of the rammer-chain, of means for actuating said sprocket-wheel, of means for causing said slipper to automatically follow the movements of the gun in its elevation or depression, and of means for keeping the said guide parallel with the axis of the gun as the slipper moves up or down in its support substantially as described.

4. In ramming apparatus for guns, the combination with a flexible rammer, of a slipper provided with a guide for said rammer and mounted to slide vertically in a support independent of the gun, of a sprocket-wheel mounted on a shaft carried by said slipper and engaging with the links of the rammer-chain, of means for actuating said sprocket-wheel, of means for causing said slipper to automatically follow the movements of the gun in its elevation or depression and of a projection on the said guide engaging with an inclined groove in the said support substantially as and for the purpose specified.

5. In ramming apparatus for guns, the combination with a flexible rammer, of a slipper provided with a guide for the rammer and mounted to slide vertically in a support independent of the gun, of a sprocket-wheel mounted on a shaft carried by said slipper and engaging with the links of the rammer-chain, of a gear-wheel on said sprocket-wheel shaft meshing with another gear-wheel adapted to revolve with and slide on a vertical shaft to which rotary motion is imparted from a suitable motor, of means for causing said slipper to automatically follow the movements of the gun in its elevation or depression, of means for keeping the said guide parallel with the axis of the gun as the slipper moves vertically up or down in its support, substantially as described.

6. In ramming apparatus for guns, the combination with a flexible rammer, of a slipper provided with a guide for the rammer and mounted to slide vertically in a support independent of the gun, of a sprocket-wheel mounted on a shaft carried by said slipper and engaging with the links of the rammer-chain, of a gear-wheel on said sprocket-wheel shaft meshing with another gear-wheel adapted to revolve with and slide on a vertical shaft to which rotary motion is imparted from a suitable motor, of means for causing said slipper to automatically follow the movements of the gun in its elevation or depression, and of means for keeping the said guide parallel to the axis of the gun as the said slipper moves vertically up or down in its support, substantially as described.

7. In ramming apparatus for guns, the combination with a flexible rammer, of a slipper provided with a guide for the rammer and mounted to slide vertically in a support independent of the gun, of a sprocket-wheel mounted on a shaft carried by said slipper and engaging with the links of the chain-rammer, of a gear-wheel on the said sprocket-wheel shaft meshing with another gear-wheel adapted to revolve with and slide on a vertical shaft to which rotary motion is imparted from a suitable motor, of means for causing said slipper to automatically follow the movements of the gun in its elevation or depression, of means for keeping the said guide parallel with the axis of the gun as the slipper moves vertically up or down in its support, of a spiral drum inclosed in a casing connected with said guide, of a shaft on and with which said drum can slide and revolve and of means for actuating said shaft from the sprocket-wheel shaft substantially as and for the purpose described.

8. In ramming apparatus for guns, the combination with a rammer mounted in a standard or support independent of the gun, of means for causing the said rammer to automatically follow the movements of the gun in its elevation or depression, of means for actuating the rammer, and of means for enabling said standard or support to be readily moved from its operative position for the purpose specified.

9. In ramming apparatus for guns, the combination with a rammer mounted on a standard or support independent of the gun, of means for causing the said rammer to automatically follow the movements of the gun in its elevation or depression, of means for actuating the rammer, and of a pivot about which said support can hinge substantially as and for the purpose specified.

10. In ramming apparatus for guns, the combination with a rammer mounted in a standard or support independent of the gun; of means for causing the said rammer to automatically follow the movements of the gun in its elevation or depression; of means for actuating the rammer, of a pivot about which said support can hinge, and of means for locking said support in its operative position substantially as and for the purpose specified.

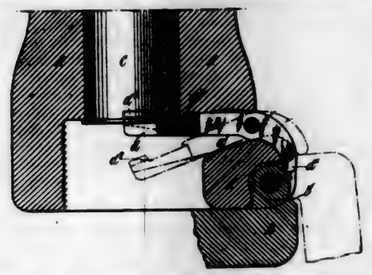
11. In ramming apparatus for guns, the combination with a flexible rammer, of a slipper provided with a guide for the rammer and mounted to slide in a support independent of the gun, of a rope or chain having one end connected with the slipper and the other end with a part that does not participate in the movements of elevation or depression of the gun, of guide-pulleys for said rope or chain one of which is carried by a part that participates in the elevation or depression of the gun and around which a bight of the said rope or chain passes and of means for compensating for the slackness or the tightness in the said rope or chain for the purpose specified.

12. In ramming apparatus for guns, the combination with the flexible rammer, the rammer-guide, the support independent of the gun, the sliding slipper, the rope or chain and its guide-pulleys; of a pulley adapted to slide in a fixed guide, and of a weight tending to press said pulley against a portion of the aforesaid rope or chain substantially as and for the purpose specified.

13. In ramming apparatus for guns, the combination with the flexible rammer, the rammer-guide, the support independent of the gun, the sliding slipper, the rope or chain and its guide-pulleys; of a pulley adapted to slide in a fixed guide, of a weight tending to press said pulley against a portion of the aforesaid rope or chain and of a removable stop for limiting the extent of movement of said pulley in its guide substantially as described.

14. In ramming apparatus for guns, the combination with the flexible rammer, the rammer-guide, the support independent of the gun, the sliding slipper, the rope or chain and its guide-pulleys; of a vertical pivot for said support to swivel upon, and of a horizontal pulley working on an axle which is approximately coincident with the axis of the pivot of said support, so that the length of the rope or chain passing from said pulley to the slipper will not materially vary in length when said support is turned about its pivot substantially as described.

708,871. CARTRIDGE-EXTRACTOR FOR GUNS. ARTHUR T. DAWSON and GERARD T. BUCKNALL, Westminster, London, England, assignors to Vickers Sons & Maxim, Limited, Westminster, London, England. Filed Feb. 28, 1902. Serial No. 96,102. (No model.)

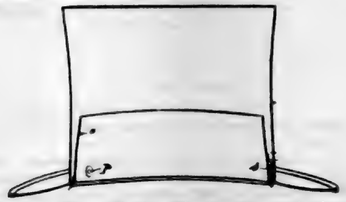


Claim.—1. The combination with the swinging carrier of a breech-loading gun, of an extractor consisting of a pivoted lever having lips adapted to engage with the flange of the cartridge-case, first at a point in proximity to the pivot of said lever and then at a point remote from said pivot, and of means for actuating said lever during the swinging of the carrier, substantially as described.

2. The combination with the swinging carrier of a breech-loading gun, of an extractor consisting of a U-shaped pivoted lever having ejecting-lips at its inner ends an extracting or prizing lip at the base of the U and also having a tail projecting through an opening in the breech-chamber and lying in the path of a cam-surface on the carrier-hinge substantially as and for the purpose described.

3. The combination with the swinging carrier of a breech-loading gun, of an extractor consisting of a U-shaped pivoted lever having at its inner ends ejecting-lips which lie a short distance in front of the cartridge-flange when the breech is closed, an extracting or prizing lip at the base of the U to lie in close contact with the front of the cartridge-flange at the side nearest to the pivot of the extractor, and a bent tail projecting through an opening in the breech-chamber and lying close to a cam-surface on the carrier-hinge, said cam-surface being formed with a shoulder for imparting to the extractor a sudden accelerated movement during the completion of the opening movement of the carrier substantially as and for the purpose specified.

708,872. HAT. ALBERT L. DELISE, Paris, France. Filed Mar. 19, 1902. Serial No. 98,997. (No model.)



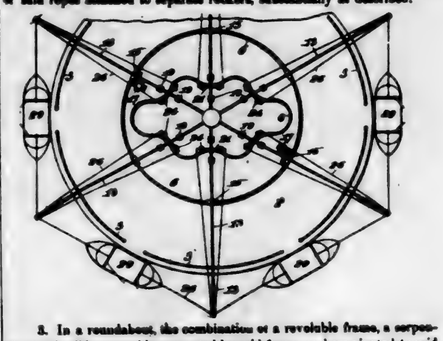
Claim.—1. The combination with a hat, of a sweat-band, means for resilvably connecting the band to the hat, and a spring yielding strip secured to the lower edge of the band and of larger diameter than the hat-opening.

2. In combination with a hat, a removable sweat-band, fastening-device members fixed to the hat and to the band, the openings of said members being upward, fastening devices fixed to the band and so arranged as to extend downward into the first-named devices, and a spring-wire fixed to the lower edge of the sweat-band and of larger circumference than the hat-opening, whereby the band will be held from moving upward in the hat.

708,873. ROUNDABOUT. MARTIN J. DOHER, St. Louis, Mo., assignor of one-half to John J. Desmarest, St. Louis, Mo. Filed Mar. 24, 1902. Serial No. 99,042. (No model.)

Claim.—1. In a roundabout, the combination of a revolvable frame, a serpentine track, rockers carried by said frame and having traveling engagement with said serpentine track, suspension-ropes connected in pairs to said rockers and extending downwardly from said frame, and carriages each adapted to receive the connection of two of said ropes attached to separate rockers, substantially as described.

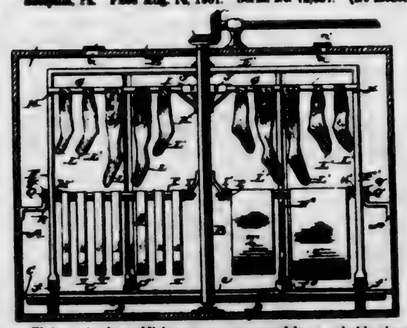
2. In a roundabout, the combination of a revolvable frame, a serpentine track, rockers having pivotal connection to said frame, rollers carried by said rockers and adapted to travel against said serpentine track, suspension-ropes connected to said rockers and extending downwardly from said frame, and carriages each adapted to receive the connection of two of said ropes attached to separate rockers, substantially as described.



3. In a roundabout, the combination of a revolvable frame, a serpentine track, slides movably supported by said frame, rockers pivoted to said slides, suspension-ropes connected to said rockers and extending downwardly from said frame, and carriages each adapted to receive the connection of two of said ropes attached to separate rockers, substantially as described.

4. In a roundabout, the combination of a revolvable frame having radially-arranged beams, a serpentine track, slides movably fitted to said beams, rockers pivoted to said slides, rollers mounted in said rockers and adapted to travel against said serpentine track, suspension-ropes connected to said rockers and extending downwardly from said frame, and a series of carriages each adapted to receive the connection of two of said ropes attached to separate rockers, substantially as described.

708,874. OXIDIZING APPARATUS. ALEXANDER H. DUDDA, Philadelphia, Pa. Filed Aug. 14, 1901. Serial No. 72,057. (No model.)



Claim.—1. An oxidizing apparatus comprising a suitable chamber provided with a ceiling, adjustable ventilating means in the ceiling, heating means located above the floor of the chamber, a rotatable rack contained within the chamber, a circular track on which the rack is supported and upon which it rotates and independently-removable poles carried by the rack, the poles having articles to be dried attached thereto.

2. An oxidizing apparatus comprising a suitable inclosed chamber, heating means stationarily located therein, horizontally-rotating means contained within the chamber, a plurality of series of supports carried by the rotary means one of the series of supports provided with means to intermittently actuate them in a direction at right angles to the plane of movement of the horizontally-rotating means.

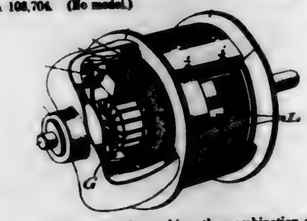
3. A drying apparatus comprising a suitably-inclosed chamber, heating means in the chamber, a rotating rack contained within the chamber, the rack provided with a plurality of independently-rotatable radial arms journaled thereto, spurs secured to and rotating with the radial arms, stationary pins placed at intervals within the chamber, the spurs adapted to contact with the pins to intermittently rotate the radial arms.

4. A drying apparatus comprising an inclosed chamber, a rotary rack therein, a plurality of radial arms carried by the rack and rotating therewith, certain of the radial arms independently rotatable in a direc-

tion at right angles to the direction of rotation of the rack, the independently-rotatable arms being flat-sided in form, spurs carried by the last-mentioned arms and rotating therewith, studs mounted in the path of the spurs, the spurs adapted to intermittently contact with the studs to effect a partial rotation of the independently-rotatable arms during the rotation of the rack.

5. An oxidizing apparatus comprising an inclosed chamber, a rotatable rack therein, rotating means therefor, the rack provided with a series of vertical supports, rollers on the supports, a trunk upon which the rollers bear, annular notched bands connecting the vertical supports of the rack, annular notched braces surrounding and secured to the rotating means, independently-removable pans supported in the notches in the bands and braces and means for intermittently actuating certain of the pans in a rotatory direction at right angles to that in which the rack moves.

708,875. DYNAMO AND MAGNETO-ELECTRIC MACHINE. NATHAN H. EDGERTON, Philadelphia, Pa. Filed May 23, 1902. Serial No. 108,704. (No model.)

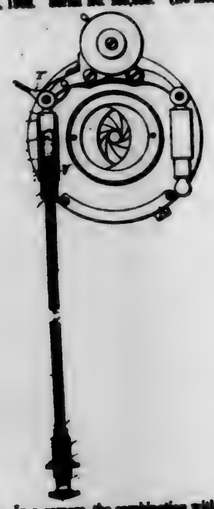


Claim.—1. In an electric machine, the combination of an isolated field magnet or magnets, composed of soft iron, energized or intensified from or by the current flowing through the armature-coils, with an armature embraced by said magnets and having its windings parallel with its shaft.

2. The combination with segregated fields of soft iron, energized by currents flowing through the armature-circuit only, of an annular inclosing frame of diamagnetic material, and an armature within said magnets having its windings parallel with its shaft, and at right angles to the laminated field.

3. In an electric machine, the combination of an isolated field magnet or magnets, composed of soft iron energized or intensified from or by the current flowing through the armature-coils, with an armature embraced by said magnets in a shell of diamagnetic material, and having its windings parallel with its shaft.

708,876. MECHANISM FOR RELEASING OR OPERATING PHOTOGRAPHIC SHUTTERS. ARTHUR H. EDWARDS, London, England. Filed Apr. 14, 1902. Serial No. 102,633. (No model.)



Claim.—1. In a camera, the combination with the shutter-releasing mechanism, of a flexible inner member secured to the camera; a flexible outer member, movable longitudinally of said inner member, engaging said shutter-releasing mechanism, and comprising a plurality of sections separable from and unconnected to each other; and means for operating said outer member.

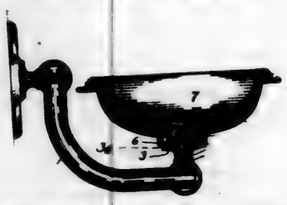
2. In a camera, the combination with the shutter-releasing mechanism, of a flexible inner member; a flexible outer member provided with slots and rollers mounted therein, one of said members being movable longitudinally of the other and adapted to engage said shutter-releasing mechanism; and means for operating said movable member.

3. In a camera, the combination with the shutter-releasing mechanism, of a flexible inner member and a flexible outer member, one of said members being movable longitudinally of the other and adapted to engage said shutter-releasing mechanism, said outer member comprising a plurality of sections separable from and unconnected to each other, and each section provided with a roller mounted therein; and means for operating said movable member.

4. In a camera, the combination with the shutter-releasing mechanism, of a flexible inner member and a flexible outer member, one of said members being movable longitudinally of the other and adapted to engage said shutter-releasing mechanism, said outer member comprising a plurality of sections separable from and unconnected to each other, and each section provided with slots and rollers mounted therein; and means for operating said movable member.

5. In a camera, the combination with the shutter, of a flexible inner member; a flexible outer member, movable longitudinally of said inner member, and comprising a plurality of sections separable from and unconnected to each other, a shutter-releasing device connecting said shutter and outer movable member; and a handle composed of two members, one of said handle members connected to said inner flexible members, and the other said handle member being movable relatively to the first handle member and engaging said outer flexible member for operating the same.

708,877. SOAP-HOLDER. JOHN P. BOWEN, Newtonville, Mass. Filed Nov. 20, 1901. Serial No. 83,972. (No model.)



Claim.—The combination of a body-dish having an outwardly-projecting ledge; a drainer having an outwardly and downturned lip which rests on said ledge, the under side of the brim-forming portion of the drainer being removed from said ledge.

708,878. SHEET-DELIVERY FOR PRINTING-PRESSES. GEO. P. PERRIN, New London, Conn. Filed Apr. 12, 1902. Serial No. 102,614. (No model.)

Claim.—1. A delivery apparatus for printing-machines comprising a reciprocating tape-carriage provided at its front end with an intermittently-operating delivery-roll, and a roll-driving or friction-strap mounted independently of the carriage and made to be slackened at suitable intervals to permit the roll to remain stationary during the return of the carriage.

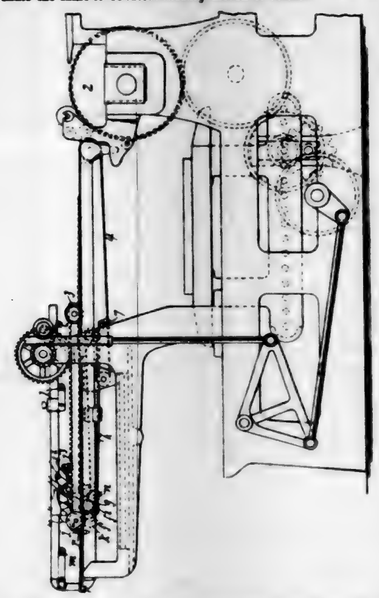
2. A tape-carriage having an intermittently-acting delivery-roll in advance of the tape, starting or drop wheels for the roll, a lifter or cam for moving the drop-wheels out of action, and a friction-strap for causing the operation of the roll, said strap being secured at its ends independently of the carriage and made to slacken at suitable intervals to leave the roll idle on the return of the carriage.

3. A tape-carriage having an intermittently-acting delivery-roll in advance of the tape, starting or drop wheels for the roll, a carrier having a roll held against the said roll, and a lifter or cam for moving the drop-wheels and carrier with its roller out of action.

4. A delivery apparatus for printing-machines comprising a reciprocating carriage provided with an intermittently-acting front or turning roll, and a curling-finger extended about the roll and having an extension provided with friction-rollers extended under the roll.

5. A delivery apparatus for printing-machines comprising a reciprocating carriage provided with an intermittently-acting front or turning roll, a curling-finger about the roll and having an extension, and a spring for holding the extension in action or to the roller.

6. A delivery apparatus for printing-machines comprising a front or turning roll and a belt or strap for alternately engaging and releasing the roll to cause the same to be intermittently driven or rotated.



7. A delivery apparatus for printing-machines comprising a front or turning roll, an actuating strap or belt and mechanism for intermittently tightening the belt to drive the roller.

8. A delivery apparatus for printing-machines comprising a front or turning roll, an actuating belt or strap and a tumbler for intermittently causing the belt to tighten or engage the roller.

9. A delivery apparatus for printing-machines comprising a front or turning roll, an actuating belt or strap for the roll, a tightening-roller for the belt and a lever and tumbler for actuating the tightening-roller.

10. A delivery apparatus for printing-machines comprising a front or turning roll, an actuating belt or strap for the roll, a tumbler having a cam portion, and a lever and belt engaging or tightening roller actuated by the cam.

11. A delivery apparatus for printing-machines comprising a front or turning roll, an actuating belt or strap for the roll, a tumbler for causing the belt to engage or drive the roller, and an actuating-pin for the tumbler.

12. A delivery apparatus for printing-machines comprising a front or turning roll, an actuating belt or strap for the roll, a spring-engaged belt-tightening tumbler and pins for tripping the tumbler.

13. A delivery apparatus for printing-machines comprising a front or turning roll, a driving belt or strap and brake for the roll and a tumbler for tightening the belt and moving the brake.

14. A delivery apparatus for printing-machines comprising a front or turning roll, a driving belt or strap and a brake for the roll, and a tumbler for putting the strap in action while taking off the brake.

15. A delivery apparatus for printing-machines comprising a front or turning roll, a driving belt or strap and a brake for the roll and a tumbler for causing the belt and brake to alternate with one another.

16. A delivery apparatus for printing-machines comprising a front or turning roll, driving mechanism for the roll, a carrier for the roll, and a dog or holder for securing the carrier out of action.

17. A sheet-delivery apparatus for printing-machines comprising a reciprocating tape-carriage with tape-rollers and a front roller and an adjustable gear made to be set for connecting the front roller to the tape-roller.

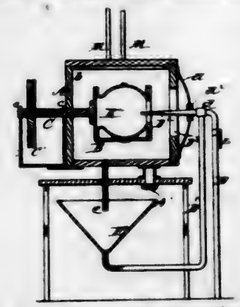
18. A sheet-delivery apparatus for printing-machines comprising a reciprocating tape-carriage with tape-rollers and a front roller, a frame movable or adjustable about the center of the front roll and a gear carried by the frame for connecting the front roll to a tape-roller.

19. A sheet-delivery apparatus for printing-machines comprising a reciprocating tape-carriage with tape-rollers and a front roller, friction-wheels for the margin of the sheet, friction-wheels made to contact with the surface of the front roll, and a gear for connecting the front roll to a tape-roll.

708,879. ROTARY ENGINE OR MOTOR. NICOLAS J. POSTUMUS and ALFRED GRAMME, Liege, Belgium, assignors of one-third to Joseph Georges, Liege, Belgium. Filed Nov. 7, 1901. Serial No. 81,267. (No model.)

Claim.—In a rotary engine or motor, a cylinder having a concentric channel, an induction-port leading thereto, an opening leading from the channel to the interior of the cylinder, an eduction-port leading from the interior of the cylinder, circular grooves in the cylinder-heads concentric with the cylinder, a rotary piston-disk eccentric to the cylinder, pistons slidably mounted in the disk at an angle to the radius, rollers yieldingly carried by the pistons and traveling in the grooves, and yielding contact-bars carried by the pistons.

708,880. SAND-BLAST MACHINE. FRANK J. HEIDGER, West Bridgewater, Pa. Filed Oct. 5, 1901. Serial No. 77,995. (No model.)



Claim.—1. In a sand-blast machine, the combination with a closed chest mounted on a vertical axis, a horizontal spindle journaled on said chest and having a work-holder and means for turning the chest on its axis and for revolving the spindle, of a sand-nozzle projecting into the chest, an air-pipe to which said nozzle is connected, an air-valve on said pipe, and means for closing said valve automatically when the chest has turned the requisite distance.

2. In a sand-blast machine, the combination with a closed chest mounted on a vertical axis, a horizontal spindle mounted on said chest and means for imparting a rotary motion to the spindle, of means for imparting a rotary movement to the chest independently of the movement of the spindle, whereby the rates of motion of the spindle and chest may be varied each independently of the other, substantially as described.

3. In a sand-blast machine, the combination of a closed chest mounted on a vertical axis, a revolving spindle mounted on said chest and carrying a work-holder and means for imparting rotary motion to the chest and the spindle, of a sand-nozzle extending into said chest and a flexible diaphragm attached to the chest and through which said nozzle projects, substantially as described.

4. In a sand-blast machine the combination with the air-pipe D, a valve on said pipe and a valve-handle L, and automatically-rotating box or chest A, of means for automatically closing the air-valve, when the work is finished.

708,881. BORING AND DRILLING MACHINE. BENJAMIN H. HERVEY, Ellensburg, Wash. Filed Mar. 20, 1902. Serial No. 98,057. (No model.)

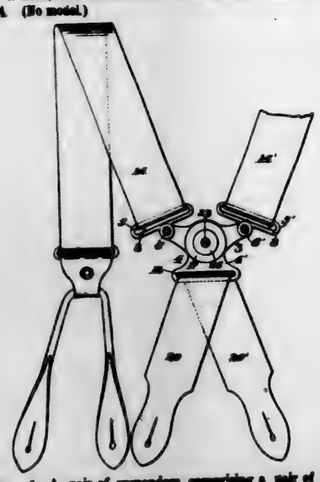
Claim.—1. In a drilling and boring machine, the combination of

ure two alined shafts M and O having a swiveling coupling N and means for locking this coupling so that the two shafts turn together as one, an endwise screw-feed for the shafts, a counter-shaft G, gears for transmitting power from shaft M to shaft G, separable gears for transmitting power from shaft G to shaft O, one of said latter gears having a feather-and-groove connection with shaft O, substantially as described.

2. In a drilling and boring machine, the combination of the two alined shafts M and O having a swiveling coupling and means for locking the same, a parallel counter-shaft G, two pairs of separable gears for imparting motion from shaft M to shaft G, said pairs of gears being arranged for different speed and having shifting devices for coupling one pair and uncoupling the other pair, and a third set of separable gears for imparting motion from shaft G to O, one of said gears being connected to the shaft by a feather and groove, and a screw-feed for said latter shaft substantially as described.

3. In a boring and drilling machine, the combination with the boring-shaft; of a cup-shaped support for holding the article to be bored, said cup-shaped support having its open side next the drill and having a set-screw tapped through the sides of the cup to hold the article to be acted upon substantially as described.

708,882. SUSPENDERS OR OTHER GARMENT-SUPPORTER. HENRY C. HIER, New Britain, Conn. Filed June 20, 1902. Serial No. 112,404. (No model.)



Claim.—1. A pair of suspenders comprising a pair of shoulder-straps, a suspender-end, and a device connecting said straps to said suspender-end, said connecting device comprising a lever to whose opposite ends said shoulder-straps are connected, and a hanger to which said suspender-end is connected; said lever being formed of thin sheet metal, and said hanger being also formed of thin sheet metal and being connected to said lever between the ends of the latter; a set of bearing-balls; said lever and hanger being so stamped or formed and assembled that they cooperate to form an annular race in which said balls are placed, said balls running in contact with each of said lever and hanger elements; and means for retaining said lever, hanger and balls in coöperative relation; whereby extensive bearing-surfaces of the thin sheet metal are brought into use, and the rapid cutting away of a bearing by the thin edge of either of said lever and hanger elements is avoided.

2. A pair of suspenders comprising a pair of shoulder-straps, a suspender-end, and a device connecting said straps to said suspender-end; said connecting device comprising a lever to whose opposite ends said shoulder-straps are connected, and a hanger to which said suspender-end is connected; each of said lever and hanger elements being stamped up from thin sheet metal, and at least one thereof having stamped therein an annular channel forming a portion of a ball-race, and the other of said members having formed therein a coöperating ball-race portion; a set of balls working in said channel or said race; and means for retaining said lever, hanger and balls in coöperative relation.

3. A pair of suspenders comprising a pair of shoulder-straps, a suspender-end, and a device connecting said straps to said suspender-end; said connecting device comprising a lever to whose opposite ends said shoulder-straps are connected, and a hanger to which said suspender-end is connected; each of said lever and hanger elements being stamped up from thin sheet metal, and each having struck up therein an annular channel, the channels together forming a ball-race; a set of balls working in said race; and means for retaining said lever, hanger and balls in coöperative relation.

4. A pair of suspenders comprising a pair of shoulder-straps, a suspender-end, and a device connecting said straps to said suspender-end; said connecting device comprising a lever to whose opposite ends said shoulder-straps are connected, and a hanger to which said suspender-end is connected; said straps being connected to said lever by means of chapes pivoted to the latter; each of said lever and hanger elements being reinforced by an annular channel struck up therein, said channels taken together forming a ball-race; a set of balls in said race; and a central device holding said lever, hanger and balls in coöperative relation.

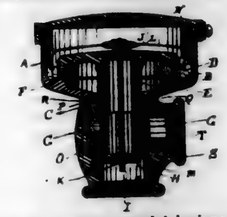
5. A pair of suspenders comprising a pair of shoulder-straps, a suspender-end, and a device connecting said straps to said suspender-end; said connecting device comprising a lever to whose opposite ends said shoulder-straps are connected, and a hanger to which said suspender-end is connected; each of said lever and hanger elements being stamped up from thin sheet metal, and each having struck up therein an annular channel, the channels together forming a ball-race; a set of balls working in said race; a second annular channel provided upon one of said lever and hanger elements; a second set of balls in said second channel; and means for retaining in coöperative relation said lever, said hanger and said sets of balls.

6. A pair of suspenders comprising a pair of shoulder-straps, a suspender-end, and a device connecting said straps to said suspender-end; said connecting device comprising a lever to whose opposite ends said shoulder-straps are connected, and a hanger to which said suspender-end is connected; each of said lever and hanger elements being stamped up from thin sheet metal; one of said lever and hanger elements having upon its opposite faces struck-up annular channels, and the other thereof being provided with means on both sides of said first-mentioned member for coöperating with both of said channels to form ball-races; and sets of balls in said races: one of said races being of smaller diameter than the other.

7. A pair of suspenders comprising a pair of shoulder-straps, a suspender-end, and a device connecting said straps to said suspender-end, said connecting device comprising a lever to whose opposite ends said shoulder-straps are connected, and a hanger to which said suspender-end is connected; each of said lever and hanger elements being stamped up from thin sheet metal; one of said lever and hanger elements having upon its opposite faces struck-up annular channels, and the other thereof having a struck-up annular channel for coöperating with one of said first-mentioned channels to form a ball-race, and a centrally-arranged transverse connector having a head which coöperates with the other of said first-mentioned channels to form another ball-race; and sets of balls in said races.

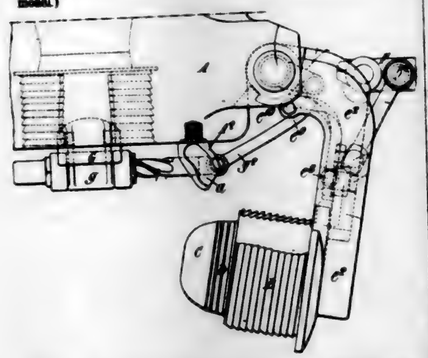
8. A pair of suspenders comprising a pair of shoulder-straps, a suspender-end, and a device connecting said straps to said suspender-end, said connecting device comprising a member to which said shoulder-straps are connected, and a second member to which said suspender-end is connected; said members being stamped up from thin sheet metal, and being connected together; a set of bearing-balls; said members being so stamped or formed and assembled that they coöperate to form an annular race in which said balls are placed; and means for retaining said members and said balls in coöperative relation; whereby extensive bearing-surfaces of the thin sheet metal are brought into use, and the rapid cutting away of a bearing by the thin edge of either of said members is avoided.

708,888. GAS-GOVERNOR. DAVID E. HODGMS, San Francisco, Cal. Filed Sept. 20, 1901. Serial No. 75,965. (No model.)



Claim.—In a gas-governor, a vessel A having an inwardly-extending lower portion and an open-ended laterally-apertured hollow stem C connecting with said inwardly-extending portion, said stem being interiorly screw-threaded, a separable bottom piece D having an annular flange resting on the interior surface of the inwardly-extending portion of the vessel and coöperating with the surrounding wall of the vessel to form a groove B for liquid, a depending screw-threaded stem on the bottom piece engaging the interior screw-thread of the hollow stem C of the vessel to secure said bottom piece firmly in place, a float adapted to be immersed in the liquid in the groove B, and a valve suspended from said float and arranged to regulate the opening at the lower end of the stem C, substantially as described.

708,884. BREECH MECHANISM FOR ORDNANCE. CARL HOLMSTRÖM, Glasgow, Scotland. Filed Jan. 8, 1902. Serial No. 88,939. (No model.)



Claim.—1. In breech mechanism for guns, the combination with a swinging carrier formed of two members one of which is capable of independent movement relatively to the other, of a block rotatably mounted on the independently-movable member, of a projection on the independently-moving member adapted to travel along a cam-path on the gun and to impart to the block during the swinging of the carrier, a movement first in a curved path, then in an approximately straight path and then again in a curved path, and of a stationary cam-surface with which another projection on the independently-movable member engages during the swinging movement of the carrier substantially as and for the purpose specified.

2. In breech mechanism for guns, the combination with a swinging carrier, a block rotatably mounted thereon, and a hand-lever for actuating said carrier; of a bell-crank lever pivoted to the carrier and engaging with a slot in the block, and of a rod connecting the bell-crank lever to the said hand-lever at a point near to the fulcrum of the latter and in a manner to permit of said rod moving in both a vertical and a horizontal plane, substantially as and for the purpose specified.

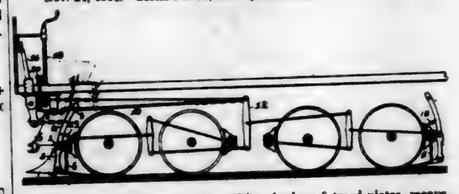
3. In breech mechanism for guns, the combination with a swinging carrier, a block rotatably mounted thereon, and a hand-lever for actuating said carrier; of a bell-crank lever pivoted to the carrier so as to operate in a vertical plane and engaging with a slot in the block, of a short arm located near the fulcrum of the hand-lever, and of a rod connecting the bell-crank lever to said short arm through universal joints substantially as and for the purpose specified.

4. In breech mechanism for guns, the combination with a swinging carrier, a block rotatably mounted thereon, and means for actuating said block by a hand-lever; of a shot-guide hinged to the gun, of a sliding quick-threaded rod engaging with corresponding threads in the boss of the hinged shot-guide, and of means for imparting a rectilinear movement to said quick-threaded rod as the carrier is swung in opening and closing the breech, substantially as and for the purpose specified.

5. In breech mechanism for guns, the combination with a swinging carrier, a block rotatably mounted thereon, and means for actuating said block by a hand-lever; of a shot-guide hinged to the gun at a point below the breech and adapted to turn in a vertical plane, of a sliding quick-threaded rod engaging with corresponding threads on the boss of the shot-guide, and of means for imparting a rectilinear movement to said quick-threaded rod as the carrier is swung in opening and closing the breech, substantially as and for the purpose specified.

6. In breech mechanism for guns the combination with a swinging carrier, a block rotatably mounted thereon and means for actuating said block by a hand-lever; of a shot-guide hinged to the gun at a point below the breech and adapted to turn in a vertical plane, of a sliding quick-threaded rod engaging with corresponding threads on the boss of the hinged shot-guide of a crank on the carrier-pivot of a bar connecting said quick-threaded rod with said crank, substantially as and for the purpose specified.

708,885. EMERGENCY-BRAKE. WILLIAM W. HOPKINS, St. Louis, Mo., assignor of one-half to Wilson P. H. Turner, Normandy, Mo. Filed Nov. 27, 1901. Serial No. 83,843. (No model.)



Claim.—1. The combination with a brake, of tread-plates, means for moving them into contact with the rails, so that the wheels will move upon them, and connections between the tread-plates and the brake mechanism; whereby all the brakes on the car will be applied when the wheels move onto any of said plates, substantially as specified.

2. The combination with a brake, of tread-plates in each truck, means for moving the plates in the front truck onto the rails so that the wheels will travel upon them, and lever connections between said plates and the brake mechanism so that all the brakes on the car will be applied whenever the wheels pass onto any of said plates, substantially as specified.

3. The combination with a brake, of tread-plates, means whereby said plates can be placed upon the rails to form treads for the wheels, means for applying the brakes when the wheels pass onto said plates; and means for releasing the brakes while the wheels are yet upon the plates, substantially as specified.

4. The combination with a brake, of tread-plates, means for placing certain of said plates upon the rails so that the wheels will pass upon them, connections between the tread-plates and the brake mechanism, and means for operating said connections to set all the brakes when the wheels pass onto any of the tread-plates, substantially as specified.

5. The combination with a brake, of tread-plates in front of the forward truck, a rock-shaft for supporting said tread-plates, means for operating the rock-shaft to move the tread-plates onto the rails to form treads for the wheels and connections between the rock-shaft, and the brake mechanism, whereby, all the brakes will be set whenever the wheels pass onto the said tread-plates, substantially as specified.

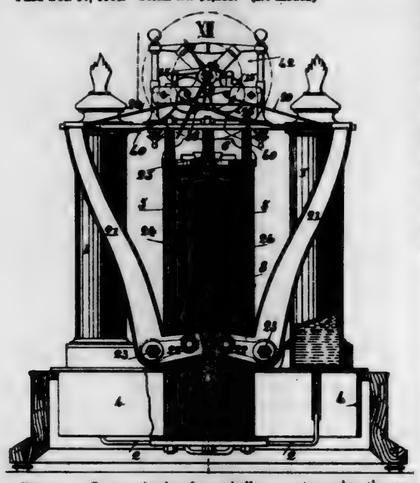
6. The combination with a brake, of thin metallic tread-plates, a rock-shaft supporting said tread-plates, means for operating the rock-shaft to move the tread-plates onto the rails to form treads for the wheels and connections leading from the rock-shaft to the brake mechanism, whereby, all the brakes will be set whenever the wheels pass onto the said tread-plates, substantially as specified.

7. The combination with a brake, of tread-plates means for holding them off of the rails and away from the wheels, means for placing certain of them upon the rails to form treads for the wheels, and means for setting all the brakes on the car when the wheels pass onto the tread-plates, substantially as specified.

8. In a car the combination with the usual brake, of a fender and tread-plates, means for placing the tread-plates upon the rails to form

treads or runners for the wheels, means for setting all the brakes on the car when the wheels pass onto said plates and means for lowering the fender to the track and holding it there when the wheels pass onto the tread-plates, substantially as specified.

708,886. **SELF-WINDING CLOCK.** CHARLES HOUR, Paris, France. Filed Dec. 17, 1901. Serial No. 86,230. (No model.)



Claim.—1. In a mechanism for rewinding a motor-spring, the combination of reservoir-receptacles, extensible corrugated receptacles in communication with said reservoir-receptacles, a cross-head actuated by the extension movement of said extensible receptacles, levers connected to said cross-head, and spring arbors having flexible connections with said levers.

2. A mechanism for rewinding a motor-spring, comprising a reservoir-receptacle having an extensible tube, one end of which is fixed and in communication with said receptacle, bell-crank levers, rods or pitmen connecting the movable end of said extensible tube with the bell-crank levers, the spring-arbors each having a spiral spring, flexible ribbons connecting said levers with said arbors and adapted to actuate the arbors on the extension movement of said tubes, and means actuated by the arbors for winding a clock-barrel or spring-box on the recoil of said springs.

3. A mechanism for rewinding a motor-spring, comprising two springs, each having one of its ends fixed, arbors to which are secured the other ends of said springs, extensible tubes adapted to contain a liquid, levers connected with said tubes, ribbons connecting said levers with one of said arbors, other ribbons connecting the same levers with the other arbors, and means for separately actuating the motor-springs by the recoil of the springs on the arbors.

4. A mechanism for rewinding a motor-spring, comprising a frame, an extensible tube having one end fixed to said frame, levers pivoted to the frame and connected operatively with the tube, a barrel or spring-box pivoted to a plate on said frame, an arbor in said barrel, a spiral spring connecting said arbor and the barrel, flexible ribbons attached to the arbor and the levers, a removable plate attached to the first-named plate, a motor-spring supported by said removable plate, and ratchet-wheels and pawls on the first-named fixed plate and disposed to actuate the motor-spring by the shortening movement of the springs on said arbors.

5. An automatically-wound clock, comprising a receptacle, an extensible tube adapted to receive a liquid dilatable by heat and to lengthen and contract according to variations of the temperature, an arbor, an intermediate spring having one end attached to the arbor, and its other end fixed to a suitable device, a flexible ribbon, means for connecting said ribbon to said arbor and to the extensible tube, a clock barrel-spring, and means connecting the clock barrel-spring with said arbor and adapted to wind the barrel-spring by the rotation of the arbor, said rotation being produced by the unwinding of the intermediate spring; said flexible ribbon adapted to become slack on contraction of the extensible tube, and the intermediate spring adapted to remain tight after a previous winding, whereby the extensible tube can subsequently dilate without coiling the intermediate spring until the flexible ribbon shall have been again stretched.

6. An automatically-wound clock comprising a receptacle, an extensible tube in communication therewith, an intermediate spring, means for connecting said spring with said tube and consisting of a flexible ribbon, a clock barrel-spring, and ratchet-wheels connecting the said springs so as to wind the last spring by the shortening of the first spring.

7. An automatically-wound clock comprising a frame, a receptacle thereon, an extensible tube in communication with the receptacle, a transmission-shaft, a flexible connection between said tube and said shaft, a plate secured on the frame, an intermediate spring attached to the frame and said shaft, another plate removably secured to the first plate, a clock-movement supported on said removable plate, and ratchet-wheels mounted on the fixed plate and arranged to connect the transmission-shaft with the shaft of the spring-barrel of the clock-movement.

8. In a mechanism for rewinding a motor-spring or the like, the combination of a reservoir, an extensible tube in communication therewith, a cross-head controlled by said tube, a work-shaft, and a lever linked to the cross-head and having a flexible connection with the work-shaft.

9. In a mechanism for rewinding a motor-spring or the like, the combination of a cross-head, thermostatically-actuated mechanism for imparting slidable travel to said cross-head, separate work-shafts adapted to actuate suitable transmitting devices, and levers actuated by the cross-head and each having independent flexible connections with said separate work-shafts.

708,887. **CORSET ATTACHMENT AND STOCKING-SUPPORTER.** LUCY B. IRESAN, Wilkesbarre, Pa. Filed Feb. 12, 1902. Serial No. 93,675. (No model.)

Claim.—1. In a corset attachment, the two-part abdominal support, comprising duplicate plate-sections each of nearly quadrate form, securable at their upper edges upon the lower edge of a separable corset-front, so that their upright meeting edges will aline with like edges of the corset, loop-plates and studs at the upright edges on the plate-sections for their detachable connection, and links depending from lower edges of the plate-sections, having laterally-swinging connection with the lower portions of the plate-sections, and adapted to connect stocking-supports therewith.

2. The combination with the open front of a corset, of an abdominal support, comprising two similar nearly-square plate-sections having rounded outer corners, and fibrous coverings thereon, said plate-sections being secured upon the lower edge of the corset at the front, the upright edges of plate-sections alining with respective front edges of the corset, a pendent link held to rock laterally upon the lower edge portion of each plate-section, tubular formations on lower ends of the links, and two pliable stocking-supporters loosely connected with the tubular formations.

708,888. **JOINT FOR TOY RAILROAD-TRACKS.** HARRY C. IVES, Bridgeport, Conn., assignor to the Ives Manufacturing Corporation, Bridgeport, Conn., a Corporation of Connecticut. Filed July 23, 1902. Serial No. 116,611. (No model.)

Claim.—1. In a sheet-metal railway-track the combination with a bollow tread and two vertically-disposed web members, of a pin adapted to enter said hollow tread and provided with a projecting fin or wing to fit in between the web members to retain the pin in place.

2. A rail-section formed of sheet metal having a hollow tread and a substantially hollow web, a pin fitted into the hollow tread of the rail and provided with a depending fin extending into the opening of the web and indentations in the web fore and aft of the fin to prevent its withdrawal.

3. A railway connection comprising a rail having a hollow tread and web, a pin in said hollow tread having a projection to enter the opening of the web to prevent the turning of the pin, the stock of the web being swaged in around the projection to prevent the lateral movement of the pin.

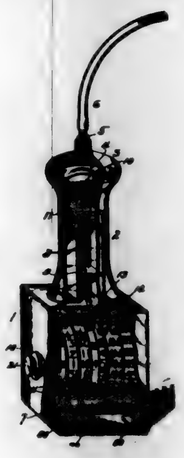
4. In a connection for toy-track sections, the combination with a rail having a hollow tread and web, of a pin to enter said tread with recesses on the side and inward projections of the rail to enter said recesses of the pin, in a manner to prevent both the withdrawal and turning of the pin within the rail.

5. A railway-joint consisting of a pin having rounded ends and a fin struck up and projections from one side of the pin, one end of the pin and its fin being adapted to frictionally enter the hollow tread and rail-web.

6. A railway-joint consisting of a pin having rounded ends and a fin struck up and projecting from one side of the pin, one end of the pin being adapted to frictionally enter the hollow tread and rail-web, and means to engage the fin to prevent its withdrawal from said rail.

7. A railway-joint, comprising a rail having a hollow tread and web, of a pin to enter said tread bearing indentations on opposite sides and a fin to enter the web, projections in the sides of the rail to engage both the indentations and the fin in a manner to retain the pin against both rotary and lateral movement.

708,889. **TIME-STAMP.** CARL F. JOHNSON, Milwaukee, Wis. Filed Oct. 4, 1897. Serial No. 653,992. (No model.)



Claim.—1. In combination with a wheel having notches 31; dog 34 having tooth 35 of a width less than that of the notches and having also hook 36; means for moving said dog; and a locking-lever 27 provided with locking-ear 28 and with projection 29, the latter located in the path of hook 36.

2. In combination with a wheel and with means for imparting a step-by-step rotation thereto; a ring secured to said wheel and having a cam-shaped periphery with a step intermediate of its portions of least and greatest radius and an inwardly-projecting stud; a notched disk concentric with but independent of the wheel; a lever arranged to bear upon the peripheral cam-face of the ring and having a slotted end; a spring serving to hold said lever against the cam; a pin extending through the slotted lever to the space between the periphery of the notched disk and the interior of the cam-ring; and a spring for drawing said pin to one end of the slot in the lever; said parts being constructed and arranged substantially as described and shown, whereby the pin is caused to bridge the space between the stud of the cam-ring and the disk and thereby lock said parts together, then to descend beneath the periphery of the disk, allowing the lug to pass, and finally to move outward beyond the periphery of the disk.

3. In combination with a wheel having a lug or stud; a notched disk concentric with but independent of said wheel; a pin movable from the path of the stud into the notches of the wheel; and means substantially such as shown and described for moving said pin; whereby it is caused to lock together the wheel and the disk, then to pass wholly within the periphery of the disk and permit the passage of the lug, and finally to move out of the disk and back to its initial position.

4. In combination with wheel 25 provided with ring 42 having a cam-shaped periphery, an external shoulder or ledge 43, and an internal lug 52; a disk 40 concentric with said wheel and having peripheral notches 41; a lever 48 having an ear or projection to bear upon the periphery of the cam-ring and slotted at its free end; a yoke 45 capable of longitudinal and lateral motion; a pin 46 carried by said yoke, passing through slot 47 and extending into the path of lug 52, and a spring 49 for drawing said pin toward one end of the slot.

5. In combination with disk 40 provided with notches 41; locking-lever 54 provided with locking-tooth 56; spring 55 bearing against said lever; yoke 45, provided with extension 58 to engage lever 54; and means for moving said yoke laterally and longitudinally.

6. In combination with wheel 25 having cam-ring 42 provided with shoulder or ledge 43 and lug 52 or 53; notched disk 40; locking-lever 54 provided with tooth 56 and ear 57; slotted yoke 45 provided with pin 46 and extension 58; lever 48, provided with slot 47 and projection 50; spring 49 connected with said yoke; and means for advancing wheel 25 step by step.

7. In combination with a wheel or disk and means for rotating the same; a notched disk concentric with said wheel; a movable locking device for connecting the wheel and the disk to cause them to move in unison; and a cam carried by the wheel and serving to move said locking device to position wholly outside of the disk, wholly within its periphery, or to an intermediate locking position, substantially as set forth.

8. In combination with a wheel or disk and means for imparting rotation thereto; a notched disk independent of said wheel; a locking member adapted to bridge the space between the disk and a lug or abutment on the wheel; and a cam carried by the wheel and having three different elevations adapted respectively to cause the locking member to fall within the periphery of the notched disk, to rise to position partly within and partly without the disk, and to move wholly beyond the disk, as the cam rotates.

9. In combination with rotary cam 60 having shoulder or ledge 61 and tooth 62; notched disk 63 arranged concentrically within said cam; slotted yoke 66 provided with pin 65; and lever 73 provided with slot 72 to receive said pin, and with ear 76 arranged to bear upon the periphery of the cam 60, said parts being arranged to operate substantially as set forth.

10. In combination with tens-wheel 26 having sleeve 39; units-wheel 25 loosely encircling said sleeve and provided with cam-ring 42 having lug 52 or 53; notched disk 40 fast upon sleeve 39; slotted yoke 45 provided with pin 46; lever 48 provided with slot 47 and ear 50; spring 51 bearing upon said lever; and spring 49 connected with yoke 45 and serving to swing it laterally.

11. In combination with axle 15; wheel 26 provided with sleeve 39; notched disk 40 and cam 60 both rigidly attached to said sleeve, said cam 60 being provided with lug 62; wheel 25 loosely encircling said sleeve; cam-ring 42 carried by wheel 25 and having lug 52 or 53; yoke 42 free to move longitudinally and laterally upon said sleeve, and provided with pin 46; slotted lever 48 provided with ear 50; notched disk 63 secured upon axle 15; yoke 66 free to move lengthwise and to rock upon said axle, and provided with pin 65; slotted lever 73, and spring 75 bearing against yoke 66.

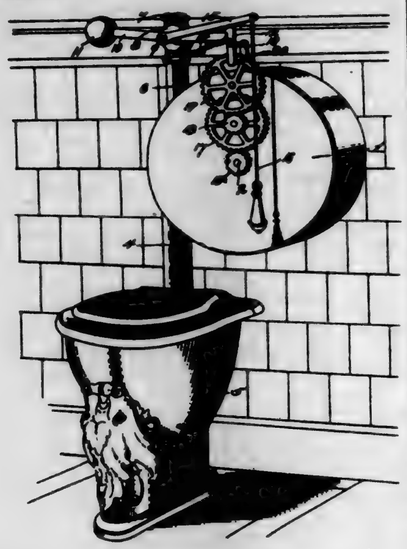
12. In a stamp, the combination of a primarily driven wheel provided with a lug or abutment; a part to be driven, provided with a notched disk; a stud or pin movable into the path of the lug, the notched disk, or partly into the path of each for locking the two together; and a cam carried by the first-mentioned wheel for determining the positions of said locking stud or pin.

13. In combination with a wheel having notches 31, lever 27 provided with locking-ear 28 and with nose 29; a spring for holding the lever in locking position; lever 32; dog 34 carried by said lever, and provided with tooth 35 and hook 36; and an actuating-stem connected with said lever.

708,890. **CLOSET-FLUSHING DEVICE.** JOSEPH M. JUSTIS, Toledo, Ohio, assignor of two-fifths to George W. Birchall and Charles E. Clapp, Toledo, Ohio. Filed Jan. 16, 1901. Serial No. 43,518. (No model.)

Claim.—The combination with a closed casing having an inlet and an exhaust in substantially vertical alinement, of a flat-winged wheel disposed in the path of the inlet, a train of gearing arranged externally of and parallel with the casing and actuated from the said wheel, a valve in the inlet-pipe, a lever connected with the valve and having at one end a weight to hold the valve normally closed and at the opposite end a nose, a pivoted spring-drawn latch having a toe arranged in the path of movement of the said nose and operating to hold the valve open, a striker on one of the train of gears and operating to trip the latch, and means for operating the lever to open the valve and bring the lever into engagement with the latch.

708,890.



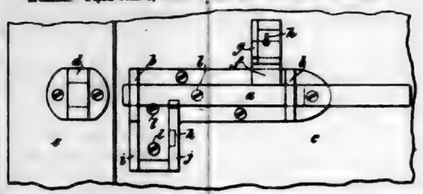
708,891. BOLT-MACHINE. CHARLES E. LASSITER, Richmond, Va. Filed Oct. 12, 1901. Serial No. 78,487. (No model.)

Claim.—1. In a device of the class set forth, a casing having oppositely-disposed inwardly-converging chambers communicating with each other at the center of the casing, inwardly-converging jaws located in and of materially less dimensions than the said chambers, oppositely-disposed cutters interposed between one side of each jaw and one wall of each chamber, the said jaws and cutters extending full length of the chambers and adapted to coöperate to form a tapered bolt, adjusting devices for the cutters, and independent adjusting devices for the jaws, one set of adjusting devices for the jaws engaging the sides of the latter opposite the sides against which the cutters have bearing for firmly clamping the jaws against the cutters.

2. In a device of the class set forth, a casing having oppositely-disposed chambers communicating with each other at the center of the casing, jaws mounted in said chambers and of materially less dimensions than the latter so as to have a normal loose movement, cutters interposed between the reverse sides of the jaws and the adjacent walls of the chambers, the cutters and jaws extending full length of the chambers, a series of alined adjusting devices engaging the cutters whereby the latter may have their cutting edges disposed at an angle to form a tapered bolt, and two separate sets of alined adjusting devices engaging the jaws to control the inward adjustment of said jaws and also to hold the latter in firm clamping position in relation to the cutters, one set of the adjusting devices engaging the sides of the jaws opposite those in contact with the cutters.

3. In a device of the class set forth, a casing having oppositely-disposed chambers communicating with each other at the center of the casing, jaws located in and coextensive with the chambers, oppositely-disposed cutters interposed between the reverse side edges of the opposite jaws and the adjacent walls of the chambers, and also coextensive with the latter, the said jaws and cutters being held mounted in the chambers and the jaws normally loose, means for controlling the inward adjustment of the jaws and cutters, and means at an angle to the means for controlling the inward adjustment of the jaws to force the latter in close clamping engagement with the cutters.

708,892. SLIDING BOLT. CHARLES E. LOSS, Branchestown, Ireland. Filed Jan. 6, 1902. Serial No. 88,884. (No model.)

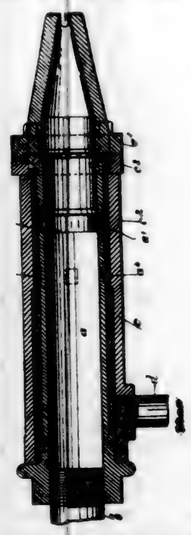


Claim.—1. The combination of a bolt-frame carrying guides, a bolt adapted to both slide and turn about its own axis in said guides, an arm fast with the bolt and projecting laterally therefrom, a key-operated lock carried by said arm, and a fixed lug with which the bolt of the key-operated lock engages.

2. The combination of a bolt-frame carrying guides, a bolt adapted to both slide and turn about its own axis in said guides, an arm fast with the bolt and projecting at right angles therefrom, a key-operated lock carried by said arm, and lugs or flanges on the bolt-frame between which the arm snugly fits and between which it is housed and shielded, one of said lugs being formed with a recess to receive the bolt of the lock carried by the arm.

3. The combination of a bolt-frame carrying guides, a bolt adapted to both slide and turn about its own axis in said guides, an arm fast with the bolt and projecting at right angles therefrom, a key-operated lock carried by said arm, lugs between which the arm snugly fits and between which it is housed and shielded, a keeper, and screws for securing the keeper and bolt-frame in place which are covered by the bolt and the arm when the bolt is shot and locked.

708,893. BURNER FOR LIQUID FUELS. CHARLES G. LUNDHOLM, San Bernardino, Cal. Filed Aug. 8, 1901. Serial No. 71,335. (No model.)

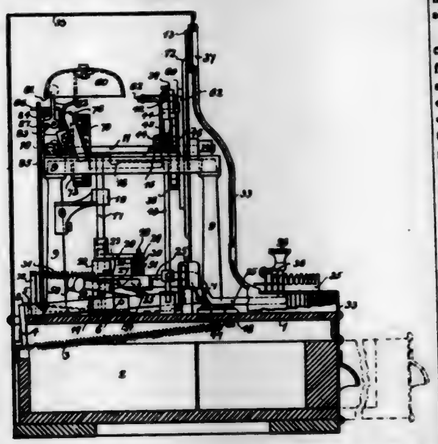


Claim.—1. A burner for liquid fuel, comprising a shell, a mouthpiece at its front end, and two nozzle-sections located in and separated from the shell in longitudinal line with each other, the nozzle-sections having a passage between them, and the front nozzle-section having a passage between its front end and the shell, and means for supplying the fuel and an atomizing fluid, the one to the interior of the nozzles and the other to the exterior of the nozzles within the shell.

2. A burner for liquid fuels, comprising a shell, a mouthpiece fastened to the front end thereof, a front nozzle-section situated in the shell and spaced therefrom, said front nozzle-section having a perforated flange secured between the front of the shell and the mouthpiece, a rear nozzle-section located in the shell in line with and back of the front nozzle-section, said nozzle-sections having a passage between them, and means for supplying the fuel and an atomizing fluid, the one to the interior of the nozzles and the other to the exterior of the nozzles within the shell.

3. A burner for liquid fuel, comprising a shell, two nozzle-sections located in and separated from the shell said nozzle-sections being in longitudinal line with each other, the nozzle-sections having a passage between them and the front nozzle-section having a passage between its front end and the shell, and means for supplying the fuel and an atomizing fluid, the one to the interior of the nozzles and the other to the exterior of the nozzles within the shell.

708,894. CASH-REGISTER AND TILL. ANDREW G. MACGILLOCH and HERBERT DOMINION, London, England. Filed Nov. 29, 1901. Serial No. 84,122. (No model.)



Claim.—1. In an automatic cash-register a dial provided with a circle of figures denoting sums of money, an inclosing case provided with an aperture adapted to display one of said figures or sums at a time, a segmental rack at the front of the machine divided and figured to correspond with the dial, a horizontal slot in the case adjacent to the rack, a key-lever at its inner end mounted upon axes of motion with capability of horizontal and vertical movement and at its outer end extending through the slot in the case adjacent to the rack and adapted to traverse and engage the latter, means for conveying only the outward horizontal traversing movement of the key-lever to the dial and converting it into rotary movement, means for retaining the dial in the position to which it has been moved while the key-lever returns to its zero position, a counting apparatus, means for causing the forward movements of the dial to give motion to the counter in such manner that each complete revolution whether made up of part revolutions or not is registered, means for releasing and returning to zero the dial upon the return to zero and depression of the key-lever and means for locking the key-lever in its zero position until the dial has returned to its zero position substantially as herein shown and described and for the purpose stated.

2. In an automatic cash-register a revolvable dial provided with a circle of figures denoting sums of money, a segmental rack located at the front of the machine and divided and figured to correspond with the dial, a key-lever at its inner end mounted upon axes of motion with capability of horizontal and vertical movement and at its outer end adapted to traverse the segmental rack, a beveled pinion fixed with the axis of the dial, a toothed segment engaging the pinion a spring for moving said toothed segment in one direction, a crank fixed with the axis of the toothed segment and adapted to loosely engage the key-lever in the outward horizontal traverse of the latter, means for retaining the dial and crank for the time being in the position to which they have been carried by the key-lever while the latter returns to its zero position, a counting apparatus, means for causing the forward movements of the dial to give motion to the counter in such manner that each complete revolution, whether made up of part revolutions or not, is registered, means for releasing and returning to zero the dial upon the return to zero and depression of the key-lever and means for locking the key-lever in its zero position until the dial has returned to its zero position substantially as herein shown and described and for the purpose stated.

3. In an automatic cash-register, a revolvable dial provided with a circle of figures denoting sums of money, a segmental rack located at the front of the machine and divided and figured to correspond with the dial, a key-lever at its inner end mounted upon axes of motion with capability of horizontal and vertical movement and at its outer end adapted to traverse the segmental rack, means for conveying only the outward horizontal traversing movement of the key-lever to the dial and converting it into rotary movement, a ratchet-wheel fixed with the dial and a pawl engaging the same for retaining the dial in the position to which it has been moved while the key-lever returns to its zero position, means adapted to be acted upon by the key-lever in its zero position for raising the pawl and permitting the return to zero of the dial, means for causing the return to zero of the dial, means for locking the key-lever in its zero position until the dial has returned to zero, a disk fixed upon the dial-shaft and provided with a depression in its face a counting spring-pin carried by the pawl and adapted in the raised position of the latter to ride upon the edge of the disk and hold the pawl out of gear until the depression again comes opposite the pin thus permitting the pawl to fall into engagement with the ratchet-wheel, a counting apparatus, and means for causing the forward movements of the dial to give motion to the counter in such manner that each complete revolution whether made up of part revolutions or not is registered substantially as herein shown and described and for the purpose stated.

5. In an automatic cash-register, a revolvable dial provided with a circle of figures denoting sums of money, a segmental rack located at the front of the machine and divided and figured to correspond with the dial, a key-lever at its inner end mounted upon axes of motion with capability of horizontal and vertical movement and at its outer end adapted to traverse the divided segmental rack, means for conveying only the outward horizontal traversing movement of the key-lever to the dial and converting it into rotary movement, means for retaining the dial in the position to which it has been moved while the key-lever returns to its zero position, a counting apparatus, means for causing the forward movements of the dial to give motion to the counter in such manner that each complete revolution whether made up of part revolutions or not is registered, means for releasing and returning to zero the dial upon the return to zero and depression of the key-lever means for locking the key-lever in its zero position until the dial has returned to zero means for returning the dial to zero a projection from the disk carrying the dial a notched or forked stop-plate having upper and lower jaws and pivotally mounted upon the frame of the machine and means for balancing the stop-plate in such manner that upon the return to zero of the dial the projection thereof will encounter the lower jaw of the stop-plate thereby arresting the dial at its zero position and the impact will momentarily throw the upper jaw forward to engage the projection and prevent the dial rebounding substantially as herein shown and described and for the purpose stated.

6. In an automatic cash-register a revolvable dial provided with a circle of figures denoting sums of money, a segmental rack located at the front of the machine and divided and figured to correspond with the dial, a key-lever at its inner end mounted upon axes of motion with capability of horizontal and vertical movement and at its outer end adapted to traverse the segmental rack, a crank provided with a crank-pin for conveying through suitable connections only the outward horizontal traversing movement of the key-lever to the dial and converting it into rotary movement, means for retaining the dial in the position to which it has been moved while the key-lever returns to its zero position, a counting apparatus, means for causing the forward movements of the dial to give motion to the counter in such manner that each complete revolution whether made up of part revolutions or not is registered, means for releasing and returning to zero the dial upon the return to zero and depression of the key-lever, a weighted lever having an inclined nose and provided with a notch adapted to engage the key-lever in its zero position and thus lock it, an extension upon the crank-pin adapted in the return movement of the crank and dial to come against the inclined nose of the weighted le-

ver and depress the same thereby releasing the key-lever substantially as herein shown and described and for the purpose stated.

7. In an automatic cash-register a revolvable dial provided with a circle of figures denoting sums of money a segmental rack located at the front of the machine and divided and figured to correspond with the dial, a key-lever at its inner end mounted upon axes of motion with capability of horizontal and vertical movement and at its outer end adapted to traverse the segmental rack, means for conveying only the outward horizontal traversing movement of the key-lever to the dial and converting it into rotary movement, means for retaining the dial in the position to which it has been moved while the key-lever returns to its zero position, an ordinary counting apparatus operated by a star-wheel a drum loosely mounted upon the shaft of the dial means for causing the drum to rotate with the dial in its forward movements and to remain stationary during its return movements, divisions and figures upon the periphery of the drum corresponding with those of the dial, a pointer opposite the drum, a projection upon the drum adapted to engage the star-wheel of the counting mechanism in the revolution of the drum, means for releasing and returning to zero the dial upon the return to zero and depression of the key-lever and means for locking the key-lever in its zero position until the dial has returned to its zero position substantially as herein shown and described and for the purpose stated.

8. In an automatic cash-register a revolvable dial provided with a circle of figures denoting sums of money a segmental rack located at the front of the machine and divided and figured to correspond with the dial, a key-lever at its inner end mounted upon axes of motion with capability of horizontal and vertical movements and at its outer end adapted to traverse the segmental rack, means for conveying only the outward traversing movement of the key-lever to the dial and converting it into rotary movement, means for retaining the dial in the position to which it has been moved while the key-lever returns to its zero position, a rocking lever having at its front end a segmental bar coextensive with the arc traversed by the key-lever minus its zero position, a spring-actuated drawer, a detent carried by the rear end of the rocking lever and adapted to engage the drawer until the rocking lever is depressed by the key-lever, a counting apparatus means for causing the forward movements of the dial to give motion to the counter means for releasing and returning to zero the dial upon the return to zero and depression of the key-lever and means for locking the key-lever in its zero position until the dial has returned to its zero position substantially as herein shown and described and for the purpose stated.

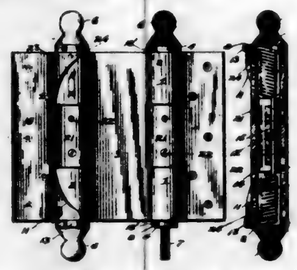
9. In an automatic cash-register the combination of two mechanisms within one case the one to register purchases in cents and the other purchases in dollars each of such mechanisms consisting of a dial provided with a circle of figures denoting sums of money, a segmental rack at the front of the machine divided and figured to correspond with the dial, a key-lever at its inner end mounted upon axes of motion with capability of horizontal and vertical movement and at its outer end adapted to traverse and engage the rack, means for conveying only the outward traversing movement of the key-lever to the dial and converting it into rotary motion, means for retaining the dial in the position to which it has been moved while the key-lever returns to its zero position, a counting apparatus, means for causing the forward movements of the dial to give motion to the counter in such manner that each complete revolution whether made up of part revolutions or not is registered, means for releasing and returning to zero the dial upon the return to zero and depression of the key-lever and means for locking the key-lever in its zero position until the dial has returned to its zero position substantially as herein shown and described and for the purpose stated.

708,895. FURNITURE-CASTER. WILLIAM J. MARTIN, Catawissa, Pa. Filed Nov. 27, 1901. Serial No. 83,881. (No model.)

Claim.—1. In combination, a supporting plate and tube adapted to be attached to a furniture-leg, the tube rising from the plate and being adapted to extend up into the leg, a rotatable part carrying a floor-roller and consisting of a disk and a shank rising centrally from the disk and extending up into the supporting-tube, a main series of antifriction-balls adapted to receive the weight and confined between and bearing upon the lower surface of the supporting-plate and the upper surface of the rotatable disk, and a supplemental series of balls confined between the shank and the supporting-tube at the upper ends of the same and having a bearing on the inner wall of the tube and the adjacent side of the shank, the balls being thereby suspended between the shank and the tube and so situated as to receive the lateral thrusts of the shank, for the purpose set forth.

2. In combination, a supporting-tube and disk, adapted for connection to an article of furniture, a roller-carrying part consisting of a disk and a shank extending up through said tube, a main series of balls confined between the upper and lower faces of the disk parts, a supplemental series of balls in a ball-race formed between the upper end of the shank and the interior wall of the tube, and a removable disk carried by the shank and confining the supplemental balls in place.

708,896. SPRING-HINGE. ELBER MATHES, Miles, Oreg. Filed Jan. 30, 1902. Serial No. 91,065. (No model.)



Claim.—1. A spring-hinge having a barrel formed of two portions divided by an intermediate space, a pintle, a spring coöperating with the pintle, and a leaf having a tongue occupying said space and detachably connected to the pintle, substantially as described.

2. A spring-hinge having a barrel formed of spaced sections, a pintle, a spring coacting with the pintle, a split sleeve surrounding the stem between the barrel-sections, and a leaf having a tongue inserted in said sleeve and pintle, and detachably connected to the pintle, substantially as described.

3. A spring-hinge having a bifurcated barrel, a pintle extending therethrough and having an enlarged intermediate portion, a spring in each section of the barrel and detachably connected to the barrel and spindle, a sleeve surrounding the enlarged portion of the pintle between the barrel-sections, cap-nuts on the spindle and closing the ends of the barrel-sections, a leaf having a tongue inserted into said sleeve and enlargement of the pintle, and fastening means detachably connecting the sleeve and tongue to the pintle, substantially as described.

4. A spring-hinge comprising a barrel, a spring-controlled spindle, a leaf detachably connected to the spindle, adjustable stops on the barrel, and cars on the leaf to engage said stops to hold the leaf from returning to its normal position, substantially as described.

5. A double-acting spring-hinge having a barrel formed of a double T-shaped blank of sheet metal, the wings of the blank forming bifurcated barrels and having flanges at their outer edges, and the cross-piece forming a web connecting said barrels, substantially as described.

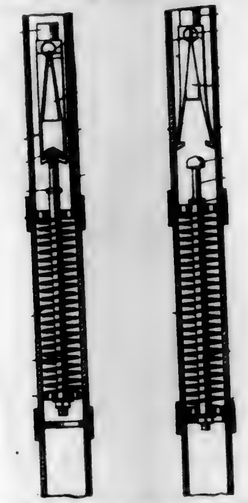
6. A double-acting spring-hinge having bifurcated barrels and an interconnecting web formed of a single piece of sheet metal, pintles extending through the barrels and having central enlargements, a cap-nut threaded upon each end of the spindle and closing the ends of the barrel, springs in each section of the barrels and detachably connected thereto and to the pintles, sleeves surrounding the enlarged central portions of the pintles between the sections of the barrels, leaves having tongues inserted in said sleeves, fastenings detachably connecting the tongues and sleeves to the pintles, ears upon the leaves, lugs upon the cap-nuts coöperating with the ears to reinforce the leaves, and adjustable stops upon the barrels coöperating with the ears to hold the movable portion of the hinge in adjusted position against the tension of said spring, substantially as described.

708,897. OIL-WELL PUMP. SAMUEL W. HERAIS, Waynesburg, Pa. Filed Feb. 10, 1902. Serial No. 93,857. (No model.)

Claim.—1. An oil-well pump having a plunger, a spring device in the well, means carried by the plunger for engaging said spring device, and a disengaging device for said means, as set forth.

2. An oil-well pump having a plunger, a spring-pressed rod below the plunger, a device carried by the plunger for engaging said rod, and means for disengaging said device, as set forth.

3. An oil-well pump having a valved plunger carrying spring-hooks at its lower end, a wire line connected with the plunger, and a spring device located between the plunger and the standing valve for imparting a downstroke to the plunger, the said spring device being adapted to be engaged by the said spring-hooks, as set forth.



4. An oil-well pump having a plunger, a wire line connected with the plunger, a spring device for imparting a downstroke to the plunger, the said spring device being a permanent fixture of the lower portion of the well-casing and comprising a spring-pressed rod for detachable connection at its upper end with the said plunger, and a weight on the said line, as set forth.

5. An oil-well pump having a plunger, a spring device in the well-tubing below the plunger and comprising a washer held in the tubing, a rod extending loosely through said washer, a spring held on said rod and abutting at its upper end against said washer, and means carried by the plunger for engaging said rod, as set forth.

6. An oil-well having a plunger, a spring-pressed rod in the well, hooks carried by the plunger and engaging the said rod, and means adapted to engage the rod, to move the said hooks out of engagement with the rod, as set forth.

7. An oil-well pump provided with a plunger, spring-hooks carried by the plunger, and a wedge supported on the spring-hooks and having a slidable movement thereon, to open the spring-hooks on the wedge striking a fixed part, as set forth.

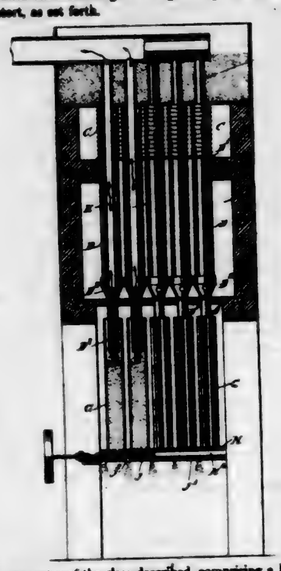
8. An oil-well pump provided with a plunger, spring-hooks carried by the plunger, a wedge supported on the spring-hooks and having a slidable movement thereon, to open the spring-hooks on the wedge striking a fixed part, and a spring-pressed rod in the oil-well, having a head adapted to be engaged by the said hooks and by the said wedge, as set forth.

9. An oil-well pump provided with a plunger, spring-hooks carried by the plunger, a wedge supported on the spring-hooks and having a slidable movement thereon, a guide held in the well-casing, a rod extending loosely through said guide and provided with a shoulder above the same, the said rod having a head at its upper end adapted to be engaged by the said hooks and by the said wedge, a spring coiled on the rod below the guide and exerting downward tension on the rod, and a weighted line connected with the plunger, as set forth.

708,898. BONE-BLACK KILN. WILLIAM T. HOBB, Glenolden, Pa. Filed May 9, 1902. Serial No. 106,888. (No model.)

Claim.—1. An apparatus of the class described, comprising a heating-chamber, an upright retort extending through the heating-chamber and through which gravitates the material to be treated, and a vertical flue extending through the retort and opening at its lower end into the heating-chamber, to form an escape for the heat from the heating-chamber, as set forth.

2. An apparatus of the class described, comprising a heating-chamber, an upright retort extending through the heating-chamber and through which gravitates the material to be treated, a flue extending vertically through the retort and opening at its lower end into the heating-chamber, to form an escape for the heat from the heating-chamber and for feeding the material into the upper end of the retort and through which the said flue also extends, the drier having means for the escape of gas and moisture from the material gravitating through the drier in its passage to the retort, as set forth.



3. An apparatus of the class described, comprising a heating-chamber, an upright retort extending through the heating-chamber and through which gravitates the material to be treated, and a drier through which the material passes to the retort, the said drier being formed of superimposed spaced sections, each in the form of an inverted frustum of a cone, the apex end of one section opening into the base end of the section below to allow the material to gravitate through the drier in its passage to the retort, and allow the moisture to escape through the spaces between adjacent sections, as set forth.

4. An apparatus of the class described, comprising a heating-chamber, an upright retort extending through the heating-chamber and through which gravitates the material to be treated, a flue forming the escape for the heat from the heating-chamber and extending vertically through the retort, and a drier, through which gravitates the material in its passage to the retort, the said drier being formed of superimposed sections, spaced apart, to allow escape of moisture and gas from the material to the spaces between adjacent sections, the said flue also extending vertically through the said drier, as set forth.

5. An apparatus of the class described, comprising a hopper, a drier into which discharges the hopper, disposed vertically and composed of superimposed spaced sections, to form escapes for the moisture and gas, a retort into which passes the lower end of the drier, a closed heating-chamber through which extends the said retort in a vertical direction, and a flue extending centrally through the said retort into the said hopper, to connect with a chimney-flue therein, the lower end of the flue opening into the heating-chamber, as set forth.

6. An apparatus of the class described, comprising a hopper, a drier into which discharges the hopper, disposed vertically and composed of superimposed spaced sections, to form escapes for the moisture and gas, a retort into which passes the lower end of the drier, a closed heating-chamber through which extends the said retort in a vertical direction, and a flue extending centrally through the said retort into the said hopper, to connect with a chimney-flue therein, the lower end of the flue opening into the heating-chamber at or near the bottom thereof, as set forth.

7. An apparatus of the class described, comprising a hopper, a drier into which discharges the hopper, disposed vertically and composed of superimposed spaced sections, to form escapes for the moisture and gas, a retort into which passes the lower end of the drier, a closed heating-chamber through which extends the said retort in a vertical direction, a flue extending centrally through the said retort into the said hopper, to connect with a chimney-flue therein, the lower end of the flue opening into the heating-chamber, and a tubular cooler below the heating-chamber, into which discharges the discharge-spout of the said retort, as set forth.

8. An apparatus of the class described, comprising a hopper, a drier into which discharges the hopper, disposed vertically and composed of superimposed spaced sections, to form escapes for the moisture and gas a retort into which passes the lower end of the drier, a closed heating-chamber through which extends the said retort in a vertical direction, a flue extending centrally through the said retort into the said hopper, to connect with a chimney-flue therein, the lower end of the flue opening into the heating-chamber, a tubular cooler below the heating-chamber, into which discharges the discharge-spout of the said retort, and a conveyer into which discharges the lower end of the said cooler, as set forth.

9. An apparatus of the class described, comprising a hopper, a drier into which discharges the hopper, disposed vertically and composed of superimposed spaced sections, to form escapes for the moisture and gas, a retort into which passes the lower end of the drier, a closed heating chamber through which extends the said retort in a vertical direction, a flue extending centrally through the said retort into the said hopper, to connect with a chimney-flue therein, the lower end of the flue opening into the heating-chamber, a tubular cooler below the heating-chamber, into which discharges the discharge-spout of the said retort, and a conveyer into which discharges the lower end of the said cooler, the conveyer having an apertured top and an apertured bottom, as set forth.

10. An apparatus of the class described, comprising a hopper, a drier into which discharges the hopper, disposed vertically and composed of superimposed spaced sections, to form escapes for the moisture and gas, a retort into which passes the lower end of the drier, a closed heating-chamber through which extends the said retort in a vertical direction, a flue extending centrally through the said retort into the said hopper, to connect with a chimney-flue therein, the lower end of the flue opening into the heating-chamber, a tubular cooler below the heating-chamber, into which discharges the discharge-spout of the said retort, and an agitating device extending into the said spout and through the open end of the cooler to the outside thereof, as set forth.

11. An apparatus of the class described, provided with a drier formed of superimposed spaced ring-sections, each in the form of an inverted frustum of a cone, and vertically-arranged rods having branches inclined outwardly and upwardly and on which the said sections are secured, as set forth.

12. An apparatus of the class described, provided with a closed heating-chamber, a retort extending vertically through the same, and a vertical flue extending centrally through the said retort and having an inlet at its lower end opening through the wall of the retort into the heating-chamber, to form an escape for the heat from the heating-chamber, as set forth.

13. An apparatus of the class described provided with a tubular cooler into which passes the material, a supporting-plate on which the lower open end of said cooler rests, and having an opening for the passage of the material and a conveyer having a casing and into which leads the said opening, the bottom of the conveyer-casing being provided with a discharge-opening, the said supporting-plate having a transverse opening leading to the opening for the passage of the material, as set forth.

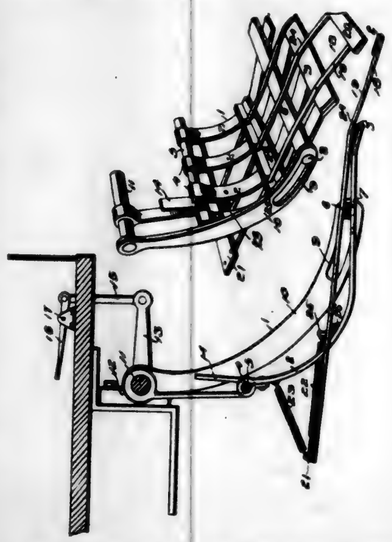
14. An apparatus of the class described, provided with a tubular cooler, polygonal in cross-section and into which passes the material, a supporting-plate for carrying the said cooler and having an opening for the passage of the material, and a conveyer below the said supporting-plate, into which leads the said opening, the conveyer having the bottom of its casing formed with a discharge-opening, as set forth.

15. An apparatus of the class described, comprising a hopper, a drier into which discharges the hopper, a retort into which opens the lower end of the drier, the said retort having a head at its lower end provided with a discharge-spout, a closed heating-chamber through which extends the said retort, and a flue extending centrally through said retort into the hopper and connected with a chimney-flue therein, the lower end of the flue having inlets comprising branch pipes leading to openings in the side wall of the said head of the retort and communicating with the heating-chamber, as set forth.

16. An apparatus of the class described, comprising a hopper, a drier into which discharges the hopper, and arranged to permit of the escape of gas and moisture from the material, a retort with which the lower end of the drier communicates, the said retort being provided with a head at its lower end provided with a discharge-spout, a heating-chamber through which extends the said retort, a flue extending centrally through the retort and drier into the hopper and connected with an outlet-flue therein, the lower end of the flue having branch inlet-pipes leading to openings in the side walls of the head of the retort, and a cooler below the heating-chamber into which extends the discharge-spout of the head of the retort, as set forth.

17. An apparatus of the class described, comprising a heating-chamber, a retort extending vertically through the heating-chamber and provided with a head at its lower end having a discharge-spout, a flue extending centrally through the retort and opening at its lower end into the heating-chamber and an agitating device extending through the discharge-spout of the retort into the head, as set forth.

708,899. CAR-FENDER. EDWARD C. HOULTON, San Jose, Cal. Filed Mar. 4, 1902. Serial No. 96,672. (No model.)



Claim.—1. The combination with a slidable fender, of guide-arms located at opposite sides of the fender and connected with the same at points between the ends thereof and adapted to form a fulcrum for the said fender, said guide-arms being arranged to permit the fender to have a limited inward or backward movement when it comes in contact with an object, and an upright guide receiving the rear portion of the fender and adapted to depress the front portion of the same when the said fender is moved inward or rearward, substantially as described.

2. The combination with a slidable fender, of guide-arms located at opposite sides of the fender and provided with slots receiving the same, and an upright loop arranged to receive the back of the fender and adapted to depress the front of the same when the said fender is moved rearward, substantially as described.

3. The combination with a slidable fender, of a rock-shaft provided with guide-arms receiving the fender at a point between the ends thereof, an upright guide also carried by the rock-shaft and receiving the rear portion of the fender, and means for operating the rock-shaft, substantially as described.

4. The combination of a rock-shaft provided with slotted guide-arms and having upright guides, a slidable fender having arms arranged in the slots of the guide-arms, said fender being also arranged in the upright guides, and means for operating the rock-shaft, substantially as described.

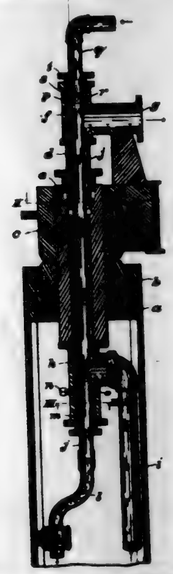
5. The combination of a fender, a supplemental slidable frame mounted on the fender and extending in advance of the same, and springs connecting the supplemental frame with the fender and located in rear of the latter, substantially as described.

6. The combination of a fender capable of a limited sliding movement, a supplemental frame arranged on the fender, guides carried by the fender and receiving the supplemental frame, and springs connecting the rear portion of the slidable frame with the fender, substantially as described.

7. The combination of a slidable fender capable of pivotal movement, means for supporting the fender and for holding the same normally in an extended position, and a slidable frame extending in advance of the fender and capable of movement longitudinally thereof, and carried by the said fender in its movements, substantially as described.

8. The combination of a fender provided with a guide-bar having guide-openings, a slidable frame arranged in the guide-openings and extending in advance and in rear of the fender, the approximately horizontal springs 22 connecting the rear portion of the frame with the fender, and the inclined springs 23 connecting the rear portion of the frame with the fender, substantially as described.

708,900. REVOLVING STEAM CONNECTION. FRANK HEDGAT-ROYD, Cleveland, Ohio. Filed Feb. 7, 1902. Serial No. 93,269. (No model.)



Claim.—1. In a fluid supplying and discharging device for revolvable machines, the combination with a hollow trunnion and a suitable bearing therefor, of a fixed discharge-pipe having a lateral outlet and inserted through a stuffing-box into the bore of said trunnion, a revolvable supply-tube passing axially through said discharge-pipe and trunnion and provided with a stuffing-box at the revolvable end of the discharge-passage, a stationary supply-tube communicating with the outer end of said revolvable tube, and a fluid-tight joint between said supply-tubes adapted to permit of both the revolution and a limited relative longitudinal movement of said revolvable tube, substantially as set forth.

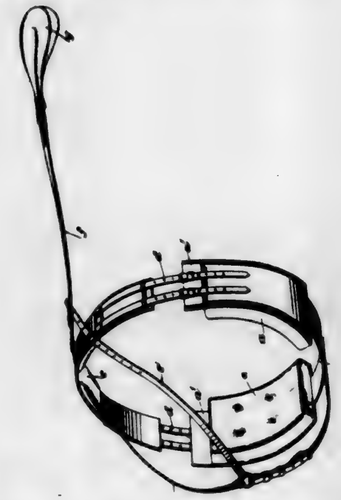
2. In a fluid supplying and discharging device for revolvable machines, the combination with a hollow trunnion and a suitable bearing therefor, of a fixed discharge-pipe having a lateral outlet and inserted through a stuffing-box into the bore of said trunnion, a revolvable supply-tube passing axially through said discharge-pipe and trunnion provided with a stuffing-box at the revolvable end of the discharge-passage and having a socket formed upon its outer end, a stationary supply-tube having a cylindrical collar upon its inner end fitted to slide into said socket, and an open-ended stuffing-box fitted to receive said socket and adapted to prevent the escape of both the incoming and outgoing fluid, substantially as set forth.

3. In a fluid supplying and discharging device for revolvable machines, the combination with a hollow trunnion and a suitable bearing therefor, of a discharge-pipe inserted through a stuffing-box into the bore of said trunnion and having a fixed T upon its outer end, a lateral discharge-outlet and a stuffing-box for the supply-tube upon the inner end of said trunnion, a supply-tube carried by the revolvable portion of the machine passing axially through said inner stuffing-box, the bore of the trunnion and the discharge-pipe and terminating in a socket fitted to said fixed T beyond the lateral outlet thereof, a stationary supply-tube having a cylindrical collar upon its inner end fitted to slide into said socket, and a gland upon said stationary supply-tube adapted to hold suitable packing in the outer end of said fixed T against the joints formed by said collar and socket, substantially as set forth.

708,901. TRAMWAY RAIL. FRANK E. MUSGRAVE, Bolton, England. Filed July 16, 1902. Serial No. 115,854. (No model.)

Claim.—The combination of parts relating to tramway-rails consisting of the tramway-rail composed of the web A, bottom flange B and the flange C on one side of the web of angular form to receive the under side or other portion of the grooved upper face D of the tramway-rail on which the wheels of the tram or other cars or vehicles travel, the upper portion having the flange or web H by which it is secured to the web A by the bolts I and nuts J at each joint, and arranged so as to break joint with the web A, and flanges B and C, thus forming a "fish-plate" at each joint in the body or web A of the permanent carrying-rail; each tramway-rail being provided with the metallic boxes E and the covers F, the whole being constructed, connected, and applied substantially as described and as illustrated in the drawings.

708,902. PAD FOR TREATING SHOE-BOILS ON HORSES. ROBERT B. MUSGRAVE, New York, N. Y. Filed Feb. 11, 1902. Serial No. 93,609. (No model.)



Claim.—1. A device for treating shoe-boils on horses, said device comprising two pads adapted to lie against the sides of the body of the horse immediately behind the fore legs, a connection between the pads, the connection passing under the body of the horse, a saddle adapted to lie on the back of the horse, connections between the sides of the saddle and the pads, a breast-strap attached to the connection between the pads under the horse and extending forward, said breast-strap having branches passed over the shoulders of the horse and connected to the saddle, and a device connected to the saddle and extending backward to the tail of the animal to prevent the saddle working forward.

2. A device for treating shoe-boils on horses, said device comprising two pads adapted to lie against the sides of the body of the horse immediately behind the fore legs, and means for holding said pads in position, said means comprising a connection between the pads, the connection passing under the horse, a saddle-like member lying on the back of the horse and connected with the pads, and fastenings extending forward and rearward from said parts to prevent forward and rearward displacement thereof.

3. A device for treating shoe-boils on horses, said device comprising two pads adapted to lie against the sides of the body of the horse immediately behind the fore legs, a connection between the pads, said connection passing under the body of the horse, a saddle-like member lying on the back of the horse and connected with the pads to support them, and means attached to said connection between the pads and extending forwardly over the shoulders of the horse, to prevent the rearward displacement of said parts.

4. A device for treating shoe-boils on horses, said device comprising two pads adapted respectively to lie at the sides of the body of the horse immediately rearward of the fore legs, and said pads having extended

coverings projected from the ends thereof, a middle-like member having connection with the covering extensions at the upper ends of the pads to sustain the pads, and a connection between the cover extensions at the lower ends of the pads, said connection passing under the body of the horse.

708,908. CATCH. DAVID W. MCCLAY, Newark, N. J., assignor to the Tea Tray Company of Newark, N. J. Filed Dec. 20, 1900. Serial No. 40,668. (No model.)

Claim.—1. In a catch, an arm adapted to be pivoted at one end and having at the other end a laterally-opening slot adapted to engage a coöperating catch member, and a tongue or extension projecting laterally from said arm at the side opposite that having the said slot and being bent out from the plane of the arm and doubled or returned to lie adjacent to the face of the slotted end of the arm, said returned portion being slotted in alinement with the slot in the arm.

2. In a catch, an arm hooked at one end to engage a coöperating catch member, and adapted at the other end to be pivoted, and having at said hooked end a lateral tongue or extension bent out from the plane of the arm and returned to lie adjacent to the face of the arm and being slotted.

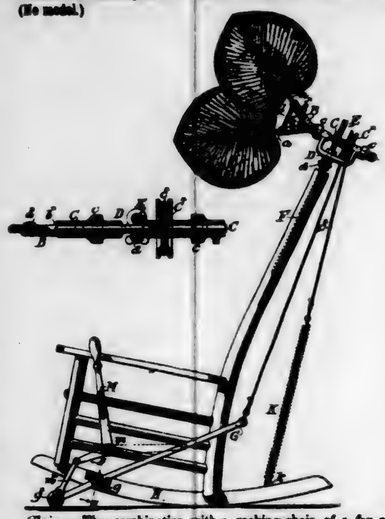
3. In a catch, a sheet-metal arm adapted to engage a coöperating catch member and having at one end means for pivoting, and at the other end a laterally-facing hook at one edge and at the opposite edge an extension, the extension being bent out of the plane of the body portion of the arm and returned to lie adjacent to said body portion and having in itself a keyhole-slot.

708,904. SIGNALING-MACHINE. HENRY L. MCGOWAN, St. John, Canada. Filed Jan. 28, 1902. Serial No. 90,998. (No model.)

Claim.—1. In a signal-tower for a tidal water the combination of a reservoir, having a supply-pipe for admitting thereto a head of the tidal water, devices for shutting off such tidal water, an air-vent, a regulating-cock to secure an adjusted flow of the water from the reservoir into a tip-tank as described, devices for operating a signal-gong by the tipping of said tip-tank, a waste-tank for receiving the used water from the tip-tank, and devices for discharging such water from the tower and for preventing the tidal water from flowing back into the waste-tank substantially as and for the purposes described.

2. In a signal-tower the combination of a reservoir having devices for supplying the same with a constant head of water, as described, a regulating-cock to secure an adjusted flow of said water in the reservoir into a tip-tank as described, devices for operating by the tipping of said tip-tank a signal-gong, and devices for discharging from the tower the used water of the tip-tank, substantially as and for the purposes described.

708,905. FAN ATTACHMENT FOR ROCKING-CHAIRS. JACOB S. MCELWEE, Philadelphia, Pa. Filed Oct. 11, 1899. Serial No. 733,254. (No model.)

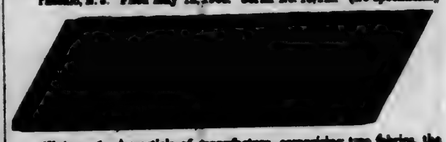


Claim.—The combination with a rocking-chair, of a fan-carrying spindle capable of being rotated, fans carried thereby, an adjustable bracket secured to one of the side posts of the chair and in which said spindle is mounted, ball-bearings for said spindle carried by the bracket, a pulley mounted on said spindle, a lever pivotally mounted on one of the rockers of the chair and having one end contacting with the floor, a spring having one end secured to one of the chair-rockers, a cord connected to the opposite end of the spring and to the high end of the lever, said cord passing over the pulley of the fan-carrying spindle, a hand-lever pivotally mounted on one of the rounds of the chair, and a slotted link connecting said levers whereby the lever in contact with the floor may be vibrated to operate the fans by the movement of the hand-lever, without the necessity of rocking the chair, substantially as described.

708,906. CHECKING DEVICE FOR HARNESS. HENRY D. MCKINNEY, Janesville, Wis. Filed Apr. 30, 1901. Serial No. 58,174. (No model.)

Claim.—In a checking device, a rounded hook having a shoulder near its base on the inner side thereof combined with a loop detachably engaging the hook and arranged to normally lie under said shoulder, and the loop having a slot and a spring-tongue inside said slot, the rear wall of the slot being rounded and the free end of the tongue being correspondingly rounded and such rounded portions being contiguous to and of a curvature corresponding with said hook below said shoulder, and the loop consisting of sheet metal in one piece and lying in a single plane.

708,907. STUFF-FINISHED WOVEN FABRIC. ANDREW MCLEAN, Passaic, N. J. Filed May 12, 1902. Serial No. 106,462. (No specimens.)

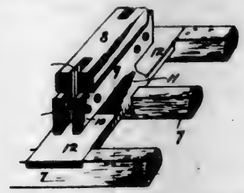


Claim.—1. An article of manufacture, comprising two fabrics, the edges of which are woven together into single-ply selvages, the threads in said selvages being woven back upon themselves so as to prevent unraveling, the two fabrics being secured together by sizing.

2. An article of manufacture, comprising two fabrics, the edges of which are woven together into single-ply selvages containing threads woven back upon themselves to prevent unraveling, said two fabrics being permanently secured together by sizing so as to form a two-ply cloth.

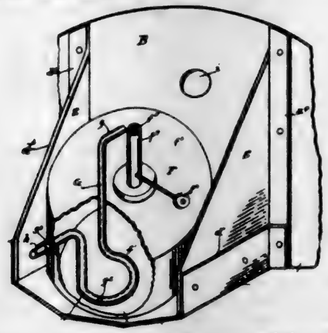
3. An article of manufacture, comprising a middle portion and edge portions of woven cloth, said edge portions terminating in threads woven back upon themselves to prevent unraveling, and said middle portion being composed of a plurality of fabrics secured together by sizing so as to form a compound cloth.

708,908. RAILWAY-TRACK JOINT. THOMAS C. MCLEE, Seattle, Wash. Filed Apr. 18, 1901. Serial No. 56,372. (No model.)



Claim.—In a rail-joint, a base-plate, a rail-section formed integral with said base-plate, fish-plates having upper and lower engaging faces extending on each side of said rail-section and having a space between said fish-plates and said base, substantially as specified.

708,909. FLASH-LIGHT APPARATUS. CHARLES H. HEINOLA, St. Louis, Mo. Filed Nov. 29, 1901. Serial No. 84,052. (No model.)



Claim.—1. A flash-lamp comprising a reservoir and a burner, a fluid-receiving and blast tube having air-inlet and fluid-discharging ends, and a portion of said tube intermediate said ends extending within the reservoir and provided with fluid-induction opening, and the discharging end of said tube extending upwardly and disposed transversely to the flame of the burner, and means for forcing air through said tube.

2. A flash-lamp comprising a reservoir and a burner, a fluid-receiving and a blast tube having an air-inlet and fluid-discharging end, and an intermediate portion of said tube extending within the reservoir and the fluid to be discharged and having a fluid-induction opening, said fluid-discharging end of said tube extending upwardly and being disposed transversely to the flame of the burner, a pneumatic blast device connected with the inlet-opening in said tube, and a check-valve between said device and the said induction-opening.

3. In a flash-light apparatus, a flash-pan, an upright shield having an opening therein, and a flame-guiding tube arranged above said pan opposite said opening, substantially as described.

4. In a flash-light apparatus, a flash-pan, an upright perforate shield, having an opening therein, a flame-guiding tube arranged above said pan opposite said opening, and a flame-deflector at the outer end of said tube, substantially as described.

5. In a flash-light apparatus, a flash-pan, an upright shield having an opening therein, a tube connected with said shield and said opening and arranged above said pan, and a flame-deflecting plate on the outer end of said tube, inclined outwardly and downwardly.

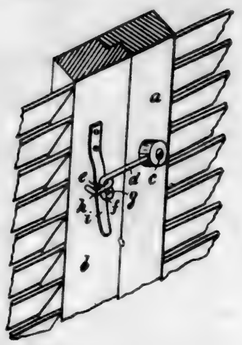
6. In flash-light apparatus, a flash-pan and a flame-spreading receiver for the fulminating material having an outwardly-flaring discharging end.

7. In flash-light apparatus, a flash-pan, and flame-spreading receivers for the fulminate upon said pan, having outwardly-flaring ends and inwardly-converging ends extending toward each other, provided with openings for the train of the fulminate.

8. In flash-light apparatus, a receiver for the fulminate, comprising a convex plate having outwardly-flaring outer ends, and an apex provided with an opening, and flanges upon said plate.

9. In flash-light apparatus, a flash-pan, and flame-spreading devices upon said pan for the fulminate, an upright shield having an opening, and a flame-guide upon said shield above said pan connected with said opening, and a flash-light lamp in rear of said shield having its flame opposite the opening in said shield.

708,910. SAFETY LOCKING-HOOK. ARTHUR H. NOYES, Boston, Mass. Filed May 15, 1902. Serial No. 107,513. (No model.)



Claim.—1. A pivoted hook having a projection at its free end, combined with a staple, and a spring entering said staple to lock the hook to the staple.

2. A pivoted hook having a shank portion, a hook proper at the end of the shank portion, a projection at right angles to the hook proper and shank portion, and a portion parallel to the hook proper, combined with a staple, and a spring entering said staple to lock the hook to the staple.

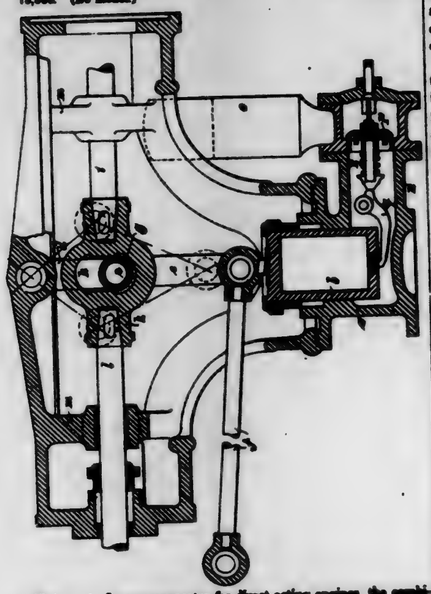
708,911. CHAIR. JAMES O'CONNOR, East Cambridge, Mass. Filed Nov. 14, 1901. Serial No. 82,302. (No model.)

Claim.—1. In a reclining-chair, a frame, a back pivoted to said frame, a spring-controlled rod in each of the arms of said chair, arranged to slide lengthwise thereof, a slide-plate in each of said arms located and guided in a groove formed therein and pivotally connected to said rod, projections upon each of said slides, and a back-rod engaging said projections and supporting said back.

2. In a reclining-chair, a frame, a back pivoted to said frame, a spring-controlled rod in each of the arms of said chair arranged to slide lengthwise thereof, a slide-plate in each of said arms located and guided in a groove formed therein, a hook formed upon each of said slides and engaging an eye formed upon each of said rods, projections upon each of said slides, and a back-rod engaging said projections and supporting said back.

3. In a reclining-chair, a frame, a block pivoted to said frame, a rod arranged to slide lengthwise of each of the arms of said chair, a spring contained in a recess provided in each of said arms controlling said controlling said rods, a slide-plate in each of said arms located and guided in a groove formed therein, a hook formed upon each of said slides and engaging an eye formed upon each of said rods, projections upon each of said slides, and a back-rod engaging said projections and supporting said back.

708,912. EQUALIZING DEVICE FOR STEAM-PUMPS. PHILIP F. OEHEN, Cochemiahen, Germany. Filed Oct. 24, 1901. Serial No. 79,603. (No model.)



Claim.—1. In a compounder for direct-acting engines, the combination with the main piston-rod provided with a cross-head, links pivoted together in said cross-head, and one of said links being also pivoted to a guide-rod, of a piston working in a compounding cylinder for transmitting to the main piston-rod in the second half of the stroke, through the medium of said links, the power stored up in the first half of the stroke, and means for arresting the action of said compounding piston at predetermined points, substantially as described.

2. In a compounder for direct-acting engines, the combination with the main piston-rod provided with a cross-head, links pivoted together in said cross-head, and one of said links being also pivoted to a guide-rod, of a piston working in a compounding cylinder for transmitting to the main piston-rod in the second half of the stroke, through the medium of said links, the power stored up in the first half of the stroke, and means operated by said compounding piston for relieving the pressure thereon at predetermined times, substantially as described.

3. In a compounder for direct-acting engines, the combination with a main piston-rod, provided with a cross-head, links pivoted together in said cross-head, and one of said links being also pivoted to a guide-rod, of a piston working in the compounding cylinder for transmitting to the main piston-rod in the second half of the stroke, through the medium of said links, the power stored up in the first half of the stroke, a compressor-flask in communication with said compounder-cylinder, and a valve between said flask and cylinder, and means operated by said compounding piston for controlling the admission of pressure to said compounding cylinder, substantially as described.

4. In a compounder for direct-acting engines, the combination with the main piston-rod provided with a cross-head, links pivoted together in said cross-head, and one of said links being also pivoted to a guide-rod, of a piston working in the compounding cylinder for transmitting to the main piston-rod in the second half of the stroke, through the medium of said links, the power stored up in the first half of the stroke, a compressor-flask in communication with said compounder-cylinder, means for maintaining a constant pressure in said flask, a valve between said flask and cylinder, and means operated by said compounding piston for controlling the admission of pressure to said compounding cylinder, substantially as described.

5. In a compounder for direct-acting engines, the combination with the main piston-rod, a compounding cylinder, a piston in said cylinder, and means for transmitting motion from said second piston to the first, of a compressor-flask, a valve between said flask and cylinder, a lever having one arm engaging said valve and another arm operated by said second piston for controlling the admission of pressure to said cylinder, substantially as described.

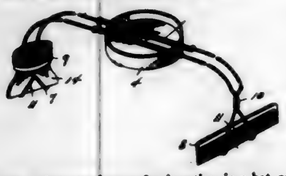
6. In a compounder for direct-acting engines, the combination with the main piston-rod, a compounding cylinder, a piston in said cylinder, and means for transmitting motion from said second piston to the first, of a compressor-flask, a valve between said flask and cylinder, and an arm on said piston engaging a stop on the valve-stem for controlling the action of said valve, substantially as described.

7. In a compounder for direct-acting engines, the combination with the main piston-rod, a compounding cylinder, a hollow piston in said cylinder, and means for transmitting motion from said second piston to the first; of a compressor flask or reservoir, a pipe or conduit provided with apertures on the sides thereof, extending from said reservoir into said hollow piston, and a sleeve on said piston adapted to close said apertures, substantially as described.

8. In a compounder for direct-acting engines, the combination with the main piston-rod, a compounding cylinder, a hollow piston in said cylinder, and means for transmitting motion from said second piston to the first; of a compressor flask or reservoir, a pipe or conduit extending from said reservoir into said hollow piston, and a valve on the end of said pipe adapted to be operated by said piston, substantially as described.

9. In a compounder for direct-acting engines, the combination with the main piston-rod, a compounding cylinder, a hollow piston in said cylinder, and means for transmitting motion from said second piston to the first, of a compressor flask or reservoir, a pipe or conduit extending from said reservoir into said hollow piston, and a valve on said pipe operated when the pressure in said compounding cylinder falls below that in the reservoir, substantially as described.

708,918. HAT ATTACHMENT. ALFRED CLASS, San Diego, Cal. Filed Dec. 31, 1901. Serial No. 87,961. (No model.)



Claim.—1. A hat attachment for insertion in a hat comprising a mirror, and members adjustable in the mirror and provided with angular extremities having terminal means for holding a brush and comb.

2. An attachment for removable insertion in a hat comprising a mirror, and members telescopically adjustable in relation to each other and passing through a portion of the mirror and having depending terminals provided with means for holding a brush and a comb, the said terminals being insertible inside the sweat-band of a hat.

3. An attachment for removable insertion in a hat comprising a reflecting device, and adjustable members in relation to said reflecting device and provided with resilient terminal holders for removably retaining a brush and a comb.

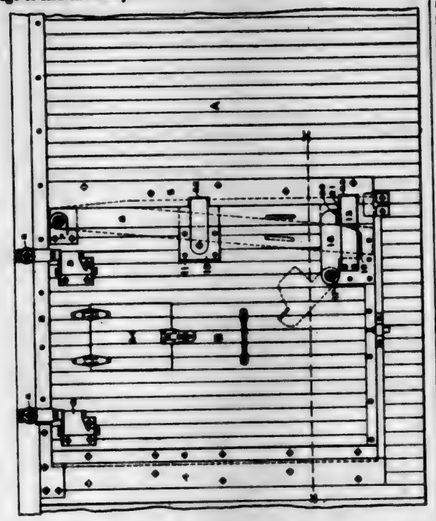
708,914. FLUSH CAR-DOOR. KNUD OHR, St. Paul, Minn. Filed Sept. 20, 1901. Serial No. 75,898. (No model.)

Claim.—1. The combination with a car formed with a door-opening, and a door slidably supported in connection therewith, of a strip fixedly secured to the outside of the car along one side of said opening, said strip projecting inwardly over the door-opening, and a strip secured to the corresponding edge of the door, said strips overlapping when the door is closed, a strip secured to the outside of the car along the opposite edge of the door, a locking-strip movably secured to the adjacent edge of the door in position to be carried under said fixed strip, guides for said locking-strip, and a dog supported alongside said locking-strip, as and for the purpose set forth.

2. The combination with a car formed with a door-opening and a door slidably supported in connection therewith, of a strip fixedly secured to the car along one side of the door-opening, and a strip having pivotal support at the upper corner of the corresponding edge of the door in position to be carried beneath said fixed strip when the door is closed.

3. The combination with a car formed with a door-opening, and a door slidably supported in connection therewith, of a metal strip fixedly secured to the car along one side of the door-opening, a strip pivoted to the upper portion of the adjacent edge of the door in position to be carried under said fixed strip when the door is closed, and means for holding said pivoted strip under the edge of said fixed strip.

4. The combination with a car formed with a door-opening, and a door slidably supported in connection therewith, of a strip fixedly secured to the outer face of said car along one side of the door-opening, a strip having pivotal support at the upper portion of the corresponding edge of the door in position to be carried under said fixed strip, guides for said pivoted strip, and means for holding said pivoted strip underneath the edge of said fixed strip.



5. The combination with a car formed with a door-opening, and a door supported in connection therewith, of strips secured to the outside of the car along each side of said opening, a strip secured along one edge of the door, a locking-strip pivotally secured to the opposite upper corner of the door in position to be carried under the adjacent strip when the door is closed, a guide secured to the corresponding lower corner formed with an opening to receive the end of said locking-strip, and a dog for holding said locking-strip under the adjacent strip.

6. The combination with a car formed with a door-opening, and a slidable door arranged in connection therewith, of a metal strip secured to the car at one side of the door-opening and projecting inwardly beyond the edge of the same, a strip secured to the car along the opposite edge of the door-opening, a locking-strip having pivotal support at the upper corner of the corresponding edge of the door in position to be carried under the adjacent strip when the door is closed, a guide secured to the corresponding lower corner of the door, said guide being formed with an opening to receive the end of said locking-strip, and a dog having pivotal support upon said door and formed with a tongue projecting into the opening in said guide alongside said strip to hold said strip under the edge of the adjacent strip.

708,915. GATE. WILLIAM B. OTT and FRANK L. PERSYL, Riverside, Iowa. Filed Apr. 12, 1902. Serial No. 102,882. (No model.)

Claim.—1. The combination with a foldable slatted gate hold to rock on a post and counterbalanced thereon, of means for operating said gate, comprising a rockably-supported lever, a tilting bar jointed by one end on an end of the gate, a connecting-rod hinged on the upper portion of the gate between its ends, the tilting bar and connecting-rod crossing each other, and a projection on the lever adapted to loosely connect it with the bar and rod, so as to actuate them and rock the gate to open and close it when the lever is rocked.

2. The combination with a post, two parallel bars pivoted near the ends on the upper and lower portions of the post, the lower parallel bar having a transverse slot near one end which loosely receives the lower pivot-bolt, a series of spaced pailings pivoted on the gate-bars, and a counterbalance on a projecting end of the upper gate-bar, of a slotted tilting bar hinged by one end on the weighted end of the upper gate-bar, a slotted connecting-rod held to rock by one end on the upper gate-bar between its ends, a rockably-supported lever-bar having a projection thereon which loosely engages the slots in the connecting-rod and tilting bar, and means to rock the lever.

3. The combination with a post, and a gate comprising two parallel bars pivoted upon the post, the upper bar being extended to receive a counterbalance-weight, of a plurality of spaced pailings pivoted upon the gate-bars, and operating means for the gate, comprising two upright spaced stanchions, a lever-bar pivoted on one stanchion and held to rock at the side of the other stanchion, a rocking lever pivoted on the last-mentioned stanchion above the lever-bar, a link loosely connecting the rocking lever with the lever-bar between the stanchions, a slotted tilting bar hinged upon the weight-block or upper gate-bar extension, a slotted connecting-rod pivoted by one end on the upper bar of the gate, and loosely engaged in its slot by a bent arm mounted upon the lever-bar which arm also engages in the slot in the tilting bar, and means pendent from the outer ends of the lever-bar and the rocking lever, for manually operating the gate mechanism to open or close it.

4. In a device of the character described, the rockably-supported gate, a counterbalance therefor, a tilting bar held loosely by one end on the counterbalanced end of the gate, a connecting-rod hinged by one end on the gate and crossing the tilting bar, a rockable lever, and means to loosely connect the lever with the tilting bar and connecting-rod.

708,916. LABEL FOR BOTTLES, &c. ORRIN C PAINTER, Baltimore, Md., assignor of one-half to Lew S. Groomsbridge, Joseph S. Groomsbridge, and R. R. Friedenwald, Baltimore, Md. Filed Feb. 19, 1902. Serial No. 94,282. (No model.)

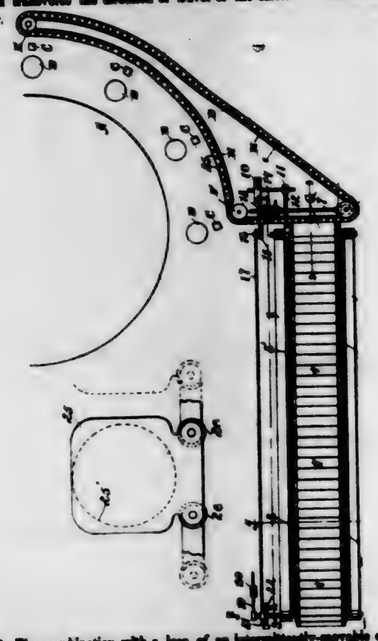
Claim.—1. A label for bottles or other receptacles comprising a folder having an inner and an outer leaf, a leaf or leaves inclosed between them and containing advertising or other printed matter, the said folder being adapted for attachment to the receptacle or bottle and the intermediate leaf or leaves being exposed by rupturing the outer leaf, substantially as described.

2. A label for bottles or other receptacles comprising a folder having an inner and an outer leaf, a leaf or leaves inclosed between them and containing advertising or other printed matter, the said folder being adapted for attachment to the bottle or receptacle, the said intermediate leaf or leaves being continuous with the inner leaf and being exposed by rupturing the outer leaf, substantially as described.

3. In combination with a bottle or other receptacle, a label consisting of a sheet of material folded to provide a leaf which is attached to the bottle and an outer leaf, said leaves or folds having between them a leaf containing advertising or other printed matter, the said outer leaf being attached at its free edge and having means whereby it may be ruptured along a certain line, substantially as described.

708,917. PLANT FOR THE MANUFACTURE OF GLASSWARE. RICHARD M. PAINTER, Washington, Pa. Filed May 24, 1901. Serial No. 61,776. (No model.)

Claim.—1. The combination with a loer, of a carrier located therein and traveling longitudinally of the loer, and a ware-carrier located outside of the loer and having a delivery portion traveling across the receiving-opening of the loer and across the receiving end of the loer-carrier, and transverse the direction of travel of the carrier located within the loer.



2. The combination with a loer, of an intermittently-movable carrier located within the loer, a continuously-movable carrier located outside of the loer and having a delivery portion extending transverse the loer-carrier, a motor operatively connected with said carriers, and means interposed between the motor and said intermittently-movable carrier for moving the latter intermittently.

3. The combination with a loer, of a carrier located therein, a ware-carrier located outside the loer and having a delivery portion extending transverse of the loer and a curved extended receiving portion.

4. The combination with a loer, of an intermittently-movable carrier therein, and a continuously-movable ware-carrier located outside the loer to receive the ware at the point of manufacture and deliver it to loer and operative connections between said carriers.

5. The combination with a loer, of a carrier therein traveling longitudinally of the loer and provided with transversely-arranged shelves to receive a plurality of articles in a row transverse the loer, and a ware-carrier located outside the loer and composed of small shelves to receive each a single article, said ware-carrier having a delivery portion extending transverse the loer to deliver the articles singly but in rows to said transverse shelf of the carrier in the loer.

6. The combination with a loer, of a carrier therein, carrier-wheels located outside and at opposite sides of the receiving end of the loer, a carrier-wheel located at a distance therefrom, and a carrier passing around said wheels, thus constituting a delivery portion transverse the loer, and an elongated extended receiving portion.

7. A plant of the nature described including a loer, and a ware-carrier having a curved receiving portion and a straight delivery portion extending transverse of and adjacent the receiving end of the loer.

8. A plant of the nature described including a loer, a carrier therein, a ware-carrier having its delivery end adjacent the receiving end of the loer-carrier, means for driving the ware-carrier, and a ratchet mechanism driven by the ware-carrier and propelling the loer-carrier.

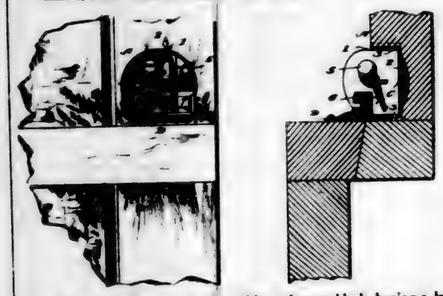
9. A plant of the nature described comprising a loer, a carrier therein, a ware-carrier, said carriers operatively connected, and an interposed disconnecting device.

708,918. PROCESS OF PRODUCING ENAMELED POLYCHROME PHOTOGRAPHS, &c. EMILE PERROT, Châtelain de Ribbes, France. Filed Mar. 24, 1902. Serial No. 99,732. (No specimens.)

Claim.—1. The process of producing vitrified enameled polychrome articles, which consists in taking a suitable transparent or translucent base, applying to said base a layer of sensitized emulsion, impressing the outlines of a picture upon said layer, brushing the said sensitized surface with vitrifiable powder, successively superimposing on said powder vitrifiable colors, eliminating the undecomposed part of the emulsion and baking the article, substantially as described.

2. The process of producing vitrified enameled polychrome articles, which consists in taking a suitable transparent or translucent base, applying to said base a layer of sensitized emulsion, impressing the outlines of a picture upon said layer by the action of light, brushing said sensitized surface with vitrifiable powder having a neutral tint, successively applying vitrifiable powders of different colors, the darkest underneath, eliminating the undecomposed part of the sensitized emulsion and vitrifying the article, substantially as described.

708,919. SASH-LOCK. JOHN T. PETRICK, Carbondale, Pa. Filed Mar. 4, 1902. Serial No. 96,902. (No model.)

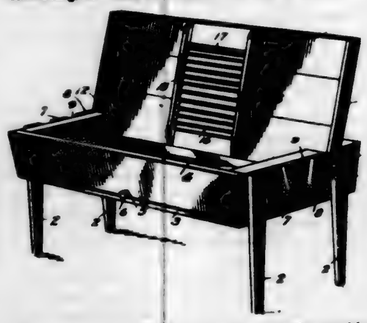


Claim.—1. The combination with a plate or block having a lug thereon, and adapted to be secured on the meeting-rail of the lower sash of a window, of a cup having a vertical slot in its bottom and extending into its sides, a catch having bearings which turn or rock in the ends of said slot, said catch having a notch to receive the lug on the plate or block on the other sash, and a spring for retaining the catch in one of two extreme positions.

2. The combination with a plate or block having a lug thereon, and adapted to be secured on the meeting-rail of the lower sash of a window, of a cup having a vertical slot in its bottom and extending into its sides, a catch having bearings which turn or rock in the ends of said slot, said catch having a notch to receive the lug on the plate or block on the other sash, a spring for retaining the catch in one of two extreme positions, the position of the catch in the slot being such that the walls of the side or flange of the cup form a stop in one direction for the catch.

3. The combination with a cup having a round flange or casing, of a catch pivoted therein and adapted to be housed in the cup when closed, said catch pivoted at one side of the cup-center and the flange or casing limiting its movement when swung open or outward.

708,920. DEVICE FOR WASHING DIAPERS. JOHN W. REED, Greensburg, Pa. Filed Feb. 11, 1902. Serial No. 93,589. (No model.)



Claim.—A washing device of the class set forth comprising a tank having legs and exteriorly-located end blocks with spaces between them, and a board of such dimensions as to cover the tank and having a cleaning device extending transversely across the center of one side and also provided with corner-recesses at one side edge portion and strips with projecting ends adjacent to said recesses, the recesses permitting the board to embrace the ends of the tank and to partially extend downwardly into the latter, and the projecting ends of the strips being detachably insertible in the spaces between the end blocks, the spaces between the pairs of the latter and one of the same and one of the tank-legs being such as to have the board stand at different angles when the said ends are in engagement therewith.

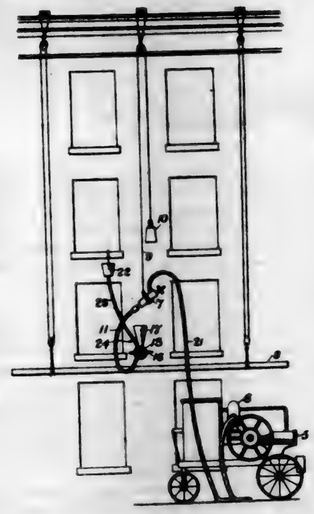
708,921. PROCESS OF MANUFACTURING CALCIUM CARBID. ISAIAH L. ROGERS, New York, N. Y. Filed Mar. 18, 1897. Serial No. 628,197. (No specimens.)

Claim.—1. The process of manufacturing carbid of calcium which consists in the admixture of lime and anthracite coal.

2. The process of manufacturing carbid of calcium which consists in the admixture of lime and finely-granulated anthracite coal.

3. The process of manufacturing carbid of calcium which consists in the admixture of molten lime and anthracite coal.

708,922. BUILDING-RENOVATING APPARATUS. DAVID F. SAER, New York, N. Y., assignor to New York Stone, Brick & Terra-Cotta Renovating Company, of New York. Filed Apr. 17, 1901. Renewed Jan. 28, 1902. Serial No. 91,775. (No model.)



Claim.—1. In a building-renovating apparatus, the combination with a source of power of a motor; means to adjustably suspend the same adjacent to the workman's platform; a flexible shaft connected with said motor, and an abrading-tool operated by said shaft.

2. A building-renovating apparatus, comprising a portable air-compressor, a motor adjustably suspended adjacent to the workman's platform, a flexible shaft connected with said motor, a disk operated by said shaft, and means to feed abrading-powder to the face of said disk, as and for the purpose set forth.

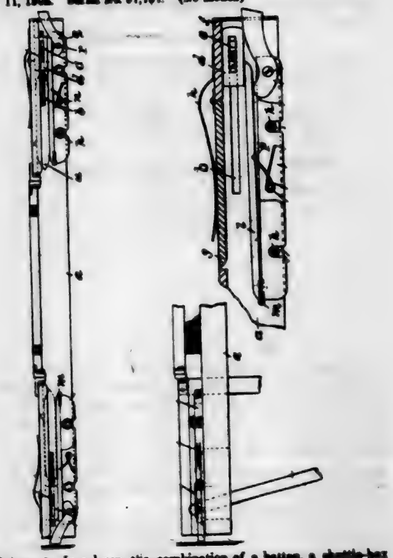
3. A building-renovating apparatus, comprising a portable air-compressor, a motor adjustably suspended adjacent to the workman's platform, a flexible shaft connected with said motor, a disk operated by said shaft, a casing inclosing said disk, and means to feed abrading-powder through said casing to the face of said disk, as and for the purpose set forth.

4. A building-renovating apparatus, comprising a source of power, a motor mounted within reach of the workman operating the abrading-tool, an abrading-tool, flexible connections between the source of power and said motor, and flexible connections between the motor and said tool, as and for the purpose set forth.

5. A building-renovating apparatus comprising a portable air-compressor, a motor adjustably suspended adjacent to the workman's platform, a flexible tube connecting said compressor and said motor, a flexible shaft connected with said motor, a disk operated by said shaft, a casing inclosing said disk, a powder-receptacle connected with said casing, and in communication with the interior thereof adjacent to the face of said disk, and means to convey a liquid to the face of said disk, as and for the purpose set forth.

6. A building-renovating apparatus comprising a portable engine and air-compressor, a motor adjustably mounted adjacent to the workman's platform, flexible connections between the compressor and said motor, a flexible shaft connected with said motor, a disk composed of abrading material operated by said shaft, a casing inclosing said disk, a powder-receptacle in communication with the interior of said casing adjacent to the face of said disk, a water-receptacle, and a flexible tube connecting said water-receptacle with the interior of said casing, as and for the purpose set forth.

708,923. SHUTTLE-CHECK. THEODORE SCHELPENDAAM, Paterson, N. J., assignor of one-half to Samuel Sutter, Paterson, N. J. Filed Mar. 11, 1902. Serial No. 97,797. (No model.)



Claim.—1. In a loom, the combination of a batten, a shuttle-box arranged on said batten and having one of its longitudinal walls movable, a suitable support secured on said batten, said wall being pivoted to the support, and a lever pivoted on the support and engaging the outer face of said wall at one of its ends and adapted to project into alinement with the shuttle at its other end, substantially as described.

2. In a loom, the combination of a batten, a shuttle-box arranged on said batten and having one of its longitudinal walls movable, a suitable support adjustably secured on said batten, said wall being pivoted to the support, and a lever pivoted on the support and engaging the outer face of said wall at one of its ends and adapted to project into alinement with the shuttle at its other end, substantially as described.

3. In a loom, the combination of the batten, a picker arranged to reciprocate on the batten, a shuttle-box having one wall movable, a plate secured on the batten, said wall being pivoted to the plate at its inner end, and a lever pivoted on said plate and engaging said wall at one end and adapted to project across the path of movement of the picker at its other end, substantially as described.

708,924. CONVEYER-CHAIN. JOHN S. SCOTT and JOSEPH G. BERGER, Structville, Pa. Filed Apr. 18, 1902. Serial No. 103,512. (No model.)

Claim.—1. In a chain, a link formed in a single solid piece and having a depressed end, a flange partly inclosing said end, and an inclined wall to the flange forming a socket.

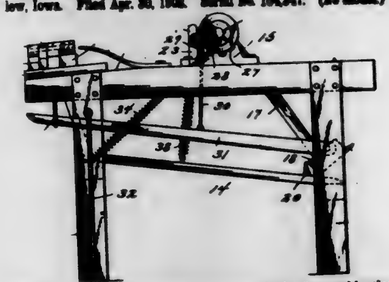
2. In a chain, a link having depressed ends, a semicircular flange partly inclosing one of said ends and forming a socket having its greatest diameter at the bottom, and a tapered circular stud extending laterally from the other end of the link, said stud having its greatest diameter at its outer end.

3. In a chain, a link having enlarged offset ends depressed on opposite sides respectively, a semicircular flange partly inclosing one of said ends and forming a socket having its greatest diameter at the bottom, and a tapered circular stud extending laterally from the other end of the link, said stud having its greatest diameter at its outer end.

4. The combination with a link having depressed ends provided with a socket and stud respectively, of a lug upon the link, an arm, a head thereto having a recess for the reception of the link and lug, means for securing the head to the link, and a flight secured to the arm.

5. A chain comprising a series of links each having enlarged offset ends depressed on opposite sides respectively, a semicircular flange upon one end forming a socket having its greatest diameter at the bottom, a circular tapered stud at the other end of the link having its greatest diameter at its outer end, said stud being adapted to engage a socket and interlock therewith, a lug upon each link, and a flight-arm engaging each lug and its link.

708,925. CALK-CUTTING MACHINE. FRED H. SEAGREN, Curlew, Iowa. Filed Apr. 30, 1902. Serial No. 104,347. (No model.)



Claim.—1. In a machine of the class set forth, the combination of a bed having an anvil thereon adjacent to one end, a transversely-extensible shaft extending over the bed, an arm secured to the shaft and having a weighted head with a cutter, the said arm being movable through a part of the bed and adapted to be overthrown by the shaft, a drum loosely mounted on the shaft and having means in connection therewith for automatically causing the same to be rotated with the shaft and become released to move independently of the latter, and means for rotating the drum and shaft.

2. In a machine of the class set forth the combination of a bed having an anvil thereon adjacent to one end thereof, a swinging arm carrying a head with a cutter to coöperate with said anvil and movable through the bed, means for returning the arm to a normal position, the said arm being normally located beneath the bed, and a rebounding device adjacent to the anvil with which the said arm is adapted to contact.

3. In a machine of the class set forth, the combination of a work-supporting bed having an anvil arranged thereon near one end, a rotatable shaft held above the bed, an arm secured to said shaft and having a cutter at its free end, the said arm movable through the bed and having a cutter thereon normally disposed below the latter, and means for automatically returning the arm and the shaft to normal position.

4. In a machine of the class set forth, the combination of a work-support, a rotatable arm carrying a cutter to coöperate with said support and movable through the latter, the greater portion of the arm carrying the cutter being normally disposed below the bed, an inclined rest device below the bed against which the free end of the arm carrying the cutter normally rests, and means for throwing the arm over in engagement with the work-support, and means for automatically returning the arm to normal position.

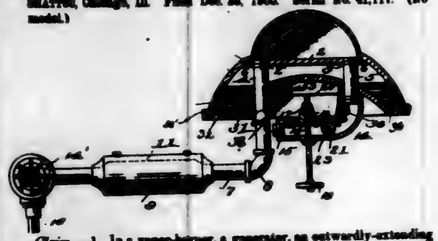
5. In a machine of the class set forth, the combination of a work-support, a transversely-extending rotatable shaft, means for returning the shaft to normal position, a shouldered collar on the shaft, a drum loosely mounted on the shaft and having a clutch-slide movably mounted thereon an arm secured to the shaft and having a cutter to coöperate with the work-support, means for releasing the clutch-slide of the drum, means for operating the shaft to throw the arm and cutter over into engagement with the work-support, and means for returning the shaft and arm to normal position.

6. In a machine of the class set forth, the combination of a work-support and holding means, a shaft having means for returning it to normal position and provided with a shouldered collar, a drum loosely mounted on the said shaft and having a spring attached thereto and adapted to partially wind thereon, a clutch-slide carried by the drum and normally engaging the shoulder of the collar, means for releasing the said slide from the shoulder of the collar, an arm secured to the shaft and having a cutter thereon, and means for rotating the drum and shaft through the medium of the clutch-slide to throw the arm and its cutter over into engagement with the work-support and holding means.

7. In a machine of the class set forth, the combination of a work-support, a rotatable shaft having means to return it to normal position and also provided with a shouldered collar, an arm having a cutter secured to said shaft, a drum rotatably mounted on the shaft and provided with a clutch-slide to engage the shoulder of the collar, means for releasing the clutch-slide from the shoulder of the collar, a spring attached to the drum and adapted to partially wind thereon, a flexible pulling device also attached to the drum and partially surrounding the same, and an operating-lever connected to the pulling device.

8. In a machine of the class set forth, the combination of a work-support, a shaft having means for returning it to normal position and carrying a projecting device, a rotatable element loosely mounted on the shaft adjacent the projecting device and having means to interlock with the latter, a device for releasing the drum from the projecting device of the shaft, and means for operating the drum to actuate the shaft and the arm carrying the cutter.

708,926. VAPOR-BURNER. CHARLES S. SEATON and CLARK E. SEATON, Chicago, Ill. Filed Dec. 26, 1900. Serial No. 41,117. (No model.)



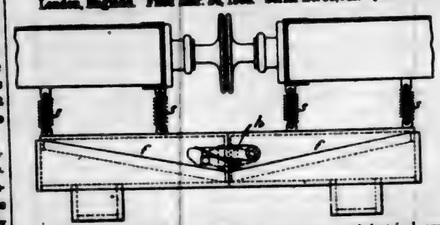
Claim.—1. In a vapor-burner, a generator, an outwardly-extending ridge formed integral with the bottom of said generator, a vapor-reservoir arranged below said generator and in communication therewith, a concaved spreader interposed between said generator and reservoir, said spreader having a centrally-arranged opening and further provided with a flange, and a burner mounted upon said flange, provided with a shoulder engaging said rib, and consisting of a conical ring provided with a circumferentially-extending series of rows of jet-passages.

2. In a vapor-burner, the combination with a generator and a vapor-reservoir in communication therewith, of a concave spreader having a centrally-arranged opening and terminating at its bottom with a horizontally-extending flange, and a substantially conical-shaped burner supported upon said flange and engaging at its top with said generator.

3. In a vapor-burner, a concave spreader provided with a flange and a centrally-arranged opening, and a burner supported by said flange and consisting of a substantially conical-shaped ring formed with a circumferentially-extending series of rows of jet-openings and having the concavity thereof receive the convexity of the spreader.

4. In a vapor-burner, the combination with a generator, a vapor-reservoir in communication therewith, and means for regulating the flow of vapor from said reservoir, of a concave spreader interposed between the generator and reservoir and having a centrally-arranged opening and terminating at its bottom in a horizontally-extending flange, and a burner supported at its bottom upon said flange and connected at its top to the bottom of said generator.

708,927. DEVICE FOR CONNECTING THE ELECTRICAL GEAR OF ELECTRIC CARS. ALEXANDER SIEMENS, Westover, Hilford-on-Sea, England, assignor to Siemens Brothers & Co., Limited, Westminster, London, England. Filed Mar. 24, 1902. Serial No. 99,749. (No model.)

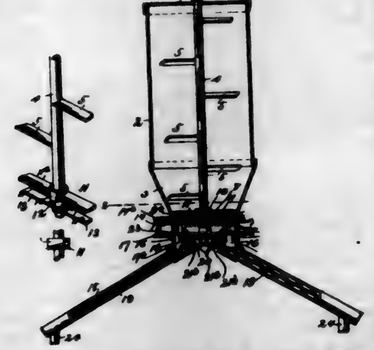


Claim.—A device for connecting the electrical gear of electrical cars, consisting of frames each carrying a controller and relay provided with flexible conductors, said frames suspended from the ends of each car, means for connecting the adjacent frames of two cars together, and means for suitably coupling the shafts of the controllers together, substantially as herein shown and described.

708,928. HAY-RACK. JOSEPH STEMEN, Valparaiso, Ind., assignor of one-half to Jacob Stemen, Valparaiso, Ind. Filed July 21, 1902. Serial No. 116,370. (No model.)

Claim.—A hay-rack comprising a base-frame, end frames mounted upon the base-frame and each comprising top and bottom and side pipes coupled together, the bottom pipes being detachably connected to the base-frame, brace-frames arranged adjacent to the end frames and each consisting of a cross-pipe detachably connected to the base-frame and inclined side pipes coupled at their lower ends to said cross-pipe and at their upper ends to the upper couplings of the adjacent end frame, so that the top pipe of the end frame is common to both frames, and side bars uniting the end and intermediate frames, substantially as and for the purpose set forth.

708,929. SANDER. SAMUEL T. STEPHENS and WALTER T. MOORE, Columbus, Ohio. Filed June 10, 1902. Serial No. 111,094. (No model.)



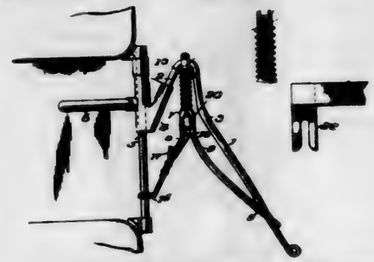
Claim.—1. In a sander, the combination of a sand-box, having outlet-apertures in the bottom, a vertical shaft bearing discharge-blades set at an angle to the bottom thereof with their forward edges in contact therewith to adapt them to scrape the sand off the bottom and raise it, and means for rotating said shaft, substantially as described.

2. In a sander, the combination of a sand-box, having discharge-apertures in the bottom thereof, chambers located below said apertures, rotatable feeders mounted in said chambers, tubes connected to said chambers, screws mounted in said tubes, and means for driving said feeders and said screws, substantially as described.

3. In a sander, the combination of a sand-box, having discharge-apertures in the bottom thereof, a shaft bearing discharge-blades located to scrape the bottom of said box, and cut-off arms carried by said shaft and located beneath said bottom parallel to said discharge-blades, substantially as described.

708,930. MAIL-BAG CATCHER. ROBERT L. SLADE, Washington, D. C., assignor to the Automatic Railway Mail Pouch Delivery Company, Washington, D. C., a Corporation of South Dakota. Filed Dec. 18, 1901. Serial No. 86,468. (No model.)

Claim.—1. The combination with a mail-bag catcher, of an auxiliary device for the purpose stated having a crotch, means holding such device to the catcher to allow of a limited independent movement thereof, said device having two divergent arms, and a spring between the catcher and the crotch of the auxiliary device, substantially as set forth.



2. The combination with a mail-bag catcher having a divergent arm, of an auxiliary device for the purpose stated, means yieldingly holding such device to the catcher to allow of a limited movement thereof, said device having divergent arms one of which is loosely secured to the catcher-arm, substantially as set forth.

3. The combination with a mail-bag catcher having divergent arms and an intermediate crotch, of an auxiliary device arranged between the arms of the catcher and also having divergent arms and an intermediate crotch, and a sliding connection between said device and the crotch of the catcher, substantially as set forth.

4. The combination with a mail-bag catcher having divergent arms and an intermediate crotch, of an auxiliary device arranged between the arms of the catcher and also having divergent arms and an intermediate crotch, and a bifurcated extension projecting from said latter crotch to accommodate the crotch of the catcher, substantially as set forth.

5. The herein-described mail-bag-catching apparatus comprising, in combination, a bar mounted on a car, a forked catcher having divergent arms, an auxiliary device arranged within said catcher, and also having divergent arms, one of said latter arms having a ring on its end, and the other bifurcated at its outer end, designed, respectively, to slidingly engage the said bar, and the outer divergent arm of the catcher, substantially as set forth.

6. The herein-described mail-bag-catching apparatus comprising, in combination, a bar mounted on a car, a forked catcher having divergent arms, an auxiliary device arranged within said catcher, and also having divergent arms, one of said latter arms having a ring on its end, and the other bifurcated at its outer end, designed, respectively, to slidingly engage the said bar, and the outer divergent arm of the catcher, substantially as set forth.

7. The herein-described mail-bag-catching apparatus comprising, in combination, a bar mounted on a car, a forked catcher having divergent arms, an auxiliary device arranged within said catcher, and also having divergent arms, one of said latter arms having a ring on its end, and the other bifurcated at its outer end, designed, respectively, to slidingly engage the said bar, and the outer divergent arm of the catcher, a bifurcated extension projecting from the crotch of said device and designed to accommodate the crotch of said catcher, and a coil-spring encircling said extension, substantially as set forth.

8. The combination with a mail-bag having a rope or chain secured thereto, a ball on said rope or chain, of a catcher mounted on the car, an auxiliary device arranged within said catcher and slidingly connected thereto, said auxiliary device having jaws between which said rope or chain is designed to be caught and by which said ball is designed to be supported, substantially as set forth.

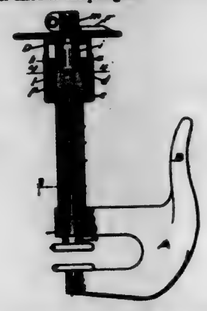
9. The herein-described attachment for mail-bag catchers comprising a V-shaped device designed to be removably positioned within such catcher and having sliding connections therewith, the arms of said device forming jaws, and a spring-catch for closing said jaws, substantially as set forth.

10. The herein-described attachment for mail-bag catchers comprising a V-shaped device designed to be removably positioned within such catcher and having sliding connections therewith, the arms of said device forming jaws, and a spring-catch for closing said jaws, said spring-catch having a cam portion and a plate-spring bearing thereon, substantially as set forth.

708,931. MICROMETER-CALIPERS. JOHN T. SLOCOMB, Providence, R. I., assignor to J. T. Slocomb Company, a Corporation of Rhode Island. Filed May 13, 1902. Serial No. 106,956. (No model.)

Claim.—1. In micrometer-calipers, the combination with a yoke of a barrel having an enlarged exteriorly-threaded upper portion, an annular shoulder thereon, a plunger within the barrel, means intermediate the

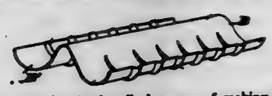
barrel and plunger for holding the latter from rotation, a threaded sleeve mounted upon the enlarged portion of the barrel, a scale-disk fixed to the sleeve, and a pointer fixed to the plunger.



2. In micrometer-calipers, the combination with a yoke of a barrel having an enlarged exteriorly-threaded portion, an annular shoulder thereon, a plunger within the barrel, means intermediate the barrel and plunger for holding the latter from rotation, a sleeve mounted upon the enlarged portion of the barrel provided with a lesser number of threads than the barrel, a scale-disk fixed to the sleeve, and a pointer fixed to the plunger.

3. In micrometer-calipers, the combination with a yoke, of a barrel fixed to said yoke, a plunger traversing said barrel, a bearing-plate upon the lower extremity of the plunger, a head near the upper end of the plunger, a coiled spring surrounding the reduced portion of the plunger, and means upon the plunger-head and engaging the barrel to guide the plunger longitudinally.

708,932. PROCESS OF MANUFACTURING SHEET-METAL PIPE-ELBOWS. EDWARD H. SMITH, Mount Vernon, Ohio, assignor to Dinkelman-Bowers Manufacturing Company, Forest, Ohio, a Copartnership. Filed Nov. 28, 1901. Serial No. 83,782. (No specimens.)



Claim.—1. The herein-described process of making pipe-elbows consisting in shaping up from a plain blank an intermediate blank having opposite longitudinally-extended and parallel semicylindrical portions provided with transverse crimps or corrugations extending to their edges and an intermediate elevated portion, bending such intermediate blank into approximately a cylindrical form, bending the cylinder so formed into elbow form whereby the preliminary crimps or corrugations are flattened radially and flattening said ribs or crimps upon the surface of the elbow, substantially as and for the purposes set forth.

2. The process of producing stovepipe-elbows which consists in forming a plate into a preliminary blank having opposite semicylindrical portions lying approximately in the same plane and separated by an intermediate projecting portion, and crimping or corrugating said semicylindrical portions transversely, bending the intermediate blank so formed into approximately a cylindrical form and bending said cylindrical form into elbow form, substantially as set forth.

3. The improvement in the art of making pipe-elbows with crimps extending partially around the circumference thereof, which consists in shaping up a plain blank into the intermediate blank with longitudinal parallel semicylindrical portions lying in the same direction and crimping them for a short distance from their outer edges to produce transverse crimps which disappear short of the inner sides of the said portions and subsequently transversely and longitudinally bending the intermediate blank into elbow form, substantially as set forth.

708,933. CATAMENIAL SACK. MARTIN H. SPARLDING, Chattanooga, Tenn. Filed Nov. 26, 1900. Serial No. 37,620. (No model.)

Claim.—1. A catamenial sack consisting of a section of fabric having a single eyelet at one end, and tapes secured to opposite corners at the opposite end of the fabric from the eyelet, said tapes being adapted for engagement with the eyelet and to be tied together to support all portions of the fabric, the base of the fabric being adapted to rest upon the hips of the wearer to support the sack.

2. A catamenial sack consisting of a triangular section of fabric, an eyelet formed at the apex of the fabric, and tapes secured to the ends of the base of the fabric and adapted for engagement with the eyelet to support the entire fabric, the ends of the base of the fabric being adapted to rest upon the hips of the wearer and the tapes being adapted to be tied together to hold the base and apex in position.

3. A catamenial sack consisting of a triangular section of fabric having its central portion reinforced and its edges hemmed, a reinforcing-piece secured at the apex of the fabric, said apex portion and reinforcement having an eyelet formed therethrough, and tapes attached to the ends of the base-hem, said tapes being adapted to pass through the eyelet and to be tied together to support the device upon the hips of the wearer, the base of the fabric being adapted to rest across the back and with its ends upon the hips of the wearer to support the sack.

708,934. DRAWING-DOWN DEVICE FOR BANJO-VELLUMS. WALTER J. SERET, Sydney, New South Wales, Australia. Filed Feb. 24, 1902. Serial No. 95,442. (No model.)

Claim.—1. In a drawing-down device for banjo-vellums, an anchor-piece consisting of a base provided with an opening and a hook depending from the side of said base, a puller-piece consisting of a fork having hooked ends and a base provided with an opening and integral with the lower end of the fork, a headed bolt extending through the said openings, the head of said bolt engaging the base of the fork, and a nut mounted on the bolt for securing said anchor and puller pieces in their adjusted position.

2. In a drawing-down device for banjo-vellums, an anchor-piece consisting of a base and a hook depending therefrom, a puller-piece consisting of a fork having hooked ends and a base integral therewith, a bolt extending through the base of said pieces, and a nut mounted on the bolt for securing said anchor and puller piece in their adjusted position.

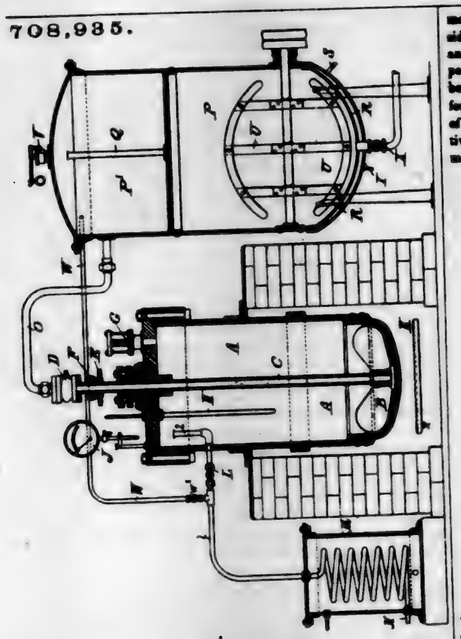
708,935. MANUFACTURE OF VARNISHES. EDWARD H. STRAHAN, London, and EDWARD GRAHAM, Tilehurst, England, assignors of one-half to Edmund Ridsdale Burrell, Hilwall, London, England. Filed Apr. 21, 1902. Serial No. 104,048. (No specimens.)

Claim.—1. The manufacture of varnishes in which hard gum, or resin, a non-volatile drying-oil, and turpentine are employed, by first dissolving the gum, or resin, in an excess of turpentine in a closed vessel at a temperature sufficiently high to dissolve the hard gum, or resin, employed, then filtering, or settling, solid impurities from the solution, then distilling off the excess of turpentine and afterward mixing the non-volatile drying-oil with the solution at a temperature lower than that at which turpentine would be evaporated; substantially as hereinbefore described.

2. The manufacture of varnishes, in which hard gum, or resin, a non-volatile drying-oil and turpentine are employed by first dissolving the gum, or resin, in an excess of turpentine in a closed vessel at a temperature of or about 300° to 350° centigrade, then filtering, or settling, the solution to remove solid impurities, then distilling off excess of turpentine, and afterward mixing the non-volatile drying-oil with the solution at a temperature not exceeding 100° centigrade; substantially as hereinbefore described.

3. The manufacture of varnishes, in which hard gum, or resin, a non-volatile drying-oil and turpentine are employed, by first dissolving the gum, or resin, in an excess of turpentine in a closed vessel at a temperature sufficiently high to dissolve the hard gum, or resin, then distilling off a portion of the turpentine to carry off water, then filtering or settling out solid impurities then distilling off the excess of turpentine, and afterward mixing the non-volatile drying-oil with the solution at a temperature lower than would cause discoloration of the non-volatile drying-oil, or the evaporation of the turpentine; substantially as hereinbefore described.

708,935.



708,936. STRUCTURAL-METAL BEAM. AXEL A. STRESS, Chicago, Ill., assignor to Stress Manufacturing Company, Chicago, Ill., a Corporation of Illinois. Filed July 15, 1902. Serial No. 115,717. (No model.)

Claim.—1. As a new article of manufacture, a wrought-metal webbed beam, having on one or on each end a forged head or base integral with, and composed wholly of sections of, all the webs of the beam upset into a solid body.

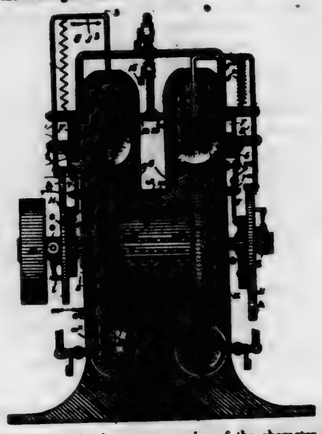
2. As a new article of manufacture, a wrought-metal webbed beam, having on one or on each end a forged head or base integral with, and composed wholly of sections of, all the webs of the beam upset into a solid body expanded beyond the depths of the webs of the article on two or more sides thereof.

708,937. ROTARY ENGINE. PETER STUDER and PETER RUFF, Whitehouse, Ohio. Filed May 31, 1902. Serial No. 109,736. (No model.)

Claim.—1. A rotary engine, comprising a casing having a plurality of annular steam-chambers, a single drive-shaft, said casing having a central bore, a disk rotatable within the bore, said disk having radial oppositely-disposed pistons, one for each annular chamber, cam devices on the shaft, a sliding abutment and cut-off valve for each annular steam-chamber, a separate means for automatically moving each abutment to its closure position, intermediate connections joining each abutment with one of the cam devices on the shaft, and connections joining the cut-off valve for each annular steam-space with its respective abutment, all being arranged substantially as shown and for the purpose described.

2. In a rotary engine, as described, the combination with the casing, having an annular steam-chamber, circular in cross-section: of a drive-shaft, a piston-carrying member mounted thereon, having a radial bracket, a piston-disk having a stub-axle, and a spring bearing on the bracket to receive the said disk, substantially as shown and for the purposes described.

3. In a rotary engine, as described, the combination with the annular steam-chamber, the steam-jackets surrounding the same, the automatically-operating abutment, said chamber having a steam-inlet at each side of the abutment, and a single exhaust; a piston operating with the annular chamber, a valve-chest communicating with the inlets, an independently-operating shifting valve for each inlet, a connection joining both valves, said connection including a rocking member, and a means for changing the fulcrum of said rocking member, whereby to throw one of the valves out of an operative condition, and the other into an operative condition, and a cam mechanism on the drive-shaft for imparting a motion to the rocking member, for the purposes described.



4. The combination in a rotary engine of the character described, with the annular steam-chamber, the sliding abutment, means for normally forcing the abutment to a closed position, the annular chamber having a steam-inlet at each side of the abutment, and a single exhaust; a piston operating in the said annular chamber, an independent valve for each inlet for controlling the steam-feed therethrough, a cam-disk mounted on the shaft, and connections between the disk and the sliding abutment cooperatively arranged for lifting the abutment, and a second cam-disk rotatable with the first cam-disk, and connections joining the second cam-disk with the rockable valve-operating member, for the purposes described.

5. In a rotary engine of the character described, the combination with the annular steam-chamber, the automatically-operating sliding abutment, said chamber having an inlet at each side of the abutment; the steam-chest common to both inlets, an independent valve for each inlet, mounted in the said chest, a changeable cam-disk connected with the inlet-controlling valves, and a governor mechanism for controlling the changes in the valve-operating cam-disk, for the purposes described.

6. The combination with the annular steam-chamber, the piston, the automatically-operating abutment, said piston having a pair of inlets, one at each side of the abutment, a valve-chest communicating therewith, a separate valve for each inlet, each valve including a crank-member, pivoted link connections joining both crank members, a rocker-arm including the said pivoted link connections, a shiftable fulcrum for the said rocker-arm, a cam disposed eccentrically of the drive-shaft and mounted to rotate with the said shaft, a link-arm joining the said eccentric with the valve-controlling mechanism, and a centrifugal governor for changing the position of the said eccentric, all being arranged substantially as shown and for the purposes described.

708,938. GRATE FOR KILNS OR FURNACES. JOHN W. TAYLOR, Summerville, S. C. Filed May 8, 1902. Serial No. 105,803. (No model.)

Claim.—1. In a grate, the combination with a series of grate-supporting bars each having portions of its length overthrown in cross-section and the remaining portions substantially T-shaped in cross-section and arranged horizontally and parallel with one another, of a plurality of bricks fitted between said bars and supported at their ends thereon, substantially as described.

2. In a grate, the combination with a series of grate-supporting bars

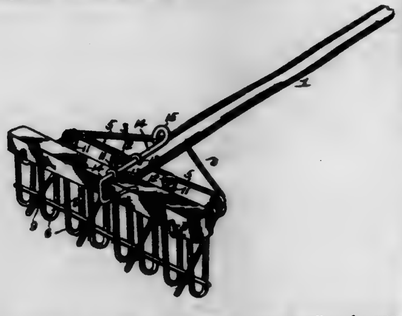
arranged horizontally and parallel with one another and each provided on its opposite vertical sides between its top and bottom with longitudinal laterally-projecting ribs or flanges, of a plurality of bricks disposed between the adjacent sides of said bars and resting at their opposite ends on said ribs or flanges, and means for preventing lateral movement of said bricks, substantially as described.

3. In a grate, the combination with a series of grate-supporting bars arranged horizontally and parallel with one another, each of said grate-bars being provided on its opposite vertical sides intermediate its top and bottom with longitudinal ribs or flanges and with lateral projections on the upper sides of said ribs or flanges, of a plurality of bricks arranged between the adjacent sides of said bars, each brick resting at its opposite ends on two of said ribs or flanges and between two of said lugs, substantially as described.

4. In a grate, the combination with a series of grate-supporting bars arranged horizontally and parallel with one another and each provided on its opposite vertical sides intermediate its top and bottom with longitudinal lateral-projecting ribs and with lugs formed on the upper sides of said ribs and the opposite sides of said bars, and a front and rear grate-supporting bar, each provided on its inner side only with a longitudinal laterally-projecting rib and laterally-projecting lugs formed on the upper side of said rib, and a plurality of bricks fitted between said grate-supporting bars and the said lugs, the upper edges of the front and rear grate-supporting bar lying flush with the upper surfaces of the bricks, substantially as described.

5. In a grate, the combination with a series of grate-supporting bars arranged horizontally and parallel with one another and provided with recesses for the reception of the ends of the bricks and provided on their under edges with depending tenons of hollow tubular standards, fitted at their upper ends over said tenons, substantially as described.

708,939. BAKE. LE GRAND TERRY, Waverly, N. Y. Filed Jan. 18, 1902. Serial No. 90,362. (No model.)



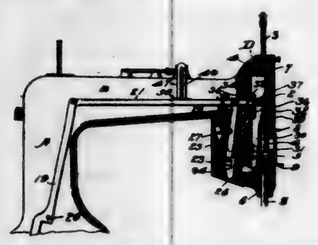
Claim.—1. In a rake, the combination with a handle and a cross-head secured thereto, of teeth secured to the cross-head and having front and rear members, a bar projecting through said teeth, and pivoted arms connected with the handle and projecting into eyes or loops in said bar.

2. In a rake, the combination with a handle and a cross-head secured thereto, of teeth secured to the cross-head and each comprising a wire bent between its ends, one end projecting into the bottom of the cross-head and the other into the side face thereof, a frame connected at its ends to the cross-head and between its ends to the handle, a rod carried by said frame disposed parallel with the cross-head, a bar projecting through the rake-teeth and having eyes at intervals throughout its length, and arms pivotally connected to said rod and projecting into the eyes in said bar.

3. In a rake, the combination with a handle and a cross-head secured thereto, of teeth secured to the cross-head, a bar projecting through said teeth, a frame carried by the rake, arms pivotally connected to the frame in front of the cross-head and having their free ends projecting through eyes on said bar, and a sliding catch on the rake adapted to support the bar and arms in an elevated position.

708,940. PRESSER-FOOT-LIFTING MECHANISM FOR SEWING-MACHINES. CONRAD TIEDEMANN, Bruning, Nebr. Filed Apr. 26, 1902. Serial No. 104,021. (No model.)

Claim.—1. A mechanism for lifting the presser-bar of a sewing-machine, comprising a presser-bar formed with rack-teeth, a bell-crank lever having teeth on the end of one arm to engage the said rack, a pivotally-supported lever to engage the other arm of the bell-crank lever, a reciprocable pitman to operate the lever, and means to reciprocate the pitman.



2. In a mechanism for lifting the presser-bar of a sewing-machine, the combination of a presser-bar formed with rack-teeth, a bell-crank lever having teeth on one arm to engage the said rack-teeth and provided with a pin in its upper end, a pivotally-supported lever 22 to engage the pin in the free arm of the bell-crank lever, a reciprocable pitman to which the upper end of the lever 22 is connected, a rocking lever to operate the pitman, and a lever under the table of the machine to rock the rocking lever.

3. In a mechanism for lifting the presser-bar of a sewing-machine, the combination with a reciprocable pitman having a pawl-catch on its inner end and means connected thereto for lifting the presser-bar, of a vertical shaft, a spider-wheel mounted on the shaft, a ratchet-pinion mounted on said shaft in the path of the pawl-catch, and means to actuate the pitman to engage the pawl-catch with the ratchet-pinion and turn the spider-wheel to engage and hold the presser-bar elevated.

4. In a mechanism for lifting the presser-bar of a sewing-machine, the combination of the lifting mechanism, the presser-bar formed with a recess, a ratchet-pinion, a spider-wheel turned thereby, and means to turn the ratchet-pinion with the spider-wheel whereby an arm of the spider is carried within the recess to support the presser-bar in raised position.

5. In a mechanism for raising and supporting the presser-bar of a sewing-machine, the combination of the presser-bar, a rotatable ratchet-pinion, a spider-wheel rotated thereby, means to lift the presser-bar, a pitman to actuate the lifting mechanism and to rotate the ratchet-pinion and bring the spider into engagement with the presser-bar, and a lever to operate the pitman.

708,941. MANUFACTURE OF IRON AND STEEL. FRANK J. TONE, Niagara Falls, N. Y., assignor to The Carborundum Company, Niagara Falls, N. Y., a Corporation of Pennsylvania. Filed Jan. 2, 1901. Serial No. 41,992. (No specimens.)

Claim.—As an improvement in the art of making iron and steel, the improvement which consists in adding to molten iron or steel silicon in its elemental form; substantially as described.

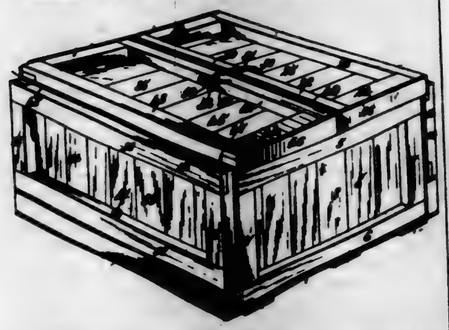
708,942. APPARATUS FOR RACKING OFF BEER. HARRY TOMESANI, Brooklyn, N. Y. Filed Nov. 9, 1901. Serial No. 81,892. (No model.)

Claim.—1. The combination of a racking-off faucet, a flanged tube connected therewith, a gasket or washer surrounding said tube, a sliding sleeve mounted on said tube and provided with a flange to engage a bushing and adapted to set on said gasket or washer, a ring connected with said tube, a guide interposed between said tube and sleeve, a handle or lever pivotally carried by said ring and having a cam-groove, a projection from said sleeve engaging said groove, and means for locking the handle or lever in the operative position, substantially as described.

2. An apparatus for the purpose specified comprising a tube adapted to be connected to a racking-off faucet provided at one end with a flange, a gasket disposed upon said tube adjacent to its flanged end, a sleeve slidably arranged upon said tube and provided with a stud and a flange adapted to engage a bushing, a ring fixed upon the upper end of said tube above said slidable sleeve, means carried by said ring and engaging said slidable sleeve whereby to hold the same against rotary movement, a lever pivotally mounted upon said ring, a cam-groove arranged in the pivoted end of said lever and engaging the stud on said slidable sleeve, a rack, and a pawl adapted to engage said rack whereby to lock said lever in its adjusted position and hold the gasket expanded within a bushing, substantially as specified.

3. An apparatus for the purpose specified comprising a tube adapted to be connected to a racking-off faucet provided at its lower end with a flange, a resilient gasket disposed upon said tube adjacent to its lower end, a slidable sleeve disposed upon said tube above said gasket and provided at its upper end with vertical apertures and an outwardly-projecting stud, and at its lower end with a flange adapted to engage a bushing, a ring fixed upon the upper end of said tube above said slidable sleeve, pins depending from said ring and extending into the vertical apertures in said slidable sleeve, a lever pivotally mounted upon said ring, a cam-groove arranged eccentrically in the pivoted end of said lever and engaging the outwardly-projecting stud on said slidable sleeve, a segmental rack arranged upon the periphery of the pivoted end of said lever, and a pawl pivoted on said slidable sleeve adapted to engage said segmental rack whereby to hold said lever to its adjusted position and the gasket expanded within a bushing, substantially as specified.

708,943. FOLDING BOX. ALEXANDER VAUSEY, Paraguald, Ark. Filed June 26, 1902. Serial No. 113,194. (No model.)

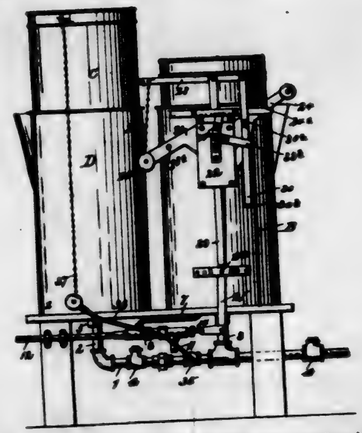


Claim.—A folding box consisting of a bottom, a plurality of supports secured to the lower face thereof, a front and rear wall, said walls each consisting of a rectangular frame having a plurality of vertically-extending abutting strips of suitable material secured to the inner face thereof, an edging-strip for the top of each of said walls, means secured to the upper face of the bottom and the inner face of each of said walls for hinging the walls to the bottom, a pair of supports secured to the upper face of said bottom, and side walls hinged to the said supports, each of the said walls comprising an upper and lower section hinged together, each of the said lower sections consisting of an oblong frame having a plurality of vertically-extending abutting strips of material secured to the inner face thereof, each of the upper sections consisting of a rectangular frame having a strip of material connected to the side edges thereof and projecting inwardly therefrom and a plurality of vertically-extending abutting strips of suitable material secured to the inner face of the frame and arranged to form a pair of grooves between the projecting strips, said grooves adapted to receive the top of the front and side walls when the box is set up, substantially as shown and described.

708,944. AIR-PUMP. EDWARD WALKER, Washington, Iowa. Filed Jan. 31, 1902. Serial No. 92,644. (No model.)

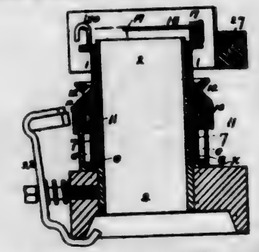
Claim.—1. The combination with the storage-ball and a pumping-ball connected by a pipe supplied with check-valves, of a meter-barrel having a piston therein connected to said pumping-ball, a valve constructed to regulate the flow of water into and out of said pumping-ball, a lever connected to operate said valve, a pair of cam-bearing levers, one located on each side of said levers in position to engage and operate said lever, and means connecting said ball and said cam-bearing levers to operate said levers, substantially as described.

2. In a device of the class described, the combination with a ball mounted in a tub, of a meter-barrel provided with a piston connected to said ball, a pipe connected to said barrel, a valve mounted in said pipe, a lever arranged to operate said valve to regulate the flow of water into and out of said barrel, a lever bearing a weight on one arm and a cam on the other, which cam is located to engage said lever, said weighted arm being connected to said ball by a flexible member, and a second lever bearing a weight on one arm and a cam on the other, said lever being located to operate said first-mentioned lever in the opposite direction from the first-mentioned cam-bearing lever, means for connecting said cam-bearing levers and said ball to operate them, substantially as described.



3. The combination with a pumping-ball, of a meter-barrel having a piston therein which is connected to said ball, a pipe connected to said meter-barrel and provided with a valve having a sliding stem, a lever connected to said stem, a first lever bearing a cam on one arm and a weight on the other, a chain connected to said ball and the weighted arm of said lever, a second lever bearing a cam on one arm and a weight on the other, a catch carried by said ball and located to engage the said second lever, said cam being located to operate said first-mentioned lever to operate said valve, substantially as described.

708,945. FLIER FOR SPINNING AND DOUBLING MACHINES. THOMAS WARDLE, Bridge of Weir, Scotland, assignor to Ernest Symington Coats, Paisley, Scotland. Original application filed Apr. 12, 1901. Serial No. 55,514. Divided and this application filed July 17, 1901. Serial No. 68,093. (No model.)



Claim.—1. In fliers for spinning and doubling machinery, a tubular bearing-piece to contain the spindle and having oil-grooves on its bearing-faces, and an oil-chamber for the bearing-piece having an annular piece fixed therein to divide the chamber into compartments, in combination with a flier-tube on the tubular bearing-piece, a head for the latter, a driving-pulley, a head-brake, a guide-eye, a two-armed lever, a stud for the latter and a stop, substantially as described.

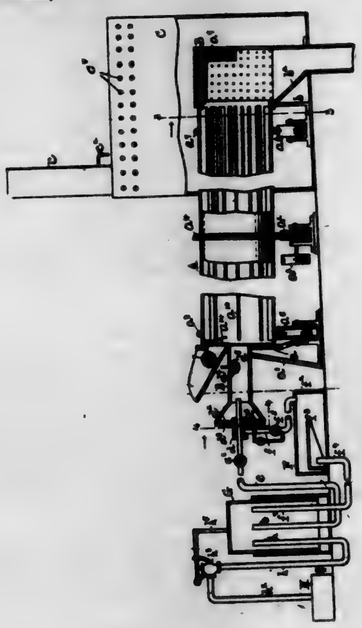
2. An improved flier for spinning and doubling machinery, comprising a tubular bearing-piece, having oil-grooves and an outer annular wall in one with it, comprising an oil-chamber, a fixed annular piece in the latter, in combination with a flier-tube adapted to rest on its lower edge in said chamber, and having heads, one outside the oil-chamber and en-

tending down below the top of the oil-chamber and one outside the annular piece extending down between the annular piece and the oil-chamber wall, substantially as described.

3. An improved flier for spinning and doubling machinery, comprising a tubular bearing-piece, a flier-tube, a pulley for the latter, and a ring-piece frictionally held to the flier-tube carrying the guide-eye, said ring-piece normally revolving with the flier-tube, but adapted to be stopped independently without stopping the pulley, substantially as described.

4. A flier-tube, comprising a pulley and head and a ring thereon carrying the guide-eye, said ring having a flanged beveled lower end fitting into a corresponding groove in the flier-tube, substantially as described.

708,946. METHOD OF HEATING MATERIALS FOR THE PURPOSE OF DRYING OR TREATING. ABRAHAM T. WELSH, Baltimore, Md. Original application filed May 28, 1897, Serial No. 638,660. Divided and this application filed June 7, 1901. Serial No. 63,653. (No specimens.)



Claim.—1. The process of heating materials continuously without burning for the purpose of drying or treating, which consists of dropping the same through flame intermittently, and then subjecting the material to gradually-declining heat, substantially as described.

2. The method of heating materials without burning for the purpose of drying or treating, which consists of subjecting the same initially in large bulks, with agitation, to the action of high heat, and then in gradually-diminishing bulks to progressively-decreasing heat, and increasing agitation whereby thoroughly to dry the substances, and at the same time, finely divide the same, substantially as described.

3. The method of heating materials without burning for the purpose of drying or treating, which consists of subjecting the goods to successive portions of a flame of diminishing intensity.

4. The method of heating materials without burning for the purpose of drying or treating, which consists of subjecting the goods to successive portions of a flame of diminishing intensity, and agitating the materials in the air.

5. The method of heating materials without burning for the purpose of drying or treating, which consists of dropping them through, or near, flame intermittently to heat them, and progressively decreasing the heat, substantially as described.

6. The method of heating materials without burning for the purpose of drying or treating, which consists of subjecting the pieces to the direct or direct radiant action of a blast-flame for a period of time dependent upon and controlled by the moisture to be evaporated.

7. The method of heating materials without burning for the purpose of drying or treating, which consists of subjecting the material intermittently to the direct or direct radiant action of flame, the period of subjection to the higher temperature, and the period of subjection to the lower temperature, being so proportioned that the temperature of the material will never rise to the ignition-point.

8. The method of heating materials without burning for the purpose of drying or treating, which consists of subjecting the materials to the direct or direct radiant action of flame and a blast for a period of time dependent upon and controlled by its weight.

9. The method of heating materials without burning for the purpose of drying or treating, which consists of subjecting the materials to the direct or direct radiant action of flame and a blast for a period of time dependent upon and controlled by its weight, and the amount of moisture to be evaporated.

10. The method of heating materials without burning for the purpose of drying or treating, which consists of subjecting the material intermittently to the direct or direct radiant action of flame for a period of time dependent upon its weight, and the speed of feed.

11. The method of heating material without burning for the purpose of drying or treating, which consists of subjecting the material to the direct or radiant action of a flame, the work and the power being substantially balanced at all stages of the process, substantially as described.

12. The method of heating materials without burning for the purpose of drying or treating, which consists of subjecting the materials to be heated to the direct or radiant action of a flame for a period of time, then withdrawing the material from the action of the flame at a speed directly proportional to the temperature of the flame.

13. The method of heating materials without burning for the purpose of drying or treating, which consists of subjecting the materials to be heated to the direct or radiant action of a flame intermittently, and subjecting the material to the action of the flame in quantity substantially proportional to the temperature of the flame.

14. The method of heating materials without burning for the purpose of drying or treating, which consists of subjecting the materials to be treated to the direct or radiant action of a flame, and then subjecting successive portions of said materials to constantly-declining temperatures, in quantities substantially proportional to the temperatures, and simultaneously feeding fresh material to the flame.

15. The method of heating mixed materials of varying size and weight, without burning, for the purpose of drying or treating, which consists of subjecting the material to be treated to the direct or radiant action of a flame and blast, intermittently passing the materials through the flame and blast, whereby the lighter and drier materials will be driven by the blast away from the flame toward its point of minimum temperature, while the heavier particles will be driven proportionally a less distance.

16. The method of heating material without burning for the purpose of drying or treating, which consists of subjecting the greatest quantity of material to be dried in its highest heat-absorbing condition, to the direct or radiant action of a flame at its point of maximum temperature, and gradually reducing the quantity as the temperature of the flame diminishes, substantially as described.

17. The method of heating materials without burning for the purpose of drying or treating, which consists of subjecting the greatest quantity of material to be treated, in its highest heat-absorbing condition, to the direct or radiant action of a flame, at its point of maximum temperature, intermittently subjecting the material to the direct action of the flame in constantly-declining quantity as the temperature decreases.

18. The method of heating materials continuously without burning, for the purpose of drying or treating, which consists of subjecting the maximum quantity of material to be heated, in its highest heat-absorbing condition, to the direct or radiant action of a flame, gradually withdrawing the material from the action of the hottest flame and subjecting it in constantly-reducing mass to a gradually-reducing temperature, and simultaneously supplying fresh material in its highest heat-absorbing condition.

19. The method of heating mixed materials of varying size and weight, without burning, for the purpose of drying or treating, which consists of subjecting the greatest quantity of material to be heated, in its highest heat-absorbing condition, to the direct or radiant action of a flame at its point of maximum temperature, intermittently passing the material through the flame, whereby the lighter and drier materials will be driven by the blast of the flame from the point of maximum temperature of the flame toward its point of minimum temperature, while the heavier particles will be driven a less distance from the point of maximum temperature of the flame.

20. The method of drying material which consists in subjecting the wettest goods to the direct action of flame for a period of time dependent upon and controlled by their contained moisture, and then withdrawing them from the action of the flame, and then subjecting them to a gradually-decreasing temperature.

21. The method of drying materials which consists of subjecting the wet goods to the direct action of flame for a period of time dependent upon and controlled by the contained moisture, and then automatically withdrawing them from the action of the flame.

22. The method of drying materials which consists of subjecting the wet goods to the direct action of a flame for a period of time dependent upon the contained moisture, and regulating the effective temperature of the flame upon the goods, by regulating the quantity of goods fed to the flame.

23. The method of drying materials which consists of subjecting the wet goods to the direct action of a flame for a period of time dependent upon and controlled by their contained moisture and then withdrawing them from the action of the flame automatically by agitation and blowing.

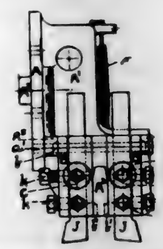
24. The method of drying materials which consists of subjecting the wet goods to the direct action of a flame for a period of time dependent upon and controlled by their contained moisture and then withdrawing them from the action of the flame by agitating an inclined mass and blowing.

25. The method of drying materials which consists of subjecting the wet goods to the direct action of a flame and regulating the effect of the flame upon the goods by regulating the quantity of goods fed to the flame.

26. The method of drying materials which consists of subjecting the wet goods to the direct action of a flame for a period of time dependent upon their contained moisture, and regulating the effects of the flame upon the goods by regulating the quantity of goods fed to the flame.

27. The method of drying which consists of subjecting the goods while passing through the drier to the direct action of a flame and hot air, while so maintaining the relative temperatures of the air and goods that the air will always continue to absorb moisture.

708,947. DUPLEX TOOL-HOLDER FOR PLANERS, &c. JOSEPH H. WICKSTEED, Leeds, England. Filed Mar. 3, 1902. Serial No. 96,532. (No model.)



Claim.—1. In a tool-holder, a plate, a bracket integral therewith, a series of abutments integral with the bracket and provided with recesses, trunnions mounted in the said bracket, springs connecting the trunnions to the bracket, sleeves connected with the trunnions and provided with lugs adapted to engage in the said recesses, and tools suitably secured within the sleeves.

2. In a tool-holder, a pair of partially-rotatable trunnions, sleeves carried thereby and provided with lugs, tools suitably secured in the sleeves, a series of abutments provided with recesses and arranged at the sides of the sleeves, said recesses adapted to receive the said lugs during the operation of the tools, and means for supporting the trunnions and abutments.

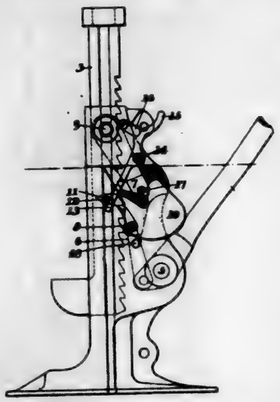
3. In a tool-holder, a pair of partially-rotatable trunnions, sleeves suitably connected with the trunnions, tools suitably mounted in the sleeves, an abutment interposed between the sleeves, an abutment at each side of the sleeves, means integral with the sleeves and engaging in the abutments to prevent sidewise or upward movement during the cutting operation of the tools and means for supporting the trunnions and abutments.

4. In a tool-holder, a pair of partially-rotatable trunnions, sleeves carried thereby and provided with lugs, abutments suitably arranged in relation to the said sleeves and provided with recesses adapted to receive the lugs carried by the sleeves, means for suitably supporting the abutments and trunnions, and springs connected with said trunnions and with said supporting means.

5. In a tool-holder, a pair of trunnions, tool-carrying sleeves connected thereto, an abutment interposed between the sleeves, an abutment arranged at one side of each of the said sleeves, means carried by the sleeves and adapted to engage in the abutments to prevent movement of the sleeves during the operation of the tools and means for supporting said abutments and trunnions.

6. In a tool-holder, a plate, a bracket integral therewith, a pair of trunnions extending through the said bracket, a pair of springs connected at one end to the trunnions and at the other end to the said bracket, tool-receiving sleeves connected with the trunnions, an abutment integral with said bracket and interposed between said sleeves, and a pair of abutments integral with said bracket and one of which is adapted to be arranged at the outer side of each of the said sleeves.

708,948. JACK. BRAHUR WOODRUM, Oakmont, Pa. Filed Dec. 10, 1901. Serial No. 85,282. (No model.)



Claim.—1. A jack having two pawls engaging a toothed bar, and a single weight pivoted to the lower pawl and arranged to act upon the upper pawl to reverse the movement of the jack: substantially as described.

2. A jack having a toothed lifting-bar, two pawls arranged to engage the same, a weight pivoted to one pawl and arranged to act upon the other, a projection on the standard arranged to act upon the weight, and mechanism for holding the weight in inoperative position; substantially as described.

3. A jack having a toothed lifting-bar, a casing provided with a pawl engaging the teeth, an operating-lever also having a pawl engaging the teeth, a weight pivoted to the lever-pawl, and having one face arranged to act upon the upper pawl, and another face arranged to engage a projection on the casing, and a movable latch arranged to engage the weight: substantially as described.

708,949. MOTOR-VEHICLE. EDGAR A. WEBSTY, Canton, Ohio, assignor to the Aultman Company, Canton, Ohio, a Corporation of Ohio. Filed Dec. 13, 1900. Serial No. 39,772. (No model.)

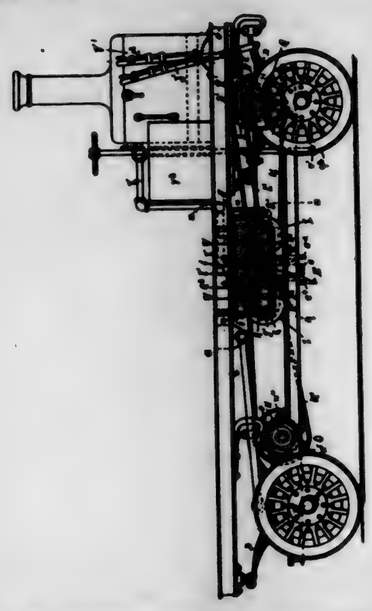
Claim.—1. The combination of the truck-frame, the steering-wheels, the pivoting devices connecting the steering-wheels with the truck-frame, the power-transmitting devices at the axis of the said pivoting devices for actuating the steering-wheels, and a motor situated between the front and rear wheels operating in lines transverse to the vehicle and connected with said power-transmitting devices, substantially as set forth.

2. In a motor-vehicle, the combination of rear traction-wheels, front traction-wheels, a motor situated between said front and rear wheels and operating in planes transverse to the vehicle, power-transmitting devices extending longitudinally of the vehicle for transmitting power to said rear traction-wheels and to said front traction-wheels and power connections between the motor and said power-transmitting devices to actuate the same.

3. In a motor-vehicle the combination of rear traction-wheels, front traction-wheels, a differential or compounding power device rotating in planes transverse to the vehicle, a motor situated between the front and rear wheels, operating in planes transverse to the vehicle and connected with said differential power device, and power-transmitting devices extending longitudinally of the vehicle for transmitting power from said differential power device to said rear traction-wheels and to said front traction-wheels.

4. In a motor-vehicle, the combination of rear traction-wheels, front traction-wheels, two friction-wheels, capable of different rotation, situated below the main frame of the vehicle, a motor for actuating said wheels, supplemental friction-wheels adapted to engage the first friction-wheels, and power-transmitting devices extending longitudinally of the vehicle for transmitting power from one of said supplemental wheels to the rear

traction-wheels and from the other of said supplemental wheels to the front traction-wheels.



5. In a motor-vehicle, the combination of rear traction-wheels, front traction-wheels, two friction-wheels capable of different rotation and turning in planes transverse to the vehicle, a motor for actuating said wheels, supplemental friction-wheels engaging said first friction-wheels and turning in planes longitudinal of the vehicle, and power-transmitting devices extending longitudinally of the vehicle from said supplemental wheels to said front and rear traction-wheels respectively.

6. The combination of the vehicle-frame, the two steering-wheels adjustable relative to the frame, the two ground-wheels fixed in relation to the frame, the compensating gear having its two elements stationary relative to the vehicle-frame, and having its two elements respectively connected to the steering-wheels, the second compensating gearing having its two elements respectively connected to the fixed ground-wheels, and the intermediate compensating gearing turning in planes transverse to the vehicle and having its two elements respectively connected to the driving parts of the aforesaid compensating gearing, substantially as set forth.

7. The combination of the axles, the two wheels on each axle, the truck-frame, the body-frame, the engine on the body-frame operating in planes transverse to the vehicle, the engine-gearing comprising a compensating gear having two driven elements turning in planes transverse to the vehicle, the power-transmitting devices interposed between the engine-gearing and the two front driving-wheels, and comprising a supplemental compensating gearing and the driving devices for the two rear wheels comprising a compensating gearing, substantially as set forth.

8. The combination of the axles, the two wheels on each axle, the truck-frame, the body-frame, the engine connected to the body-frame and having its main driving-shaft longitudinal of the vehicle, the compensating gearing actuated by the engine turning in planes transverse to the vehicle and supported from the body-frame, the independent power devices for the front ground-wheels, the compensating gearing between said power devices, the two sets of driving devices for the rear ground-wheels, the compensating gearing between said devices, and two transmitting devices respectively connecting the first aforesaid compensating gear with the last two compensating gears, substantially as set forth.

9. The combination of the axles, the two driving-wheels on each axle, the truck-frame, the body-frame, the engine on the body-frame, the compensating gearing driven by the engine two friction-wheels driven by the compensating gearing, two sets of driving devices, one for each front wheel, the compensating gearing interposed between said driving devices, friction-driven power-transmitting devices connecting one of the aforesaid friction-wheels to the said compensating gearing two sets of driving devices for the rear ground-wheels, a compensating gear interposed between them, friction-driven power-transmitting devices connecting the last said gearing with the second aforesaid friction-wheel, substantially as set forth.

10. The combination of the truck-frame, the front pair of ground-wheels, the rear pair of ground-wheels, the engine or motor, the compensating gearing driven by the engine and mounted on a shaft longitudinal of the vehicle, the friction-wheels driven by the compensating gearing, the friction-pulleys on shafts transverse to the vehicles, and power-transmitting devices connecting one of the said transverse shafts with both of the front ground-wheels, and transmitting devices connecting the other transverse shaft with both of the rear ground-wheels, substantially as set forth.

11. The combination of the truck-frame, the two shafts mounted thereon, the pair of ground-wheels mounted in fixed positions relative to the truck-frame, a pair of ground-wheels adjustable on the truck-frame for steering, the two sets of compensating gears, one connected to the two fixed wheels and one connected to the two adjustable wheels, the intermediate compensating gearing, comprising transverse friction-wheels and longitudinally-turning friction-wheels, I, power devices for actuating the intermediate gearing, and two trains of power-transmitting devices, one connecting each of the aforesaid sets of compensating gears with the intermediate compensating gearing, substantially as set forth.

12. In a motor-vehicle, the combination of rear traction-wheels, front traction-wheels, a differential or compensating power device rotating in planes transverse to the vehicle and situated between said front and rear wheels, a motor for actuating said differential power device, longitudinally-turning chain-wheels, H, H', operated by the separate power elements of said differential power device respectively, and longitudinally-extending chains, M', M, for driving said rear and front traction-wheels.

13. In a motor-vehicle, the combination of rear traction-wheels, front traction-wheels, a differential or compensating power device rotating in planes transverse to the vehicle, situated between said front and rear wheels and having friction wheels or surfaces, c', c^2, friction-wheels, I, turning in longitudinal planes, chain-wheels, H, H', shafts, G, G', connecting the wheels, I, with the chain-wheels, and longitudinally-extending chains, M', M, for actuating the rear and front traction-wheels respectively.

14. In a motor-vehicle, the combination of the vehicle-frame, bearings g pivotally supported thereby, shafts supported in said bearings, movable bearings carrying the other ends of said shafts, means for moving the latter bearings, a compensating gearing between said shafts, having driving-wheels, driven wheels on said shafts, front and rear traction-wheels driven from said shafts, and means for actuating the compensating gearing.

15. In a motor-vehicle, the combination of the vehicle-frame, the traction-wheels, a compensating gearing comprising pinions and driving elements or wheels at the sides of said pinions, said pinions and wheels having intermeshing gear-teeth and also having curved surfaces engaging by a smooth rolling contact limiting the depth of engagement of said teeth, a motor for actuating said gearing, and means for driving the traction-wheels from said gearing.

16. In a motor-vehicle, the combination of the vehicle-frame, straps F', F', supported thereby, a compensating gearing, having a shaft supported in the inner parts of said straps, bearings supported in the outer parts of said straps, shafts at the sides of the compensating gearing driven thereby, and having journals in said bearings, traction-wheels driven from said shafts, and means for actuating the compensating gearing.

17. In a motor vehicle, the combination of front steering and traction wheels independently mounted by vertical pivots, gear-wheels on said traction-wheels, double-faced pinions, S', mounted in vertical line with said pivots, the lower face of said pinions engaging the gear-wheels of the traction-wheels, and means for engaging and driving said pinions on their upper faces, said pivots being extended and forming journals for said pinions.

18. In a motor-vehicle, the combination of a steering truck-frame, a transverse axle carrying the same, steering and traction wheels mounted on vertical pivots at the ends of said axle, transverse frame-bars forming a part of the truck-frame, an upwardly-extending frame carried by said axle, a transverse driving-shaft on said upwardly-extending frame, means whereby said traction-wheels are driven from said shaft, and braces extending from the upwardly-extending frame to said transverse frame-bars.

19. In a motor-vehicle, the combination of rear traction-wheels, front traction-wheels, a compensating gearing, E, a motor for driving the same, shafts, G, G', means by which said shafts are driven frictionally from said gearing, oscillatory bearn, g, forming bearings for said shafts, bearings, g', also supporting said shafts, a lever, L, means for operating the same, and connections between said lever and said bearings, g'.

20. In a motor-vehicle, the combination of rear traction-wheels, front traction-wheels, a compensating gearing operating in planes transverse to the vehicle and between said front and rear wheels, friction wheels or surfaces carried by the driving elements of said gearing, transverse shafts

movable toward and from said friction-surfaces, supplemental friction-wheels longitudinally movable on said shafts and turning in planes longitudinal of the vehicle, means for moving said shafts toward and from said gearing to engage and disengage the supplemental wheels, and means for moving the latter wheels longitudinally on their shafts, substantially as set forth.

708,950. MAIL-CHUTE. ARTHUR G. SARGENT, Boston, Mass. Filed July 2, 1902. Serial No. 114,071. (No model.)

Claim.—1. A mail-chute comprising a lower tubular section, and an upper tubular section having its lower end telescopically fitted within the upper end of the lower section and formed with an integral hook-shaped extension bent upwardly on the outer side of said upper section and taking over the edge of the lower section.

2. A mail-chute comprising a lower tubular section, and an upper tubular section having its lower end telescopically fitted within the upper end of the lower section, and formed with an integral hook-shaped extension bent upwardly on the outer side of said upper section and taking over the edge of the lower section, said upper section having its walls convergent from its upper toward its lower end.

708,951. LENO-LOOM. ROBERT H. RALLEY, Pawtucket, R. I. Filed May 27, 1901. Serial No. 62,162. (No model.)

Claim.—1. In a lease-loom, the combination of the lay, with a reed detachable from the lay, and deep and standard harnesses held for operative movement in front of the reed, and means for imparting such movement.

2. In a lease-loom, the combination of the lay, with a reed detachable from the lay, and deep and standard harnesses, arranged for operation in front of the reed, and means for locking the combined reed and deep and standard harnesses to the lay, and for disengaging the same.

3. In a lease-loom, the combination of the lay, with a reed detachable from the lay, and deep and standard harnesses arranged for operation in front of the reed, means for locking the combined reed and deep and standard harnesses to the lay, and for disengaging the same, and the metallic loops by means of which the deeps of the deep-harness are adapted to resist the wear caused by the forward and backward movement of the deep-harness with the lay.

4. In a lease-loom, the combination of the lay, with a reed detachable from the lay, and deep and standard harnesses, arranged for operation in front of the reed, and adapted to swing back and forth with the lay, means for locking the combined reed, and deep and standard harnesses to the lay, and for disengaging the same, and the soft lower portion of the standard-harness heddles, whereby the heddles are made adapted for heating up the weft in front of the reed.

5. In a lease-loom, the combination of the lay, with a reed detachable from the lay, and deep and standard harnesses arranged for operation in front of the reed, means for locking the combined reed, and deep and standard harnesses to the lay, and for disengaging the same, and the spring-buffers limiting the backward movement of the reed and the deep and standard harnesses.

6. In a lease-loom, the combination of the lay, with a reed detachable from the lay, and deep and standard harnesses arranged for operation in front of the reed, means for locking the combined reed, and deep and standard harnesses to the lay, and for disengaging the same, the shuttle guide-bar having guide-pins attached thereto, and means for raising the pins of the shuttle guide-bar into the shed.
